## Absorptive Ointment

吸水軟膏

### Method of preparation

White Petrolatum	400 g
Cetanol	100 g
White Beeswax	50 g
Sorbitan Sesquioleate	50 g
Lauromacrogol	5 g
Ethyl Parahydroxybenzoate or Methyl Parahydroxybenzoate	1 g
Butyl Parahydroxybenzoate or Propyl Parahydroxybenzoate	1 g
Purified Water	a sufficient quantity

To make 1000 g

Melt White Petroleum, Cetanol, White Beeswax, Sorbitan Sesquioleate and Lauromacrogol by heating on a water bath, mix and maintain at about 75°C. Add Methyl Parahydroxybenzoate or Ethyl Parahydroxybenzoate and Propyl Parahydroxybenzoate or Butyl Parahydroxybenzoate to Purified Water, dissolve by warming at 80°C. Combine both solutions, mix to make emulsion, cool, and stir thoroughly until it congeals.

**Description** Absorptive Ointment is white in color and is lustrous. It has a slightly characteristic odor.

**Containers and storage** Containers—Tight containers.

## Acebutolol Hydrochloride

アセブトロール塩酸塩

$C_{18}H_{28}N_2O_4 \cdot HCl$ : 372.89

*N*-{3-Acetyl-4-[(2*RS*)-2-hydroxy-3-(1-methylethyl)aminopropoxy]phenyl}butanamide monohydrochloride [34381-68-5]

Acebutolol Hydrochloride, when dried, contains not less than 98.0% and not more than 102.0% of  $C_{18}H_{28}N_2O_4 \cdot HCl$ .

**Description** Acebutolol Hydrochloride occurs as white to pale yellowish white crystals or crystalline powder.

It is freely soluble in water, in methanol, in ethanol (95) and in acetic acid (100), and practically insoluble in diethyl ether.

A solution of Acebutolol Hydrochloride (1 in 20) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Acebutolol Hydrochloride in 0.01 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Acebutolol Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Acebutolol Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> for chloride.

**Melting point** <2.60> 141 – 145°C

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Acebutolol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

**(2)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Acebutolol Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

**(3)** Related substances—Dissolve 40 mg of Acebutolol Hydrochloride in 2 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 25 mL, and pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with the upper layer of a mixture of water, 1-butanol and acetic acid (100) (5:4:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 365 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (0.5 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.25 g of Acebutolol Hydrochloride, previously dried, dissolve in 20 mL of acetic acid (100), add 80 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 37.29 mg of  $C_{18}H_{28}N_2O_4 \cdot HCl$

**Containers and storage** Containers—Well-closed containers.

## Aceglutamide Aluminum

アセグルタミドアルミニウム

$C_{35}H_{59}Al_3N_{10}O_{24}$ : 1084.84

Pentakis[(2*S*)-2-acetylamino-4-carbamoylbutanoato]tetrahydroxotrialuminium  
[12607-92-0]

Aceglutamide Aluminum contains not less than 85.4% and not more than 87.6% of aceglutamide ( $C_7H_{12}N_2O_4$ : 188.18), and not less than 7.0% and not more than 8.0% of aluminum (Al: 26.98), calculated on the dried basis.

**Description** Aceglutamide Aluminum occurs as a white powder, having astringent bitter taste.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

It dissolves in dilute hydrochloric acid.

It is hygroscopic.

**Identification** (1) Dissolve 0.03 g each of Aceglutamide Aluminum and Aceglutamide Reference Standard in 5 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of cellulose for thin-layer chromatography. Develop the plate with a mixture of 1-propanol, water and acetic acid (100) (16:8:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of bromocresol green in ethanol (95) (1 in 1000), then spray evenly diluted ammonia solution (28) (1 in 100): the spots from the sample solution and the standard solution show a light yellow and have the same  $R_f$  value.

(2) A solution of Aceglutamide Aluminum in dilute hydrochloric acid (1 in 20) responds to the Qualitative Tests <1.09> for aluminum salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-5.5 - -7.5^\circ$  (2 g calculated on the dried basis, water, 50 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Put 1.0 g of Aceglutamide Aluminum in a porcelain crucible, cover the crucible loosely, and heat gently to carbonize. After cooling, add 2 mL of nitric acid and 1 mL of sulfuric acid, heat gently until the white fumes no more evolve, and heat to incinerate at 500 to 600°C. If the incineration is not accomplished, add 2 mL of nitric acid and 1 mL of sulfuric acid, heat in the same manner as above, then ignite at 500 to 600°C to incinerate. After cooling, add 2 mL of hydrochloric acid, proceed with this solution according to Method 2, and perform the test. Prepare the control solution as follows: proceed in the same manner as the preparation of the test solution with the same amount of the reagents, and add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 20

ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Aceglutamide Aluminum according to Method 1, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.10 g of Aceglutamide Aluminum in the mobile phase to make exactly 100 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution (1). Separately, dissolve 10 mg of 2-acetamidoglutarimide in the mobile phase to make exactly 100 mL. Pipet 3 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution (2). Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solutions (1) and (2) as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of 2-acetamidoglutarimide from the sample solution is not more than that from the standard solution (2), the peak areas other than aceglutamide and 2-acetamidoglutarimide from the sample solution are not more than 3/10 times the peak area of aceglutamide from the standard solution (1), and the total of the peak areas other than aceglutamide and 2-acetamidoglutarimide from the sample solution is not more than the peak area of aceglutamide from the standard solution (1).

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of aceglutamide.

**System suitability**—

Test for required detection: To exactly 5 mL of the standard solution (1) add the mobile phase to make exactly 50 mL. Confirm that the peak area of aceglutamide obtained from 20  $\mu$ L of this solution is equivalent to 7 to 13% of that of aceglutamide obtained from 20  $\mu$ L of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay (1).

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution (1) under the above operating conditions, the relative standard deviation of the peak area of aceglutamide is not more than 2.0%.

**Loss on drying** <2.41> Not more than 5.0% (1 g, 130°C, 5 hours).

**Assay** (1) Aceglutamide—Weigh accurately about 50 mg of Aceglutamide Aluminum, dissolve in a suitable amount of the mobile phase, add exactly 10 mL of the internal standard solution and the mobile phase to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 45 mg of Aceglutamide Reference Standard, dissolve in a suitable amount of the mobile phase, add exactly 10 mL of the internal standard solution and the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of aceglutamide to that of the internal standard.

Amount (mg) of aceglutamide ( $C_7H_{12}N_2O_4$ )

$$= W_s \times (Q_T/Q_S)$$

$W_s$ : Amount (mg) of Aceglutamide Reference Standard

**Internal standard solution**—A solution of thymine in methanol (1 in 4000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 210 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 25°C.

**Mobile phase**: A mixture of diluted perchloric acid (1 in 1000) and methanol (99:1).

**Flow rate**: Adjust the flow rate so that the retention time of aceglutamide is about 5 minutes.

**System suitability**—

**System performance**: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, aceglutamide and the internal standard are eluted in this order with the resolution between these peaks being not less than 11.

**System repeatability**: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of aceglutamide to that of the internal standard is not more than 1.0%.

(2) **Aluminum**—Weigh accurately about 3.0 g of Aceglutamide Aluminum, add 20 mL of dilute hydrochloric acid, and heat on a water bath for 60 minutes. After cooling, add water to make exactly 200 mL. Pipet 20 mL of this solution, add exactly 25 mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS and 20 mL of acetic acid-ammonium acetate buffer solution, pH 4.8, and boil for 5 minutes. After cooling, add 50 mL of ethanol (95), and titrate <2.50> with 0.05 mol/L zinc acetate VS until the color of the solution changes from light dark green to light red (indicator: 2 mL of dithizone TS). Perform a blank determination in the same manner.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 1.349 mg of Al

**Containers and storage** Containers—Tight containers.

## Acetaminophen

### Paracetamol

アセトアミノフェン

$C_8H_9NO_2$ : 151.16

*N*-(4-Hydroxyphenyl)acetamide [103-90-2]

Acetaminophen, when dried, contains not less than 98.0% of  $C_8H_9NO_2$ .

**Description** Acetaminophen occurs as white crystals or

crystalline powder.

It is freely soluble in methanol and in ethanol (95), sparingly soluble in water, and very slightly soluble in diethyl ether.

It dissolves in sodium hydroxide TS.

**Identification** Determine the infrared absorption spectra of Acetaminophen, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Acetaminophen Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 169 – 172°C

**Purity (1) Chloride** <1.03>—Dissolve 4.0 g of Acetaminophen in 100 mL of water by heating, cool with shaking in ice water, allow to stand until ordinary temperature is attained, add water to make 100 mL, and filter. To 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(2) **Sulfate** <1.14>—To 25 mL of the filtrate obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.019%).

(3) **Heavy metals** <1.07>—Proceed with 2.0 g of Acetaminophen according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) **Arsenic** <1.11>—Prepare the test solution with 1.0 g of Acetaminophen according to Method 3, and perform the test (not more than 2 ppm).

(5) **Related substances**—Dissolve 50 mg of Acetaminophen in 1 mL of methanol, add the mobile phase to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of all peaks other than the peak area of acetaminophen from the sample solution is not larger than the peak area of acetaminophen from the standard solution.

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 225 nm).

**Column**: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: A mixture of 0.05 mol/L potassium dihydrogenphosphate, pH 4.7 and methanol (4:1)

**Flow rate**: Adjust the flow rate so that the retention time of acetaminophen is about 5 minutes.

**Selection of column**: Dissolve 0.01 g each of Acetaminophen and *p*-aminophenol in 1 mL of methanol, add the mobile phase to make 50 mL, to 1 mL of this solution

add the mobile phase to make 10 mL. Proceed with 10  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of *p*-aminophenol and acetaminophen in this order with the resolution between these peaks being not less than 7.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of acetaminophen obtained from 10  $\mu$ L of the standard solution is about 15% of the full scale.

Time span of measurement: About 6 times as long as the retention time of acetaminophen beginning after the solvent peak.

**Loss on drying** <2.41> Not more than 0.3% (0.5 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 20 mg each of Acetaminophen and Acetaminophen Reference Standard, previously dried, dissolve in 2 mL of methanol, and add water to make exactly 100 mL. Pipet 3 mL each of these solutions, add water to make exactly 100 mL, and use these solutions as the sample solution and standard solution, respectively. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at the wavelength of maximum absorption at about 244 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the blank.

$$\text{Amount (mg) of } C_8H_9NO_2 = W_S \times (A_T/A_S)$$

$W_S$ : Amount (mg) of Acetaminophen Reference Standard

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Acetazolamide

アセタゾラミド

$C_4H_6N_4O_3S_2$ : 222.25

*N*-(5-Sulfamoyl-1,3,4-thiadiazol-2-yl)acetamide [59-66-5]

Acetazolamide contains not less than 98.0% and not more than 102.0% of  $C_4H_6N_4O_3S_2$ , calculated on the dried basis.

**Description** Acetazolamide occurs as a white to pale yellowish white, crystalline powder. It is odorless, and has a slight bitter taste.

It is slightly soluble in ethanol (95), very slightly soluble in water, and practically insoluble in diethyl ether.

Melting point: about 255°C (with decomposition).

**Identification** (1) To 0.1 g of Acetazolamide add 5 mL of sodium hydroxide TS, then add 5 mL of a solution of 0.1 g of hydroxylammonium chloride and 0.05 g of copper (II) sulfate pentahydrate in 10 mL of water: a light yellow color develops. Then heat this solution for 5 minutes: a deep yellow color is produced gradually.

(2) To 0.02 g of Acetazolamide add 2 mL of dilute hydrochloric acid, boil for 10 minutes, cool, and add 8 mL of water: this solution responds to the Qualitative Tests <1.09> for primary aromatic amines.

(3) To 0.2 g of Acetazolamide add 0.5 g of granulated zinc and 5 mL of diluted hydrochloric acid (1 in 2): the gas evolved darkens moistened lead (II) acetate paper.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Acetazolamide in 10 mL of sodium hydroxide TS: the solution is clear and colorless to pale yellow.

(2) Chloride <1.03>—To 1.5 g of Acetazolamide add 75 mL of water, and warm at 70°C for 20 minutes with occasional shaking. After cooling, filter, and to 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(3) Sulfate <1.14>—To 25 mL of the filtrate obtained in (2) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.038%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of Acetazolamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(5) Silver-reducing substances—Wet 5 g of Acetazolamide with 5 mL of aldehyde-free ethanol, and add 125 mL of water, 10 mL of nitric acid and exactly 5 mL of 0.1 mol/L silver nitrate VS. Stir for 30 minutes by protecting from light, filter through a glass filter (G3), and wash the residue on the glass filter with two 10-mL portions of water. Combine the filtrate with the washings, to the solution add 5 mL of ferric ammonium sulfate TS, and titrate <2.50> with 0.1 mol/L ammonium thiocyanate VS: not less than 4.8 mL of 0.1 mol/L ammonium thiocyanate VS is consumed.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 0.15 g of Acetazolamide, and dissolve in 400 mL of water in a water bath by heating. After cooling, add water to make exactly 1000 mL. Pipet 5 mL of the solution, add 10 mL of 1 mol/L hydrochloric acid TS, and then add water to make exactly 100 mL. Determine the absorbance *A* of this solution at the wavelength of maximum absorption at about 265 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

$$\text{Amount (mg) of } C_4H_6N_4O_3S_2 = (A/474) \times 200,000$$

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Acetic Acid

酢酸

Acetic Acid contains not less than 30.0 w/v% and

not more than 32.0 w/v% of  $C_2H_4O_2$ : 60.05.

**Description** Acetic Acid is a clear, colorless liquid. It has a pungent, characteristic odor and an acid taste.

It is miscible with water, with ethanol (95) and with glycerin.

Specific gravity  $d_{20}^{20}$ : about 1.04

**Identification** Acetic Acid changes blue litmus paper to red, and responds to the Qualitative Tests <1.09> for acetate.

**Purity (1) Chloride**—To 20 mL of Acetic Acid add 40 mL of water, and use this solution as the sample solution. To 10 mL of the sample solution add 5 drops of silver nitrate TS: no opalescence is produced.

**(2) Sulfate**—To 10 mL of the sample solution obtained in (1) add 1 mL of barium chloride TS: no turbidity is produced.

**(3) Heavy metals <1.07>**—Evaporate 10 mL of Acetic Acid on a water bath to dryness, and to the residue add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test with this solution as the test solution. Prepare the control solution with 3.0 mL of Standard Lead Solution by adding 2 mL of dilute acetic acid and water to make 50 mL (not more than 3 ppm).

**(4) Potassium permanganate-reducing substances**—To 20 mL of the sample solution obtained in (1) add 0.02 mol/L potassium permanganate VS: the red color does not disappear within 30 minutes.

**(5) Non-volatile residue**—Evaporate 30 mL of Acetic Acid on a water bath to dryness, and dry at 105°C for 1 hour: the mass of the residue is not more than 1.0 mg.

**Assay** Measure exactly 5 mL of Acetic Acid, add 30 mL of water, and titrate <2.50> with 1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS).

Each mL of 1 mol/L sodium hydroxide VS  
= 60.05 mg of  $C_2H_4O_2$

**Containers and storage** Containers—Tight containers.

## Glacial Acetic Acid

氷酢酸

$C_2H_4O_2$ : 60.05

Acetic acid [64-19-7]

Glacial Acetic Acid contains not less than 99.0% of  $C_2H_4O_2$ .

**Description** Glacial Acetic Acid is a clear, colorless, volatile liquid, or colorless or white, crystalline masses. It has a pungent, characteristic odor.

It is miscible with water, with ethanol (95) and with diethyl ether.

Boiling point: about 118°C

Specific gravity  $d_{20}^{20}$ : about 1.049

**Identification** A solution of Glacial Acetic Acid (1 in 3) changes blue litmus paper to red, and responds to the Qualitative Tests <1.09> for acetate.

**Congearing point** <2.42> Not below 14.5°C.

**Purity (1) Chloride**—To 10 mL of Glacial Acetic Acid add water to make 100 mL, and use this solution as the sample solution. To 10 mL of the sample solution add 5 drops of silver nitrate TS: no opalescence is produced.

**(2) Sulfate**—To 10 mL of the sample solution obtained in (1) add 1 mL of barium chloride TS: no turbidity is produced.

**(3) Heavy metals <1.07>**—Evaporate 2.0 mL of Glacial Acetic Acid on a water bath to dryness. Dissolve the residue in 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution by adding 2.0 mL of dilute acetic acid and water to make 50 mL (not more than 10 ppm).

**(4) Potassium permanganate-reducing substances**—To 20 mL of the sample solution obtained in (1) add 0.10 mL of 0.1 mol/L potassium permanganate VS: the red color does not disappear within 30 minutes.

**(5) Non-volatile residue**—Evaporate 10 mL of Glacial Acetic Acid on a water bath to dryness, and dry at 105°C for 1 hour: the mass of the residue is not more than 1.0 mg.

**Assay** Place 10 mL of water in a glass-stoppered flask, and weigh accurately. Add about 1.5 g of Glacial Acetic Acid, weigh accurately again, then add 30 mL of water, and titrate <2.50> with 1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS).

Each mL of 1 mol/L sodium hydroxide VS  
= 60.05 mg of  $C_2H_4O_2$

**Containers and storage** Containers—Tight containers.

## Acetohexamide

アセトヘキサミド

$C_{15}H_{20}N_2O_4S$ : 324.40

4-Acetyl-N-(cyclohexylcarbamoyl)benzenesulfonamide  
[968-81-0]

Acetohexamide, when dried, contains not less than 98.0% and not more than 101.0% of  $C_{15}H_{20}N_2O_4S$ .

**Description** Acetohexamide occurs as a white to yellowish white powder.

It is freely soluble in *N,N*-dimethylformamide, sparingly soluble in acetone, slightly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

Melting point: about 185°C (with decomposition).

**Identification (1)** Dissolve 0.10 g of Acetohexamide in 100 mL of methanol. To 5 mL of the solution add 20 mL of 0.5 mol/L hydrochloric acid TS and 75 mL of methanol, and use the solution as the sample solution (1). Determine the absorption spectrum of the sample solution (1) as directed under Ultraviolet-visible Spectrophotometry <2.24>, using methanol as the blank, and compare the spectrum with the

Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, to exactly 10 mL of the sample solution (1) add methanol to make exactly 50 mL, and use the solution as the sample solution (2). Determine the absorption spectrum of the sample solution (2) as directed under Ultraviolet-visible Spectrophotometry <2.24>, using methanol as the blank, and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Acetohexamide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1) Chloride <1.03>**—Dissolve 1.5 g of Acetohexamide in 40 mL of *N,N*-dimethylformamide, add 6 mL of dilute nitric acid and *N,N*-dimethylformamide to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.45 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid and *N,N*-dimethylformamide to make 50 mL (not more than 0.011%).

(2) **Sulfate <1.14>**—Dissolve 2.0 g of Acetohexamide in 40 mL of *N,N*-dimethylformamide, and add 1 mL of dilute hydrochloric acid and *N,N*-dimethylformamide to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.40 mL of 0.005 mol/L sulfuric acid VS add 1 mL of dilute hydrochloric acid and *N,N*-dimethylformamide to make 50 mL (not more than 0.010%).

(3) **Heavy metals <1.07>**—Proceed with 1.0 g of Acetohexamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) **Related substances (i) Cyclohexylamine**—Dissolve exactly 1.0 g of Acetohexamide in exactly 30 mL of 0.5 mol/L sodium hydroxide TS, add exactly 5 mL of hexane, shake vigorously for 60 minutes, allow to stand for 5 minutes, and use the upper layer as the sample solution. Separately, dissolve exactly 50 mg of cyclohexylamine in 0.5 mol/L sodium hydroxide TS to make exactly 50 mL. Pipet 2 mL of this solution, and add 0.5 mol/L sodium hydroxide TS to make exactly 300 mL. Pipet 30 mL of this solution, add exactly 5 mL of hexane, shake vigorously for 60 minutes, allow to stand for 5 minutes, and use the upper layer as the standard solution. Perform the test with exactly 2  $\mu$ L each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and determine the peak area of cyclohexylamine by the automatic integration method: the peak area of cyclohexylamine is not more than that with the standard solution.

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A fused-silica column 0.53 mm in inside diameter and 30 m in length, coated the inner surface with methylsilicone polymer for gas chromatography 1.5  $\mu$ m in thickness.

Column temperature: A constant temperature of about 90°C.

Injection port temperature: A constant temperature of about 150°C.

Detector temperature: A constant temperature of about

210°C.

Carrier gas: Helium

Flow rate: Adjust the flow rate so that the retention time of cyclohexylamine is about 4 minutes.

Split ratio: 1:1

**System suitability**—

System performance: When the procedure is run with 2  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates of the peak of cyclohexylamine is not less than 8000.

System repeatability: When the test is repeated 6 times with 2  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cyclohexylamine is not more than 5%.

(ii) **Dicyclohexylurea**—Dissolve exactly 1.0 g of Acetohexamide in exactly 10 mL of 0.5 mol/L sodium hydroxide TS, add exactly 20 mL of methanol, shake, then add exactly 5 mL of diluted hydrochloric acid (1 in 10), shake vigorously for 15 minutes, and centrifuge. Filter 10 mL or more of the supernatant liquid through a membrane filter with pore size of not larger than 0.5  $\mu$ m. Discard the first 5 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, dissolve exactly 50 mg of dicyclohexylurea in methanol to make exactly 100 mL. Pipet 2 mL of this solution, and add methanol to make exactly 100 mL. Pipet 20 mL of this solution, add exactly 10 mL of 0.5 mol/L sodium hydroxide TS, shake, then add exactly 5 mL of diluted hydrochloric acid (1 in 10), shake, and use this solution as the standard solution. Perform the test with exactly 50  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak area of dicyclohexylurea by the automatic integration method: the peak area of dicyclohexylurea is not more than that with the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 0.5 g of sodium hydroxide in 1000 mL of 0.05 mol/L sodium dihydrogen phosphate TS, and adjust the pH to 6.5 with 0.5 mol/L sodium hydroxide TS. To 500 mL of this solution add 500 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of dicyclohexylurea is about 10 minutes.

**System suitability**—

System performance: When the procedure is run with 50  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates of the peak of dicyclohexylurea is not less than 10,000.

System repeatability: When the test is repeated 6 times with 50  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of dicyclohexylurea is not more than 2.0%.

(iii) **Other related substances**—Dissolve 0.10 g of Acetohexamide in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add acetone to make exactly 20 mL. Pipet two 1 mL portions of

this solution, add acetone to make exactly 10 mL and 25 mL, respectively, and use these solutions as the standard solution (1) and the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol, ammonia solution (28) and cyclohexane (6:2:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than spot from the standard solution (1), and the number of them which are more intense than the spot from the standard solution (2) is not more than 4.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Acetohexamide, previously dried, dissolve in 30 mL of *N,N*-dimethylformamide, add 10 mL of water, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination using a solution prepared by adding 19 mL of water to 30 mL of *N,N*-dimethylformamide, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 32.44 mg of  $C_{15}H_{20}N_2O_4S$

**Containers and storage** Containers—Well-closed containers.

## Acetylcholine Chloride for Injection

注射用アセチルコリン塩化物

$C_7H_{16}ClNO_2$ : 181.66

2-Acetoxy-*N,N,N*-trimethylethylammonium chloride  
[60-31-1]

Acetylcholine Chloride for Injection is a preparation for injection which is dissolved before use.

It contains not less than 98.0% and not more than 102.0% of acetylcholine chloride ( $C_7H_{16}ClNO_2$ ), and not less than 19.3% and not more than 19.8% of chlorine (Cl: 35.45), calculated on the dried basis.

It contains not less than 93% and not more than 107% of the labeled amount of acetylcholine chloride ( $C_7H_{16}ClNO_2$ ).

**Method of preparation** Prepare as directed under Injections.

**Description** Acetylcholine Chloride for Injection occurs as white crystals or crystalline powder.

It is very soluble in water, and freely soluble in ethanol (95).

It is extremely hygroscopic.

**Identification (1)** Determine the infrared absorption spectrum of Acetylcholine Chloride for Injection, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) A solution of Acetylcholine Chloride for Injection (1 in 10) responds to the Qualitative Tests <1.09> (2) for chloride.

**Melting point** <2.60> 149 – 152°C. Seal Acetylcholine Chloride for Injection in a capillary tube for melting point immediately after drying both of the sample and the tube at 105°C for 3 hours, and determine the melting point.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Acetylcholine Chloride for Injection in 10 mL of water: the solution is clear and colorless.

(2) Acidity—Dissolve 0.10 g of Acetylcholine Chloride for Injection in 10 mL of freshly boiled and cooled water, and add 1 drop of bromothymol blue TS, and 0.30 mL of 0.01 mol/L sodium hydroxide VS: the solution is blue in color.

(3) Heavy metals <1.07>—Proceed with 2.0 g of Acetylcholine Chloride for Injection according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay (1)** Acetylcholine chloride—Weigh accurately the contents of not less than 10 Acetylcholine Chloride for Injections. Weigh accurately about 0.5 g of the contents, dissolve in 15 mL of water, then add exactly 40 mL of 0.1 mol/L sodium hydroxide VS, stopper loosely, and heat on a water bath for 30 minutes. Cool quickly, and titrate <2.50> the excess sodium hydroxide with 0.05 mol/L sulfuric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 18.17 mg of  $C_7H_{16}ClNO_2$

(2) Chlorine—Titrate <2.50> the solution, which has been titrated in (1), with 0.1 mol/L silver nitrate VS (indicator: 3 drops of fluorescein sodium TS).

Each mL of 0.1 mol/L silver nitrate VS  
= 3.545 mg of Cl

**Containers and storage** Containers—Hermetic containers.

## Aclarubicin Hydrochloride

アクリルビシン塩酸塩

$C_{42}H_{53}NO_{15} \cdot HCl$ : 848.33

Methyl (1*R*,2*R*,4*S*)-4-{2,6-dideoxy-4-*O*-[(2*R*,6*S*)-6-methyl-5-oxo-3,4,5,6-tetrahydro-2*H*-pyran-2-yl]- $\alpha$ -*L*-*lyxo*-hexopyranosyl-(1 $\rightarrow$ 4)-2,3,6-trideoxy-3-dimethylamino- $\alpha$ -*L*-*lyxo*-hexopyranosyloxy}-2-ethyl-2,5,7-trihydroxy-6,11-dioxo-1,2,3,4-tetrahydrotetracene-1-carboxylate monohydrochloride [75443-99-0]

Aclarubicin Hydrochloride is the hydrochloride of an anthracycline substance having antitumor activity produced by the growth of *Streptomyces galilaeus*.

It contains not less than 920  $\mu$ g (potency) and not more than 975  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Aclarubicin Hydrochloride is expressed as mass (potency) of aclarubicin ( $C_{42}H_{53}NO_{15}$ : 811.87).

**Description** Aclarubicin Hydrochloride occurs as a yellow to pale orange-yellow powder.

It is very soluble in chloroform and in methanol, freely soluble in water, and slightly soluble in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Aclarubicin Hydrochloride in diluted methanol (4 in 5) (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Aclarubicin Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Aclarubicin Hydrochloride in methanol (1 in 200) responds to the Qualitative Tests <1.09> (2) for chloride.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-146$  –  $-162^\circ$  (50 mg calculated on the anhydrous basis, water, 10 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 0.05 g of Aclarubicin Hydrochloride in 10 mL of water is between 5.5 and 6.5.

**Purity (1)** Clarity and color of solution—Dissolve 0.10 g of Aclarubicin Hydrochloride in 10 mL of water: the solution is clear and yellow to pale orange-yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Aclarubicin Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 10 mg of Aclarubicin Hydrochloride in 10 mL of the mobile phase, and use this solution as the sample solution. Perform the test with 20  $\mu$ L of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of the related substances by the area percentage method: the amount of aklavinone having the relative retention time of about 0.6 to aclarubicin is not more than 0.2%, aclacinomycin L1 having the relative retention time of about 0.75 to aclarubicin is not more than 0.5%, 1-deoxypyrrromycin having the relative retention time of about 1.7 to aclarubicin is not more than 1.5% and aclacinomycin S1 having the relative retention time of about 2.3 to aclarubicin is not more than 0.5%, and the total amount of the peaks other than aclarubicin and the peaks mentioned above is not more than 1.0% of the peak area of aclarubicin.

**Operating conditions—**

Detector: A visible absorption photometer (wavelength: 436 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of chloroform, methanol, acetic acid (100), water and triethylamine (6800:2000:1000:200:1).

Flow rate: Adjust the flow rate so that the retention time of aclarubicin is about 5 minutes.

Time span of measurement: As long as about 4 times of the retention time of aclarubicin beginning after the solvent peak.

**System suitability—**

Test for required detectability: Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of aclarubicin obtained from 20  $\mu$ L of this solution is equivalent to 7 to 13% of that from 20  $\mu$ L of the solution for system suitability test.

System performance: Dissolve 5 mg of Aclarubicin Hydrochloride in 10 mL of 0.1 mol/L hydrochloric acid TS, and allow to stand for 60 minutes. To 1.0 mL of this solution add 1.0 mL of 0.2 mol/L sodium hydroxide TS, 1.0 mL of phosphate buffer solution, pH 8.0 and 1.0 mL of chloroform, shake vigorously, and take the chloroform layer. When the procedure is run with 20  $\mu$ L of the chloroform under the above operating conditions, aclarubicin and 1-deoxypyrrromycin are eluted in this order with the resolution between these peaks being not less than 3.0.

System repeatability: When the test is repeated 5 times with 20  $\mu$ L of the sample solution under the above operating conditions, the relative standard deviation of the peak area of

aclarubicin is not more than 2.0%.

**Water** <2.48> Not more than 3.5% (0.1 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately an amount of Aclarubicin Hydrochloride, equivalent to about 20 mg (potency), and dissolve in diluted methanol (4 in 5) to make exactly 100 mL. Pipet 15 mL of this solution, add diluted methanol (4 in 5) to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Aclarubicin Reference Standard, equivalent to about 20 mg (potency), add 0.6 mL of diluted hydrochloric acid (1 in 250) and diluted methanol (4 in 5) to make exactly 100 mL. Pipet 15 mL of this solution, add diluted methanol (4 in 5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances,  $A_T$  and  $A_S$ , at 433 nm.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of aclarubicin (C}_{42}\text{H}_{53}\text{NO}_{15}) \\ &= W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Aclarubicin Reference Standard

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant and at 5°C or below.

## Acrinol and Zinc Oxide Oil

アクリノール・チンク油

### Method of preparation

Acrinol, very finely powdered	10 g
Zinc Oxide Oil	990 g
To make 1000 g	

Prepare by mixing the above ingredients.

**Description** Acrinol and Zinc Oxide Oil is a yellowish white, slimy substance. Separation of a part of its ingredients occurs on prolonged standing.

**Identification (1)** Shake well 1 g of Acrinol and Zinc Oxide Oil with 10 mL of diethyl ether, 2 mL of acetic acid (100) and 10 mL of water, and separate the water layer. Shake the layer with 5 mL of hydrochloric acid and 2 to 3 drops of sodium nitrite TS, and allow to stand: a dark red color is produced (acrinol).

(2) Place 1 g of Acrinol and Zinc Oxide Oil in a crucible, melt by warming, heat, gradually raising the temperature until the mass is thoroughly charred, and then ignite strongly: a yellow color is produced, and disappears on cooling. To the residue add 10 mL of water and 5 mL of dilute hydrochloric acid, filter after thorough shaking, and to the filtrate add 2 to 3 drops of potassium hexacyanoferrate (II) TS: a white precipitate is formed (zinc oxide).

(3) Shake well 0.2 g of Acrinol and Zinc Oxide Oil with 20 mL of ethanol (95) and 1 mL of acetic acid (100), centrifuge, filter, and use the filtrate as the sample solution. Separately, dissolve 5 mg of acrinol in 50 mL of ethanol (95)

and 2.5 mL of acetic acid (100), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 2-propanol and acetic acid (100) (9:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 365 nm): the spots from the sample solution and standard solution exhibit a blue fluorescence and show the same  $R_f$  value.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Compound Acrinol and Zinc Oxide Oil

複方アクリノール・チンク油

### Method of preparation

Acrinol, very finely powdered	10 g
Zinc Oxide Oil	650 g
Ethyl Aminobenzoate, finely powdered	50 g
White Beeswax	20 g
Hydrophilic Petrolatum	270 g
To make 1000 g	

Prepare by mixing the above ingredients.

**Description** Compound Acrinol and Zinc Oxide Oil is light yellow to yellow in color.

**Identification (1)** Shake well 1 g of Compound Acrinol and Zinc Oxide Oil with 10 mL of diethyl ether, 2 mL of acetic acid (100) and 10 mL of water, and separate the water layer. Shake the layer with 5 mL of hydrochloric acid and 2 to 3 drops of sodium nitrite TS, and allow to stand: a dark red color is produced (acrinol).

(2) Place 1 g of Compound Acrinol and Zinc Oxide Oil in a crucible, melt by warming, heat, gradually raising the temperature until the mass is thoroughly charred, and then ignite strongly: a yellow color is produced, and disappears on cooling. To the residue add 10 mL of water and 5 mL of dilute hydrochloric acid, shake well, and filter. To the filtrate add 2 to 3 drops of potassium hexacyanoferrate (II) TS: a white precipitate is produced (zinc oxide).

(3) Shake well 0.2 g of Compound Acrinol and Zinc Oxide Oil with 20 mL of ethanol (95) and 1 mL of acetic acid (100), centrifuge, filter, and use the filtrate as the sample solution. Separately, dissolve 5 mg of acrinol and 25 mg of ethyl aminobenzoate in 50 mL of ethanol (95) and in 2.5 mL of acetic acid (100), respectively, and use both solutions as the standard solutions (1) and (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solutions on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 2-propanol and acetic acid (100) (9:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 365 nm): the spots from the sample solution and standard solution (1) exhibit a blue fluorescence, and show the same  $R_f$  value. Also examine under ultraviolet

light (main wavelength: 254 nm): the spots from the sample solution and standard solution (2) exhibit a purple color, and show the same *R<sub>f</sub>* value.

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Acrinol and Zinc Oxide Ointment

アクリノール・亜鉛華軟膏

### Method of preparation

Acrinol, very finely powdered	10 g
Zinc Oxide Ointment	990 g
To make 1000 g	

Prepare as directed under Ointments, with the above ingredients.

**Description** Acrinol and Zinc oxide Ointment is yellow in color.

**Identification (1)** Shake 0.5 g of Acrinol and Zinc Oxide Ointment with 5 mL of diethyl ether, 5 mL of dilute hydrochloric acid and 2 to 3 drops of sodium nitrite TS, and allow to stand: a dark red color develops in the water layer (acrinol).

(2) Ignite 0.5 g of Acrinol and Zinc Oxide Ointment to char, and dissolve the residue in 5 mL of dilute hydrochloric acid: the solution responds to the Qualitative Tests <1.09> for zinc salt.

(3) Shake 0.5 g of Acrinol and Zinc Oxide Ointment with 5 mL of diethyl ether, 1 mL of acetic acid (100) and 5 mL of water, separate the water layer, and use the water layer as the sample solution. Dissolve 5 mg of acrinol in 1 mL of acetic acid (100) and 5 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of diethyl ether, ethanol (95) and acetic acid (100) (40:10:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 365 nm): the spots from the sample solution and the standard solution exhibit a blue fluorescence and show the same *R<sub>f</sub>* value.

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Acrinol Hydrate

### Ethacridine Lactate

アクリノール水和物

$C_{15}H_{15}N_3O \cdot C_3H_6O_3 \cdot H_2O$ : 361.39  
2-Ethoxy-6,9-diaminoacridine monolactate monohydrate  
[1837-57-6]

Acrinol Hydrate contains not less than 98.5% and not more than 101.0% of acrinol ( $C_{15}H_{15}N_3O \cdot C_3H_6O_3$ : 343.38), calculated on the anhydrous basis.

**Description** Acrinol Hydrate occurs as a yellow, crystalline powder.

It is sparingly soluble in water, in methanol and in ethanol (99.5).

Melting point: about 245°C (with decomposition).

The pH of a solution of Acrinol Hydrate (1 in 100) is between 5.5 and 7.0.

**Identification (1)** Determine the absorption spectrum of a solution of Acrinol Hydrate (3 in 250,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Acrinol Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 5 mL of a solution of Acrinol Hydrate (1 in 100) add 5 mL of dilute sulfuric acid, shake well, allow to stand for about 10 minutes at room temperature, and filter: the filtrate responds to the Qualitative Tests <1.09> for lactate.

**Purity (1) Chloride <1.03>**—Dissolve 1.0 g of Acrinol Hydrate in 80 mL of water by warming on a water bath, cool, and add 10 mL of sodium hydroxide TS and water to make 100 mL. Shake well, allow to stand for 30 minutes, filter, to 40 mL of the filtrate add 7 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare 50 mL of the control solution with 4 mL of sodium hydroxide TS, 7 mL of dilute nitric acid, 0.30 mL of 0.01 mol/L hydrochloric acid VS and sufficient water (not more than 0.026%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Acrinol Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Volatile fatty acids—Dissolve 0.5 g of Acrinol Hydrate in a mixture of 20 mL of water and 5 mL of dilute sulfuric acid, shake well, filter, and heat the filtrate: no odor of volatile fatty acids is perceptible.

(4) Related substances—Dissolve 10 mg of Acrinol Hy-

drate in 25 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution (1). Pipet 1 mL of the standard solution (1), add the mobile phase to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solutions (1) and (2) as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than acrinol is not larger than 3 times the peak area of acrinol obtained with the standard solution (2), and the total area of the peaks other than acrinol is not larger than the peak area of acrinol with the standard solution (1).

#### Operating conditions—

**Detector:** An ultraviolet absorption photometer (wavelength: 268 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 7.8 g of sodium dihydrogen phosphate in 900 mL of water, adjust to pH 2.8 with phosphoric acid, and add water to make 1000 mL. To 700 mL of this solution add 300 mL of acetonitrile for liquid chromatography, and add 1.0 g of sodium 1-octanesulfonate to dissolve.

**Flow rate:** Adjust the flow rate so that the retention time of acrinol is about 15 minutes.

**Time span of measurement:** About 3 times as long as the retention time of acrinol beginning after the solvent peak.

#### System suitability—

**Test for required detectability:** Confirm that the peak area of acrinol obtained with 10  $\mu$ L of the standard solution (2) is equivalent to 7 to 13% of that with 10  $\mu$ L of the standard solution (1).

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution (1) under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of acrinol are not less than 5000 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution (1) under the above operating conditions, the relative standard deviation of the peak area of acrinol is not more than 1.5%.

**Water** <2.48> 4.5 – 5.5% (0.2 g, volumetric titration, direct titration)

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.27 g of Acrinol Hydrate, dissolve in 5 mL of formic acid, add 60 mL of a mixture of acetic anhydride and acetic acid (100) (1:1), and titrate <2.50> immediately with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 34.34 mg of acrinol (C<sub>15</sub>H<sub>15</sub>N<sub>3</sub>O·C<sub>3</sub>H<sub>6</sub>O<sub>3</sub>)

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Actinomycin D

### アクチノマイシン D

C<sub>62</sub>H<sub>86</sub>N<sub>12</sub>O<sub>16</sub>: 1255.42  
[50-76-0]

Actinomycin D is a peptide substance having antitumor activity produced by the growth of *Streptomyces parvulus*.

It, when dried, contains not less than 950  $\mu$ g (potency) and not more than 1030  $\mu$ g (potency) per mg. The potency of Actinomycin D is expressed as mass (potency) of actinomycin D (C<sub>62</sub>H<sub>86</sub>N<sub>12</sub>O<sub>16</sub>).

**Description** Actinomycin D occurs as an orange-red to red crystalline powder.

It is freely soluble in acetone, sparingly soluble in acetonitrile and in methanol, slightly soluble in ethanol (99.5), and very slightly soluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Actinomycin D in methanol (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Actinomycin D Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Dissolve 0.1 g each of Actinomycin D and Actinomycin D Reference Standard in 10 mL of acetone, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and methanol (4:2:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the R<sub>f</sub> value of the principal spot from the sample solution is the same as that from the standard solution.

**Optical rotation** <2.49> [ $\alpha$ ]<sub>D</sub><sup>20</sup>: -292 – -317° (after drying, 10 mg, methanol, 10 mL, 100 mm).

**Loss on drying** <2.41> Not more than 5.0% (1 g, in vacuum, 60°C, 3 hours).

**Assay** Weigh accurately an amount of Actinomycin D and Actinomycin D Reference Standard, previously dried, equivalent to about 60 mg (potency), dissolve each in the mobile phase to make exactly 50 mL, and use these solutions as the sample solution and standard solution. Perform the

test with exactly 25  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak area of actinomycin D,  $A_T$  and  $A_S$ , of both solutions.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of } \text{C}_{62}\text{H}_{86}\text{N}_{12}\text{O}_{16} \\ = W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Actinomycin D Reference Standard

#### Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.02 mol/L acetic acid-sodium acetate TS and acetonitrile (25:23).

Flow rate: Adjust the flow rate so that the retention time of actinomycin D is about 23 minutes.

#### System suitability—

System performance: When the procedure is run with 25  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of actinomycin D are not less than 2000 steps and not more than 1.5, respectively.

System repeatability: When the test is repeated 5 times with 25  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of actinomycin D is not more than 2.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Adrenaline

### Epinephrine

アドレナリン

$\text{C}_9\text{H}_{13}\text{NO}_3$ : 183.20

4-[(1*R*)-1-Hydroxy-2-(methylamino)ethyl]benzene-1,2-diol [51-43-4]

Adrenaline, when dried, contains not less than 98.0% of  $\text{C}_9\text{H}_{13}\text{NO}_3$ .

**Description** Adrenaline occurs as a white to grayish white, crystalline powder. It has no odor.

It is freely soluble in acetic acid (100), very slightly soluble in water, and practically insoluble in methanol, in ethanol (95) and in diethyl ether.

It dissolves in dilute hydrochloric acid.

It gradually changes to brown in color by air and by light.

**Identification** (1) Dissolve 0.01 g of Adrenaline in 10 mL

of diluted acetic acid (31) (1 in 500), and use this solution as the sample solution. To 1 mL of the sample solution add 4 mL of water and 1 drop of iron (III) chloride TS: a deep green color is produced, and it gradually changes to red.

(2) Place 1 mL each of the sample solution obtained in (1) in test tubes A and B. Add 10 mL of potassium hydrogen phthalate buffer solution, pH 3.5, to A, and add 10 mL of phosphate buffer solution, pH 6.5, to B. To each of the test tubes add 1 mL of iodine TS, allow to stand for 5 minutes, and add 2 mL each of sodium thiosulfate TS: a red color develops in test tube A, and a deep red color develops in test tube B.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-50.0 - -53.5^\circ$  (after drying, 1 g, 1 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**Purity** (1) Clarity and color of solution—Dissolve 0.10 g of Adrenaline in 10 mL of dilute hydrochloric acid: the solution is clear, and is not more colored than Matching Fluid A.

(2) Adrenalone—Dissolve 50 mg of Adrenaline in 0.05 mol/L hydrochloric acid TS to make exactly 25 mL, and determine the absorbance of this solution at 310 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>: it is not more than 0.40.

(3) Noradrenaline—Dissolve 10.0 mg of Adrenaline in 2.0 mL of a L-tartaric acid solution (1 in 200). Pipet 1 mL of the solution, add 3.0 mL of pyridine, then add 1.0 mL of freshly prepared sodium naphthoquinone sulfonate TS, and allow to stand in a dark place for 30 minutes. To this solution add 5.0 mL of pyridine containing 0.05 g of L-ascorbic acid: the solution is not more colored than the following control solution.

Control solution: Dissolve 2.0 mg of Noradrenaline Bitartrate Reference Standard and 90 mg of Adrenaline Bitartrate Reference Standard in methanol to make exactly 10 mL. Pipet 1 mL of this solution, and proceed in the same manner.

**Loss on drying** <2.41> Not more than 1.0% (2 g, in vacuum, silica gel, 18 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Adrenaline, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L perchloric acid VS} \\ = 18.32 \text{ mg of } \text{C}_9\text{H}_{13}\text{NO}_3 \end{aligned}$$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, under nitrogen atmosphere, and in a cold place.

## Adrenaline Injection

### Epinephrine Injection

アドレナリン注射液

Adrenaline Injection is aqueous solution for injection.

It contains not less than 0.085 w/v% and not more

than 0.115 w/v% of adrenaline ( $C_9H_{13}NO_3$ : 183.20).

**Method of preparation** Dissolve Adrenaline in diluted Hydrochloric Acid (9 in 10,000), and prepare as directed under Injections.

**Description** Adrenaline Injection is a colorless, clear liquid.

It changes gradually to pale red and then to brown on exposure to air and light.

pH: 2.3 – 5.0

**Identification (1)** To 1 mL of Adrenaline Injection add 4 mL of water and 1 drop of iron (III) chloride TS: a deep green color is produced, and it gradually changes to red.

**(2)** Place 1 mL each of Adrenaline Injection in test tubes A and B, and proceed as directed in the Identification (2) under Adrenaline.

**Extractable volume** <6.05> It meets the requirement.

**Assay** Pipet 30 mL of Adrenaline Injection into a separator, add 25 mL of carbon tetrachloride, shake vigorously for 1 minute, allow the liquids to separate, and discard the carbon tetrachloride. Repeat this procedure three times. Rinse the stopper and mouth of the separator with a small amount of water. Add 0.2 mL of starch TS, then while swirling the separator add iodine TS dropwise until a persistent blue color develops, and immediately add sodium thiosulfate TS to discharge the blue color. Add 2.1 g of sodium hydrogen carbonate to the liquid in the separator, preventing it from coming in contact with the mouth of the separator, and shake until most of the sodium hydrogen carbonate dissolves. Rapidly inject 1.0 mL of acetic anhydride into the contents of the separator. Immediately stopper the separator loosely, and allow to stand until the evolution of gas ceases. Shake vigorously, allow to stand for 5 minutes, extract with six 25-mL portions of chloroform, and filter each chloroform extract through a pledget of absorbent cotton. Evaporate the combined chloroform extracts on a water bath in a current of air to 3 mL, completely transfer this residue by means of small portions of chloroform to a tared beaker, and heat again to evaporate to dryness. Dry the residue at 105°C for 30 minutes, cool in a desiccator (silica gel), and accurately measure the mass  $W$  (mg) of the dried residue. Dissolve in chloroform to make exactly 5 mL, and determine the optical rotation <2.49>  $[\alpha]_D^{20}$  using a 100-mm cell.

$$\begin{aligned} \text{Amount (mg) of adrenaline (C}_9\text{H}_{13}\text{NO}_3\text{)} \\ = W \times \{0.5 + (0.5 \times |[\alpha]_D^{20}|)/93\} \times 0.5923 \end{aligned}$$

**Containers and storage** Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant.

## Adrenaline Solution

### Epinephrine Solution

アドレナリン液

Adrenaline Solution contains not less than 0.085 w/v% and not more than 0.115 w/v% of adrenaline ( $C_9H_{13}NO_3$ : 183.20)

#### Method of preparation

Adrenaline	1 g
Sodium Chloride	8.5 g
Diluted Hydrochloric Acid (9 in 100)	10 mL
Stabilizer	a suitable quantity
Preservative	a suitable quantity
Purified Water	a sufficient quantity
To make 1000 mL	

Prepare by mixing the above ingredients.

**Description** Adrenaline Solution is clear, colorless or slightly reddish liquid.

It changes gradually to pale red and then to brown on exposure to air and light.

pH: 2.3 – 5.0

**Identification** Proceed as directed in the Identification under Adrenaline Injection.

**Assay** Proceed as directed in the Assay under Adrenaline Injection.

$$\begin{aligned} \text{Amount (mg) of adrenaline (C}_9\text{H}_{13}\text{NO}_3\text{)} \\ = W \times \{0.5 + (0.5 \times |[\alpha]_D^{20}|)/93\} \times 0.5923 \end{aligned}$$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Afloqualone

アフロクアロン

$C_{16}H_{14}FN_3O$ : 283.30

6-Amino-2-fluoromethyl-3-(2-tolyl)-3H-quinazolin-4-one  
[56287-74-2]

Afloqualone, when dried, contains not less than 98.5% of  $C_{16}H_{14}FN_3O$ .

**Description** Afloqualone occurs as white to light yellow crystals or crystalline powder.

It is soluble in acetonitrile, sparingly soluble in ethanol (99.5), and practically insoluble in water.

It is gradually colored by light.

Melting point: about 197°C (with decomposition).

**Identification (1)** Conduct this procedure without exposure to light, using light-resistant containers. Determine the absorption spectrum of a solution of Afloqualone in ethanol (99.5) (1 in 150,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Afloqualone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Acidity or alkalinity—Take 1.0 g of Afloqualone in a light-resistant vessel, add 20 mL of freshly boiled and cooled water, shake well, and filter. To 10 mL of the filtrate add 2 drops of bromothymol blue TS: a yellow color develops. The color changes to blue by adding 0.20 mL of 0.01 mol/L sodium hydroxide TS.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Afloqualone in a platinum crucible according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Conduct this procedure without exposure to light, using light-resistant vessels. Dissolve 10 mg of Afloqualone in 25 mL of the mobile phase, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the areas of each peak by the automatic integration method: the total of the peak areas other than the peak area of afloqualone from the sample solution is not more than the peak area of afloqualone from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 7.2 g of disodium hydrogen phosphate dodecahydrate in 1000 mL of water, adjust to pH 5.5 with diluted phosphoric acid (1 in 10). To 600 mL of this solution add 400 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of afloqualone is about 5.5 minutes.

Time span of measurement: About 4 times as long as the retention time of afloqualone beginning after the solvent peak.

**System suitability—**

Test for required detection: Pipet 5 mL of the standard solution, add the mobile phase to make exactly 25 mL, and confirm that the peak area of afloqualone obtained from 20  $\mu$ L of this solution is equivalent to 15 to 25% of that of afloqualone obtained from 20  $\mu$ L of the standard solution.

System performance: Dissolve 0.01 g of Afloqualone in a suitable amount of the mobile phase, add 5 mL of a solution

of propyl parahydroxybenzoate in the mobile phase (1 in 2000) and the mobile phase to make 100 mL. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, afloqualone and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of afloqualone is not more than 5%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, 60°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1.0 g, platinum crucible).

**Assay** Weigh accurately about 0.4 g of Afloqualone, previously dried, dissolve in 10 mL of hydrochloric acid and 40 mL of water, and add 10 mL of a solution of potassium bromide (3 in 10). After cooling at 15°C or below, titrate <2.50> with 0.1 mol/L sodium nitrite VS according to the potentiometric titration or amperometric titration under the Electrometric Titration method.

Each mL of 0.1 mol/L sodium nitrite  
= 28.33 mg of C<sub>16</sub>H<sub>14</sub>FN<sub>3</sub>O

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Ajmaline

アジマリン

C<sub>20</sub>H<sub>26</sub>N<sub>2</sub>O<sub>2</sub>: 326.43  
(17*R*,21*R*)-Ajmalan-17,21-diol [4360-12-7]

Ajmaline, when dried, contains not less than 96.0% of C<sub>20</sub>H<sub>26</sub>N<sub>2</sub>O<sub>2</sub>.

**Description** Ajmaline occurs as a white to pale yellow, crystalline powder. It is odorless, and has a bitter taste.

It is freely soluble in acetic anhydride and in chloroform, sparingly soluble in methanol, in ethanol (95), in acetone and in diethyl ether, and very slightly soluble in water.

It dissolves in dilute hydrochloric acid.

Melting point: about 195°C (with decomposition).

**Identification (1)** Dissolve 0.05 g of Ajmaline in 5 mL of methanol, and use this solution as the sample solution. Add 3 mL of nitric acid to 1 mL of the sample solution: a deep red color develops.

(2) Spot the sample solution of (1) on filter paper, and spray Dragendorff's TS: an orange color develops.

**Absorbance** <2.24>  $E_{1\text{ cm}}^{1\%}$  (249 nm): 257 – 271 (after drying, 2 mg, ethanol (95), 100 mL).

$E_{1\text{cm}}^{1\%}$  (292 nm): 85 – 95 (after drying, 2 mg, ethanol (95), 100 mL).

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +136 – +151° (after drying, 0.5 g, chloroform, 50 mL, 100 mm).

**Purity** Related substances—Dissolve 0.10 g of Ajmaline in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, acetone and diethylamine (5:4:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (0.6 g, in vacuum, 80°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (0.5 g).

**Assay** Weigh accurately about 0.3 g of Ajmaline, previously dried, dissolve in 50 mL of acetic anhydride and 50 mL of acetone for nonaqueous titration, and titrate <2.50> with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS  
= 16.32 mg of  $\text{C}_{20}\text{H}_{26}\text{N}_2\text{O}_2$

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Ajmaline Tablets

アジマリン錠

Ajmaline Tablets contain not less than 90% and not more than 110% of the labeled amount of ajmaline ( $\text{C}_{20}\text{H}_{26}\text{N}_2\text{O}_2$ : 326.43).

**Method of preparation** Prepare as directed under Tablets, with Ajmaline.

**Identification** (1) Shake a quantity of powdered Ajmaline Tablets, equivalent to 0.1 g of Ajmaline according to the labeled amount, with 30 mL of chloroform, and filter. Evaporate the filtrate on a water bath to dryness. With the residue, proceed as directed in the Identification under Ajmaline.

(2) Dissolve 0.01 g of the residue of (1) in 100 mL of ethanol (95). To 10 mL of this solution add ethanol (95) to make 50 mL, and determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 247 nm and 251 nm and between 291 nm and 294 nm, and a minimum between 269 nm and 273 nm.

**Dissolution** <6.10> Perform the test according to the following method: It meets the requirement.

Perform the test with 1 tablet of Ajmaline Tablets at 100 revolutions per minute according to the Paddle method using 900 mL of 2 nd fluid for dissolution test as the test solution. Take 20 mL or more of the dissolved solution 60 minutes after start of the test, and filter through a membrane filter with a pore size not exceeding 0.8  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 28 mg of ajmaline for assay, previously dried in vacuum at 80°C for 3 hours, dissolve in 2 nd fluid for dissolution test to make exactly 500 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 288 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>. The dissolution rate of Ajmaline Tablets in 60 minutes is not less than 75%.

Dissolution rate (%) with respect to the labeled amount of ajmaline ( $\text{C}_{20}\text{H}_{26}\text{N}_2\text{O}_2$ )  
=  $W_S \times (A_T/A_S) \times (1/C) \times 180$

$W_S$ : Amount (mg) of ajmaline for assay.

$C$ : Labeled amount (mg) of ajmaline ( $\text{C}_{20}\text{H}_{26}\text{N}_2\text{O}_2$ ) in 1 tablet.

**Assay** Weigh accurately and powder not less than 20 Ajmaline Tablets. Weigh accurately a portion of the powder, equivalent to about 0.3 g of ajmaline ( $\text{C}_{20}\text{H}_{26}\text{N}_2\text{O}_2$ ), add 15 mL of ammonia solution (28), and extract with four 25-mL portions of chloroform. Combine the chloroform extracts, wash with 10 mL of water, add 5 g of anhydrous sodium sulfate, shake well, and filter. Wash the container and the residue with two 10-mL portions of chloroform, and filter. Evaporate the combined filtrate on a water bath to dryness, dissolve the residue in 50 mL of acetic anhydride and 50 mL of acetone for nonaqueous titration, and titrate <2.50> with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS  
= 16.32 mg of  $\text{C}_{20}\text{H}_{26}\text{N}_2\text{O}_2$

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Alacepril

アラセプリル

$\text{C}_{20}\text{H}_{26}\text{N}_2\text{O}_5\text{S}$ : 406.50

(2S)-2-[(2S)-1-[(2S)-3-(Acetylsulfanyl)-2-methylpropanoyl]pyrrolidine-2-carbonyl]amino-3-phenylpropanoic acid  
[74258-86-9]

Alacepril, when dried, contains not less than 98.5% and not more than 101.0% of  $\text{C}_{20}\text{H}_{26}\text{N}_2\text{O}_5\text{S}$ .

**Description** Alacepril occurs as white crystals or crystalline powder.

It is freely soluble in methanol, soluble in ethanol (95), and slightly soluble in water.

It dissolves in sodium hydroxide TS.

**Identification (1)** To 20 mg of Alacepril add 0.1 g of sodium hydroxide, and heat gradually to melt: the gas evolved changes the color of a moistened red litmus paper to blue. After cooling, to the melted substance add 2 mL of water, shake, and add 1 mL of lead (II) acetate TS: a brown to black precipitate is formed.

(2) Determine the infrared absorption spectrum of Alacepril, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-81 - -85^\circ$  (after drying, 0.25 g, ethanol (95), 25 mL, 100 mm).

**Melting point** <2.60> 153 – 157°C

**Purity (1) Chloride** <1.03>—Dissolve 0.5 g of Alacepril in 30 mL of methanol, add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test with this solution as the test solution. Prepare the control solution as follows: to 0.30 mL of 0.01 mol/L hydrochloric acid VS add 30 mL of methanol, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.021%).

(2) Sulfate <1.14>—Dissolve 0.5 g of Alacepril in 30 mL of methanol, add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.50 mL of 0.005 mol/L sulfuric acid VS add 30 mL of methanol, 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.048%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Alacepril according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 50 mg of Alacepril in 5 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than alacepril from the sample solution is not larger than 2/5 times the peak area of alacepril from the standard solution, and the total area of the peaks other than the peak of alacepril from the sample solution is not larger than the peak area of alacepril from the standard solution. For this calculation, use the areas of the peaks, having the relative retention time of about 2.3 and about 2.6 with respect to alacepril, after multiplying by their sensitivity factors, 1.5 and 1.9, respectively.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylated

silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** A mixture of diluted acetic acid (100) (1 in 100), acetonitrile, methanol and tetrahydrofuran (6:2:1:1).

**Flow rate:** Adjust the flow rate so that the retention time of alacepril is about 5 minutes.

**Time span of measurement:** About 3 times as long as the retention time of alacepril beginning after the solvent peak.

**System suitability**—

**Test for required detectability:** To exactly 4 mL of the standard solution add ethanol (95) to make exactly 10 mL. Confirm that the peak area of alacepril obtained with 10  $\mu$ L of this solution is equivalent to 30 to 50% of that with 10  $\mu$ L of the standard solution.

**System performance:** Dissolve 20 mg of Alacepril in 50 mL of a solution of propyl parahydroxybenzoate in ethanol (95) (1 in 80,000). When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, alacepril and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 7.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of alacepril is not more than 2.0%.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Alacepril, previously dried, dissolve in 75 mL of a mixture of methanol and water (2:1), and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 40.65 mg of C<sub>20</sub>H<sub>26</sub>N<sub>2</sub>O<sub>5</sub>S

**Containers and storage** Containers—Tight containers.

## Alacepril Tablets

アラセプリル錠

Alacepril Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of alacepril (C<sub>20</sub>H<sub>26</sub>N<sub>2</sub>O<sub>5</sub>S: 406.50).

**Method of preparation** Prepare as directed under Tablets, with Alacepril.

**Identification** Shake well a quantity of powdered Alacepril Tablets, equivalent to 0.1 g of Alacepril according to the labeled amount, with 10 mL of ethanol (95), filter, and use the filtrate as the sample solution. Separately, dissolve 10 mg of alacepril in 1 mL of ethanol (95), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of ethanol

(99.5) and hexane (2:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the principal spot from the sample solution and the spot from the standard solution show the same color tone and *R<sub>f</sub>* value.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Alacepril Tablets add 2 mL of water, disperse the particle with the aid of ultrasonic wave, and add exactly 2 mL of the internal standard solution every 10 mg of alacepril (C<sub>20</sub>H<sub>26</sub>N<sub>2</sub>O<sub>5</sub>S) according to the labeled amount. To this solution add a suitable amount of methanol, extract for 15 minutes with the aid of ultrasonic wave while occasional shaking, and shake more 15 minutes. Add methanol to make exactly *V* mL so that each mL of the solution contains about 0.5 mg of alacepril (C<sub>20</sub>H<sub>26</sub>N<sub>2</sub>O<sub>5</sub>S), centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 25 mg of alacepril for assay, previously dried at 105°C for 3 hours, add exactly 5 mL of the internal standard solution and methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios, *Q<sub>T</sub>* and *Q<sub>S</sub>*, of the peak area of alacepril to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of alacepril (C}_{20}\text{H}_{26}\text{N}_{2}\text{O}_{5}\text{S)} \\ & = W_S \times (Q_T/Q_S) \times (V/50) \end{aligned}$$

*W<sub>S</sub>*: Amount (mg) of alacepril for assay

**Internal standard solution**—A solution of propyl parahydroxybenzoate in methanol (3 in 20,000).

**Operating conditions**—

Proceed as directed in the operating conditions in the Assay.

**System suitability**—

Proceed as directed in the system suitability in the Assay.

**Dissolution** <6.10> Perform the test according to the following method: It meets the requirement.

Perform the test with 1 tablet of Alacepril Tablets at 50 revolutions per minute according to the Paddle method using 900 mL of water as the dissolution medium. Withdraw not less than 20 mL of the dissolution medium 30 minutes after start of the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add water to make exactly *V'* mL so that each mL contains about 14 μg of alacepril (C<sub>20</sub>H<sub>26</sub>N<sub>2</sub>O<sub>5</sub>S) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 14 mg of alacepril for assay, previously dried at 105°C for 3 hours, dissolve in 2 mL of methanol, and add water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, *A<sub>T1</sub>* and *A<sub>S1</sub>*, at 230 nm, and *A<sub>T2</sub>* and *A<sub>S2</sub>*, at 300 nm, of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>. The dissolution rates for a 12.5-mg tablet and a 25-mg tablet in 30 minutes are not less than 75%, respectively, and that for a 50-mg tablet in 30 minutes is not less than 70%.

Dissolution rate (%) with respect to the labeled amount of

alacepril (C<sub>20</sub>H<sub>26</sub>N<sub>2</sub>O<sub>5</sub>S)

$$= W_S \times \frac{A_{T1} - A_{T2}}{A_{S1} - A_{S2}} \times \frac{V'}{V} \times \frac{1}{C} \times 90$$

*W<sub>S</sub>*: Amount (mg) of alacepril for assay

*C*: Labeled amount (mg) of alacepril (C<sub>20</sub>H<sub>26</sub>N<sub>2</sub>O<sub>5</sub>S) in 1 tablet

**Assay** Weigh accurately, and powder not less than 20 Alacepril Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of alacepril (C<sub>20</sub>H<sub>26</sub>N<sub>2</sub>O<sub>5</sub>S), moisten with 2 mL of water, add exactly 3 mL of the internal standard solution and 40 mL of methanol, extract for 15 minutes with the aid of ultrasonic wave, cool, and add methanol to make 50 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of alacepril for assay, previously dried at 105°C for 3 hours, add exactly 3 mL of the internal standard solution, dissolve with methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios, *Q<sub>T</sub>* and *Q<sub>S</sub>*, of the peak area of alacepril to that of the internal standard.

$$\text{Amount (mg) of alacepril (C}_{20}\text{H}_{26}\text{N}_{2}\text{O}_{5}\text{S)} = W_S \times (Q_T/Q_S)$$

*W<sub>S</sub>*: Amount (mg) of alacepril for assay

**Internal standard solution**—A solution of propyl parahydroxybenzoate in methanol (3 in 20,000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: A mixture of diluted acetic acid (100) (1 in 100), acetonitrile, methanol and tetrahydrofuran (13:5:1:1).

**Flow rate**: Adjust the flow rate so that the retention time of alacepril is about 6 minutes.

**System suitability**—

**System performance**: When the procedure is run with 10 μL of the standard solution under the above operating conditions, alacepril and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.

**System repeatability**: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of alacepril to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Albumin Tannate

タンニン酸アルブミン

Albumin Tannate is a compound of tannic acid and a protein.

The label states the origin of the protein of Albumin Tannate.

**Description** Albumin Tannate occurs as a light brown powder. It is odorless, or has a faint, characteristic odor.

It is practically insoluble in water and in ethanol (95).

It dissolves in sodium hydroxide TS with turbidity.

**Identification (1)** To 0.1 g of Albumin Tannate add 10 mL of ethanol (95), and heat in a water bath for 3 minutes with shaking. After cooling, filter, and to 5 mL of the filtrate add 1 drop of iron (III) chloride TS: a blue-purple to bluish black color is produced. On standing, a bluish black precipitate is produced.

**(2)** To 0.1 g of Albumin Tannate add 5 mL of nitric acid: an orange-yellow color develops.

**Purity (1) Acidity**—Shake 1.0 g of Albumin Tannate with 50 mL of water for 5 minutes, and filter. To 25 mL of the filtrate add 1.0 mL of 0.1 mol/L sodium hydroxide VS and 2 drops of phenolphthalein TS: a red color develops.

**(2) Fats**—To 2.0 g of Albumin Tannate add 20 mL of petroleum benzene, shake vigorously for 15 minutes, and filter. Evaporate 10 mL of the filtrate on a water bath: the mass of the residue is not more than 50 mg.

**Loss on drying** <2.41> Not more than 6.0% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 1.0% (0.5 g).

**Digestion test** To 1.00 g of Albumin Tannate add 0.25 g of saccharated pepsin and 100 mL of water, shake well, and allow to stand for 20 minutes at  $40 \pm 1^\circ\text{C}$  in a water bath. Add 1.0 mL of dilute hydrochloric acid, shake, and allow to stand for 3 hours at  $40 \pm 1^\circ\text{C}$ . Cool rapidly to ordinary temperature, and filter. Wash the residue with three 10-mL portions of water, dry in a desiccator (silica gel) for 18 hours, and dry at 105°C for 5 hours: the mass of the residue is 0.50 to 0.58 g.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Aldioxa

アルジオキサ

$\text{C}_4\text{H}_7\text{AlN}_4\text{O}_5$ : 218.10

Dihydroxo(5-oxo-4-ureido-4,5-dihydro-1*H*-imidazol-2-yl)oxoaluminum [5579-81-7]

Aldioxa is a condensation product of allantoin and aluminum hydroxide.

When dried, it contains not less than 65.3% and not more than 74.3% of allantoin ( $\text{C}_4\text{H}_6\text{N}_4\text{O}_3$ : 158.12), and not less than 11.1% and not more than 13.0% of aluminum (Al: 26.98).

**Description** Aldioxa occurs as a white powder. It is odorless and tasteless.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It dissolves in dilute hydrochloric acid and in dilute nitric acid.

Melting point: about 230°C (with decomposition).

**Identification (1)** To 0.2 g of Aldioxa add 10 mL of dilute hydrochloric acid, boil for 5 minutes, and add 10 mL of a solution of phenylhydrazinium chloride (1 in 100). After cooling, mix well with 0.5 mL of potassium hexacyanoferrate (III) TS, and shake with 1 mL of hydrochloric acid: a red color develops.

**(2)** To 0.2 g of Aldioxa add 10 mL of dilute hydrochloric acid, dissolve by warming, and cool: the solution responds to the Qualitative Tests <1.09> for aluminum salt.

**Purity (1) Chloride** <1.03>—To 0.10 g of Aldioxa add 6 mL of dilute nitric acid, boil to dissolve with shaking for 5 minutes, cool, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.142%).

**(2) Sulfate** <1.14>—To 0.20 g of Aldioxa add 6 mL of dilute hydrochloric acid, boil to dissolve with shaking for 5 minutes, cool, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.240%).

**(3) Nitrate**—To 0.10 g of Aldioxa add carefully 5 mL of water and 5 mL of sulfuric acid, dissolve by shaking, cool, and superimpose 2 mL of iron (II) sulfate TS: no brown ring is produced at the zone of contact.

**(4) Heavy metals** <1.07>—To 1.0 g of Aldioxa add 3 mL of hydrochloric acid and 3 mL of water, heat gently to boil with shaking, and evaporate on a water bath to dryness. To the residue add 30 mL of water, shake under warming, cool, filter, and to the filtrate add 2 mL of dilute acetic acid (31) and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 3 mL of hydrochloric acid add 3 mL of water,

evaporate on a water bath to dryness, and add 2.0 mL of Standard Lead Solution, 2 mL of dilute acetic acid (31) and water to make 50 mL (not more than 20 ppm).

(5) Arsenic <1.11>—Prepare the test solution with 1.0 g of Aldioxa according to Method 2, and perform the test (not more than 2 ppm).

**Loss on drying** <2.41> Not more than 4.0% (1 g, 105°C, 2 hours).

**Assay** (1) Allantoin—Weigh accurately about 0.1 g of Aldioxa, previously dried, dissolve in 50 mL of dilute sulfuric acid by heating, cool, and add water to make exactly 100 mL. Pipet 10 mL of this solution, and perform the test as directed under Nitrogen Determination <1.08>.

Each mL of 0.005 mol/L sulfuric acid VS  
= 0.3953 mg of C<sub>4</sub>H<sub>6</sub>N<sub>4</sub>O<sub>3</sub>

(2) Aluminum—Weigh accurately about 0.2 g of Aldioxa, previously dried, dissolve carefully in 50 mL of dilute hydrochloric acid by heating, cool, and add dilute hydrochloric acid to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 25 mL, and use this solution as the sample solution. Separately, pipet a suitable quantity of Standard Aluminum Stock Solution, dilute with water so that each mL of the solution contains not less than 16.0 µg and not more than 64.0 µg of aluminum (Al: 26.98), and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Atomic Absorption Spectrophotometry <2.23> according to the following conditions, and calculate the aluminum content of the sample solution from the calibration curve obtained from the absorbance of the standard solution.

Gas: Combustible gas—Acetylene

Supporting gas—Nitrous oxide

Lamp: An aluminum hollow cathode lamp

Wavelength: 309.2 nm

**Containers and storage** Containers—Well-closed containers.

## Alimemazine Tartrate

アリメマジン酒石酸塩

(C<sub>18</sub>H<sub>22</sub>N<sub>2</sub>S)<sub>2</sub>·C<sub>4</sub>H<sub>6</sub>O<sub>6</sub>: 746.98

*N,N*,2-Trimethyl-3-(10*H*-phenothiazin-10-yl)propylamine hemitartrate [41375-66-0]

Alimemazine Tartrate, when dried, contains not less than 98.0% of (C<sub>18</sub>H<sub>22</sub>N<sub>2</sub>S)<sub>2</sub>·C<sub>4</sub>H<sub>6</sub>O<sub>6</sub>.

**Description** Alimemazine Tartrate occurs as a white powder. It is odorless, and has a bitter taste.

It is freely soluble in water and in acetic acid (100), sparingly soluble in ethanol (95), and practically insoluble in diethyl

ether.

The pH of a solution of Alimemazine Tartrate (1 in 50) is between 5.0 and 6.5.

It is gradually colored by light.

**Identification** (1) To 2 mL of a solution of Alimemazine Tartrate (1 in 100) add 1 drop of iron (III) chloride TS: a red-brown color is produced, and immediately a yellow precipitate is formed.

(2) Dissolve 1 g of Alimemazine Tartrate in 5 mL of water, add 3 mL of sodium hydroxide TS, extract with two 10-mL portions of diethyl ether [use the aqueous layer obtained in the Identification (4)]. Shake the combined diethyl ether extracts with 3 g of anhydrous sodium sulfate, filter, and evaporate the diethyl ether with the aid of a current of air. Dry the residue in a desiccator (in vacuum, phosphorus (V) oxide) for 16 hours: it melts <2.60> between 66°C and 70°C.

(3) Determine the absorption spectrum of a solution of Alimemazine Tartrate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) The aqueous layer, obtained in the identification (2), when neutralized with dilute acetic acid, responds to the Qualitative Tests <1.09> (1) and (2) for tartrate.

**Melting point** <2.60> 159 – 163°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Alimemazine Tartrate in 20 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Alimemazine Tartrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Alimemazine Tartrate according to Method 3, and perform the test. Use a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 5) (not more than 2 ppm).

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.8 g of Alimemazine Tartrate, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from red through brown to green-brown (indicator: 2 mL of *p*-naphtholbenzene TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 37.35 mg of (C<sub>18</sub>H<sub>22</sub>N<sub>2</sub>S)<sub>2</sub>·C<sub>4</sub>H<sub>6</sub>O<sub>6</sub>

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Allopurinol

アロプリノール

$C_5H_4N_4O$ : 136.11

1*H*-Pyrazolo[3,4-*d*]pyrimidin-4-ol [315-30-0]

Allopurinol, when dried, contains not less than 98.0% of  $C_5H_4N_4O$ .

**Description** Allopurinol occurs as white to pale yellowish white crystals or crystalline powder. It is odorless.

It is slightly soluble in *N,N*-dimethylformamide, very slightly soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

It dissolves in sodium hydroxide TS and in ammonia TS.

Melting point: not lower than 320°C (with decomposition).

**Identification (1)** Dissolve 0.1 g of Allopurinol in 50 mL of water by warming. To 5 mL of this solution add 1 mL of ammonia TS and 1 mL of silver nitrate TS: a white precipitate is produced.

(2) Dissolve 0.1 g of Allopurinol in 50 mL of water by warming. To 5 mL of this solution add 0.5 mL of copper (II) sulfate TS: a blue precipitate is produced.

(3) Determine the absorption spectrum of a solution of Allopurinol (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Allopurinol in 10 mL of sodium hydroxide TS: the solution is clear, and has no more color than Matching Fluid D.

(2) Sulfate <1.14>—To 2.0 g of Allopurinol add 100 mL of water, and boil for 5 minutes. Cool, add water to make 100 mL, and filter. To 25 mL of the filtrate add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.038%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Allopurinol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Allopurinol according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.05 g of Allopurinol in 10 mL of ammonia TS, and use this solution as the sample solution. Pipet 1 mL of this solution, add ammonia TS to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of cellulose with fluorescent indicator for thin-layer chromatography. Develop the plate with ammonia TS-saturated

1-butanol to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.16 g of Allopurinol, previously dried, dissolve in 70 mL of *N,N*-dimethylformamide by warming. Cool, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration). To 70 mL of *N,N*-dimethylformamide add 12 mL of water, perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS  
= 13.61 mg of  $C_5H_4N_4O$

**Containers and storage** Containers—Tight containers.

## Alprazolam

アルプラゾラム

$C_{17}H_{13}ClN_4$ : 308.76

8-Chloro-1-methyl-6-phenyl-4*H*-[1,2,4]triazolo[4,3-*a*][1,4]benzodiazepine [28981-97-7]

Alprazolam, when dried, contains not less than 98.5% of  $C_{17}H_{13}ClN_4$ .

**Description** Alprazolam occurs as white crystals or crystalline powder.

It is freely soluble in chloroform, soluble in methanol and in ethanol (95), sparingly soluble in acetic anhydride, and practically insoluble in water.

It dissolves in dilute nitric acid.

**Identification (1)** Determine the absorption spectrum of a solution of Alprazolam in ethanol (95) (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 0.05 g of Alprazolam in 0.7 mL of deuteriochloroform for nuclear magnetic resonance spectroscopy, and determine the spectrum of this solution using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ): it exhibits a single signal A at around  $\delta$  2.6 ppm,

doublet signals B and C at around  $\delta$  4.0 ppm and  $\delta$  5.4 ppm, and a broad signal D between  $\delta$  7.1 ppm and 7.9 ppm. The ratio of integrated intensity of each signal, A:B:C:D, is about 3:1:1:8.

(3) Perform the test with Alprazolam as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Melting point** <2.60> 228 – 232°C

**Purity** (1) Chloride <1.03>—Dissolve 0.5 g of Alprazolam in 10 mL of dilute nitric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Alprazolam according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances – Dissolve 50 mg of Alprazolam in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, then pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop with a mixture of acetone, hexane, ethyl acetate and ethanol (95) (4:2:2:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, reduced pressure not exceeding 0.67 kPa, 60°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.25 g of Alprazolam, previously dried, dissolve in 100 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 15.44 mg of C<sub>17</sub>H<sub>13</sub>ClN<sub>4</sub>

**Containers and storage** Containers—Well-closed containers.

## Alprenolol Hydrochloride

アルプレノロール塩酸塩

C<sub>15</sub>H<sub>23</sub>NO<sub>2</sub>.HCl: 285.81  
(2*RS*)-1-(2-Allylphenoxy)-3-  
[(1-methylethyl)amino]propan-2-ol monohydrochloride  
[13707-88-5]

Alprenolol Hydrochloride, when dried, contains not

less than 99.0% of C<sub>15</sub>H<sub>23</sub>NO<sub>2</sub>.HCl.

**Description** Alprenolol Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in water, in ethanol (95) and in acetic acid (100), slightly soluble in acetic anhydride, and practically insoluble in diethyl ether.

**Identification** (1) To 2 mL of a solution of Alprenolol Hydrochloride (1 in 100) add 0.05 mL of copper (II) sulfate TS and 2 mL of sodium hydroxide TS: a blue-purple color develops. To this solution add 1 mL of diethyl ether, shake well, and allow to stand: a red-purple color develops in the diethyl ether layer.

(2) Dissolve 0.05 g of Alprenolol Hydrochloride in 5 mL of water, add 1 to 2 drops of bromine TS, and shake: the color of the test solution disappears.

(3) Determine the absorption spectrum of a solution of Alprenolol Hydrochloride in ethanol (95) (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Alprenolol Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(5) A solution of Alprenolol Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**pH** <2.54> Dissolve 1.0 g of Alprenolol Hydrochloride in 10 mL of water: the pH of this solution is between 4.5 and 6.0.

**Melting point** <2.60> 108 – 112°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Alprenolol Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Alprenolol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Alprenolol Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.10 g of Alprenolol Hydrochloride in 10 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add ethanol (95) to make exactly 100 mL. Pipet 2.5 mL of this solution, add ethanol (95) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, acetone, acetic acid (100) and water (60:42:5:3) to a distance of about 10 cm, air-dry the plate, and then dry at 80°C for 30 minutes. After cooling, allow the plate to stand in iodine vapor for 30 minutes: the spots other than the principal spot and the spot on the starting point from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum,

silica gel, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Alprenolol Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 28.58 mg of  $C_{15}H_{23}NO_2 \cdot HCl$

**Containers and storage** Containers—Well-closed containers.

## Alprostadil

### Prostaglandin E<sub>1</sub>

アルプロスタジール

$C_{20}H_{34}O_5$ : 354.48

7-[(1R,2R,3R)-3-Hydroxy-2-[(1E,3S)-3-hydroxyoct-1-en-1-yl]-5-oxocyclopentyl]heptanoic acid  
[745-65-3]

Alprostadil, when dried, contains not less than 97.0% and not more than 103.0% of  $C_{20}H_{34}O_5$ .

**Description** Alprostadil occurs as white crystals or crystalline powder.

It is freely soluble in ethanol (99.5) and in tetrahydrofuran, slightly soluble in acetonitrile, and practically insoluble in water.

**Identification (1)** The absorption spectrum of a solution of Alprostadil in ethanol (99.5) (1 in 100,000) determined as directed under Ultraviolet-visible Spectrophotometry <2.24> shows no absorption between 210 nm and 350 nm. Separately, to 10 mL of this solution add 1 mL of potassium hydroxide-ethanol TS, allow to stand for 15 minutes, and determine the absorption spectrum in the same way. Compare the spectrum so obtained with the Reference Spectrum or the spectrum of a solution of Alprostadil Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Alprostadil, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Alprostadil Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-53 - -61^\circ$  (after drying, 25 mg, tetrahydrofuran, 5 mL, 100 mm).

**Melting point** <2.60> 114 - 118°C

**Purity** Related substances—Dissolve 4 mg of Alprostadil in 2 mL of a mixture of acetonitrile for liquid chromatography and water (9:1), and use this solution as the sample solution. Pipet 0.5 mL of the sample solution, and add the mixture of acetonitrile for liquid chromatography and water (9:1) to make exactly 10 mL. Pipet 2 mL of this solution, add the mixture of acetonitrile for liquid chromatography and water (9:1) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peaks, having the relative retention time of about 0.70 and 1.26 with respect to alprostadil, is not larger than 1/2 times the peak area of alprostadil with the standard solution, the area of the peaks, having the relative retention time of about 0.88 and 1.18 with respect to alprostadil, is not larger than the peak area of alprostadil with the standard solution, the area of the peaks other than alprostadil and the peaks mentioned above is not larger than 1/10 times the peak area of alprostadil with the standard solution and the total area of the peaks other than alprostadil is not larger than 2 times the peak area of alprostadil with the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 5 times as long as the retention time of alprostadil beginning after the solvent peak. **System suitability**—

Test for required detectability: Measure exactly 2 mL of the standard solution, add the mixture of acetonitrile for liquid chromatography and water (9:1) to make exactly 20 mL. Confirm that the peak area of alprostadil obtained with 5  $\mu$ L of this solution is equivalent to 7 to 13% of that with 5  $\mu$ L of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of alprostadil is not more than 1.5%.

**Loss on drying** <2.41> Not more than 1.0% (0.1 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Assay** Weigh accurately about 5 mg each of Alprostadil and Alprostadil Reference Standard, previously dried, dissolve in exactly 5 mL of the internal standard solution, add a mixture of acetonitrile for liquid chromatography and water (9:1) to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of alprostadil to that of the internal standard.

Amount (mg) of  $C_{20}H_{34}O_5$  =  $W_S \times (Q_T/Q_S)$

$W_S$ : Amount (mg) of Alprostadil Reference Standard

**Internal standard solution**—A solution of dimethyl phthalate in the mixture of acetonitrile for liquid chromatography and

water (9:1) (1 in 10,000).

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 196 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Dissolve 9.07 g of potassium dihydrogen phosphate in water to make 1000 mL. Adjust the pH to 6.3 with a solution prepared by dissolving 9.46 g of disodium hydrogen phosphate in water to make 1000 mL, and dilute to 10 times its volume with water. To 360 mL of this solution add 110 mL of acetonitrile for liquid chromatography and 30 mL of methanol for liquid chromatography.

**Flow rate:** Adjust the flow rate so that the retention time of alprostadil is about 10 minutes.

**System suitability—**

**System performance:** When the procedure is run with 5  $\mu$ L of the standard solution under the above operating conditions, alprostadil and the internal standard are eluted in this order with the resolution between these peaks being not less than 9.

**System repeatability:** When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of alprostadil to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and at a temperature not exceeding 5°C.

## Alprostadil Alfadex

### Prostaglandin E<sub>1</sub> $\alpha$ -Cyclodextrin Clathrate Compound

アルプロスタジール アルファデクス

$C_{20}H_{34}O_5 \cdot x C_{36}H_{60}O_{30}$

7-[(1R,2R,3R)-3-Hydroxy-2-[(1E,3S)-3-hydroxyoct-1-en-1-yl]-5-oxocyclopentyl]heptanoic acid— $\alpha$ -cyclodextrin [55648-20-9]

Alprostadil Alfadex is a  $\alpha$ -cyclodextrin clathrate compound of alprostadil.

It contains not less than 2.8% and not more than 3.2% of alprostadil ( $C_{20}H_{34}O_5$ ; 354.48), calculated on the anhydrous basis.

**Description** Alprostadil Alfadex occurs as a white powder.

It is freely soluble in water, and practically insoluble in ethanol (95), in ethyl acetate and in diethyl ether.

It is hygroscopic.

**Identification (1)** Dissolve 0.02 g of Alprostadil Alfadex in 5 mL of water, add 5 mL of ethyl acetate, shake, and centrifuge. Use the supernatant liquid as the sample solution (1). Separately, to 0.02 g of Alprostadil Alfadex add 5 mL of ethyl acetate, shake, and centrifuge. Use the supernatant liquid as the sample solution (2). Evaporate the solvent from these solutions under reduced pressure, add 2 mL of sulfuric acid to the residue, and shake for 5 minutes: the liquid obtained from the sample solution (1) shows an orange-yellow color, while the liquid obtained from the sample solution (2) does not show that color.

(2) Dissolve 0.02 g of Alprostadil Alfadex in 5 mL of water, add 5 mL of ethyl acetate, shake, centrifuge, and evaporate the solvent from the supernatant liquid under reduced pressure. Dissolve the residue in 2 mL of ethanol (95), add 5 mL of 1,3-dinitrobenzene TS, then add 5 mL of a solution of potassium hydroxide in ethanol (95) (17 in 100) under ice-cooling, and allow to stand for 20 minutes in a dark place under ice-cooling: a purple color develops.

(3) Dissolve 0.05 g of Alprostadil Alfadex in 1 mL of iodine TS, by heating on a water bath, and allow to stand: a dark blue precipitate is formed.

(4) Determine the absorption spectrum of a solution of Alprostadil Alfadex in dilute ethanol (3 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits no absorption between 220 nm and 400 nm. Separately, to 10 mL of the solution add 1 mL of potassium hydroxide-ethanol TS, allow to stand for 15 minutes, and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +126 – +138° (0.1 g calculated on the anhydrous basis, dilute ethanol, 20 mL, 100 mm).

**pH** <2.54> Dissolve 0.10 g of Alprostadil Alfadex in 20 mL of water: the pH of this solution is between 4.0 and 5.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Alprostadil Alfadex in 10 mL of water: the solution is colorless. Perform the test with this solution as directed under Ultraviolet-visible Spectrophotometry within 30 minutes after preparation of the solution: the absorbance at 450 nm is not larger than 0.10.

(2) Prostaglandin A<sub>1</sub>—Dissolve 0.10 g of Alprostadil Alfadex in 5 mL of water, add exactly 5 mL of the internal standard solution and ethanol (95) to make 15 mL, and use this solution as the sample solution. Separately, dissolve 1.5 mg of prostaglandin A<sub>1</sub> in ethanol (95) to make exactly 100 mL. Pipet 3 mL of this solution, add exactly 5 mL of the internal standard solution, 2 mL of ethanol (95) and water to make 15 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the operating conditions described in the Assay, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of prostaglandin A<sub>1</sub> to that of the internal standard:  $Q_T$  is not larger than  $Q_S$ .

**Internal standard solution**—A solution of propyl parahydroxybenzoate in dilute ethanol (1 in 15,000).

(3) Related substances—Dissolve 0.10 g of Alprostadil

Alfadex in 3 mL of water, add exactly 3 mL of ethyl acetate, shake, centrifuge, and use the supernatant liquid obtained as the sample solution. Separately, dissolve 1.0 mg of Prostaglandin A<sub>1</sub> in ethyl acetate to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, hexane and acetic acid (100) (10:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of phosphomolybdic acid in ethanol (95) (1 in 4) on the plate, and heat at 100°C for 5 minutes: the spots other than the principal spot from the sample solution, and the spots other than the spot corresponding to the spot from the standard solution are all not more intense than the spot from the standard solution.

**Water** <2.48> Not more than 6.0% (0.2 g, direct titration).

**Assay** Weigh accurately about 0.1 g of Alprostadil Alfa-dex, dissolve in 5 mL of water, add exactly 5 mL of the internal standard solution and water to make 15 mL, and use this solution as the sample solution. Separately, weigh accurately about 3 mg of Alprostadil Reference Standard, dissolve in 5 mL of ethanol (95), add exactly 5 mL of the internal standard solution and water to make 15 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of alprostadil to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of alprostadil (C}_{20}\text{H}_{34}\text{O}_5\text{)} \\ & = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Alprostadil Reference Standard

**Internal standard solution**—A solution of propyl para-hydroxybenzoate in dilute ethanol (1 in 15,000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 205 nm).

**Column**: A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecyl-silanized silica gel for liquid chromatography (5 μm in particle diameter).

**Column temperature**: A constant temperature of about 25°C.

**Mobile phase**: A mixture of 0.02 mol/L potassium dihydrogenphosphate and acetonitrile (3:2).

**Flow rate**: Adjust the flow rate so that the retention time of alprostadil is about 6 minutes.

**Selection of column**: Dissolve about 0.1 g of Alprostadil Alfadex in 5 mL of water, add 5 mL of a solution of prostaglandin A<sub>1</sub> in ethanol (95) (3 in 200,000) and 5 mL of the internal standard solution. Proceed with 10 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of alprostadil, the internal standard and prostaglandin A<sub>1</sub> in this order and complete separation of these peaks.

**Containers and storage** Containers—Tight containers.

**Storage**—Light-resistant, at a temperature not exceeding 5°C.

**Expiration date** 24 months after preparation.

## Dried Aluminum Hydroxide Gel

乾燥水酸化アルミニウムゲル

Dried Aluminum Hydroxide Gel contains not less than 50.0% of aluminum oxide (Al<sub>2</sub>O<sub>3</sub>: 101.96).

**Description** Dried Aluminum Hydroxide Gel occurs as a white, amorphous powder. It is odorless and tasteless.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

Most of it dissolves in dilute hydrochloric acid and in sodium hydroxide TS.

**Identification** To 0.2 g of Dried Aluminum Hydroxide Gel add 20 mL of dilute hydrochloric acid, warm, and centrifuge: the supernatant liquid responds to the Qualitative Tests <1.09> for aluminum salt.

**Purity (1)** Acidity or alkalinity—To 1.0 g of Dried Aluminum Hydroxide Gel add 25 mL of water, shake well, and centrifuge: the supernatant liquid is neutral.

(2) Chloride <1.03>—To 1.0 g of Dried Aluminum Hydroxide Gel add 30 mL of dilute nitric acid, heat gently to boil while shaking, cool, add water to make 100 mL, and centrifuge. To 5 mL of the supernatant liquid add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.284%).

(3) Sulfate <1.14>—To 1.0 g of Dried Aluminum Hydroxide Gel add 15 mL of dilute hydrochloric acid, heat gently to boil while shaking, cool, add water to make 250 mL, and centrifuge. To 25 mL of the supernatant liquid add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.480%).

(4) Nitrate—To 0.10 g of Dried Aluminum Hydroxide Gel add 5 mL of water, then carefully add 5 mL of sulfuric acid, shake well to dissolve, and cool. Superimpose the solution on 2 mL of iron (II) sulfate TS: no brown-colored ring is produced at the zone of contact.

(5) Heavy metals <1.07>—Dissolve 2.0 g of Dried Aluminum Hydroxide Gel in 10 mL of dilute hydrochloric acid by heating, filter if necessary, and add water to make 50 mL. Perform the test with this solution as the test solution. Prepare the control solution as follows: evaporate 10 mL of dilute hydrochloric acid to dryness, and add 2.0 mL of Standard Lead Solution, 2 mL of dilute acetic acid and water to make 50 mL (not more than 10 ppm).

(6) Arsenic <1.11>—To 0.8 g of Dried Aluminum Hydroxide Gel add 10 mL of dilute sulfuric acid, heat gently to boil while shaking, cool, and filter. Take 5 mL of the filtrate, use this solution as the test solution, and perform the test (not more than 5 ppm).

**Acid-consuming capacity** Weigh accurately about 0.2 g of Dried Aluminum Hydroxide Gel, and transfer to a glass-stoppered flask. Add exactly 100 mL of 0.1 mol/L

hydrochloric acid VS, stopper the flask, shake at  $37 \pm 2^\circ\text{C}$  for 1 hour, and filter. Measure exactly 50 mL of the filtrate, and titrate <2.50> while thoroughly stirring, the excess hydrochloric acid with 0.1 mol/L sodium hydroxide VS until the pH of the solution becomes to 3.5. The volume of 0.1 mol/L hydrochloric acid VS consumed is not less than 250 mL per g of Dried Aluminum Hydroxide Gel.

**Assay** Weigh accurately about 2 g of Dried Aluminum Hydroxide Gel, add 15 mL of hydrochloric acid, heat on a water bath with shaking for 30 minutes, cool, and add water to make exactly 500 mL. Pipet 20 mL of this solution, add exactly 30 mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS and 20 mL of acetic acid (31)-ammonium acetate buffer solution, pH 4.8, boil for 5 minutes, and cool. Add 55 mL of ethanol (95), and titrate <2.50> with 0.05 mol/L zinc acetate VS until the color of the solution changes from light dark green to light red. (indicator: 2 mL of dithizone TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 2.549 mg of  $\text{Al}_2\text{O}_3$

**Containers and storage** Containers—Tight containers.

## Dried Aluminum Hydroxide Gel Fine Granules

乾燥水酸化アルミニウムゲル細粒

Dried Aluminum Hydroxide Gel Fine Granules contain not less than 47.0% of aluminum oxide ( $\text{Al}_2\text{O}_3$ : 101.96).

**Method of preparation** Prepare with Dried Aluminum Hydroxide Gel as directed under Powders.

**Identification** To 0.2 g of Dried Aluminum Hydroxide Gel Fine Granules add 20 mL of dilute hydrochloric acid, warm and centrifuge: the supernatant liquid responds to the Qualitative Tests <1.09> for aluminum salt.

**Acid-consuming capacity** Proceed as directed for Acid-consuming capacity under Dried Aluminum Hydroxide Gel: the volume of 0.1 mol/L hydrochloric acid VS consumed is not less than 235 mL per g of Dried Aluminum Hydroxide Gel Fine Granules.

**Assay** Proceed as directed in the Assay under Dried Aluminum Hydroxide Gel.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 2.549 mg of  $\text{Al}_2\text{O}_3$

**Containers and storage** Containers—Tight containers.

## Natural Aluminum Silicate

天然ケイ酸アルミニウム

**Description** Natural Aluminum Silicate occurs as a white or slightly colored powder. It is odorless and tasteless.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

Natural Aluminum Silicate (1 g) dissolves when heated in 20 mL of a solution of sodium hydroxide (1 in 5), with some decomposition, leaving a large amount of insoluble substance.

**Identification (1)** To 0.5 g of Natural Aluminum Silicate add 3 mL of diluted sulfuric acid (1 in 3), heat until white fumes evolve, cool, add 20 mL of water, and filter. Render the filtrate slightly acid with ammonia TS: the solution responds to the Qualitative Tests <1.09> for aluminum salt.

(2) Prepare a bead by fusing ammonium sodium hydrogenphosphate tetrahydrate on a platinum loop. Place the bead in contact with Natural Aluminum Silicate, and fuse again: an infusible material appears in the bead, producing, upon cooling, an opaque bead with a web-like structure.

**Purity (1)** Acidity or alkalinity—Shake 5.0 g of Natural Aluminum Silicate with 100 mL of water, and centrifuge: the supernatant liquid so obtained is neutral.

(2) Chloride <1.03>—To 5.0 g of Natural Aluminum Silicate add 100 mL of water, boil gently for 15 minutes while shaking, then cool, add water to restore the original volume, and centrifuge. To 10 mL of the supernatant liquid add 6 mL of dilute nitric acid, dilute to 50 mL with water, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate <1.14>—To the residue obtained in (6) add 3 mL of dilute hydrochloric acid, heat on a water bath for 10 minutes, dilute to 50 mL with water, and filter. To 2.0 mL of the filtrate add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.480%).

(4) Heavy metals <1.07>—To 1.5 g of Natural Aluminum Silicate add 50 mL of water and 5 mL of hydrochloric acid, boil gently for 20 minutes while shaking, then cool, centrifuge, remove the supernatant liquid, wash the residue with two 10-mL portions of water, centrifuging each time, combine these washings with the filtrate, and add ammonia solution (28) dropwise, until a precipitate just appears. Add dropwise dilute hydrochloric acid with vigorous shaking and redissolve the precipitate. Heat the mixture with 0.45 g of hydroxylammonium chloride, cool, and add 0.45 g of sodium acetate trihydrate, 6 mL of dilute acetic acid and water to make 150 mL. Perform the test, using 50 mL of this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution, 0.15 g of hydroxylammonium chloride, 0.15 g of sodium acetate trihydrate, 2 mL of dilute acetic acid and water to make 50 mL (not more than 40 ppm).

(5) Arsenic <1.11>—To 1.0 g of Natural Aluminum Silicate, add 5 mL of dilute hydrochloric acid, heat gently to boil while shaking well, cool rapidly, and centrifuge. Mix the

The figures are in mm.

- A: Distilling flask of about 300-mL capacity.  
 B: Steam generator of about 1000-mL capacity, containing a few boiling tips to prevent bumping  
 C: Condenser  
 D: Receiver: 200-mL volumetric flask  
 E: Steam-introducing tube having an internal diameter of about 8 mm  
 F, G: Rubber tube with a clamp  
 H: Thermometer

residue with 5 mL of dilute hydrochloric acid with shaking, centrifuge, then add 10 mL of water to the residue, and repeat the extraction in the same manner. Concentrate the combined extracts on a water bath to 5 mL. Use this solution as the test solution, and perform the test (not more than 2 ppm).

(6) Soluble salts—Evaporate 50 mL of the supernatant liquid obtained in (1) on a water bath to dryness, and ignite the residue at 700°C for 2 hours: the mass of the ignited residue is not more than 40 mg.

(7) Fluoride—(i) Apparatus: Use a hard glass apparatus as illustrated in the figure. Ground-glass joints may be used.

(ii) Procedure: Transfer 5.0 g of Natural Aluminum Silicate to the distilling flask A with the aid of 20 mL of water, add about 1 g of glass wool and 50 mL of diluted purified sulfuric acid (1 in 2), and connect A to the distillation apparatus, previously washed with steam streamed through the steam introducing tube E. Connect the condenser C with the receiver D containing 10 mL of 0.01 mol/L sodium hydroxide VS and 10 mL of water so that the lower end of C is immersed in the solution. Heat A gradually until the temperature of the solution in A reaches 130°C, then open the rubber tube F, close the rubber tube G, boil water in the steam generator B vigorously, and introduce the generated steam into F. Simultaneously, heat A, and maintain the temperature of the solution in A between 135°C and 145°C. Adjust the distilling rate to about 10 mL per minute. Collect about 170 mL of the distillate, then stop the distillation, wash C with a small quantity of water, combine the washings with the distillate, add water to make exactly 200 mL, and use this solution as the test solution. Perform the test with the test solution as directed in the procedure of determination for

fluoride under Oxygen Flask Combustion Method <1.06>. No corrective solution is used in this procedure.

$$\begin{aligned} \text{Amount (mg) of fluoride (F: 19.00) in the test solution} \\ = \text{amount (mg) of fluoride in 5 mL of} \\ \text{the standard solution} \\ \times (A_T/A_S) \times (200/V) \end{aligned}$$

The content of fluoride (F) is not more than 0.01%.

**Loss on drying** <2.41> Not more than 20.0% (1 g, 105°C, 3 hours).

**Adsorptive power** To 0.10 g of Natural Aluminum Silicate add 20 mL of a solution of methylene blue trihydrate (3 in 2000), shake for 15 minutes, allow to stand for 5 hours at  $37 \pm 2^\circ\text{C}$ , and centrifuge. Dilute 1.0 mL of the supernatant liquid with water to 200 mL. Place 50 mL of the solution in a Nessler tube and observe horizontally or vertically against a white background: the color of the solution is not deeper than that of the following control solution.

Control solution: Dilute 1.0 mL of a solution of methylene blue trihydrate (3 in 2000) with water to 400 mL, and use 50 mL of this solution.

**Containers and storage** Containers—Well-closed containers.

## Synthetic Aluminum Silicate

合成ケイ酸アルミニウム

**Description** Synthetic Aluminum Silicate occurs as a white powder. It is odorless and tasteless.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

Synthetic Aluminum Silicate (1 g) dissolves when heated in 20 mL of a solution of sodium hydroxide (1 in 5), leaving a small amount of insoluble substance .

**Identification (1)** To 0.5 g of Synthetic Aluminum Silicate add 3 mL of diluted sulfuric acid (1 in 3), heat until white fumes evolve, cool, add 20 mL of water, and filter. Render the filtrate slightly acid with ammonia TS: the solution responds to the Qualitative Tests <1.09> for aluminum salt.

(2) Prepare a bead by fusing ammonium sodium hydrogenphosphate tetrahydrate on a platinum loop. Place the bead in contact with Synthetic Aluminum Silicate, and fuse again: an infusible material appears in the bead, producing, upon cooling, an opaque bead with a web-like structure.

**Purity (1)** Acidity or alkalinity—Shake 1.0 g of Synthetic Aluminum Silicate with 20 mL of water, and centrifuge: the supernatant liquid so obtained is neutral.

(2) Chloride <1.03>—To 5.0 g of Synthetic Aluminum Silicate add 100 mL of water, boil gently for 15 minutes while shaking, then cool, add water to restore the original volume, and centrifuge. To 10 mL of the supernatant liquid add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate <1.14>—To 2.0 mL of the supernatant liquid obtained in (2) add 1 mL of dilute hydrochloric acid and

water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.480%).

(4) Heavy metals <1.07>—To 3.0 g of Synthetic Aluminum Silicate add 50 mL of water and 5 mL of hydrochloric acid, boil gently for 20 minutes while shaking, then after cooling, centrifuge, remove the supernatant liquid, wash the precipitate with two 10-mL portions of water, centrifuging each time, combine these washings with the filtrate, and add ammonia solution (28) dropwise until a precipitate just appears. Add dropwise dilute hydrochloric acid with vigorous shaking to redissolve the precipitate. Heat the solution with 0.45 g of hydroxylammonium chloride, and after cooling, add 0.45 g of sodium acetate trihydrate, 6 mL of dilute acetic acid and water to make 150 mL. Perform the test with 50 mL of this solution as the test solution. Prepare the control solution with 3.0 mL of Standard Lead Solution, 0.15 g of hydroxylammonium chloride, 0.15 g of sodium acetate trihydrate, 2 mL of dilute acetic acid and water to make 50 mL (not more than 30 ppm).

(5) Arsenic <1.11>—To 1.0 g of Synthetic Aluminum Silicate add 10 mL of dilute hydrochloric acid, heat gently to boiling while shaking well, cool rapidly, and centrifuge. Mix the residue with 5 mL of dilute hydrochloric acid with shaking, centrifuge, then add 10 mL of water to the residue, and repeat the extraction in the same manner. Concentrate the combined extracts on a water bath to 5 mL. Use this solution as the test solution, and perform the test (not more than 2 ppm).

**Loss on drying** <2.41> Not more than 20.0% (1 g, 105°C, 3 hours).

**Acid-consuming capacity** <6.04> Weigh accurately about 1 g of Synthetic Aluminum Silicate, transfer to a glass-stoppered flask, add 200 mL of 0.1 mol/L hydrochloric acid VS, exactly measured, stopper the flask, and shake at  $37 \pm 2^\circ\text{C}$  for 1 hour. Filter, pipet 50 mL of the filtrate, and titrate <2.50> by stirring well the excess hydrochloric acid with 0.1 mol/L sodium hydroxide VS until the pH of the solution changes to 3.5. The volume of 0.1 mol/L hydrochloric acid VS consumed is not less than 50.0 mL per g of Synthetic Aluminum Silicate.

**Containers and storage** Containers—Well-closed containers.

## Aluminum Monostearate

モノステアリン酸アルミニウム

Aluminum Monostearate is mainly aluminum compounds of stearic acid ( $\text{C}_{18}\text{H}_{36}\text{O}_2$ ; 284.48) and palmitic acid ( $\text{C}_{16}\text{H}_{32}\text{O}_2$ ; 256.42).

Aluminum Monostearate, when dried, contains not less than 7.2% and not more than 8.9% of aluminum (Al; 26.98).

**Description** Aluminum Monostearate occurs as a white to yellowish white powder. It is odorless or has a faint, characteristic odor.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

**Identification** (1) Heat 3 g of Aluminum Monostearate with 30 mL of hydrochloric acid in a water bath with occasional shaking for 10 minutes. After cooling, shake the mixture vigorously with 50 mL of water and 30 mL of diethyl ether for 3 minutes, and allow to stand. To the separated aqueous layer add sodium hydroxide TS until the solution becomes slightly turbid, and filter: the filtrate responds to the Qualitative Tests <1.09> for aluminum salt.

(2) Wash the diethyl ether layer separated in (1) with two 20-mL portions of water, and evaporate the diethyl ether layer on a water bath: the residue melts <1.13> at above  $54^\circ\text{C}$ .

**Acid value for fatty acid** <1.13> 193 – 210. Weigh accurately about 1 g of fatty acid obtained in the Identification (2), transfer a 250-mL glass-stoppered flask, add 100 mL of a mixture of diethyl ether and ethanol (95) (2:1), warm to dissolve, add several drops of phenolphthalein TS, and proceed as directed under Acid Value.

**Purity** (1) Free fatty acid—Mix 1.0 g of Aluminum Monostearate with about 50 mL of a mixture of neutralized ethanol and diethyl ether (1:1), filter through dry filter paper, wash the vessel and the filter paper with a small amount of a mixture of neutralized ethanol and diethyl ether (1:1), combine the filtrate and the washings, and add 2.1 mL of 0.1 mol/L potassium hydroxide VS: a red color develops.

(2) Water-soluble salts—Heat 2.0 g of Aluminum Monostearate with 80 mL of water in a loosely stoppered conical flask on a water bath for 30 minutes with occasional shaking. After cooling, filter through dry filter paper, wash the residue with a small amount of water, combine the washings with the filtrate, add water to make 100 mL, evaporate 50 mL of this solution on a water bath, and heat strongly at  $600^\circ\text{C}$ : the mass of the residue is not more than 10.0 mg.

(3) Heavy metals <1.07>—Heat 1.0 g of Aluminum Monostearate over a small flame with caution at the beginning, and continue the heating, gradually raising the temperature, to ash. After cooling, add 10 mL of diluted hydrochloric acid (1 in 2), evaporate on a water bath, and boil the residue with 20 mL of water for 1 minute. Cool, filter, wash the residue with water, combine the filtrate and the washings, and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Evaporate 10 mL of diluted hydrochloric acid (1 in 2) on a water bath to dryness, add 2 mL of dilute acetic acid and 5.0 mL of Standard Lead Solution, dilute with water to make 50 mL, and use this solution as the control solution (not more than 50 ppm).

(4) Arsenic <1.11>—Mix 1.0 g of Aluminum Monostearate with 2 g of magnesium nitrate hexahydrate, ignite over a small flame, moisten the residue after cooling with 0.5 mL of nitric acid, and heat. Heat again the residue with 10 mL of dilute sulfuric acid until white fumes evolve, add water to make 5 mL, and perform the test with this solution as the test solution (not more than 2 ppm).

**Loss on drying** <2.41> Not more than 3.0% (1 g,  $105^\circ\text{C}$ , 3 hours).

**Assay** Weigh accurately about 1 g of Aluminum Monostearate, previously dried, ignite gently to ash, and cool. Add dropwise 0.5 mL of nitric acid, evaporate on a water bath by heating, and then heat strongly between  $900^\circ\text{C}$

and 1100°C to a constant mass. After cooling, weigh rapidly the ignited residue, and designate the mass as aluminum oxide ( $\text{Al}_2\text{O}_3$ ; 101.96).

Amount (mg) of aluminum (Al)  
= amount (mg) of aluminum oxide ( $\text{Al}_2\text{O}_3$ )  $\times$  0.5293

**Containers and storage** Containers—Well-closed containers.

## Aluminum Potassium Sulfate Hydrate

### Alum

硫酸アルミニウムカリウム水和物

$\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$ : 474.39

Aluminum Potassium Sulfate Hydrate contains not less than 99.5% of  $\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$ .

**Description** Aluminum Potassium Sulfate Hydrate occurs as colorless or white crystals or powder. It is odorless. It has a slightly sweet, strongly astringent taste.

It is freely soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

A solution of Aluminum Potassium Sulfate Hydrate (1 in 20) is acid.

**Identification** A solution of Aluminum Potassium Sulfate Hydrate (1 in 10) responds to the Qualitative Tests <1.09> for aluminum salt, to the Qualitative Tests <1.09> (1), (3) and (4) for potassium salt, and to the Qualitative Tests <1.09> (1) and (3) for sulfate.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Aluminum Potassium Sulfate Hydrate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Iron <1.10>—Prepare the test solution with 1.0 g of Aluminum Potassium Sulfate Hydrate according to Method 1, and perform the test according to Method A. Prepare the control solution with 2.0 mL of Standard Iron Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 0.6 g of Aluminum Potassium Sulfate Hydrate, according to Method 1, and perform the test (not more than 3.3 ppm).

**Assay** Weigh accurately about 4.5 g of Aluminum Potassium Sulfate Hydrate, and dissolve in water to make exactly 200 mL. Take exactly 20 mL of this solution, and add exactly 30 mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS and 20 mL of acetic acid-ammonium acetate buffer solution, pH 4.8, boil for 5 minutes, and cool. Add 55 mL of ethanol (95), and titrate <2.50> with 0.05 mol/L zinc acetate VS (indicator: 2 mL of dithizone TS), until the color of the solution changes from light dark green to light red. Perform a blank determination.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 23.72 mg of  $\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$

**Containers and storage** Containers—Tight containers.

## Dried Aluminum Potassium Sulfate

### Burnt Alum

乾燥硫酸アルミニウムカリウム

$\text{AlK}(\text{SO}_4)_2$ : 258.21

Dried Aluminum Potassium Sulfate, when dried, contains not less than 98.0% of  $\text{AlK}(\text{SO}_4)_2$ .

**Description** Dried Aluminum Potassium Sulfate occurs as white masses or white powder. It is odorless. It has a slightly sweet, astringent taste.

It is freely soluble in hot water and practically insoluble in ethanol (95).

It dissolves slowly in water.

**Identification** A solution of Dried Aluminum Potassium Sulfate (1 in 20) responds to the Qualitative Tests <1.09> for aluminum salt, to the Qualitative Tests <1.09> (1), (3) and (4) for potassium salt, and to the Qualitative Tests <1.09> (1) and (3) for sulfate.

**Purity (1)** Water-insoluble substances—To 2.0 g of Dried Aluminum Potassium Sulfate add 40 mL of water, shake frequently, and allow to stand for 48 hours. Collect the insoluble residue on a glass filter (G4), wash with 50 mL of water, and dry at 105°C for 2 hours: the mass of the residue is not more than 50 mg.

(2) Heavy metals <1.07>—Dissolve 0.5 g of Dried Aluminum Potassium Sulfate in 45 mL of water, and filter, if necessary. Add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution, 2 mL of dilute acetic acid and water to make 50 mL (not more than 40 ppm).

(3) Iron <1.10>—Prepare the test solution with 0.54 g of Dried Aluminum Potassium Sulfate according to Method 1, and perform the test according to Method A. Prepare the control solution with 2.0 mL of Standard Iron Solution (not more than 37 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 0.40 g of Dried Aluminum Potassium Sulfate, according to Method 1, and perform the test (not more than 5 ppm).

**Loss on drying** <2.41> Not more than 15.0% (2 g, 200°C, 4 hours).

**Assay** Weigh accurately about 1.2 g of Dried Aluminum Potassium Sulfate, previously dried, add 80 mL of water, and heat on a water bath with occasional shaking for 20 minutes. Cool, add water to make exactly 100 mL, and filter, if necessary. Discard the first 30 mL of the filtrate, take exactly the subsequent 20 mL of the filtrate, and add exactly 30 mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS and 20 mL of acetic acid-ammonium acetate buffer solution, pH 4.8, boil for 5 minutes, and cool. Add 55 mL of ethanol (95), and titrate <2.50> with 0.05 mol/L zinc acetate VS (indicator: 2 mL of dithizone TS), until the color of the solution changes from light dark green to light red. Perform a blank determination.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 12.91 mg of AlK(SO<sub>4</sub>)<sub>2</sub>

**Containers and storage** Containers—Tight containers.

## Alum Solution

ミヨウバン水

Alum Solution contains not less than 0.27 w/v% and not more than 0.33 w/v% of aluminum potassium sulfate Hydrate [AlK(SO<sub>4</sub>)<sub>2</sub>·12H<sub>2</sub>O: 474.39].

### Method of preparation

Aluminum Potassium Sulfate Hydrate	3 g
Mentha Water	50 mL
Water or Purified Water	a sufficient quantity
To make 1000 mL	

Dissolve and mix the above ingredients.

**Description** Alum Solution is a clear, colorless liquid. It has the odor of the mentha oil and an astringent taste.

**Identification (1)** To 5 mL of Alum Solution add 3 mL of ammonium chloride TS and 1 mL of ammonia TS: a white, gelatinous precipitate is produced, which changes to red upon the addition of 5 drops of alizarin red S TS (aluminum sulfate).

(2) Place 100 mL of Alum Solution in an evaporating dish, evaporate on a water bath to dryness, and dissolve the residue in 5 mL of water: the solution responds to the Qualitative Tests <1.09> for potassium salt.

(3) Alum Solution responds to the Qualitative Tests <1.09> (1) and (2) for sulfate.

**Assay** Pipet 50 mL of Alum Solution, add exactly 30 mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, and further add 20 mL of acetic acid-ammonium acetate buffer solution, pH 4.8. Boil for 5 minutes, cool, add 55 mL of ethanol (95), and titrate <2.50> with 0.02 mol/L zinc acetate VS (indicator: 2 mL of dithizone TS), until the color of the solution changes from light dark green to light red. Perform a blank determination.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 9.488 mg of AlK(SO<sub>4</sub>)<sub>2</sub>·12H<sub>2</sub>O

**Containers and storage** Containers—Tight containers.

## Amantadine Hydrochloride

アマンタジン塩酸塩

C<sub>10</sub>H<sub>17</sub>N·HCl: 187.71

Tricyclo[3.3.1.1<sup>3,7</sup>]dec-1-ylamine monohydrochloride  
[665-66-7]

Amantadine Hydrochloride, when dried, contains not less than 99.0% of C<sub>10</sub>H<sub>17</sub>N·HCl.

**Description** Amantadine Hydrochloride occurs as a white, crystalline powder. It is odorless, and has a bitter taste.

It is very soluble in formic acid, freely soluble in water, in methanol and in ethanol (95), and practically insoluble in diethyl ether.

**Identification (1)** To 0.1 g of Amantadine Hydrochloride add 1 mL of pyridine and 0.1 mL of acetic anhydride, dissolve by boiling for 1 minute, add 10 mL of dilute hydrochloric acid, and cool in ice water. Filter the crystals separated, wash with water, and dry at 105°C for 1 hour: the residue melts <2.60> between 147°C and 151°C.

(2) Determine the infrared absorption spectrum of Amantadine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Amantadine Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**pH <2.54>** Dissolve 1.0 g of Amantadine Hydrochloride in 5 mL of water: the pH of this solution is between 4.0 and 6.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Amantadine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Amantadine Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Amantadine Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.50 g of Amantadine Hydrochloride in 10 mL of water, add 10 mL of sodium hydroxide TS and 10 mL of chloroform, and shake. Filter the chloroform layer through absorbent cotton with 3 g of anhydrous sodium sulfate on a funnel, and use the filtrate as the sample solution. Pipet 1 mL of the sample solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 2 μL each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions. Determine each peak area of these solutions by the automatic integration method: each peak area other than that of amantadine from the sample solution is not larger

than 1/3 of the peak area of amantadine from the standard solution, and the total area of each peak is not larger than the peak area of amantadine from the standard solution.

**Operating conditions—**

**Detector:** A hydrogen flame-ionization detector.

**Column:** A glass column about 3 mm in inside diameter and about 2 m in length, packed with siliceous earth for gas chromatography (150 to 180  $\mu\text{m}$  in particle diameter) coated with a mixture (L) of branched hydrocarbon of petroleum hexamethyltetracosane group for gas chromatography and potassium hydroxide at the ratios of 2% and 1%, respectively.

**Column temperature:** Inject at a constant temperature of about 125°C, maintain the temperature for 5 minutes, raise at the rate of 5°C per minute to 150°C, and maintain at a constant temperature of about 150°C for 15 minutes.

**Carrier gas:** Nitrogen

**Flow rate:** Adjust the flow rate so that the retention time of amantadine is about 11 minutes.

**Selection of column:** Dissolve 0.15 g of naphthalene in 5 mL of the sample solution, and add chloroform to make 100 mL. Proceed with 2  $\mu\text{L}$  of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of naphthalene and amantadine in this order with the resolution between these peaks being not less than 2.5.

**Detection sensitivity:** Adjust the detection sensitivity so that the peak height of amantadine obtained from 2  $\mu\text{L}$  of the standard solution composes about 10% of the full scale.

**Time span of measurement:** About twice as long as the retention time of amantadine beginning after the solvent peak.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.2 g of Amantadine Hydrochloride, previously dried, dissolve in 2 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid VS, and heat on a water bath for 30 minutes. After cooling, add acetic acid (100) to make 70 mL, and titrate <2.50> the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 18.77 mg of  $\text{C}_{10}\text{H}_{17}\text{N}\cdot\text{HCl}$

**Containers and storage** Containers—Well-closed containers.

## Ambenonium Chloride

アンベノニウム塩化物

$\text{C}_{28}\text{H}_{42}\text{Cl}_4\text{N}_4\text{O}_2$ : 608.47

2,2'-[(1,2-Dioxoethane-1,2-diyl)diimino]bis[N-(2-chlorobenzyl)-N,N-diethylethylammonium] dichloride  
[115-79-7]

Ambenonium Chloride contains not less than 98.5% of  $\text{C}_{28}\text{H}_{42}\text{Cl}_4\text{N}_4\text{O}_2$ , calculated on the dried basis.

**Description** Ambenonium Chloride occurs as a white powder.

It is freely soluble in water, in methanol and in acetic acid (100), soluble in ethanol (95), and slightly soluble in acetic anhydride.

It is hygroscopic.

Melting point: about 205°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Ambenonium Chloride in methanol (1 in 5000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Ambenonium Chloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Ambenonium Chloride (1 in 100) responds to the Qualitative Tests <1.09> for chloride.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Ambenonium Chloride in 10 mL of water: the solution is clear and colorless.

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of Ambenonium Chloride according to Method 4, and perform the test. Use a solution of magnesium nitrate in ethanol (95) (1 in 5). Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Related substances—Dissolve 0.10 g of Ambenonium Chloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 20 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, formic acid and water (12:6:5) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor: the spots other than the principal spot from the sample solution are not more

intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 11.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.3 g of Ambenonium Chloride, and dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3). Titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L perchloric acid VS} \\ = 30.42 \text{ mg of } C_{28}H_{42}Cl_4N_4O_2 \end{aligned}$$

**Containers and storage** Containers—Tight containers.

## Amidotrizoic Acid

アミドトリゾ酸

$C_{11}H_9I_3N_2O_4$ : 613.91

3,5-Bis(acetylamino)-2,4,6-triiodobenzoic acid [117-96-4]

Amidotrizoic Acid, calculated on the dried basis, contains not less than 98.0% of  $C_{11}H_9I_3N_2O_4$ .

**Description** Amidotrizoic Acid occurs as a white, crystalline powder. It is odorless.

It is slightly soluble in ethanol (95), very slightly soluble in water, and practically insoluble in diethyl ether.

It dissolves in sodium hydroxide TS.

**Identification** (1) Heat 0.1 g of Amidotrizoic Acid over a flame: a purple gas is evolved.

(2) Determine the infrared absorption spectrum of Amidotrizoic Acid as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Amidotrizoic Acid in 10 mL of 0.2 mol/L sodium hydroxide TS: the solution is clear and colorless.

(2) Primary aromatic amines—Dissolve 0.20 g of Amidotrizoic Acid in 5 mL of water and 1 mL of sodium hydroxide TS, add 4 mL of a solution of sodium nitrite (1 in 100) and 10 mL of 1 mol/L hydrochloric acid TS, shake, and allow to stand for 2 minutes. Add 5 mL of ammonium amidosulfate TS, shake well, allow to stand for 1 minute, and add 0.4 mL of a solution of 1-naphthol in ethanol (95) (1 in 10), 15 mL of sodium hydroxide TS and water to make exactly 50 mL. Determine the absorbance of this solution at 485 nm as directed under Ultraviolet-visible Spectrophotometry <2.24> using a solution, prepared in the same manner, as the blank: the absorbance is not more than 0.15.

(3) Soluble halides—Dissolve 2.5 g of Amidotrizoic Acid

in 20 mL of water and 2.5 mL of ammonia TS, add 20 mL of dilute nitric acid and water to make 100 mL, allow to stand for 15 minutes with occasional shaking, and filter. Discard the first 10 mL of the filtrate, transfer the subsequent 25 mL of the filtrate to a Nessler tube, and add ethanol (95) to make 50 mL. Proceed as directed under Chloride Limit Test <1.03> using this solution as the test solution. Prepare the control solution as follows: to 0.10 mL of 0.01 mol/L hydrochloric acid VS, add 6 mL of dilute nitric acid and water to make 25 mL, then ethanol (95) to make 50 mL.

(4) Iodine—Dissolve 0.20 g of Amidotrizoic Acid in 2.0 mL of sodium hydroxide TS, add 2.5 mL of 0.5 mol/L sulfuric acid TS, allow to stand for 10 minutes with occasional shaking, add 5 mL of chloroform, shake well, and allow to stand: the solution is colorless in the chloroform layer.

(5) Heavy metals <1.07>—Proceed with 2.0 g of Amidotrizoic Acid according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(6) Arsenic <1.11>—Prepare the test solution with 0.6 g of Amidotrizoic Acid according to Method 3, and perform the test (not more than 3.3 ppm).

**Loss on drying** <2.41> Not more than 7.0% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Transfer about 0.5 g of Amidotrizoic Acid, accurately weighed, to a saponification flask, dissolve in 40 mL of sodium hydroxide TS, add 1 g of zinc powder, connect to a reflux condenser, boil for 30 minutes, cool, and filter. Wash the flask and the filter paper with 50 mL of water, and combine the washings and the filtrate. Add 5 mL of acetic acid (100) to this solution, and titrate <2.50> with 0.1 mol/L silver nitrate VS until the color of the precipitate changes from yellow to green (indicator: 1 mL of tetrabromophenolphthalein ethyl ester TS).

$$\begin{aligned} \text{Each mL of 0.1 mol/L silver nitrate VS} \\ = 20.46 \text{ mg of } C_{11}H_9I_3N_2O_4 \end{aligned}$$

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

## Amikacin Sulfate

アミカシン硫酸塩

$C_{22}H_{43}N_5O_{13} \cdot 2H_2SO_4$ ; 781.76

3-Amino-3-deoxy- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 6)-  
[6-amino-6-deoxy- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)]-1-*N*-  
[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-D-streptomycin  
disulfate [39831-55-5]

Amikacin Sulfate is the sulfate of a derivative of kanamycin.

It contains not less than 691  $\mu$ g (potency) and not more than 791  $\mu$ g (potency) per mg, calculated on the dried basis. The potency of Amikacin Sulfate is expressed as mass (potency) of amikacin ( $C_{22}H_{43}N_5O_{13}$ ; 585.60).

**Description** Amikacin Sulfate occurs as a white to yellowish white powder.

It is very soluble in water, and practically insoluble in ethanol (95).

**Identification (1)** Determine the infrared absorption spectrum of Amikacin Sulfate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Amikacin Sulfate Reference Standard previously dried: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Dissolve 0.1 g each of Amikacin Sulfate and Amikacin Sulfate Reference Standard in 4 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of water, ammonia water (28), methanol and tetrahydrofuran (1:1:1:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin-citric acid-acetic acid TS on the plate, and heat at 100°C for 10 minutes: the principal spots from the sample solution and the standard solution exhibit a red-purple color and show the same *R<sub>f</sub>* value.

(3) A solution of Amikacin Sulfate (1 in 100) responds to the Qualitative Tests <1.09> (1) for sulfate.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +76 – +84° (1 g, water, 100 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Amikacin Sulfate in 100 mL of water: the pH of the solution is between 6.0 and 7.5.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Amikacin Sulfate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.10 g of Amikacin Sulfate in 4 mL of a water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of water, ammonia water (28), methanol and tetrahydrofuran (1:1:1:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin-citric acid-acetic acid TS on the plate, and heat at 100°C for 10 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 4.0% (1 g, in vacuum, 60°C, 3 hours).

**Assay** Weigh accurately an amount of Amikacin Sulfate and Amikacin Sulfate Reference Standard, equivalent to about 50 mg (potency), dissolve each in water to make exactly 50 mL. Pipet 200  $\mu$ L each of these solutions in the test tube with glass stopper, add exactly 3 mL of pyridine and exactly 2 mL of a solution of 2,4,6-trinitrobenzenesulfonic acid (1 in 100), stopper tightly, and heat in a water bath at 70°C for 30 minutes. After cooling, add exactly 2 mL each of acetic acid (100), and use these solutions as the sample solution and standard solution, respectively. Perform the test with exactly 20  $\mu$ L each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the heights, *H<sub>T</sub>* and *H<sub>S</sub>*, of the peak of amikacin derivative.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of amikacin } (C_{22}H_{43}N_5O_{13}) \\ = W_S \times (H_T/H_S) \times 1000 \end{aligned}$$

*W<sub>S</sub>*: Amount [mg (potency)] of Amikacin Sulfate Reference Standard

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 340 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 2.72 g of potassium dihydrogenphosphate in 800 mL of water, adjust to pH 6.5 with a solution of potassium hydroxide (1 in 40), and add water to make 1000 mL. To 280 mL of this solution add 720 mL of methanol, and mix.

Flow rate: Adjust the flow rate so that the retention time of amikacin derivative is about 9 minutes.

**System suitability**—

System performance: Dissolve about 5 mg (potency) of Amikacin Sulfate and about 5 mg (potency) of Kanamycin

Sulfate in 5 mL of water. Transfer 200  $\mu$ L of this solution in a glass-stoppered test tube, add 3 mL of pyridine and 2 mL of a solution of 2,4,6-trinitrobenzenesulfonic acid (1 in 100), stopper tightly, heat in a water bath at 70°C for 30 minutes. After cooling, add 2 mL of acetic acid (100). When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, amikacin derivative and kanamycin derivative are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak height of amikacin derivative is not more than 2.0%.

**Containers and storage** Containers—Hermetic containers.

## Aminophylline Hydrate

アミノフィリン水和物

$C_{14}H_{16}N_8O_4 \cdot C_2H_8N_2 \cdot xH_2O$   
1,3-Dimethyl-1*H*-purine-2,6 (3*H*,7*H*)-dione  
hemi(ethylenediamine) hydrate [5877-66-5, dihydrate]

Aminophylline Hydrate contains not less than 84.0% and not more than 86.0% of theophylline ( $C_7H_8N_4O_2$ : 180.16), and not less than 14.0% and not more than 15.0% of ethylenediamine ( $C_2H_8N_2$ : 60.10), calculated on the anhydrous basis.

**Description** Aminophylline Hydrate occurs as white to pale yellow granules or powder. It is odorless or slightly ammonia-like odor, and has a bitter taste.

It is soluble in water, slightly soluble in methanol, and practically insoluble in ethanol (95) and in diethyl ether.

To 1 g of Aminophylline Hydrate add 5 mL of water, and shake: it dissolves almost completely. Separation of crystals begins in 2 to 3 minutes, and these crystals dissolve on the addition of a small amount of ethylenediamine.

It is gradually affected by light, and gradually loses ethylenediamine in air.

**Identification (1)** Dissolve 0.75 g of Aminophylline Hydrate in 30 mL of water, and use this solution as the sample solution. To 20 mL of the sample solution add 1 mL of dilute hydrochloric acid: a precipitate is gradually formed. Filter the precipitate, recrystallize from water, and dry at 105°C for 1 hour: the crystals so obtained melt <2.60> between 271°C and 275°C.

(2) Dissolve 0.1 g of the crystals obtained in (1) in 50 mL of water, and to 2 mL of this solution add tannic acid TS dropwise: a white precipitate is produced, and this precipitate dissolves upon dropwise addition of tannic acid TS.

(3) To 0.01 g of the crystals obtained in (1) add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, and evaporate on a water bath to dryness: the residue shows a yellow-red color. Invert the dish containing the residue over a

vessel containing 2 to 3 drops of ammonia TS: the color of the residue changes to red-purple, which is destroyed on the addition of 2 to 3 drops of sodium hydroxide TS.

(4) Dissolve 0.01 g of the crystals obtained in (1) in 5 mL of water, add 3 mL of ammonia-ammonium chloride buffer solution, pH 8.0, and 1 mL of copper (II) sulfate-pyridine TS, and mix. Add 5 mL of chloroform to the mixture, and shake: the chloroform layer develops a green color.

(5) To 5 mL of the sample solution obtained in (1) add 2 drops of copper (II) sulfate TS: a purple color develops. Add 1 mL of copper (II) sulfate TS: the color changes to blue, and green precipitates are formed on standing.

**pH <2.54>** Dissolve 1.0 g of Aminophylline Hydrate in 25 mL of water: the pH of the solution is between 8.0 and 9.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Aminophylline Hydrate in 10 mL of hot water: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Aminophylline Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Water <2.48>** Not more than 7.9% (0.3 g, direct titration).

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Assay (1)** Theophylline—Weigh accurately about 0.25 g of Aminophylline Hydrate, and dissolve in 50 mL of water and 8 mL of ammonia TS by gentle warming on a water bath. Add exactly 20 mL of 0.1 mol/L silver nitrate VS, warm on a water bath for 15 minutes, allow to stand between 5°C and 10°C for 20 minutes, collect the precipitate by suction, and wash with three 10-mL portions of water. Combine the filtrate and washings, and add dilute nitric acid to make neutral. Add 3 mL of dilute nitric acid, and titrate <2.50> the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination.

Each mL of 0.1 mol/L silver nitrate VS  
= 18.02 mg of theophylline ( $C_7H_8N_4O_2$ )

(2) Ethylenediamine—Weigh accurately about 0.5 g of Aminophylline Hydrate, dissolve in 30 mL of water, and titrate <2.50> with 0.1 mol/L hydrochloric acid VS (indicator: 3 drops of bromophenol blue TS).

Each mL of 0.1 mol/L hydrochloric acid VS  
= 3.005 mg of ethylenediamine ( $C_2H_8N_2$ )

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Aminophylline Injection

アミノフィリン注射液

Aminophylline Injection is an aqueous solution for injection.

It contains not less than 75% and not more than 86% of the labeled amount of theophylline ( $C_7H_8N_4O_2$ : 180.16), and not less than 13% and not more than 20% of ethylenediamine ( $C_2H_8N_2$ : 60.10).

The concentration of Aminophylline Injection is expressed as the quantity of aminophylline dihydrate ( $C_{16}H_{24}N_{10}O_4 \cdot 2H_2O$ : 456.46).

**Method of preparation** Prepare as directed under Injections, with Aminophylline Hydrate. It may be prepared with Theophylline and its equivalent Ethylenediamine, instead of Aminophylline Hydrate.

It may contain not more than 60 mg of Ethylenediamine as a stabilizer for each g of Aminophylline Hydrate.

**Description** Aminophylline Injection is a clear and colorless liquid. It has a slightly bitter taste.

It gradually changes in color by light.

pH: 8.0 – 10.0

**Identification** To a volume of Aminophylline Injection, equivalent to 0.75 g of Aminophylline Hydrate according to the labeled amount, add water to make 30 mL. Proceed with this solution as directed in the Identification under Aminophylline Hydrate.

**Extractable volume** <6.05> It meets the requirement.

**Assay (1)** Theophylline—To an accurately measured volume of Aminophylline Injection, equivalent to about 0.2 g of theophylline ( $C_7H_8N_4O_2$ ) (about 0.25 g of Aminophylline Hydrate), add 15 mL of water, 8 mL of ammonia TS and 20 mL of silver nitrate TS, and warm on a water bath for 15 minutes. Cool to between 5°C and 10°C for 20 minutes, filter the precipitate through a glass filter (G4), and wash with three 10-mL portions of water. Dissolve the precipitate in 5 mL of nitric acid, and wash the filter with three 10-mL portions of water. Combine the nitric acid solution and washings, and titrate <2.50> with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS).

Each mL of 0.1 mol/L ammonium thiocyanate VS  
= 18.02 mg of theophylline ( $C_7H_8N_4O_2$ )

**(2)** Ethylenediamine—To an accurately measured volume of Aminophylline Injection, equivalent to about 30 mg of ethylenediamine ( $C_2H_8N_2$ ) (about 0.2 g of Aminophylline Hydrate), add water to make 30 mL, and titrate <2.50> with 0.1 mol/L hydrochloric acid VS (indicator: 2 to 3 drops of bromophenol blue TS).

Each mL of 0.1 mol/L hydrochloric acid VS  
= 3.005 mg of ethylenediamine ( $C_2H_8N_2$ )

**Containers and storage** Containers—Hermetic containers.  
Storage—Light-resistant.

## Amitriptyline Hydrochloride

アミトリプチリン塩酸塩

$C_{20}H_{23}N \cdot HCl$ : 313.86

3-(10,11-Dihydro-5H-dibenzo[*a,d*]cyclohepten-5-

ylidene)-*N,N*-dimethylpropylamine monohydrochloride  
[549-18-8]

Amitriptyline Hydrochloride, when dried, contains not less than 99.0% of  $C_{20}H_{23}N \cdot HCl$ .

**Description** Amitriptyline Hydrochloride occurs as colorless crystals or a white to pale yellow crystalline powder. It has a bitter taste and a numbing effect.

It is freely soluble in water, in ethanol (95) and in acetic acid (100), soluble in acetic anhydride, and practically insoluble in diethyl ether.

The pH of a solution of Amitriptyline Hydrochloride (1 in 20) is between 4.0 and 5.0.

**Identification (1)** Dissolve 5 mg of Amitriptyline Hydrochloride in 3 mL of sulfuric acid: a red color develops. Add 5 drops of potassium dichromate TS to this solution: it turns dark brown.

**(2)** Acidify 1 mL of a solution of Amitriptyline Hydrochloride (1 in 500) with 0.5 mL of dilute nitric acid, and add 1 drop of silver nitrate TS: a white, opalescent precipitate is produced.

**(3)** Determine the absorption spectrum of a solution of Amitriptyline Hydrochloride (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Amitriptyline Hydrochloride Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Melting point** <2.60> 195 – 198°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Amitriptyline Hydrochloride in 20 mL of water: the solution is clear and colorless.

**(2)** Heavy metals <1.07>—Proceed with 2.0 g of Amitriptyline Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Amitriptyline Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 31.39 mg of  $C_{20}H_{23}N \cdot HCl$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Amitriptyline Hydrochloride Tablets

アミトリプチリン塩酸塩錠

Amitriptyline Hydrochloride Tablets contain not less than 90% and not more than 110% of the labeled amount of amitriptyline hydrochloride ( $C_{20}H_{23}N.HCl$ ; 313.86).

**Method of preparation** Prepare as directed under Tablets, with Amitriptyline Hydrochloride.

**Identification (1)** Weigh a quantity of powdered Amitriptyline Hydrochloride Tablets, equivalent to 0.1 g of Amitriptyline Hydrochloride according to the labeled amount. Add 10 mL of chloroform, shake thoroughly, and filter. Evaporate the filtrate on a water bath to about 2 mL, add diethyl ether until turbidity is produced, and allow to stand. Filter the crystals formed through a glass filter (G4), and proceed as directed in the Identification (1) and (2) under Amitriptyline Hydrochloride.

(2) Determine the absorption spectrum of a solution of the crystals obtained in (1) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 238 nm and 240 nm, and a minimum between 228 nm and 230 nm.

**Dissolution <6.10>** Perform the test according to the following method: It meets the requirement.

Perform the test with 1 tablet of Amitriptyline Hydrochloride Tablets at 50 revolutions per minute according to the Paddle method using 900 mL of 2 nd fluid for dissolution test as the test solution. Take 20 mL or more of the dissolved solution 60 minutes after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8  $\mu$ m. Discard the first 10 mL of the filtrate, pipet the subsequent  $V$  mL of the filtrate, add 2 nd fluid for dissolution test to make exactly  $V'$  mL so that each mL contains about 11  $\mu$ g of amitriptyline hydrochloride ( $C_{20}H_{23}N.HCl$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 55 mg of Amitriptyline Hydrochloride Reference Standard, previously dried at 105°C for 2 hours, and dissolve in 2 nd fluid for dissolution test to make exactly 250 mL. Pipet 5 mL of this solution, add 2 nd fluid for dissolution test to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 239 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

The dissolution rate of Amitriptyline Hydrochloride Tablets in 60 minutes should be not less than 70%.

Dissolution rate (%) with respect to the labeled amount of amitriptyline hydrochloride ( $C_{20}H_{23}N.HCl$ )

$$= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 18$$

$W_S$ : Amount (mg) of Amitriptyline Hydrochloride Reference Standard.

$C$ : Labeled amount (mg) of amitriptyline hydrochloride ( $C_{20}H_{23}N.HCl$ ) in 1 tablet.

**Assay** Weigh accurately and powder not less than 20 Amitriptyline Hydrochloride Tablets. Weigh accurately a portion of the powder, equivalent to about 20 mg of amitriptyline hydrochloride ( $C_{20}H_{23}N.HCl$ ), and add 75 mL of diluted methanol (1 in 2). After shaking for 30 minutes, add diluted methanol (1 in 2) to make exactly 100 mL, and filter. Discard the first 20-mL portion of the filtrate, measure exactly the subsequent 5-mL portion, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Amitriptyline Hydrochloride Reference Standard, previously dried at 105°C for 2 hours, and dissolve in diluted methanol (1 in 2) to make exactly 100 mL. Measure exactly 5 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 239 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, respectively.

$$\begin{aligned} &\text{Amount (mg) of amitriptyline hydrochloride} \\ &(\text{C}_{20}\text{H}_{23}\text{N.HCl}) \\ &= W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Amitriptyline Hydrochloride Reference Standard

**Containers and storage** Containers—Tight containers.

## Ammonia Water

アンモニア水

Ammonia Water contains not less than 9.5 w/v% and not more than 10.5 w/v% of ammonia ( $NH_3$ ; 17.03).

**Description** Ammonia Water occurs as a clear, colorless liquid, having a very pungent, characteristic odor.

It is alkaline.

Specific gravity  $d_{20}^{20}$ : 0.95 – 0.96

**Identification (1)** Hold a glass rod moistened with hydrochloric acid near the surface of Ammonia Water: dense white fumes are produced.

(2) Hold moistened red litmus paper near the surface of Ammonia Water: it turns blue.

**Purity (1)** Residue on evaporation—Evaporate 10.0 mL of Ammonia Water to dryness, and dry the residue at 105°C for 1 hour: the mass of the residue is not more than 2.0 mg.

(2) Heavy metals <1.07>—Evaporate 5.0 mL of Ammonia Water to dryness on a water bath, add 1 mL of dilute hydrochloric acid to the residue, and evaporate to dryness. Dissolve the residue in 2 mL of dilute acetic acid, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 2.5 mL of Standard Lead Solution, 2 mL of dilute acetic acid and water to make 50 mL (not more than 5 ppm).

(3) Potassium permanganate-reducing substances—To 10.0 mL of Ammonia Water add 40 mL of dilute sulfuric acid while cooling, and add 0.10 mL of 0.02 mol/L potassium permanganate VS: the red color of the potassium permanganate does not disappear within 10 minutes.

**Assay** Measure exactly 5 mL of Ammonia Water, add 25 mL of water, and titrate <2.50> with 0.5 mol/L sulfuric acid VS (indicator: 2 drops of methyl red TS).

Each mL of 0.5 mol/L sulfuric acid VS  
= 17.03 mg of NH<sub>3</sub>

**Containers and storage** Containers—Tight containers.  
Storage—Not exceeding 30°C.

## Amobarbital

アモバルビタール

C<sub>11</sub>H<sub>18</sub>N<sub>2</sub>O<sub>3</sub>; 226.27  
5-Ethyl-5-(3-methylbutyl)pyrimidine-  
2,4,6(1*H*,3*H*,5*H*)-trione [57-43-2]

Amobarbital, when dried, contains not less than 99.0% of C<sub>11</sub>H<sub>18</sub>N<sub>2</sub>O<sub>3</sub>.

**Description** Amobarbital occurs as white crystals or crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in ethanol (95), in acetone and in diethyl ether, sparingly soluble in chloroform, and practically insoluble in water.

It dissolves in sodium hydroxide TS and in sodium carbonate TS.

The pH of a saturated solution of Amobarbital is between 5.0 and 5.6.

**Identification (1)** Boil 0.2 g of Amobarbital with 10 mL of sodium hydroxide TS: the gas evolved changes moistened red litmus paper to blue.

**(2)** Dissolve 0.05 g of Amobarbital in 2 to 3 drops of ammonia-ammonium chloride buffer solution, pH 10.7, and 5 mL of diluted pyridine (1 in 10). Add 5 mL of chloroform and 0.3 mL of copper (II) sulfate TS to the solution: a red-purple precipitate is produced in the aqueous layer. Shake the mixture: a red-purple color is produced in the chloroform layer.

**(3)** To 0.4 g of Amobarbital add 0.1 g of anhydrous sodium carbonate and 4 mL of water, shake, and add a solution of 0.3 g of 4-nitrobenzyl chloride in 7 mL of ethanol (95). Heat the mixture on a water bath for 30 minutes under a reflux condenser, and allow to stand for 1 hour. Filter the crystals produced, wash with 7 mL of sodium hydroxide TS and a small portion of water, recrystallize from ethanol, and dry at 105°C for 30 minutes: the crystals so obtained melt <2.60> between 168°C and 173°C or between 150°C and 154°C.

**Melting point** <2.60> 157 – 160°C

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Amobarbital in 5 mL of sodium hydroxide TS: the solution is clear and colorless.

**(2)** Chloride <1.03>—Dissolve 0.30 g of Amobarbital in 20 mL of acetone, and add 6 mL of dilute nitric acid and

water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: take 0.30 mL of 0.01 mol/L hydrochloric acid VS, 20 mL of acetone and 6 mL of dilute nitric acid, and add water to make 50 mL (not more than 0.035%).

**(3)** Sulfate <1.14>—Dissolve 0.40 g of Amobarbital in 20 mL of acetone, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: take 0.40 mL of 0.005 mol/L sulfuric acid VS, 20 mL of acetone, and 1 mL of dilute hydrochloric acid, and add water to make 50 mL (not more than 0.048%).

**(4)** Heavy metals <1.07>—Proceed with 1.0 g of Amobarbital according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(5)** Readily carbonizable substances <1.15>—Perform the test with 0.5 g of Amobarbital. The solution is not more colored than Matching Fluid A.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Amobarbital, previously dried, and dissolve in 5 mL of ethanol (95) and 50 mL of chloroform. Titrate <2.50> with 0.1 mol/L potassium hydroxide-ethanol VS until the color of the solution changes from yellow through light blue to purple (indicator: 1 mL of alizarin yellow GG-thymolphthalein TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS  
= 22.63 mg of C<sub>11</sub>H<sub>18</sub>N<sub>2</sub>O<sub>3</sub>

**Containers and storage** Containers—Well-closed containers.

## Amobarbital Sodium for Injection

注射用アモバルビタールナトリウム

C<sub>11</sub>H<sub>17</sub>N<sub>2</sub>NaO<sub>3</sub>; 248.25  
Monosodium 5-ethyl-5-(3-methylbutyl)-4,6-  
dioxo-1,4,5,6-tetrahydropyrimidin-2-olate [64-43-7]

Amobarbital Sodium for Injection is a preparation for injection which is dissolved before use.

When dried, it contains not less than 98.5% of amobarbital sodium (C<sub>11</sub>H<sub>17</sub>N<sub>2</sub>NaO<sub>3</sub>), and not less than 92.5% and not more than 107.5% of the labeled amount of amobarbital sodium (C<sub>11</sub>H<sub>17</sub>N<sub>2</sub>NaO<sub>3</sub>).

**Method of preparation** Prepare as directed under Injections.

**Description** Amobarbital Sodium for Injection occurs as white crystals or a crystalline powder. It is odorless, and has a bitter taste.

It is freely soluble in water and in ethanol (95), and practically insoluble in diethyl ether and in chloroform.

The pH of its solution (1 in 10) is between 10.0 and 11.0. It is hygroscopic.

**Identification (1)** Dissolve 1.5 g of Amobarbital Sodium for Injection in 20 mL of water, and add 10 mL of dilute hydrochloric acid with stirring: a white precipitate is produced. Collect the precipitate, wash with four 10-mL portions of water, and dry at 105°C for 3 hours: it melts <2.60> between 157°C and 160°C. With this precipitate, proceed as directed in the Identification under Amobarbital.

(2) Ignite 0.5 g of Amobarbital Sodium for Injection, cool, and dissolve the residue in 10 mL of water: the solution responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Amobarbital Sodium for Injection in 10 mL of freshly boiled and cooled water: the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 1.0 g of Amobarbital Sodium for Injection in 49 mL of water, add 1 mL of acetic acid (100), shake, and filter. Discard the first 10 mL of the filtrate, and to the subsequent 30 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.30 mL of 0.01 mol/L hydrochloric acid VS add 0.5 mL of acetic acid (100), 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.018%).

(3) Sulfate <1.14>—Dissolve 2.0 g of Amobarbital Sodium for Injection in 49 mL of water, add 1 mL of acetic acid (100), shake, and filter. Discard the first 10 mL of the filtrate, and to the subsequent 25 mL of the filtrate add 2.5 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.40 mL of 0.005 mol/L sulfuric acid VS add 0.5 mL of acetic acid (100), 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.019%).

(4) Heavy metals <1.07>—Dissolve 2.0 g of Amobarbital Sodium for Injection in 45 mL of water, add 5 mL of dilute hydrochloric acid, shake vigorously, and warm on a water bath for 2 minutes with occasional shaking. Cool, add 30 mL of water, shake, and filter. Discard the first 10 mL of the filtrate, add 1 drop of phenolphthalein TS to the subsequent 40 mL of the filtrate, add ammonia TS until a slight red color develops, and add 2.5 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.5 mL of dilute hydrochloric acid add 1 drop of phenolphthalein TS, add ammonia TS until a pale red color develops, and add 2.5 mL of dilute acetic acid, 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 20 ppm).

(5) Neutral or basic substances—Dissolve about 1 g of Amobarbital Sodium for Injection, accurately weighed, in 10 mL of water and 5 mL of sodium hydroxide TS, then add 40 mL of chloroform, and shake well. Separate the chloroform layer, wash with two 5-mL portions of water, and filter. Evaporate the filtrate on a water bath to dryness, and dry the residue at 105°C for 1 hour: the mass of the residue is not more than 0.30%.

(6) Readily carbonizable substances <1.15>—Perform the test with 0.5 g of Amobarbital Sodium for Injection: the so-

lution is not more colored than Matching Fluid A.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 4 hours).

**Assay** Weigh accurately the contents of not less than 10 samples of Amobarbital Sodium for Injection. Weigh accurately about 0.5 g of the contents, previously dried, transfer to a separator, dissolve in 20 mL of water, add 5 mL of ethanol (95) and 10 mL of dilute hydrochloric acid, and extract with 50 mL of chloroform, then with three 25-mL portions of chloroform. Combine the chloroform extracts, wash with two 5-mL portions of water, and extract the washings with two 10-mL portions of chloroform. Filter the combined chloroform extracts into a conical flask, and wash the filter paper with three 5-mL portions of chloroform. Combine the filtrate and the washings, and add 10 mL of ethanol (95). Titrate <2.50> with 0.1 mol/L potassium hydroxide-ethanol VS until the color of the solution changes from yellow through light blue to purple (indicator: 2 mL of alizarin yellow GG-thymolphthalein TS). Perform a blank determination with a mixture of 160 mL of chloroform and 30 mL of ethanol (95), and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS = 24.83 mg of  $C_{11}H_{17}N_2NaO_3$

**Containers and storage** Containers—Hermetic containers.

## Amoxapine

アモキサピン

$C_{17}H_{16}ClN_3O$ : 313.78

2-Chloro-11-(piperazin-1-yl)dibenzo[*b,f*][1,4]oxazepine [14028-44-5]

Amoxapine, when dried, contains not less than 98.5% of  $C_{17}H_{16}ClN_3O$ .

**Description** Amoxapine occurs as white to light yellowish white crystals or crystalline powder.

It is freely soluble in acetic acid (100), slightly soluble in ethanol (95) and in diethyl ether, and practically insoluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Amoxapine in 0.1 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption as the same wavelengths.

(2) Determine the infrared absorption spectrum of Amoxapine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Amoxapine as directed under Flame Coloration Test <1.04> (2); a green color appears.

**Melting point** <2.60> 178 – 182°C

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Amoxapine according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 15 ppm).

(2) Related substances—Dissolve 0.5 g of Amoxapine in 10 mL of a mixture of ethanol (95) and acetic acid (100) (9:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add a mixture of ethanol (95) and acetic acid (100) (9:1) to make exactly 10 mL. Pipet 1 mL of this solution, add a mixture of ethanol (95) and acetic acid (100) (9:1) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethanol (95) and acetic acid (100) (9:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.4% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Amoxapine, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue to greenish blue (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 15.69 mg of C<sub>17</sub>H<sub>16</sub>ClN<sub>3</sub>O

**Containers and storage** Containers—Tight containers.

## Amoxicillin Hydrate

アモキシシリン水和物

C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>5</sub>S·3H<sub>2</sub>O: 419.45  
(2*S*,5*R*,6*R*)-6-[(2*R*)-2-Amino-2-(4-hydroxyphenyl)-acetylamino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid trihydrate [61336-70-7]

Amoxicillin Hydrate contains not less than 950  $\mu$ g (potency) and not more than 1010  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Amoxicillin Hydrate is expressed as mass (potency) of amoxicillin (C<sub>16</sub>H<sub>19</sub>N<sub>3</sub>O<sub>5</sub>S: 365.40).

**Description** Amoxicillin Hydrate occurs as white to light yellowish white, crystals or crystalline powder.

It is slightly soluble in water and in methanol, and very slightly soluble in ethanol (95).

**Identification** Determine the infrared absorption spectrum of Amoxicillin Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Amoxicillin Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> [ $\alpha$ ]<sub>D</sub><sup>20</sup>: +290 – +315° (0.1 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—To 1.0 g of Amoxicillin Hydrate add 2 mL of a solution of magnesium sulfate heptahydrate (1 in 4), mix, and heat on a water bath to dryness. Carbonize the residue by gently heating. After cooling, add 1 mL of sulfuric acid, heat carefully, then heat at 500 – 600°C to incinerate. After cooling, add 1 mL of hydrochloric acid to the residue, and heat on a water bath to dryness. Then add 10 mL of water to the residue, and heat on a water bath to dissolve. After cooling, add ammonia TS to adjust the pH to 3 – 4, and add 2 mL of dilute acetic acid. If necessary, filter, wash the residue on the filter with 10 mL of water, transfer the filtrate and washings into a Nessler tube, add water to make 50 mL, and use this solution as the test solution. Prepare the control solution as follows: To 2.0 mL of Standard Lead Solution add 2 mL of a solution of magnesium sulfate heptahydrate (1 in 4), then proceed in the same manner as for preparation of the test solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Amoxicillin Hydrate according to Method 4, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.10 g of Amoxicillin Hydrate in 50 mL of a solution of sodium tetraborate decahydrate (1 in 200), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a solution of sodium tetraborate decahydrate (1 in 200) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than amoxicillin obtained from the sample solution is not more than the peak area of amoxicillin from the standard solution.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 1.361 g of sodium acetate trihydrate in 750 mL of water, adjust the pH to 4.5 with acetic acid (31), and add water to make 1000 mL. To 950 mL of this solution add 50 mL of methanol.

**Flow rate:** Adjust the flow rate so that the retention time of amoxicillin is about 8 minutes.

**Time span of measurement:** About 4 times as long as the

retention time of amoxicillin.

*System suitability*—

Test for required detection: To exactly 1 mL of the standard solution add a solution of sodium tetraborate decahydrate (1 in 200) to make exactly 10 mL. Confirm that the peak area of amoxicillin obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that of amoxicillin obtained from 10  $\mu$ L of the standard solution.

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates of the peak of amoxicillin is not less than 2500.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of amoxicillin is not more than 1.0%.

**Water** <2.48> Not less than 11.0% and not more than 15.0% (0.1 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Amoxicillin Hydrate and Amoxicillin Reference Standard, equivalent to about 30 mg (potency), dissolve each in a solution of boric acid (1 in 200) to make exactly 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak areas,  $A_T$  and  $A_S$ , of amoxicillin of each solution.

$$\text{Amount } [\mu\text{g (potency)}] \text{ of amoxicillin (C}_{16}\text{H}_{19}\text{N}_3\text{O}_5\text{S)} \\ = W_S \times (A_T/A_S) \times 1000$$

$W_S$ : Amount [mg (potency)] of Amoxicillin Reference Standard

*Operating conditions*—

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 1.361 g of sodium acetate trihydrate in 750 mL of water, adjust the pH to 4.5 with acetic acid (31), and add water to make 1000 mL. To 950 mL of this solution add 50 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of amoxicillin is about 8 minutes.

*System suitability*—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates of the peak of amoxicillin is not less than 2500.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of amoxicillin is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Amphotericin B

アムホテリシン B

$C_{47}H_{73}NO_{17}$ : 924.08

(1*R*,3*S*,5*R*,6*R*,9*R*, 11*R*, 15*S*, 16*R*, 17*R*, 18*S*, 19*E*, 21*E*, 23*E*,25*E*,27*E*,29*E*,31*E*,33*R*,35*S*,36*S*,37*S*)-33-(3-Amino-3,6-dideoxy- $\beta$ -D-mannopyranosyloxy)-1,3,5,6,9,11,17,37-octahydroxy-15,16,18-trimethyl-13-oxo-14,39-dioxabicyclo[33.3.1]nonatriaconta-19,21,23,25,27,29,31-heptaene-36-carboxylic acid [1397-89-3]

Amphotericin B is a polyene macrolide substance having antifungal activity produced by the growth of *Streptomyces nodosus*.

It contains not less than 840  $\mu$ g (potency) per mg, calculated on the dried basis. The potency of Amphotericin B is expressed as mass (potency) of amphotericin B ( $C_{47}H_{73}NO_{17}$ ).

**Description** Amphotericin B occurs as a yellow to orange powder.

It is freely soluble in dimethylsulfoxide and practically insoluble in water and in ethanol (95).

**Identification** (1) Dissolve 5 mg of Amphotericin B in 10 mL of dimethylsulfoxide. To 1 mL of this solution add 5 mL of phosphoric acid: a blue color develops between the two layers, and the solution becomes blue by shaking. After addition of 15 mL of water it becomes yellow to light yellow-brown by shaking.

(2) Dissolve 25 mg of Amphotericin B in 5 mL of dimethylsulfoxide, and add methanol to make 50 mL. To 1 mL of this solution add methanol to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of Amphotericin B Reference Standard: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity** Amphotericin A—Weigh accurately about 50 mg each of Amphotericin B and Amphotericin B Reference Standard, add exactly 10 mL each of dimethylsulfoxide to dissolve, and add methanol to make exactly 50 mL. Pipet 4 mL each of these solutions, add methanol to make exactly 50 mL, and use these solutions as the sample solution and standard solution (1), respectively. Separately, weigh accurately about 20 mg of Nystatin Reference Standard, add exactly 40 mL of dimethylsulfoxide to dissolve, then add methanol to make exactly 200 mL. Pipet 4 mL of this solu-

tion, add methanol to make exactly 50 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24> using a solution obtained in the same manner as the sample solution as the blank, and determine the absorbances at 282 nm and at 304 nm. Calculate the amount of amphotericin A by the following equation: not more than 5% for Amphotericin B used for injections, and not more than 15% for Amphotericin B not used for injections.

$$\begin{aligned} & \text{Amount (\% of amphotericin A)} \\ &= \frac{W_S \times \{(A_{Sa1} \times A_{T2}) - (A_{Sa2} \times A_{T1})\} \times 25}{W_T \times \{(A_{Sa1} \times A_{Sb2}) - (A_{Sa2} \times A_{Sb1})\}} \end{aligned}$$

$W_S$ : Amount (mg) of Nystatin Reference Standard

$W_T$ : Amount (mg) of the sample

$A_{Sa1}$ : Absorbance at 282 nm of the standard solution (1)

$A_{Sb1}$ : Absorbance at 282 nm of the standard solution (2)

$A_{Sa2}$ : Absorbance at 304 nm of the standard solution (1)

$A_{Sb2}$ : Absorbance at 304 nm of the standard solution (2)

$A_{T1}$ : Absorbance at 282 nm of the sample solution

$A_{T2}$ : Absorbance at 304 nm of the sample solution

**Loss on drying** <2.41> Not more than 5.0% (0.1 g, in vacuum, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Saccharomyces cerevisiae* ATCC 9763

(ii) Culture medium—Use the medium 2) under (1) Agar media for seed and base layer.

(iii) Preparation of cylinder-agar plate—Proceed as directed in 5 under the Cylinder plate method, using Petri dish plates not dispensing the agar medium for base layer and dispensing 8.0 mL of the seeded agar medium.

(iv) Standard solution—Use light-resistant vessels. Weigh accurately an amount of Amphotericin B Reference Standard equivalent to about 20 mg (potency), dissolve in dimethylsulfoxide to make exactly 20 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 24 hours. Take exactly a suitable amount of the standard stock solution before use, and add dimethylsulfoxide to make solutions so that each mL contains 200 µg (potency) and 50 µg (potency). Pipet 1 mL each of these solutions, add 0.2 mol/L phosphate buffer solution, pH 10.5 to make exactly 20 mL, and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(v) Sample solution—Use light-resistant vessels. Weigh accurately an amount of Amphotericin B equivalent to about 20 mg (potency), dissolve in dimethylsulfoxide to make exactly 20 mL, and use this solution as the sample stock solution. Take exactly a suitable amount of the sample stock solution, add dimethylsulfoxide to make solutions so that each mL contains 200 µg (potency) and 50 µg (potency). Pipet 1 mL each of these solutions, add 0.2 mol/L phosphate buffer solution, pH 10.5 to make exactly 20 mL, and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and in a cold place.

## Amphotericin B for Injection

### 注射用アムホテリシン B

Amphotericin B for Injection is a preparation for injection which is dissolved before use.

It contains not less than 90.0% and not more than 120.0% of the labeled amount of amphotericin B (C<sub>47</sub>H<sub>73</sub>NO<sub>17</sub>: 924.08).

**Method of preparation** Prepare as directed under Injections, with Amphotericin B.

**Description** Amphotericin B for Injection occurs as yellow to orange, powder or masses.

**Identification** To an amount of Amphotericin B for Injection, equivalent to 25 mg (potency) of Amphotericin B according to the labeled amount, add 5 mL of dimethylsulfoxide and 45 mL of methanol, and shake. To 1 mL of this solution add methanol to make 50 mL, and filter if necessary. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 361 nm and 365 nm, between 380 nm and 384 nm and between 403 nm and 407 nm.

**pH** <2.54> Dissolve an amount of Amphotericin B for Injection, equivalent to 50 mg (potency) of Amphotericin B according to the labeled amount, in 10 mL of water. To 1 mL of this solution add water to make 50 mL: 7.2 – 8.0.

**Purity** Clarity and color of solution—Dissolve an amount of Amphotericin B for Injection, equivalent to 50 mg (potency) of Amphotericin B according to the labeled amount, in 10 mL of water: the solution is clear and yellow to orange.

**Loss on drying** <2.41> Not more than 8.0% (0.3 g, in vacuum, 60°C, 3 hours).

**Bacterial endotoxins** <4.01> Less than 3.0 EU/mg (potency).

**Uniformity of dosage units** <6.02> It meets the requirement of the Mass variation test. However, use the average of the limits specified in the potency definition for *T*.

**Foreign insoluble matter** <6.06> Perform the test according to Method 2: it meets the requirement.

**Insoluble particulate matter** <6.07> Perform the test according to Method 1: it meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, culture medium, preparation of cylinder-agar plate and standard solutions—Proceed as directed in the Assay under Amphotericin B.

(ii) Sample solutions—Prepare using light-resistant containers. Weigh accurately an amount of Amphotericin B for Injection, equivalent to about 50 mg (potency) according to the labeled amount, dissolve in dimethylsulfoxide to make exactly 50 mL, and use this solution as the sample stock solu-

tion. Measure exactly a suitable quantity of the sample stock solution, add dimethylsulfoxide to make solutions so that each mL contains about 200  $\mu\text{g}$  (potency) and 50  $\mu\text{g}$  (potency). Pipet 1 mL each of these solutions, add 0.2 mol/L phosphate buffer solution, pH 10.5 to make exactly 20 mL, and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Hermetic containers. Storage—Store in a cold place.

## Amphotericin B Syrup

アムホテリシン B シロップ

Amphotericin B Syrup contain not less than 90.0% and not more than 115.0% of the labeled amount of amphotericin B ( $\text{C}_{47}\text{H}_{73}\text{NO}_{17}$ : 924.08).

**Method of preparation** Prepare as directed under Syrup, with Amphotericin B.

**Identification** To an amount of Amphotericin B Syrup, equivalent to 25 mg (potency) of Amphotericin B according to the labeled amount, add 5 mL of dimethylsulfoxide and 45 mL of methanol, and shake. To 1 mL of this solution add methanol to make 50 mL, and filter, if necessary. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 361 nm and 365 nm, between 380 nm and 384 nm and between 403 nm and 407 nm.

**pH** <2.54> 5.0 – 7.0.

**Microbial limits** <4.05> Perform the test as directed under Microbial Limit Test: the total microbial count is not more than 100 per mL, and the total fungus and yeast count is not more than 50 per mL.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, culture medium, preparation of cylinder-agar plate and standard solutions—Proceed as directed in the Assay under Amphotericin B.

(ii) Sample solutions—Prepare using light-resistant containers. Weigh accurately an amount of Amphotericin B Syrup, equivalent to about 0.1 g (potency) according to the labeled amount, add about 70 mL of dimethylsulfoxide, shake, then add dimethylsulfoxide to make exactly 100 mL, and use this solution as the sample stock solution. Measure exactly a suitable amount of the sample stock solution, add dimethylsulfoxide to make solutions so that each mL contains about 200  $\mu\text{g}$  (potency) and 50  $\mu\text{g}$  (potency). Pipet 1 mL each of these solutions, add 0.2 mol/L phosphate buffer solution, pH 10.5 to make exactly 20 mL, and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

## Amphotericin B Tablets

アムホテリシン B 錠

Amphotericin B Tablets contain not less than 90.0% and not more than 120.0% of the labeled amount of amphotericin B ( $\text{C}_{47}\text{H}_{73}\text{NO}_{17}$ : 924.08).

**Method of preparation** Prepare as directed under Tablets, with Amphotericin B.

**Identification** To an amount of pulverized Amphotericin B Tablets, equivalent to 25 mg (potency) of Amphotericin B according to the labeled amount, add 5 mL of dimethylsulfoxide and 45 mL of methanol, and shake. To 1 mL of this solution add methanol to make 50 mL, and filter, if necessary. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 361 nm and 365 nm, between 380 nm and 384 nm and between 403 nm and 407 nm.

**Uniformity of dosage units** <6.02> It meets the requirement of the Mass variation test. However, use the average of the limits specified in the potency definition for *T*.

**Loss on drying** <2.41> Not more than 5.0% (0.3 g, in vacuum, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, culture medium, preparation of cylinder-agar plate and standard solutions—Proceed as directed in the Assay under Amphotericin B.

(ii) Sample solutions—Prepare using light-resistant containers. Weigh accurately and powder not less than 20 tablets of Amphotericin B Tablets. Weigh accurately a part of the powder, equivalent to about 0.1 g (potency) according to the labeled amount, add about 70 mL of dimethylsulfoxide, shake, then add dimethylsulfoxide to make exactly 100 mL, centrifuge, and use the supernatant liquid as the sample stock solution. Measure exactly a suitable amount of the sample stock solution, add dimethylsulfoxide to make solutions so that each mL contains 200  $\mu\text{g}$  (potency) and 50  $\mu\text{g}$  (potency). Pipet 1 mL each of these solutions, add 0.2 mol/L phosphate buffer solution, pH 10.5 to make exactly 20 mL, and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Well-closed containers.

## Anhydrous Ampicillin

### Anhydrous Aminobenzylpenicillin

無水アンピシリン

$C_{16}H_{19}N_3O_4S$ : 349.40  
(2*S*,5*R*,6*R*)-6-[(2*R*)-2-Amino-2-phenylacetyl-amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid [69-53-4]

Anhydrous Ampicillin contains not less than 960  $\mu$ g (potency) and not more than 1005  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Anhydrous Ampicillin is expressed as mass (potency) of ampicillin ( $C_{16}H_{19}N_3O_4S$ ).

**Description** Anhydrous Ampicillin occurs as white to light yellowish white, crystals or crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, very slightly soluble in ethanol (95), and practically insoluble in acetonitrile.

**Identification** Determine the infrared absorption spectrum of Anhydrous Ampicillin as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +280 – +305° (0.5 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 1.0 g of Anhydrous Ampicillin in 100 mL of water is between 4.0 and 5.5.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Anhydrous Ampicillin according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Anhydrous Ampicillin according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.05 g of Anhydrous Ampicillin in the mobile phase to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of each peak other than ampicillin from the sample solution is not more than the peak area of ampicillin from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and

flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: As long as about 10 times of the retention time of ampicillin.

**System suitability**—

Test for required detectability: To exactly 1 mL of the standard solution add the mobile phase to make exactly 10 mL. Confirm that the peak area of ampicillin obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that from 10  $\mu$ L of the standard solution.

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

**Water** <2.48> Not more than 2.0% (2.5 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Anhydrous Ampicillin and Ampicillin Reference Standard, equivalent to about 50 mg (potency), add exactly 5 mL each of the internal standard solution and the mobile phase to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of ampicillin to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of ampicillin } (C_{16}H_{19}N_3O_4S) \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Ampicillin Reference Standard

**Internal standard solution**—A solution of guaifenesin in the mobile phase (1 in 200).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 5.94 g of diammonium hydrogen phosphate in 850 mL of water, add 100 mL of acetonitrile, adjust the pH to 5.0 with phosphoric acid, and add water to make exactly 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of ampicillin is about 6 minutes.

**System suitability**—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, ampicillin and the internal standard are eluted in this order with the resolution between these peaks being not less than 40.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ampicillin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Ampicillin Hydrate

### Aminobenzylpenicillin Hydrate

アンピシリン水和物

$C_{16}H_{19}N_3O_4S \cdot 3H_2O$ : 403.45

(2*S*,5*R*,6*R*)-6-[(2*R*)-2-Amino-2-phenylacetyl-amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid trihydrate [7177-48-2]

Ampicillin Hydrate contains not less than 960  $\mu$ g (potency) and not more than 1005  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Ampicillin Hydrate is expressed as mass (potency) of ampicillin ( $C_{16}H_{19}N_3O_4S$ : 349.40).

**Description** Ampicillin Hydrate occurs as a white to light yellowish white, crystals or crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, very slightly soluble in ethanol (95), and practically insoluble in acetonitrile.

**Identification** Determine the infrared absorption spectrum of Ampicillin Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ampicillin Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +280 – +305° (0.5 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 1.0 g of Ampicillin Hydrate in 400 mL of water is between 3.5 and 5.5.

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Ampicillin Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Ampicillin hydrate according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 50 mg of Ampicillin hydrate in the mobile phase to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than that of ampicillin obtained from the sample solution is not more than the peak area of ampicillin from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 10 times as long as the retention time of ampicillin.

**System suitability**—

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of ampicillin obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that from 10  $\mu$ L of the standard solution.

(4) *N,N*-Dimethylaniline—Weigh accurately about 1 g of Ampicillin Hydrate, dissolve in 5 mL of sodium hydroxide TS, add exactly 1 mL of the internal standard solution, shake vigorously for 1 minute, and use the upper layer liquid obtained after allowing it to stand as the sample solution. Separately, weigh accurately about 50 mg of *N,N*-dimethylaniline, dissolve in 2 mL of hydrochloric acid and 20 mL of water, add water to make exactly 50 mL, and use this solution as the standard stock solution. Pipet 5 mL of the standard stock solution, and add water to make exactly 250 mL. Pipet 1 mL of this solution, add 5 mL of sodium hydroxide TS and exactly 1 mL of the internal standard solution, shake vigorously for 1 minute, and use the upper layer liquid obtained after allowing it to stand as the standard solution. Perform the test with 1  $\mu$ L each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of *N,N*-dimethylaniline to that of the internal standard, and calculate the amount of *N,N*-dimethylaniline by the following equation: not more than 20 ppm.

$$\begin{aligned} \text{Amount (ppm) of } N,N\text{-dimethylaniline} \\ = (W_S/W_T) \times (Q_T/Q_S) \times 400 \end{aligned}$$

$W_S$ : Amount (g) of *N,N*-dimethylaniline

$W_T$ : Amount (g) of the sample

**Internal standard solution**—A solution of naphthalene in cyclohexane (1 in 20,000).

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A glass column 2.6 mm in inside diameter and 2 m in length, packed with siliceous earth for gas chromatography (180 – 250  $\mu$ m in particle diameter) coated with 50% phenyl-50% methyl polysiloxane for gas chromatography at the ratio of 3%.

Column temperature: A constant temperature of about 120°C.

Carrier gas: Helium

Flow rate: Adjust the flow rate so that the retention time of *N,N*-dimethylaniline is about 5 minutes.

**System suitability**—

Test for required detectability: Measure exactly 1 mL of the standard stock solution, and add water to make exactly 250 mL. Pipet 1 mL of this solution, add 5 mL of sodium hydroxide TS and exactly 1 mL of the internal standard solution, shake vigorously for 1 minute, and use the upper layer liquid obtained after allowing it to stand for the test. Confirm that when the procedure is run with 1  $\mu$ L of the upper layer liquid under the above operating conditions, the

ratio of the peak area of *N,N*-dimethylaniline to that of the internal standard is equivalent to 15 – 25% of the ratio of the peak area of *N,N*-dimethylaniline to that of the internal standard obtained from the standard solution.

**System performance:** Dissolve 50 mg of *N,N*-dimethylaniline in cyclohexane to make 50 mL. To 1 mL of this solution add the internal standard solution to make 50 mL, and use this solution as the solution for system suitability test. When the procedure is run with 1  $\mu$ L of the solution for system suitability test under the above operating conditions, *N,N*-dimethylaniline and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

**System repeatability:** When the test is repeated 6 times with 1  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the ratios of the peak area of *N,N*-dimethylaniline to that of the internal standard is not more than 2.0%.

**Water** <2.48> 12.0 – 15.0% (0.1 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Ampicillin Hydrate and Ampicillin Reference Standard, equivalent to about 50 mg (potency), dissolve in a suitable volume of the mobile phase, add exactly 5 mL each of the internal standard solution and the mobile phase to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of ampicillin to that of the internal standard.

$$\text{Amount } [\mu\text{g (potency)}] \text{ of ampicillin } C_{16}H_{19}N_3O_4S \\ = W_S \times (Q_T/Q_S) \times 1000$$

$W_S$ : Amount [mg (potency)] of Ampicillin Reference Standard

**Internal standard solution**—A solution of guaifenesin in the mobile phase (1 in 200).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 230 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 5.94 g of diammonium hydrogen phosphate in 850 mL of water, add 100 mL of acetonitrile, adjust the pH to 5.0 with phosphoric acid, and add water to make exactly 1000 mL.

**Flow rate:** Adjust the flow rate so that the retention time of ampicillin is about 6 minutes.

**System suitability**—

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, ampicillin and the internal standard are eluted in this order with the resolution between these peaks being not less than 40.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating

conditions, the relative standard deviation of the ratios of the peak area of ampicillin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Ampicillin Sodium

### Aminobenzylpenicillin Sodium

アンピシリンナトリウム

$C_{16}H_{18}N_3NaO_4S$ : 371.39

Monosodium (2*S*,5*R*,6*R*)-6-[(2*R*)-2-amino-2-phenylacetamino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [69-52-3]

Ampicillin Sodium contains not less than 850  $\mu$ g (potency) and not more than 950  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Ampicillin Sodium is expressed as mass (potency) of ampicillin ( $C_{16}H_{19}N_3O_4S$ : 349.40).

**Description** Ampicillin Sodium occurs as white to light yellowish white, crystals or crystalline powder.

It is very soluble in water, and sparingly soluble in ethanol (99.5).

**Identification (1)** Determine the infrared absorption spectrum of Ampicillin Sodium, previously dried in a desiccator (reduced pressure not exceeding 0.67 kPa, 60°C) for 3 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(2)** Ampicillin Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +246 – +272° (1 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 1.0 g of Ampicillin Sodium in 10 mL of water is between 8.0 and 10.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Ampicillin Sodium in 10 mL of water: the solution is clear and colorless or pale yellow.

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of Ampicillin Sodium according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Ampicillin Sodium according to Method 1, and perform the test (not more than 2 ppm).

**(4)** Related substances—Dissolve 50 mg of Ampicillin Sodium in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this

solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than ampicillin obtained from the sample solution is not more than the peak area of ampicillin from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 230 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 5.94 g of diammonium hydrogen phosphate in 850 mL of water, add 100 mL of acetonitrile, adjust the pH to 5.0 with phosphoric acid, and add water to make exactly 1000 mL.

**Flow rate:** Adjust the flow rate so that the retention time of ampicillin is about 6 minutes.

**Time span of measurement:** About 10 times as long as the retention time of ampicillin.

**System suitability—**

**Test for required detectability:** Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of ampicillin obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that of ampicillin obtained from 10  $\mu$ L of the standard solution.

**System performance:** Dissolve 50 mg of Ampicillin Reference Standard in a suitable amount of the mobile phase, add 5 mL of a solution of guaifenesin in the mobile phase (1 in 200) and the mobile phase to make 50 mL, and use this solution as the solution for system suitability test. When the procedure is run with 10  $\mu$ L of the solution for system suitability test under the above operating conditions, ampicillin and guaifenesin are eluted in this order with the resolution between these peaks being not less than 35.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the ratios of the peak area of ampicillin to that of guaifenesin is not more than 1.0%.

**Water <2.48>** Not more than 2.0% (0.2 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) under (1) Agar media for seed and base layer, having pH 6.5 to 6.6 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Ampicillin Reference Standard, equivalent to about 25 mg (potency), and dissolve in phosphate buffer solution, pH 6.0 to make exactly 50 mL. Take exactly a suitable amount of this solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 5  $\mu$ g (potency) and 1.25  $\mu$ g (potency), and use these solutions as the high concentration

standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Ampicillin Sodium, equivalent to about 25 mg (potency), and dissolve in phosphate buffer solution, pH 6.0 to make exactly 50 mL. Take exactly a suitable amount of this solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 5  $\mu$ g (potency) and 1.25  $\mu$ g (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Amyl Nitrite

亜硝酸アミル

C<sub>5</sub>H<sub>11</sub>NO<sub>2</sub>: 117.15

Amyl Nitrite is the nitrous acid ester of 3-methylbutanol-1 and contains a small quantity of 2-methylbutanol-1 and the nitrous acid esters of other homologues.

It contains not less than 90.0 % of C<sub>5</sub>H<sub>11</sub>NO<sub>2</sub>.

**Description** Amyl Nitrite is a clear, light yellowish liquid, and has a characteristic, fruity odor.

It is miscible with ethanol (95), and with diethyl ether.

It is practically insoluble in water.

It is affected by light and by heat.

It is volatile at ordinary temperature and flammable even at a low temperature.

Boiling point: about 97°C

**Identification** Determine the infrared spectrum of Amyl Nitrite as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Specific gravity <2.56>**  $d_{20}^{20}$ : 0.871 – 0.880

**Purity (1) Acidity**—To 5 mL of Amyl Nitrite add a mixture of 1.0 mL of 1 mol/L sodium hydroxide VS, 10 mL of water and 1 drop of phenolphthalein TS, shake, and allow to stand for 1 minute: the light red color of the water layer does not disappear.

(2) Water—Allow 2.0 mL of Amyl Nitrite to stand in ice water: no turbidity is produced.

(3) Aldehyde—To 3 mL of a mixture of equal volumes of silver nitrate TS and aldehyde free-ethanol add ammonia TS dropwise until the precipitate first formed is redissolved. Add 1.0 mL of Amyl Nitrite, and warm between 60°C and 70°C for 1 minute: a brown to black color is not produced.

(4) Residue on evaporation—Evaporate 10.0 mL of Amyl Nitrite on a water bath in a draft, carefully protecting from flame, and dry the residue at 105°C for 1 hour: the mass of the residue is not more than 1.0 mg.

**Assay** Weigh accurately a volumetric flask containing 10 mL of ethanol (95), add about 0.5 g of Amyl Nitrite, and weigh accurately again. Add exactly 25 mL of 0.1 mol/L sil-

ver nitrate VS, then add 15 mL of potassium chlorate solution (1 in 20) and 10 mL of dilute nitric acid, stopper the flask immediately, and shake it vigorously for 5 minutes. Dilute with water to make exactly 100 mL, shake, and filter through dry filter paper. Discard the first 20 mL of the filtrate, measure exactly 50 mL of the subsequent filtrate, and titrate <2.50> the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination.

Each mL of 0.1 mol/L silver nitrate VS  
= 35.14 mg of  $C_5H_{11}NO_2$

**Containers and storage** Containers—Hermetic containers not exceeding 10-ml capacity.

Storage—Light-resistant, in a cold place, and remote from fire.

## Dental Antiformin

### Dental Sodium Hypochlorite Solution

歯科用アンチホルミン

Dental Antiformin contains not less than 3.0 w/v% and not more than 6.0 w/v% of sodium hypochlorite (NaClO: 74.44).

**Description** Dental Antiformin is a slightly light yellow-green, clear liquid. It has a slight odor of chlorine.

It gradually changes by light.

**Identification (1)** Dental Antiformin changes red litmus paper to blue, and then decolorizes it.

(2) To Dental Antiformin add dilute hydrochloric acid: it evolves the odor of chlorine, and the gas changes potassium iodide starch paper moistened with water to blue.

(3) Dental Antiformin responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Assay** Measure exactly 3 mL of Dental Antiformin in a glass-stoppered flask, add 50 mL of water, 2 g of potassium iodide and 10 mL of acetic acid (31), and titrate <2.50> the liberated iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS).

Each mL of 0.1 mol/L sodium thiosulfate VS  
= 3.722 mg of NaClO

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and not exceeding 10°C.

## Antipyrine

### Phenazone

アンチピリン

$C_{11}H_{12}N_2O$ : 188.23

1,5-Dimethyl-2-phenyl-1,2-dihydro-3H-pyrazol-3-one  
[60-80-0]

Antipyrine, when dried, contains not less than 99.0% of  $C_{11}H_{12}N_2O$ .

**Description** Antipyrine occurs as colorless or white crystals, or a white, crystalline powder. It is odorless, and has a slightly bitter taste.

It is very soluble in water, freely soluble in ethanol (95), and sparingly soluble in diethyl ether.

A solution of Antipyrine (1 in 10) is neutral.

**Identification (1)** To 5 mL of a solution of Antipyrine (1 in 100) add 2 drops of sodium nitrite TS and 1 mL of dilute sulfuric acid: a deep green color develops.

(2) To 2 mL of a solution of Antipyrine (1 in 100) add 4 drops of dilute iron (III) chloride TS: a yellow-red color develops. Then add 10 drops of dilute sulfuric acid: the color changes to light yellow.

(3) To 5 mL of a solution of Antipyrine (1 in 100) add 2 to 3 drops of tannic acid TS: a white precipitate is produced.

(4) To 0.1 g of Antipyrine add 0.1 g of vanillin, 5 mL of water and 2 mL of sulfuric acid, boil the mixture, and cool: a yellow-red precipitate is produced.

**Melting point** <2.60> 111 – 113°C

**Purity (1)** Chloride <1.03>—Perform the test with 1.0 g of Antipyrine. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Antipyrine according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Readily carbonizable substances <1.15>—Perform the test with 0.5 g of Antipyrine: the solution remains colorless.

**Loss on drying** <2.41> Not more than 0.5% (1 g, silica gel, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Dissolve about 0.2 g of Antipyrine, previously dried and accurately weighed, in 20 mL of sodium acetate TS, add exactly 30 mL of 0.05 mol/L iodine VS, and allow to stand for 20 minutes with occasional shaking. Dissolve the precipitate in 10 mL of chloroform, and titrate <2.50> the excess iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank determination.

Each mL of 0.05 mol/L iodine VS  
= 9.411 mg of  $C_{11}H_{12}N_2O$

**Containers and storage** Containers—Well-closed containers.

## Arbekacin Sulfate

アルベカシン硫酸塩

$C_{22}H_{44}N_6O_{10} \cdot xH_2SO_4$  ( $x = 2 - 2\frac{1}{2}$ )

3-Amino-3-deoxy- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 6)-[2,6-diamino-2,3,4,6-tetrahydro- $\alpha$ -D-*erythro*-hexopyranosyl-(1 $\rightarrow$ 4)]-1-N-[(2*S*)-4-amino-2-hydroxybutanoyl]-2-deoxy-D-streptamine sulfate [51025-85-5, Arbekacin]

Arbekacin Sulfate is the sulfate of a derivative of dibekacin.

It contains not less than 670  $\mu$ g (potency) and not more than 750  $\mu$ g (potency) per mg, calculated on the dried basis. The potency of Arbekacin Sulfate is expressed as mass (potency) of arbekacin ( $C_{22}H_{44}N_6O_{10}$ : 552.62).

**Description** Arbekacin Sulfate occurs as a white powder.

It is very soluble in water, and practically insoluble in ethanol (99.5).

**Identification (1)** Dissolve 10 mg each of Arbekacin Sulfate and Arbekacin Sulfate Reference Standard in 1 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ammonia solution (28), methanol, chloroform and ethanol (95) (7:6:4:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate, and heat at 100°C for 10 minutes: the principal spot obtained from the sample solution and the spot from the standard solution are purple-brown in color and their  $R_f$  values are the same.

(2) A solution of Arbekacin Sulfate (1 in 50) responds to the Qualitative Tests <1.09> (1) for sulfate.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +69 – +79° (0.25 g after drying, water, 25 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 0.75 g of Arbekacin Sulfate in 10 mL of water is between 6.0 and 8.0.

**Purity (1)** Clarity and color of solution—A solution obtained by dissolving 1.0 g of Arbekacin Sulfate in 5 mL of water is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Arbekacin Sulfate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Dibekacin—Weigh accurately about 20 mg of Arbekacin Sulfate, add exactly 10 mL of the internal standard solution to dissolve, add water to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Dibekacin Sulfate Reference Standard, equivalent to about 10 mg (potency), and dissolve in water to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 10 mL of the internal standard solution and water to make 20 mL, and use this solution as the standard solution. Perform the test with 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of dibekacin to that of the internal standard. Calculate the amount of dibekacin by the following equation: not more than 2.0%.

$$\begin{aligned} \text{Amount (\%)} \text{ of dibekacin} \\ = (W_S/W_T) \times (Q_T/Q_S) \times (1/10) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Dibekacin Sulfate Reference Standard

$W_T$ : Amount (mg) of the sample

**Internal standard solution**—A solution of bekanamycin sulfate (1 in 2000).

**Operating conditions**—

Detector: Fluorometric detector (excitation wavelength: 340 nm, detection wavelength: 460 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Reaction coil: A column about 0.3 mm in inside diameter and about 3 m in length.

Reaction coil temperature: A constant temperature of about 50°C.

Mobile phase: Dissolve 8.70 g of sodium 1-pentane sulfonate and 8.52 g of anhydrous sodium sulfate in 980 mL of water, adjust the pH to 4.0 with acetic acid (100), and add water to make 1000 mL. To 230 mL of this solution add 20 mL of methanol.

Reagent: Dissolve 12.36 g of boric acid in 960 mL of water, add 10 mL of a solution of *o*-phthalaldehyde in ethanol (99.5) (1 in 25), adjust the pH to 10.5 with 8 mol/L potassium hydroxide TS, and add water to make 1000 mL. To this solution add 1 mL of 2-mercaptoethanol.

Reaction temperature: A constant temperature of about 50°C.

Flow rate of the mobile phase: 0.5 mL per minute.

Flow rate of the reagent: 1 mL per minute.

**System suitability**—

System performance: Dissolve 20 mg each of Arbekacin Sulfate, bekanamycin sulfate and dibekacin sulfate in 200 mL

of water. When the procedure is run with 5  $\mu\text{L}$  of this solution under the above operating conditions, bekanamycin, arbekacin and dibekacin are eluted in this order, and the resolution between the peaks, bekanamycin and arbekacin is not less than 5 and arbekacin and dibekacin is not less than 1.5, respectively.

**System repeatability:** When the test is repeated 6 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of dibekacin to that of the internal standard is not more than 2.0%.

(4) **Related substances**—Dissolve 20 mg of Arbekacin Sulfate in 20 mL of water, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add water to make exactly 250 mL, and use this solution as the standard solution. Perform the test with exactly 5  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the area of each peak by the automatic integration method: the total area of the peaks other than arbekacin and dibekacin obtained from the sample solution is not more than the peak area of arbekacin from the standard solution.

**Operating conditions**—

Detector, column, column temperature, reaction coil, reaction coil temperature, mobile phase, reagent, reaction temperature, flow rate of mobile phase, and flow rate of reagent: Proceed as directed in the operating conditions in the Purity (3).

**Time span of measurement:** About 1.5 times as long as the retention time of arbekacin.

**System suitability**—

**System performance:** Dissolve 10 mg each of Arbekacin Sulfate and dibekacin sulfate in 200 mL of water. When the procedure is run with 5  $\mu\text{L}$  of this solution under the above operating conditions, arbekacin and dibekacin are eluted in this order with the resolution between these peaks being not less than 1.5.

**System repeatability:** When the test is repeated 6 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of arbekacin is not more than 5.0%.

**Loss on drying** <2.41> Not more than 5.0% (0.5 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) **Test organism**—*Bacillus subtilis* ATCC 6633

(ii) **Culture medium**—Use the medium i in 1) under (1) Agar media for seed and base layer, having pH 7.8 – 8.0 after sterilization.

(iii) **Standard solutions**—Weigh accurately an amount of Arbekacin Sulfate Reference Standard, previously dried, equivalent to about 20 mg (potency), dissolve in diluted phosphate buffer solution, pH 6.0 (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5 to 15°C and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20  $\mu\text{g}$  (potency) and 5  $\mu\text{g}$  (potency), and use these solutions as the high concentration standard solution and low concentration standard

solution, respectively.

(iv) **Sample solutions**—Weigh accurately an amount of Arbekacin Sulfate, equivalent to about 20 mg (potency), and dissolve in water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20  $\mu\text{g}$  (potency) and 5  $\mu\text{g}$  (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Arbekacin Sulfate Injection

アルベカシン硫酸塩注射液

Arbekacin Sulfate Injection is an aqueous injection.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of arbekacin sulfate ( $\text{C}_{22}\text{H}_{44}\text{N}_6\text{O}_{10}$ : 552.62).

**Method of preparation** Prepare as directed under Injections, with Arbekacin Sulfate.

**Description** Arbekacin Sulfate Injection occurs as a clear and colorless liquid.

**Identification** To 0.2 mL of Arbekacin Sulfate Injection add 1 mL of water, and use this solution as the sample solution. Separately, dissolve 10 mg of Arbekacin Sulfate Reference Standard in 1 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop with a mixture of ammonia solution (28), methanol, chloroform and ethanol (95) (7:6:4:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate, and heat at 80°C for 10 minutes: the principal spot with the sample solution and the spot with the standard solution show a purple-brown color and the same  $R_f$  value.

**Osmotic pressure ratio** <2.47> 0.8 – 1.2 (for the preparation intended for intramuscular use).

**pH** <2.54> 6.0 – 8.0

**Bacterial endotoxins** <4.01> Less than 0.50 EU/mg (potency).

**Extractable volume** <6.05> It meets the requirement.

**Foreign insoluble matter** <6.06> Perform the test according to the Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> Perform the test according to the Method 1: it meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) **Test organism, Culture medium and Standard solutions:** Proceed as directed in the Assay under Arbekacin Sul-

fate.

(ii) Sample solutions—Take exactly a volume of Arbekacin Sulfate Injection, equivalent to about 20 mg (potency), and add water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20  $\mu$ g (potency) and 5  $\mu$ g (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Hermetic containers.

## L-Arginine

L-アルギニン

$C_6H_{14}N_4O_2$ : 174.20

(2S)-2-Amino-5-guanidinopentanoic acid

[74-79-3]

L-Arginine, when dried, contains not less than 98.5% and not more than 101.0% of  $C_6H_{14}N_4O_2$ .

**Description** L-Arginine occurs as white crystals or crystalline powder. It has a characteristic odor.

It is freely soluble in water and in formic acid, and practically insoluble in ethanol (99.5).

It dissolves in dilute hydrochloric acid.

It is hygroscopic.

**Identification** Determine the infrared absorption spectrum of previously dried L-Arginine as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +26.9 – +27.9° (after drying, 2 g, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**pH** <2.54> The pH of a solution prepared by dissolving 1.0 g of L-Arginine in 10 mL of water is between 10.5 and 12.0.

**Purity (1)** Clarity and color of solution—A solution obtained by dissolving 1.0 g of L-Arginine in 10 mL of water is clear and colorless.

(2) Chloride <1.03>—Perform the test with 0.5 g of L-Arginine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate <1.14>—Perform the test with 0.6 g of L-Arginine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).

(4) Ammonium <1.02> Perform the test with 0.25 g of L-Arginine, using the distillation under reduced pressure. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(5) Heavy metals <1.07>—Dissolve 2.0 g of L-Arginine in 30 mL of water, add 1 drop of phenolphthalein TS, neutralize with dilute hydrochloric acid, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution

(not more than 10 ppm).

(6) Iron <1.10>—Prepare the test solution with 1.0 g of L-Arginine according to Method 1, and perform the test using Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(7) Related substances—Dissolve 0.10 g of L-Arginine in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add water to make exactly 50 mL. Pipet 2 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 2-propanol and ammonia solution (28) (7:3) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly ninhydrin-butanol TS on the plate, and heat at 80°C for 10 minutes: the spot other than the principal spot with the sample solution is not more intense than the spot with the standard solution.

**Loss on drying** <2.41> Not more than 0.30% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 80 mg of L-Arginine, previously dried, dissolve in 3 mL of formic acid, add 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 8.710 mg of  $C_6H_{14}N_4O_2$

**Containers and storage** Containers—Tight containers.

## L-Arginine Hydrochloride

L-アルギニン塩酸塩

$C_6H_{14}N_4O_2 \cdot HCl$ : 210.66

(2S)-2-Amino-5-guanidinopentanoic acid monohydrochloride [1119-34-2]

L-Arginine Hydrochloride, when dried, contains not less than 98.5% of  $C_6H_{14}N_4O_2 \cdot HCl$ .

**Description** L-Arginine Hydrochloride occurs as white crystals or crystalline powder. It is odorless, and has a slight, characteristic taste.

It is freely soluble in water and in formic acid, and very slightly soluble in ethanol (95).

**Identification (1)** Determine the infrared absorption spectrum of L-Arginine Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) A solution of L-Arginine Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +21.5 – +23.5° (after drying, 2 g, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of L-Arginine Hydrochloride in 10 mL of water: the pH of this solution is between 4.7 and 6.2.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of L-Arginine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Perform the test with 0.6 g of L-Arginine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).

(3) Ammonium <1.02>—Perform the test with 0.25 g of L-Arginine Hydrochloride, using the distillation under reduced pressure. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of L-Arginine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(5) Arsenic <1.11>—Prepare the test solution with 1.0 g of L-Arginine Hydrochloride according to Method 1, and perform the test (not more than 2 ppm).

(6) Related substances—Dissolve 0.20 g of L-Arginine Hydrochloride in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add water to make exactly 10 mL. Pipet 1 mL of this solution, add water to make exactly 25 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethanol (99.5), water, 1-butanol and ammonia water (28) (2:1:1:1) to a distance of about 10 cm, and dry the plate at 100°C for 30 minutes. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and heat at 80°C for 5 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.20% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.1 g of L-Arginine Hydrochloride, previously dried, dissolve in 2 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid VS, and heat on a water bath for 30 minutes. After cooling, add 45 mL of acetic acid (100), and titrate <2.50> the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS  
= 10.53 mg of  $C_6H_{14}N_4O_2HCl$

**Containers and storage** Containers—Tight containers.

## L-Arginine Hydrochloride Injection

L-アルギニン塩酸塩注射液

L-Arginine Hydrochloride Injection is an aqueous solution for injection.

It contains not less than 9.5 w/v% and not more than 10.5 w/v% of L-arginine hydrochloride ( $C_6H_{14}N_4O_2 \cdot HCl$ ; 210.66).

### Method of preparation

L-Arginine Hydrochloride	100 g
Water for Injection	a sufficient quantity
To make 1000 mL	

Prepare as directed under Injections, with the above ingredients.

No preservative is added.

**Description** L-Arginine Hydrochloride Injection is a clear, colorless liquid.

**Identification** (1) To 5 mL of a solution of L-Arginine Hydrochloride Injection (1 in 100) add 1 mL of ninhydrin TS, and heat for 3 minutes: a blue-purple color develops.

(2) To 5 mL of a solution of L-Arginine Hydrochloride Injection (1 in 10) add 2 mL of sodium hydroxide TS and 1 to 2 drops of a solution of 1-naphthol in ethanol (95) (1 in 1000), allow to stand for 5 minutes, and add 1 to 2 drops of sodium hypochlorite TS: a red-orange color develops.

**pH** <2.54> 5.0 – 6.0

**Extractable volume** <6.05> It meets the requirement.

**Pyrogen** <4.04> Perform the test with L-Arginine Hydrochloride Injection stored in a container in a volume exceeding 10 mL: it meets the requirement.

**Assay** Pipet 20 mL of L-Arginine Hydrochloride Injection, add 7.5 mol/L hydrochloric acid TS to make exactly 100 mL, and determine the optical rotation  $\alpha_D$  as directed under Optical Rotation Determination <2.49> at  $20 \pm 1^\circ C$  in a 100-mm cell.

Amount (mg) of L-arginine hydrochloride ( $C_6H_{14}N_4O_2 \cdot HCl$ )  
=  $\alpha_D \times 4444$

**Containers and storage** Containers—Hermetic containers.

## Arotinolol Hydrochloride

アロチノロール塩酸塩

$C_{15}H_{21}N_3O_2S_3 \cdot HCl$ : 408.00

5-{2-[(2RS)-3-(1,1-Dimethylethyl)amino-2-hydroxypropylsulfanyl]-1,3-thiazol-4-yl}thiophene-2-carboxamide monohydrochloride [68377-91-3]

Arotinolol Hydrochloride, when dried, contains not less than 99.0% of  $C_{15}H_{21}N_3O_2S_3 \cdot HCl$ .

**Description** Arotinolol Hydrochloride occurs as a white to light yellow crystalline powder.

It is freely soluble in dimethylsulfoxide, slightly soluble in methanol and in water, very slightly soluble in ethanol (99.5), and practically insoluble in diethyl ether.

A solution of Arotinolol Hydrochloride in methanol (1 in 125) does not show optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Arotinolol Hydrochloride in methanol (1 in 75,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Arotinolol Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Arotinolol Hydrochloride (1 in 200) responds to the Qualitative Tests <1.09> (2) for chloride.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Arotinolol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

**(2)** Related substances—Dissolve 0.05 g of Arotinolol Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 40  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, acetone and ammonia solution (28) (30:10:10:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying <2.41>** Not more than 0.20% (1 g, in vacuum, 105°C, 4 hours).

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 1.5 g of Arotinolol Hydrochloride, previously dried, dissolve in dimethylsulfoxide to make exactly 25 mL. Pipet 5 mL of this solution, add 100 mL of water and 5 mL of sodium hydroxide TS, and extract with three 50-mL portions of dichloromethane. Filter each dichloromethane extract through a pledget of absorbent cotton with anhydrous sodium sulfate on it. Evaporate combined filtrate to dryness in vacuum. Dissolve the residue in 70 mL of acetic acid (100), and titrate <2.50> with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS

= 20.40 mg of  $C_{15}H_{21}N_3O_2S_3 \cdot HCl$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Arsenical Paste

亜ヒ酸パスタ

Arsenical Paste contains not less than 36.0% and not more than 44.0% of arsenic (III) trioxide ( $As_2O_3$ : 197.84).

### Method of preparation

Arsenic Trioxide, finely powdered	40 g
Procaine Hydrochloride, finely powdered	10 g
Hydrophilic Ointment	30 g
Clove Oil	a suitable quantity
Medicinal Carbon	a suitable quantity
To make 100 g	

Mix Arsenic Trioxide and Procaine Hydrochloride with Hydrophilic Ointment, and add Clove Oil to make a suitably viscous liquid, followed by Medicinal Carbon for coloring.

**Description** Arsenical Paste is grayish black and has the odor of clove oil.

**Identification (1)** Place 0.1 g of Arsenical Paste in a small flask, add 5 mL of fuming nitric acid and 5 mL of sulfuric acid, and heat over a flame until the reacting liquid becomes colorless and white fumes begin to evolve. After cooling, add the reacting liquid to 20 mL of water cautiously, and add 10 mL of hydrogen sulfide TS while warming: a yellow precipitate is produced (arsenic (III) trioxide).

**(2)** Shake thoroughly 0.5 g of Arsenical Paste with 25 mL of diethyl ether, 5 mL of dilute hydrochloric acid and 20 mL of water, separate the water layer, and filter: 5 mL of the filtrate responds to the Qualitative Tests <1.09> for primary aromatic amines (procaine hydrochloride).

**(3)** Shake thoroughly 0.5 g of Arsenical Paste with 25 mL of diethyl ether and 25 mL of water, separate the water layer, filter, and use the filtrate as the sample solution. Dissolve 0.01 g of procaine hydrochloride in 5 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, ethanol (99.5) and ammonia solution (28) (50:5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots from the sample solution and standard solution exhibit the same  $R_f$  value.

**Assay** Weigh accurately about 0.3 g of Arsenical Paste into a 150-mL Kjeldahl flask, add 5 mL of fuming nitric acid and 10 mL of sulfuric acid, and shake thoroughly. Heat cautiously the mixture, gently at first, and then continue strong heating, until red fumes of nitrogen oxide are sparingly evolved. After cooling, add 5 mL of fuming nitric acid, heat again until red fumes of nitrogen oxide are no longer evolved and

the reacting liquid becomes clear, and cool. Add 30 mL of a saturated solution of ammonium oxalate monohydrate, heat again until white fumes of sulfuric acid are evolved, and continue the heating for 10 minutes. Decompose completely oxalic acid, cool, transfer cautiously the colorless reacting liquid to a glass-stoppered flask, containing 40 mL of water. Wash thoroughly the Kjeldahl flask with 60 mL of water, add the washings to the content of the glass-stoppered flask, and cool. Dissolve 3 g of potassium iodide in this solution, allow to stand in a dark place at room temperature for 45 minutes, and titrate <2.50> the liberated iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 5 mL of starch TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS  
= 4.946 mg of  $\text{As}_2\text{O}_3$

**Containers and storage** Containers—Tight containers.

## Arsenic Trioxide

### Arsenous Acid

三酸化ヒ素

$\text{As}_2\text{O}_3$ : 197.84

Arsenic Trioxide, when dried, contains not less than 99.5% of  $\text{As}_2\text{O}_3$ .

**Description** Arsenic Trioxide occurs as a white powder.

It is odorless. It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It dissolves in sodium hydroxide TS.

**Identification** Dissolve 0.2 g of Arsenic Trioxide in 40 mL of water by heating on a water bath: the solution responds to the Qualitative Tests <1.09> for arsenite.

**Purity** Clarity of solution—To 1.0 g of Arsenic Trioxide add 10 mL of ammonia TS, and heat gently: the solution is clear.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Assay** Weigh accurately about 0.15 g of Arsenic Trioxide, previously dried, dissolve in 20 mL of a solution of sodium hydroxide (1 in 25), by warming, if necessary. Add 40 mL of water and 2 drops of methyl orange TS, then add dilute hydrochloric acid until the color of the solution becomes light red. Add 2 g of sodium hydrogen carbonate and 50 mL of water to this solution, and titrate <2.50> with 0.05 mol/L iodine VS (indicator: 3 mL of starch TS).

Each mL of 0.05 mol/L iodine VS = 4.946 mg of  $\text{As}_2\text{O}_3$

**Containers and storage** Containers—Tight containers.

## Ascorbic Acid

### Vitamin C

アスコルビン酸

$\text{C}_6\text{H}_8\text{O}_6$ : 176.12

L-threo-Hex-2-enono-1,4-lactone [50-81-7]

Ascorbic Acid, when dried, contains not less than 99.0% of L-ascorbic acid ( $\text{C}_6\text{H}_8\text{O}_6$ ).

**Description** Ascorbic Acid occurs as white crystals or a white, crystalline powder. It is odorless, and has an acid taste.

It is freely soluble in water, sparingly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 190°C (with decomposition).

**Identification** (1) To 5 mL each of a solution of Ascorbic Acid (1 in 50) add 1 drop of potassium permanganate TS or 1 to 2 drops of 2,6-dichloroindophenol sodium TS: the color of the solution is discharged immediately in each case.

(2) Dissolve 0.1 g of Ascorbic Acid in 100 mL of a solution of metaphosphoric acid (1 in 50). To 5 mL of the solution add iodine TS until the color of the solution becomes light yellow. Then add 1 drop of a solution of copper (II) sulfate pentahydrate (1 in 1000) and 1 drop of pyrrole, and warm the mixture at 50°C for 5 minutes: a blue color develops.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : + 20.5 – + 21.5° (2.5 g, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Ascorbic Acid in 20 mL of water: the pH of this solution is between 2.2 and 2.5.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Ascorbic Acid in 20 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Perform the test with 1.0 g of Ascorbic Acid according to Method 1. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** <2.41> Not more than 0.20% (1 g, silica gel, 24 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Ascorbic Acid, previously dried, dissolve in 50 mL of a solution of metaphosphoric acid (1 in 50), and titrate <2.50> with 0.05 mol/L iodine VS (indicator: 1 mL of starch TS).

Each mL of 0.05 mol/L iodine VS  
= 8.806 mg of L-ascorbic acid ( $\text{C}_6\text{H}_8\text{O}_6$ )

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Ascorbic Acid Injection

### Vitamin C Injection

アスコルビン酸注射液

Ascorbic Acid Injection is an aqueous solution for injection.

It contains not less than 95% and not more than 115% of the labeled amount of L-ascorbic acid ( $C_6H_8O_6$ ; 176.12).

**Method of preparation** Prepare as directed under Injections, with the sodium salt of Ascorbic Acid.

**Description** Ascorbic Acid Injection occurs as a clear, colorless liquid.

**Identification (1)** Measure a volume of Ascorbic Acid Injection, equivalent to 0.5 g of Ascorbic Acid according to the labeled amount, and add water to make 25 mL. Proceed with 5 mL each of the solution as directed in the Identification (1) under Ascorbic Acid.

(2) Measure a volume of Ascorbic Acid Injection, equivalent to 5 mg of Ascorbic Acid according to the labeled amount. Add a solution of metaphosphoric acid (1 in 50) to make 5 mL, and proceed with this solution as directed in the Identification (2) under Ascorbic Acid.

(3) Ascorbic Acid Injection responds to the Qualitative Tests (1) for sodium salt.

**pH** <2.54> 5.6 – 7.4

**Extractable volume** <6.05> It meets requirement.

**Assay** Measure exactly a volume of Ascorbic Acid Injection, equivalent to about 0.1 g of L-ascorbic acid ( $C_6H_8O_6$ ), previously diluted with metaphosphoric acid-acetic acid TS, if necessary, and add metaphosphoric acid-acetic acid TS to make exactly 200 mL. Measure exactly 2 mL of the solution, and shake with 8 mL of metaphosphoric acid-acetic acid TS and 2 mL of hydrogen peroxide TS. Titrate <2.50> with 2,6-dichloroindophenol sodium TS for titration until a light red color persists for 5 seconds. Perform a blank determination, and make any necessary correction.

Each mL of 2, 6-dichlorophenol-indophenol sodium TS for titration  
=  $A$  mg of L-ascorbic acid ( $C_6H_8O_6$ )

$A$  is decided by the following standardization of 2,6-dichloroindophenol sodium TS for titration.

2,6-Dichlorophenol-indophenol sodium TS for titration:

**Preparation**—Dissolve 42 mg of sodium hydrogen carbonate in 50 mL of water, add 0.5 g of 2,6-dichloroindophenol sodium dihydrate and water to make 200 mL, and filter. Prepare before use.

**Standardization**—Weigh accurately about 50 mg of Ascorbic Acid Reference Standard, previously dried in a desiccator (silica gel) for 24 hours, and dissolve in metaphosphoric acid-acetic acid TS to make exactly 100 mL. Pipet 2 mL of this solution, shake with 8 mL of metaphosphoric acid-acetic acid TS and 2 mL of hydrogen peroxide TS, and titrate <2.50> with 2,6-dichloroindophenol sodium TS for titration until a light red color persists for 5 se-

conds. Perform a blank determination, and make any necessary correction. Calculate the quantity ( $A$  mg) of L-ascorbic acid ( $C_6H_8O_6$ ) equivalent to 1 mL of this test solution.

**Containers and storage** Containers—Hermetic containers.  
Storage—Under nitrogen atmosphere.

## Ascorbic Acid Powder

### Vitamin C Powder

アスコルビン酸散

Ascorbic Acid Powder contains not less than 95% and not more than 120% of the labeled amount of L-ascorbic acid ( $C_6H_8O_6$ ; 176.12).

**Method of preparation** Prepare as directed under Powders, with Ascorbic Acid.

**Identification (1)** Weigh a portion of Ascorbic Acid Powder, equivalent to 0.5 g of Ascorbic Acid according to the labeled amount, add 30 mL of water, shake for 1 minute, and filter. Proceed with 5 mL each of the filtrate as directed in the Identification (1) under Ascorbic Acid.

(2) Weigh a portion of Ascorbic Acid Powder, equivalent to about 0.01 g of Ascorbic Acid according to the labeled amount, add 10 mL of a solution of metaphosphoric acid (1 in 50), shake for 1 minute, and filter. Proceed with 5 mL of the filtrate as directed in the Identification (2) under Ascorbic Acid.

**Purity** Rancidity—Ascorbic Acid Powder is free from any unpleasant or rancid odor and taste.

**Assay** Weigh accurately a portion of Ascorbic Acid Powder, equivalent to about 0.1 g of L-ascorbic acid ( $C_6H_8O_6$ ) according to the labeled amount, extract with several successive portions of metaphosphoric acid-acetic acid TS, combine the extracts, and filter. Wash the residue with metaphosphoric acid-acetic acid TS. Combine the filtrates and washings, and add metaphosphoric acid-acetic acid to make exactly 200 mL. Pipet 2 mL of the solution, and shake with 8 mL of metaphosphoric acid-acetic acid TS and 2 mL of hydrogen peroxide TS. Titrate <2.50> with 2,6-dichloroindophenol sodium TS for titration until a light red color persists for 5 seconds. Perform a blank determination, and make any necessary correction.

Each mL of 2,6-dichlorophenol-indophenol sodium TS for titration  
=  $A$  mg of  $C_6H_8O_6$

$A$  is decided by the following standardization of 2,6-dichloroindophenol sodium TS for titration.

2,6-Dichlorophenol-indophenol sodium TS for titration:

**Preparation**—Dissolve 42 mg of sodium hydrogen carbonate in 50 mL of water, add 0.05 g of 2,6-dichloroindophenol sodium dihydrate and water to make 200 mL, and filter. Prepare before use.

**Standardization**—Weigh accurately about 50 mg of Ascorbic Acid Reference Standard, previously dried in a desiccator (silica gel) for 24 hours, and dissolve in metaphosphoric acid-acetic acid TS to make exactly 100 mL.

Pipet 2 mL of this solution, shake with 8 mL of metaphosphoric acid-acetic acid TS and 2 mL of hydrogen peroxide TS, and titrate <2.50> with 2,6-dichloroindophenol sodium TS for titration until a light red color persists for 5 seconds. Perform a blank determination, and make any necessary correction. Calculate the quantity (*A* mg) of L-ascorbic acid (C<sub>6</sub>H<sub>8</sub>O<sub>6</sub>) equivalent to 1 mL of this test solution.

**Containers and storage** Containers—Tight containers.

## L-Aspartic Acid

L-アスパラギン酸

C<sub>4</sub>H<sub>7</sub>NO<sub>4</sub>: 133.10  
(2*S*)-2-Aminobutanedioic acid  
[56-84-8]

L-Aspartic Acid, when dried, contains not less than 98.5% and not more than 101.0% of C<sub>4</sub>H<sub>7</sub>NO<sub>4</sub>.

**Description** L-Aspartic Acid occurs as white, crystals or crystalline powder.

It is sparingly soluble in water, and practically insoluble in ethanol (99.5).

It dissolves in dilute hydrochloric acid and in 0.2 mol/L sodium hydroxide TS.

**Identification** Determine the infrared absorption spectrum of L-Aspartic Acid as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +24.0 – +26.0° (2 g, after drying, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**pH** <2.54> Dissolve 0.4 g of L-Aspartic Acid in 100 mL of water by warming, and allow to cool: between 2.5 and 3.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of L-Aspartic Acid in 20 mL of 1 mol/L hydrochloric acid TS: the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 0.5 g of L-Aspartic Acid in 6 mL of dilute nitric acid and 20 mL of water, add water to make 50 mL, and perform the test with this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate <1.14>—Dissolve 0.6 g of L-Aspartic Acid in 5 mL of dilute hydrochloric acid and 30 mL of water, add water to make 45 mL, and add 5 mL of barium chloride TS. Perform the test with this solution as the test solution. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS, add 5 mL of dilute hydrochloric acid and water to make 45 mL, and add 5 mL of barium chloride (not more than 0.028%).

(4) Ammonium <1.02>—Perform the test with 0.25 g of L-Aspartic Acid. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(5) Heavy metals <1.07>—Proceed with 1.0 g of L-Aspartic Acid according to Method 4, and perform the test. Pre-

pare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(6) Iron <1.10>—Prepare the test solution with 1.0 g of L-Aspartic Acid according to Method 1, and perform the test according to Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(7) Related substances—Dissolve 0.20 g of L-Aspartic Acid in 10 mL of 0.2 mol/L sodium hydroxide TS, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 10 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography, develop with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly a solution of ninhydrin in a mixture of methanol and acetic acid (100) (97:3) (1 in 100), and heat at 80°C for 10 minutes: the spot other than the principal spot is not more intense than the spot obtained with the standard solution.

**Loss on drying** <2.41> Not more than 0.30% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.15 g of L-Aspartic Acid, previously dried, dissolve in 50 mL of water by warming. After cooling, titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 13.31 mg of C<sub>4</sub>H<sub>7</sub>NO<sub>4</sub>

**Containers and storage** Containers—Tight containers.

## Aspirin

### Acetylsalicylic Acid

アスピリン

C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>: 180.16  
2-Acetoxybenzoic acid [50-78-2]

Aspirin, when dried, contains not less than 99.5% of C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>.

**Description** Aspirin occurs as white crystals, granules or powder. It is odorless, and has a slight acid taste.

It is freely soluble in ethanol (95) and in acetone, soluble in diethyl ether, and slightly soluble in water.

It dissolves in sodium hydroxide TS and in sodium carbonate TS.

In moist air, it gradually hydrolyzes to salicylic acid and acetic acid.

Melting point: about 136°C (bath fluid is heated at 130°C previously).

**Identification (1)** Boil 0.1 g of Aspirin in 5 mL of water for 5 to 6 minutes, cool, and add 1 to 2 drops of iron (III) chloride TS: a red-purple color is produced.

**(2)** Boil 0.5 g of Aspirin in 10 mL of sodium carbonate TS for 5 minutes, and add 10 mL of dilute sulfuric acid: the odor of acetic acid is perceptible, and a white precipitate is produced. Filter the precipitate, add 3 mL of ethanol (95) and 3 mL of sulfuric acid to the filtrate, and heat: the odor of ethyl acetate is perceptible.

**Purity (1)** Clarity of solution—Dissolve 0.5 g of Aspirin in 10 mL of warm sodium carbonate TS: the solution is clear.

**(2)** Salicylic acid—Dissolve 2.5 g of Aspirin in 25 mL of ethanol (95), and add 1.0 mL of this solution to a solution which is prepared by transferring 1 mL of a freshly prepared dilute ammonium iron (III) sulfate TS to a Nessler tube and diluting with water to 50 mL. Allow to stand for 30 seconds: the solution has no more color than the following control solution.

Control solution: Dissolve 0.100 g of salicylic acid in water, and add 1 mL of acetic acid (100) and water to make 1000 mL. Add 1.0 mL of this solution to a solution which is prepared by transferring 1 mL of freshly prepared dilute ammonium iron (III) sulfate TS and 1 mL of ethanol (95) to a Nessler tube and diluting with water to 50 mL. Allow to stand for 30 seconds.

**(3)** Chloride <1.03>—Boil 1.8 g of Aspirin in 75 mL of water for 5 minutes, cool, add water to make 75 mL, and filter. To 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.015%).

**(4)** Sulfate <1.14>—To 25 mL of the filtrate obtained in (3) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.040%).

**(5)** Heavy metals <1.07>—Dissolve 2.5 g of Aspirin in 30 mL of acetone, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 2.5 mL of Standard Lead Solution, 30 mL of acetone, 2 mL of dilute acetic acid and water to make 50 mL (not more than 10 ppm).

**(6)** Readily carbonizable substances <1.15>—Weigh 0.5 g of Aspirin, and perform the test. The solution has no more color than Matching Fluid Q.

**Loss on drying** <2.41> Not more than 0.5% (3 g, silica gel, 5 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 1.5 g of Aspirin, previously dried, add exactly 50 mL of 0.5 mol/L sodium hydroxide VS, and boil gently for 10 minutes under a reflux condenser with a carbon dioxide-absorbing tube (soda lime). Cool, and titrate <2.50> immediately the excess sodium hydroxide with 0.25 mol/L sulfuric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination.

Each mL of 0.5 mol/L sodium hydroxide VS  
= 45.04 mg of C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>

**Containers and storage** Containers—Well-closed contain-

ers.

## Aspirin Tablets

### Acetylsalicylic Acid Tablets

アスピリン錠

Aspirin Tablets contain not less than 95% and not more than 105% of the labeled amount of aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>: 180.16).

**Method of preparation** Prepare as directed under Tablets, with Aspirin.

**Identification (1)** Weigh a quantity of powdered Aspirin Tablets, equivalent to 0.1 g of Aspirin according to the labeled amount, add 10 mL of water, and boil for 5 to 6 minutes. After cooling, filter, and add 1 to 2 drops of iron (III) chloride TS to the filtrate: a red-violet color develops.

**(2)** Weigh a portion of powdered Aspirin Tablets, equivalent to 0.5 g of Aspirin according to the labeled amount, extract with two 10-mL portions of warm ethanol (95), and filter the combined extracts. Evaporate the filtrate to dryness, and boil the residue with 10 mL of sodium carbonate TS for 5 minutes. Proceed as directed in the Identification (2) under Aspirin.

**Purity** Salicylic acid—Take a portion of the powdered Aspirin Tablets, equivalent to 1.0 g of Aspirin according to the labeled amount, shake with 15 mL of ethanol (95) for 5 minutes, filter, discard the first 5 mL of the filtrate, and add 1.0 mL of the subsequent filtrate to a solution which is prepared by transferring 1 mL of freshly prepared dilute ammonium iron (III) sulfate TS to a Nessler tube and diluting with water to make 50 mL. Proceed as directed in the Purity (2) under Aspirin.

**Assay** Weigh accurately and powder not less than 20 Aspirin Tablets. Weigh accurately a portion of the powder, equivalent to about 1.5 g of aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>), add exactly 50 mL of 0.5 mol/L sodium hydroxide VS, and proceed as directed in the Assay under Aspirin.

Each mL of 0.5 mol/L sodium hydroxide VS  
= 45.04 mg of aspirin (C<sub>9</sub>H<sub>8</sub>O<sub>4</sub>)

**Containers and storage** Containers—Well-closed containers.

## Aspirin Aluminum

### Aluminum Acetylsalicylate

アスピリンアルミニウム

C<sub>18</sub>H<sub>15</sub>AlO<sub>9</sub>: 402.29

Bis(2-acetoxybenzoato)hydroxoaluminium [23413-80-1]

Aspirin Aluminum contains not less than 83.0% and

not more than 90.0% of aspirin ( $C_9H_8O_4$ : 180.16), and not less than 6.0% and not more than 7.0% of aluminum (Al: 26.98), calculated on the anhydrous basis.

**Description** Aspirin Aluminum occurs as a white, crystalline powder. It is odorless or has a slight, acetic odor.

It is practically insoluble in water, in methanol, in ethanol (95) and in diethyl ether.

It dissolves, with decomposition, in sodium hydroxide TS and in sodium carbonate TS.

**Identification (1)** Dissolve 0.1 g of Aspirin Aluminum in 10 mL of sodium hydroxide TS by heating, if necessary. Neutralize 2 mL of the solution with hydrochloric acid, and add 1 to 2 drops of iron (III) chloride TS: a red-purple color develops.

(2) Determine the absorption spectrum of the sample solution obtained in the Assay (1) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 277 nm and 279 nm.

(3) Place 2 g of Aspirin Aluminum in a platinum crucible, and ignite until charred. To the residue add 1 g of anhydrous sodium carbonate, and ignite for 20 minutes. After cooling, to the residue add 15 mL of dilute hydrochloric acid, shake, and filter: the filtrate responds to the Qualitative Tests <1.09> for aluminum salt.

**Purity (1)** Salicylate—Using  $A_{T2}$  and  $A_{S2}$  obtained in the Assay (1), calculate the amount of salicylate [as salicylic acid ( $C_7H_6O_3$ : 138.12)] by the following equation: salicylate content is not more than 7.5%, calculated on the anhydrous basis.

$$\begin{aligned} & \text{Amount (mg) of salicylic acid (C}_7\text{H}_6\text{O}_3\text{)} \\ & = W_S \times (A_{T2}/A_{S2}) \times (1/4) \end{aligned}$$

$W_S$ : Amount (mg) of salicylic acid for assay

(2) Heavy metals <1.07>—Place 2.0 g of Aspirin Aluminum in a porcelain crucible, cover the crucible loosely, and ignite at a low temperature until charred. After cooling, add 2 mL of nitric acid and 1 mL of sulfuric acid to the content of the crucible, heat gently the crucible until white fumes are evolved, and continue the heating until white fumes are no longer evolved, then ignite between 500°C and 600°C until the carbon is incinerated. When the incineration is not completed, add 2 mL of nitric acid and 1 mL of sulfuric acid, and heat gently in the same manner, then ignite between 500°C and 600°C to incinerate completely. After cooling, add 2 mL of hydrochloric acid, and proceed as directed in Method 2, and perform the test. Prepare the control solution by using the same quantities of the same reagents as directed for the preparation of the test solution, and add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 10 ppm).

(3) Arsenic <1.11>—Dissolve 1.0 g of Aspirin Aluminum in 15 mL of sodium hydroxide TS. To this solution add 1 drop of phenolphthalein TS, and with stirring, add dropwise hydrochloric acid until the red color of the solution disappears. Then add 2 mL of hydrochloric acid, cool with occasional shaking for 10 minutes, and filter with a glass filter (G3). Wash the residue with two 5 mL portions of 1 mol/L hydrochloric acid TS, and combine the filtrate and the washings. Use this solution as the test solution, and perform the test (not more than 2 ppm).

**Water** <2.48> Not more than 4.0% (0.15 g, direct titration).

**Assay (1)** Aspirin—Weigh accurately about 0.1 g of Aspirin Aluminum, add 40 mL of sodium fluoride TS, and shake for 5 minutes. Allow the solution to stand for 10 minutes with frequent shaking. Extract the solution with six 20-mL portions of chloroform. Combine all chloroform extracts, and add chloroform to make exactly 200 mL. Measure exactly 10 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.09 g of salicylic acid for assay, previously dried in a desiccator (silica gel) for 3 hours, and dissolve in chloroform to make exactly 200 mL. Measure exactly 5 mL of this solution, add chloroform to make exactly 200 mL, and use this solution as the standard solution (1). Then weigh accurately about 0.09 g of aspirin for assay, previously dried in a desiccator (silica gel) for 5 hours, and dissolve in chloroform to make exactly 200 mL. Measure exactly 10 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>. Determine the absorbances,  $A_{T1}$  and  $A_{S1}$ , of the sample solution and standard solution (1) at 278 nm, and absorbances,  $A_{T2}$  and  $A_{S2}$ , of these solution, at 308 nm, respectively. Then determine the absorbance  $A_{S3}$  of the standard solution (2) at 278 nm.

$$\begin{aligned} & \text{Amount (mg) of aspirin (C}_9\text{H}_8\text{O}_4\text{)} \\ & = W_S \times \left[ \frac{A_{T1} - \frac{A_{T2} \times A_{S1}}{A_{S2}}}{A_{S3}} \right] \end{aligned}$$

$W_S$ : Amount (mg) of aspirin for assay

(2) Aluminum—Weigh accurately about 0.4 g of Aspirin Aluminum, and dissolve in 10 mL of sodium hydroxide TS. Add dropwise 1 mol/L hydrochloric acid TS to adjust the solution to a pH of about 1, add 20 mL of acetic acid-ammonium acetate buffer solution, pH 3.0, and 0.5 mL of Cu-PAN TS, and heat. While boiling, titrate <2.50> with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red to yellow and persists for 1 minute. Perform a blank determination, and make any necessary correction.

$$\begin{aligned} & \text{Each mL of 0.05 mol/L disodium dihydrogen} \\ & \text{ethylenediamine tetraacetate VS} \\ & = 1.349 \text{ mg of Al} \end{aligned}$$

**Containers and storage** Containers—Well-closed containers.

## Aspoxicillin Hydrate

アスポキシシリン水和物

$C_{21}H_{27}N_5O_7 \cdot 3H_2O$ : 547.58  
(2*S*,5*R*,6*R*)-6-[(2*R*)-2-[(2*R*)-2-Amino-3-methylcarbamoylpropanoylamino]-

2-(4-hydroxyphenyl)acetamino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid trihydrate [63358-49-6, anhydride]

Aspxocillin Hydrate contains not less than 950  $\mu\text{g}$  (potency) and not more than 1020  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Aspxocillin Hydrate is expressed as mass (potency) of aspxocillin ( $\text{C}_{21}\text{H}_{27}\text{N}_5\text{O}_7\text{S}$ : 493.53).

**Description** Aspxocillin Hydrate occurs as a white, crystals or crystalline powder.

It is freely soluble in *N,N*-dimethylformamide, sparingly soluble in water, and practically insoluble in acetonitrile, in methanol and in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Aspxocillin Hydrate (1 in 4000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Aspxocillin Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Aspxocillin Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or spectrum of Aspxocillin Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +170 – +185° (0.2 g calculated on the anhydrous bases, water, 20 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Aspxocillin Hydrate in 50 mL of water: the pH of the solution is between 4.2 and 5.2.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Aspxocillin Hydrate in 50 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Aspxocillin Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 2.0 g of Aspxocillin Hydrate according to Method 5, and perform the test (not more than 1 ppm).

(4) Related substances—Dissolve 0.05 g of Aspxocillin Hydrate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu\text{L}$  each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the areas of each peak by the automatic integration method: the area of each peak other than aspxocillin from the sample solution is not more than 3/10 of the peak area of aspxocillin from the standard solution, and the total of peak areas other than aspxocillin from the sample solution is not more than the peak area of aspxocillin from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 6 times as long as the retention time of aspxocillin.

**System suitability**—

Test for required detection: Pipet 2 mL of the standard solution, add the mobile phase to make exactly 10 mL. Confirm that the peak area of aspxocillin obtained from 10  $\mu\text{L}$  of this solution is equivalent to 15 to 25% of that of aspxocillin obtained from 10  $\mu\text{L}$  of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of aspxocillin is not more than 5%.

**Water** <2.48> Not less than 9.5% and not more than 13.0% (0.2 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Aspxocillin Hydrate and Aspxocillin Reference Standard, equivalent to about 0.1 g (potency), dissolve each in a suitable amount of water, add exactly 10 mL of the internal standard solution, 6.5 mL of acetonitrile and water to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10  $\mu\text{L}$  each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of aspxocillin to that of the internal standard of each solution.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of aspxocillin } (\text{C}_{21}\text{H}_{27}\text{N}_5\text{O}_7\text{S}) \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Aspxocillin Reference Standard

**Internal standard solution**—A solution of *N*-(3-hydroxyphenyl)acetamide (1 in 1000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: To 130 mL of acetonitrile add potassium dihydrogenphosphate TS, pH 3.0 to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of aspxocillin is about 3 minutes.

**System suitability**—

System performance: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, aspxocillin and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of aspxocillin to that of the internal standard is not more than 0.8%.

**Containers and storage** Containers—Tight containers.

## Astromicin Sulfate

アストロマイシン硫酸塩

$C_{17}H_{35}N_5O_6 \cdot 2H_2SO_4$ : 601.65

2,6-Diamino-2,3,4,6,7-pentadeoxy- $\beta$ -L-lyxo-heptopyranosyl-(1 $\rightarrow$ 3)-4-amino-1-(2-aminoacetyl-N-methylamino)-1,4-dideoxy-6-O-methyl-L-chiro-inositol disulfate  
[72275-67-3]

Astromicin Sulfate is the sulfate of an aminoglycoside substance having antibacterial activity produced by the growth of *Micromonospora olivasterospora*.

It contains not less than 610  $\mu$ g (potency) and not more than 680  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Astromicin Sulfate is expressed as mass (potency) of astromicin ( $C_{17}H_{35}N_5O_6$ : 405.49).

**Description** Astromicin Sulfate occurs as a white to light yellowish white, powder or masses.

It is very soluble in water, sparingly soluble in ethylene glycol, and practically insoluble in methanol and in ethanol (99.5).

It is hygroscopic.

**Identification (1)** Dissolve 10 mg each of Astromicin Sulfate and Astromicin Sulfate Reference Standard in 10 mL of water. To 5 mL each of these solutions add water to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu$ L each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions: the retention time of astromicin obtained from the sample solution is the same with that from the standard solution.

**Operating conditions**—

Detector, column, column temperature, reaction coil, temperature of reaction coil, mobile phase, reaction reagent, reaction temperature, flow rate of mobile phase, and flow rate of reaction reagent: Proceed as directed in the operating conditions in the Purity (3).

(2) To 2 mL of a solution of Astromicin Sulfate (1 in 100) add 2 to 3 drops of barium chloride TS: a white precipitate is formed, and it does not dissolve by addition of dilute nitric acid.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +90 – +110° (0.25 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 1.0 g of Astromicin Sulfate in 10 mL of water is between 4.5 and 6.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Astromicin Sulfate in 10 mL of water: the solution is clear

and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Astromicin Sulfate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.10 g of Astromicin Sulfate in 100 mL of water, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of the related substance III, having the relative retention time of about 0.1, and the related substance I, having the relative retention time of about 1.2 with respect to the peak of astromicin, from the sample solution are not more than the peak area of astromicin from the standard solution, the peak area of the related substance II, having the related retention time of about 0.8, is not more than 2.0 times the peak area of astromicin from the standard solution, and the total area of the peaks other than astromicin from the sample solution is not more than 3.5 times the peak area of astromicin from the standard solution.

**Operating conditions**—

Detector: A fluorophotometer (excitation wavelength: 340 nm; detection wavelength: 430 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Reaction coil: A stainless steel tube 0.25 mm in inside diameter and 150 cm in length.

Temperature of reaction coil: 50°C

Mobile phase: To 800 mL of a solution of anhydrous sodium sulfate (71 in 2000) add 25 mL of a solution of sodium 1-heptanesulfonate (1 in 1000) and 1 mL of acetic acid (100), and add water to make 1000 mL.

Reaction reagent: Dissolve 11.2 g of potassium hydroxide, 0.458 g of polyoxyethylene (23) lauryl ether, 0.300 g of *o*-phthalaldehyde and 1 mL of 2-mercaptoethanol in 400 mL of a solution of boric acid (31 in 1000), and add water to make 500 mL.

Reaction temperature: 50°C

Flow rate of mobile phase: 0.7 mL per minute

Flow rate of reaction reagent: 0.2 mL per minute

Time span of measurement: About 2 times as long as the retention time of astromicin.

**System suitability**—

Test for required detectability: To 5 mL of the sample solution add water to make 100 mL, and use this solution as the solution for system suitability test. Pipet 2 mL of the solution for system suitability test, and add water to make exactly 100 mL. Confirm that the peak area of astromicin obtained from 10  $\mu$ L of this solution is equivalent to 1.5 to 2.5% of that from 10  $\mu$ L of the solution for system suitability test.

System performance: To 100 mL of water add 5 mL of the sample solution and 2 mL of a solution of L-valine (1 in 5000). When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, L-valine and astromi-

cin are eluted in this order with the resolution between these peaks being not less than 1.5, and when the procedure is run with 10  $\mu\text{L}$  of the solution for system suitability test under the above operating conditions, the symmetry factor of the peak of astromicin is not more than 2.0.

**System repeatability:** When the test is repeated 6 times with 10  $\mu\text{L}$  of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of astromicin is not more than 2.0%.

**Water** <2.48> Not more than 8.0% (0.2 g, volumetric titration, back titration). Use a mixture of methanol for water determination and ethylene glycol for water determination (1:1) instead of methanol for water determination.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) under (1) Agar media for seed and base layer.

(iii) Standard solutions—Weigh accurately an amount of Astromicin Sulfate Reference Standard, equivalent to about 25 mg (potency), dissolve in diluted hydrochloric acid (1 in 1000) to make exactly 25 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5–15°C, and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0 to make solutions so that each mL contains 4  $\mu\text{g}$  (potency) and 1  $\mu\text{g}$  (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Astromicin Sulfate, equivalent to about 25 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0 to make exactly 25 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0 to make solutions so that each mL contains 4  $\mu\text{g}$  (potency) and 1  $\mu\text{g}$  (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Atenolol

アテノロール

$\text{C}_{14}\text{H}_{22}\text{N}_2\text{O}_3$ ; 266.34

2-(4-[(2*R,S*)-2-Hydroxy-3-

[(1-methylethyl)amino]propyloxy]phenyl)acetamide  
[29122-68-7]

Atenolol, when dried, contains not less than 99.0% and not more than 101.0% of  $\text{C}_{14}\text{H}_{22}\text{N}_2\text{O}_3$ .

**Description** Atenolol occurs as a white to pale yellow crystalline powder.

It is freely soluble in methanol and in acetic acid (100), soluble in ethanol (99.5), and slightly soluble in water.

A solution of Atenolol in methanol (1 in 25) shows no optical rotation.

**Identification** (1) Determine the absorption spectrum of a solution of Atenolol in methanol (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Atenolol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting Point** <2.60> 152–156°C

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Atenolol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Atenolol in 25 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than atenolol is not larger than 1/2 times the peak area of atenolol obtained with the standard solution, and the total area of the peaks other than atenolol is not larger than the peak area of atenolol with the standard solution.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 226 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 3.4 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust to pH 3.0 with phosphoric acid. To 40 volume of this solution add 9 volume of methanol and 1 volume of tetrahydrofuran. Dissolve 1 g of sodium 1-octanesulfonate and 0.4 g of tetrabutylammonium hydrogensulfate in 1000 mL of this solution.

**Flow rate:** Adjust the flow rate so that the retention time of atenolol is about 8 minutes.

**Time span of measurement:** About 4 times as long as the retention time of atenolol.

**System suitability**—

**Test for required detectability:** To exactly 10 mL of the standard solution add the mobile phase to make exactly 50 mL. Confirm that the peak area of atenolol obtained with 10  $\mu\text{L}$  of this solution is equivalent to 14 to 26% of that obtained with 10  $\mu\text{L}$  of the standard solution.

**System performance:** When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry fac-

tor of the peak of atenolol are not less than 5000 and not more than 1.5, respectively.

**System repeatability:** When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of atenolol is not more than 1.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.3 g of Atenolol, previously dried, dissolve in 100 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 26.63 mg of  $\text{C}_{14}\text{H}_{22}\text{N}_2\text{O}_3$

**Containers and storage** Containers—Tight containers.

## Atropine Sulfate Hydrate

アトロピン硫酸塩水和物

$(\text{C}_{17}\text{H}_{23}\text{NO}_3)_2 \cdot \text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ : 694.83  
(1*R*,3*r*,5*S*)-8-Methyl-8-azabicyclo[3.2.1]oct-3-yl [(2*RS*)-3-hydroxy-2-phenyl]propanoate hemisulfate hemihydrate [5908-99-6]

Atropine Sulfate Hydrate, when dried, contains not less than 98.0% of atropine sulfate [ $(\text{C}_{17}\text{H}_{23}\text{NO}_3)_2 \cdot \text{H}_2\text{SO}_4$ : 676.82].

**Description** Atropine Sulfate Hydrate occurs as colorless crystals or a white, crystalline powder. It is odorless.

It is very soluble in water and in acetic acid (100), freely soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: 188 – 194°C (with decomposition). Introduce a capillary tube charged with dried sample into a bath previously heated to 180°C, and continue to heat at a rate of rise of about 3°C per minute.

It is affected by light.

**Identification (1)** To 1 mg of Atropine Sulfate Hydrate add 3 drops of fuming nitric acid, and evaporate the mixture on a water bath to dryness. Dissolve the residue in 1 mL of *N,N*-dimethylformamide, and add 5 to 6 drops of tetraethylammonium hydroxide TS: a red-purple color develops.

(2) To 2 mL of a solution of Atropine Sulfate Hydrate (1 in 50) add 4 to 5 drops of hydrogen tetrachloroaurate (III) TS: a lusterless, yellowish white precipitate is formed.

(3) To 5 mL of a solution of Atropine Sulfate Hydrate (1 in 25) add 2 mL of ammonia TS, and allow to stand for 2 to 3 minutes. Collect the precipitate, wash with water, and dry in

a desiccator (in vacuum, silica gel) for 4 hours: it melts <2.60> between 115°C and 118°C.

(4) A solution of Atropine Sulfate Hydrate (1 in 20) responds to the Qualitative Tests <1.09> for sulfate.

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Atropine Sulfate Hydrate in 10 mL of water: the solution is clear and colorless.

(2) Acidity—Dissolve 1.0 g of Atropine Sulfate Hydrate in 20 mL of water, and add 0.30 mL of 0.02 mol/L sodium hydroxide VS and 1 drop of methyl red-methylene blue TS: a green color develops.

(3) Related substances—Dissolve 0.25 g of Atropine Sulfate Hydrate in 1 mL of diluted hydrochloric acid (1 in 10), add water to make 15 mL, and use this solution as the sample solution.

(i) To 5 mL of the sample solution add 2 to 3 drops of hydrogen hexachloroplatinate (IV) TS: no precipitate is formed.

(ii) To 5 mL of the sample solution add 2 mL of ammonia TS, and shake vigorously: the turbidity of the solution is not greater than that of the following control solution.

Control solution: To 0.30 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid and water to make 50 mL. To this solution add 1 mL of silver nitrate TS, and allow 7 mL of the mixture to stand for 5 minutes.

(4) Hyoscyamine—Weigh accurately about 1 g of Atropine Sulfate Hydrate, previously dried, and dissolve in water to make exactly 10 mL: the specific optical rotation  $[\alpha]_D^{20}$  <2.49> of this solution in a 100-mm cell is between  $-0.60^\circ$  and  $+0.10^\circ$ .

(5) Readily carbonizable substances <1.15>—Take 0.20 g of Atropine Sulfate Hydrate, and perform the test: the solution has no more color than Matching Fluid A.

**Loss on drying** <2.41> Not more than 4.0% (0.5 g, in vacuum, phosphorus (V) oxide, 110°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Dissolve about 0.25 g of Atropine Sulfate Hydrate, previously dried and accurately weighed, in 30 mL of acetic acid (100). If necessary, dissolve it by warming, and cool. Titrate <2.50> with 0.05 mol/L perchloric acid VS until the color of the solution changes from purple through blue to blue-green (indicator: 3 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS  
= 33.84 mg of atropine sulfate [ $(\text{C}_{17}\text{H}_{23}\text{NO}_3)_2 \cdot \text{H}_2\text{SO}_4$ ]

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Atropine Sulfate Injection

アトロピン硫酸塩注射液

Atropine Sulfate Injection is an aqueous solution for injection.

It contains not less than 93.0% and not more than 107.0% of the labeled amount of atropine sulfate hydrate [ $(\text{C}_{17}\text{H}_{23}\text{NO}_3)_2 \cdot \text{H}_2\text{SO}_4 \cdot \text{H}_2\text{O}$ : 694.83].

**Method of preparation** Prepare as directed under Injec-

tions, with Atropine Sulfate Hydrate.

**Description** Atropine Sulfate Injection is a clear, colorless liquid.

pH: 4.0 – 6.0

**Identification (1)** Evaporate a volume of Atropine Sulfate Injection, equivalent to 1 mg of Atropine Sulfate Hydrate according to the labeled amount, on a water bath to dryness. Proceed with the residue as directed in the Identification (1) under Atropine Sulfate Hydrate.

**(2)** Evaporate an exactly measured volume of Atropine Sulfate Injection, equivalent to 5 mg of Atropine Sulfate Hydrate according to the labeled amount, on a water bath to dryness. After cooling, dissolve the residue in 1 mL of ethanol (95), and use this solution as the sample solution. If insoluble substance remains, crush it, allow to stand, and use the supernatant liquid as the sample solution. Separately, dissolve 10 mg of Atropine Sulfate Reference Standard in 2 mL of ethanol (95), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetone, water and ammonia water (28) (90:7:3) to a distance of about 10 cm, and dry the plate at 80°C for 10 minutes. After cooling, spray evenly Dragendorff's TS for spraying on the plate: the spots obtained from the sample solution and the standard solution show an orange color and the same *R<sub>f</sub>* value.

**(3)** Atropine Sulfate Injection responds to the Qualitative Tests <1.09> for sulfate.

**Bacterial endotoxins** <4.01> Less than 75 EU/mg.

**Extractable volume** <6.05> It meets the requirements.

**Foreign insoluble matter** <6.06> Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> Perform the test according to Method 1: it meets the requirement.

**Sterility** <4.06> Perform the test: it meets the requirement.

**Assay** To an exactly measured volume of Atropine Sulfate Injection, equivalent to about 5 mg of atropine sulfate Hydrate [(C<sub>17</sub>H<sub>23</sub>NO<sub>3</sub>)<sub>2</sub>·H<sub>2</sub>SO<sub>4</sub>·H<sub>2</sub>O], add exactly 3 mL of the internal standard solution and water to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Atropine Sulfate Reference Standard, separately determine its loss on drying <2.41> in the same conditions as for Atropine Sulfate Hydrate, and dissolve in water to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 3 mL of the internal standard solution and water to make 50 mL, and use this solution as the standard solution. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios, *Q<sub>T</sub>* and *Q<sub>S</sub>*, of the peak area of atropine to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of atropine sulfate Hydrate} \\ & [(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O] \\ & = W_S \times (Q_T/Q_S) \times (1/5) \times 1.0266 \end{aligned}$$

*W<sub>S</sub>*: Amount (mg) of Atropine Reference Standard, calculated based on the dried basis

**Internal standard solution**—A solution of etilefrine hydrochloride (1 in 1000).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 210 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** To 0.4 g of sodium lauryl sulfate add 500 mL of diluted phosphoric acid (1 in 1000) to dissolve, and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran, and mix.

**Flow rate:** Adjust the flow rate so that the retention time of atropine is about 16 minutes.

**System suitability**—

**System performance:** When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, the internal standard and atropine are eluted in this order with the resolution between these peaks being not less than 3.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of atropine to that of the internal standard is not more than 1.5%.

**Containers and storage** Containers—Hermetic containers.

Storage—Light-resistant.

## Azathioprine

アザチオプリン

C<sub>9</sub>H<sub>7</sub>N<sub>7</sub>O<sub>2</sub>S: 277.26

6-(1-Methyl-4-nitro-1*H*-imidazol-5-ylthio)purine  
[446-86-6]

Azathioprine, when dried, contains not less than 98.5% of C<sub>9</sub>H<sub>7</sub>N<sub>7</sub>O<sub>2</sub>S.

**Description** Azathioprine is light yellow crystals or crystalline powder. It is odorless.

It is sparingly soluble in *N,N*-dimethylformamide and in pyridine, very slightly soluble in water and in ethanol (99.5), and practically insoluble in chloroform and in diethyl ether.

It dissolves in sodium hydroxide TS and in ammonia TS.

It is gradually colored by light.

Melting point: about 240°C (with decomposition).

**Identification (1)** Dissolve 0.01 g of Azathioprine in 50 mL of water by warming. To 5 mL of this solution add 1 mL of dilute hydrochloric acid and 0.01 g of zinc powder, and allow to stand for 5 minutes: a yellow color is produced.

Filter this solution: the filtrate responds to the Qualitative Tests <1.09> for primary aromatic amines, and a red color is produced.

(2) Dissolve 0.01 g of Azathioprine in 50 mL of water by warming. To 1 mL of this solution add 0.5 mL of phosphotungstic acid TS and 0.5 mL of dilute hydrochloric acid: a white precipitate is formed.

(3) Prepare the test solution by proceeding with 0.03 g of Azathioprine according to the Oxygen Flask Combustion Method <1.06>, using 20 mL of water as the absorbing liquid: the test solution responds to the Qualitative Tests <1.09> (1) for sulfate.

(4) Dissolve 0.01 g of Azathioprine in 2 mol/L hydrochloric acid TS to make 100 mL. Dilute 5 mL of the solution with water to make 50 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Azathioprine Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity** (1) Clarity and color of solution—Dissolve 0.5 g of Azathioprine in 50 mL of *N,N*-dimethylformamide: the solution is clear and shows a light yellow color.

(2) Acidity or alkalinity—Add 100 mL of water to 2.0 g of Azathioprine, shake well for 15 minutes, centrifuge for 5 minutes at 10,000 revolutions per minute, and filter. Discard the first 20 mL of the filtrate, add 2 drops of methyl red TS to 40 mL of the subsequent filtrate, and use this solution as the sample solution

(i) Add 0.10 mL of 0.02 mol/L hydrochloric acid VS to 20 mL of the sample solution: a red color develops.

(ii) Add 0.10 mL of 0.02 mol/L sodium hydroxide VS to 20 mL of the sample solution: a yellow color develops.

(3) Sulfate <1.14>—To 25 mL of the filtrate obtained in (2) add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.038%).

(4) Heavy metals <1.07>—Proceed with 2.0 g of Azathioprine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Arsenic <1.11>—Prepare the test solution with 1.0 g of Azathioprine, according to Method 3, and perform the test (not more than 2 ppm).

(6) Related substances—Dissolve 10 mg of Azathioprine in 80 mL of the mobile phase by warming, cool, add the mobile phase to make 100 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of the peaks other than that of azathioprine from the sample solution is not larger than 1/2 of the peak area of azathioprine from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 296 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Adjust to pH 2.5 of a solution of 0.05 mol/L potassium dihydrogenphosphate TS (1 in 2) with diluted phosphoric acid (3 in 2000). To 800 mL of this solution add 200 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of azathioprine is about 8 minutes.

Time span of measurement: About three times as long as the retention time of azathioprine beginning after the solvent peak.

**System suitability**—

Test for required detection: To exactly 5 mL of the standard solution add water to make exactly 50 mL. Confirm that the peak area of azathioprine obtained from 20  $\mu$ L of this solution is equivalent to 8 to 12% of that of azathioprine obtained from 20  $\mu$ L of the standard solution.

System performance: Dissolve 10 mg of Azathioprine in 80 mL of water by warming, cool, and add water to make 100 mL. To 2 mL of this solution add 2 mL of a solution, separately prepared by dissolving 0.06 g of benzoic acid in 3 mL of methanol and diluting with water to make 10 mL, and add the mobile phase to make 25 mL. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, azathioprine and benzoic acid are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of azathioprine is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 5 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Azathioprine, previously dried, add 80 mL of *N,N*-dimethylformamide, and warm to dissolve. After cooling, titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide VS until the color of the solution changes from yellow through yellow-green to blue-green (indicator: 1 mL of thymol blue-dimethylformamide TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS  
= 27.73 mg of C<sub>9</sub>H<sub>7</sub>O<sub>7</sub>O<sub>2</sub>S

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Azathioprine Tablets

アザチオプリン錠

Azathioprine Tablets contain not less than 95.0%

and not more than 105.0% of the labeled amount of azithioprine ( $C_9H_7N_7O_2S$ : 277.26).

**Method of preparation** Prepare as directed under Tablets, with Azathioprine.

**Identification (1)** Weigh a quantity of powdered Azathioprine Tablets, equivalent to 0.01 g of Azathioprine according to the labeled amount. Add 50 mL of water, shake well while warming, and filter. Proceed with 5 mL of the filtrate as directed in the Identification (1) under Azathioprine.

(2) Proceed with 1 mL of the filtrate obtained in (1) as directed in the Identification (2) under Azathioprine.

(3) Determine the absorption spectrum of the sample solution in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 278 nm and 282 nm.

(4) Weigh a quantity of powdered Azathioprine Tablets, equivalent to 0.1 g of Azathioprine to the labeled amount. Add 10 mL of a solution of ammonia solution (28) in methanol (1 in 10), shake well, filter, and use the filtrate as the sample solution. Separately, dissolve 0.1 g of Azathioprine Reference Standard in 10 mL of a solution of ammonia solution (28) in methanol (1 in 10), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, a solution of ammonia solution (28) in methanol (1 in 10), *n*-butyl formate and 1,2-dichloroethane (15:10:5:2) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots from the sample solution and the standard solution show the same *R<sub>f</sub>* value.

**Assay** Weigh accurately and powder not less than 20 Azathioprine Tablets. Weigh accurately a portion of the powder, equivalent to about 0.1 g of azathioprine ( $C_9H_7N_7O_2S$ ), add 20 mL of dimethylsulfoxide for ultraviolet-visible spectrophotometry, shake well, add 0.1 mol/L hydrochloric acid TS to make exactly 500 mL, and filter. Discard the first 20 mL of the filtrate, measure exactly 3 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of Azathioprine Reference Standard, previously dried at 105°C for 5 hours, dissolve in 20 mL of dimethylsulfoxide for ultraviolet-visible spectrophotometry, and add 0.1 mol/L hydrochloric acid TS to make exactly 500 mL. Measure exactly 3 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 280 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, respectively.

$$\begin{aligned} &\text{Amount (mg) of azathioprine (C}_9\text{H}_7\text{N}_7\text{O}_2\text{S)} \\ &= W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Azathioprine Reference Standard

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Azithromycin Hydrate

アジスロマイシン水和物

$C_{38}H_{72}N_2O_{12} \cdot 2H_2O$ : 785.02

(2*R*,3*S*,4*S*,5*R*,6*R*,8*R*,11*R*,12*R*,13*S*,14*R*)-5-(3,4,6-Trideoxy-3-dimethylamino- $\beta$ -D-xylohexopyranosyloxy)-3-(2,6-dideoxy-3-C-methyl-3-O-methyl- $\alpha$ -L-ribo-hexopyranosyloxy)-10-aza-6,12,13-trihydroxy-2,4,6,8,10,11,13-heptamethylhexadecan-14-olide dihydrate  
[17772-70-0]

Azithromycin Hydrate is the derivative of erythromycin.

It contains not less than 945  $\mu$ g (potency) and not more than 1030  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Azithromycin Hydrate is expressed as mass (potency) of azithromycin ( $C_{38}H_{72}N_2O_{12}$ : 748.98).

**Description** Azithromycin Hydrate occurs as a white crystalline powder.

It is freely soluble in methanol and in ethanol (99.5), and practically insoluble in water.

**Identification** Determine the infrared absorption spectrum of Azithromycin Hydrate as directed in the potassium bromide disk method under the Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Azithromycin Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-45$  –  $-49^\circ$  (0.4 g calculated on the anhydrous basis, ethanol (99.5), 20 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Azithromycin Hydrate according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Being specified separately.

(3) Residual solvent—Being specified separately.

**Water** <2.48> Not less than 4.0% and not more than 5.0% (0.4 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately an amount of Azithromycin Hydrate and Azithromycin Reference Standard, equivalent to about 50 mg (potency), dissolve each in an adequate amount of a mixture of acetonitrile and water (3:2), add

exactly 2 mL of the internal standard solution and the mixture of acetonitrile and water (3:2) to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of azithromycin to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of azithromycin } (\text{C}_{38}\text{H}_{72}\text{N}_2\text{O}_{12}) \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Azithromycin Reference Standard

**Internal standard solution**—A solution of 4,4'-bis(diethylamino)benzophenone in acetonitrile (3 in 4000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 215 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized polyvinyl alcohol gel polymer for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: Dissolve 6.97 g of dipotassium hydrogen phosphate in about 750 mL of water, adjust the pH to 11.0 with potassium hydroxide TS, and add water to make 1000 mL. To 400 mL of this solution add 600 mL of acetonitrile for liquid chromatography.

**Flow rate**: Adjust the flow rate so that the retention time of azithromycin is about 10 minutes.

**System suitability**—

**System performance**: When the procedure is run with 5  $\mu$ L of the standard solution under the above operating conditions, azithromycin and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.0.

**System repeatability**: When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of azithromycin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Aztreonam

アズトレオナム

$\text{C}_{13}\text{H}_{17}\text{N}_5\text{O}_8\text{S}_2$ : 435.43

2-[(Z)-(2-Aminothiazol-4-yl)-[(2S,3S)-2-methyl-4-oxo-1-sulfoazetidino-3-ylcarbamoyl]methyleneaminoxy]-2-methyl-1-propanoic acid [78110-38-0]

Aztreonam contains not less than 920  $\mu$ g (potency)

and not more than 1030  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Aztreonam is expressed as mass (potency) of aztreonam ( $\text{C}_{13}\text{H}_{17}\text{N}_5\text{O}_8\text{S}_2$ ).

**Description** Aztreonam occurs as a white to yellowish white crystalline powder.

It is freely soluble in dimethylsulfoxide, slightly soluble in water and in methanol, and very slightly soluble in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Aztreonam (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of Aztreonam Reference Standard: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the spectrum of a solution of Aztreonam in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 10), using a light hydrogen substance existing in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy as an internal reference compound and 2.50 ppm for its chemical shift, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ): it exhibits a multiple signal at around  $\delta$  1.5 ppm, and a single signal at around  $\delta$  7.0 ppm. The ratio of integrated intensity of each signal is 9:1.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-26 - -32^\circ$  (0.25 g calculated on the anhydrous bases, water, 50 mL, 100 mm).

**pH** <2.54> Dissolve 0.05 g of Aztreonam in 10 mL of water: the pH of this solution is between 2.2 and 2.8.

**Purity (1)** Clarity and color of solution—Dissolve 0.1 g of Aztreonam in 20 mL of water: the solution is clear and colorless to pale yellow.

**(2)** Heavy metals <1.07>—Proceed with 2.0 g of Aztreonam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(3)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Aztreonam according to Method 3, and perform the test (not more than 2 ppm).

**(4)** Related substances—Dissolve 0.04 g of Aztreonam in 100 mL of water, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 25  $\mu$ L each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the areas of each peak by the automatic integration method: the area of each peak is not more than the peak area of aztreonam from the standard solution, and the total area of peaks other than aztreonam from the sample solution is not more than 2.5 times of the peak area of aztreonam from the standard solution.

**Operating conditions**—

**Column, column temperature, mobile phase, and flow rate**: Proceed as directed in the operating conditions in the Assay.

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Time span of measurement**: About 4 times as long as the retention time of aztreonam beginning after the solvent peak.

**System suitability**—

Test for required detection: Pipet 5 mL of the standard solution, add water to make exactly 10 mL, and use this solution as the solution for the test for required detection. Pipet 1 mL of the solution, and add water to make exactly 10 mL. Confirm that the peak area of aztreonam obtained from 25  $\mu$ L of this solution is equivalent to 7 to 13% of that obtained from 25  $\mu$ L of the solution for the test for required detection.

System performance: When the procedure is run under the above operating conditions with 25  $\mu$ L of the standard solution obtained in the Assay, the internal standard and aztreonam are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 25  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of aztreonam is not more than 2.0%.

**Water** <2.48> Not more than 2.0% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately an amount of Aztreonam and Aztreonam Reference Standard, equivalent to about 20 mg (potency), dissolve each in 70 mL of water, add exactly 10 mL of the internal standard solution and water to make 100 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 25  $\mu$ L each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of aztreonam to that of the internal standard of each solution.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of aztreonam (C}_{13}\text{H}_{17}\text{N}_5\text{O}_8\text{S}_2) \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Aztreonam Reference Standard

**Internal standard solution**—A solution of 4-aminobenzoic acid (1 in 6250).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 280 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Dissolve 1.7 g of tetrabutylammonium hydrogensulfate in 300 mL of water, adjust to pH 3.0 with 0.5 mol/L disodium hydrogenphosphate TS, and add water to make 1000 mL. To 650 mL of this solution add 350 mL of methanol.

**Flow rate:** Adjust the flow rate so that the retention time of aztreonam is about 8 minutes.

**System suitability**—

System performance: When the procedure is run with 25  $\mu$ L of the standard solution under the above operating conditions, the internal standard and aztreonam are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 25  $\mu$ L of the standard solution under the above operating

conditions, the relative standard deviation of the ratios of the peak area of aztreonam to that of the internal standard is not more than 1.5%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Bacampicillin Hydrochloride

### Ampicillin Ethoxycarbonyloxyethyl Hydrochloride

バカンピシリン塩酸塩

$\text{C}_{21}\text{H}_{27}\text{N}_3\text{O}_7\text{S} \cdot \text{HCl}$ : 501.98

1-Ethoxycarbonyloxyethyl (2*S*,5*R*,6*R*)-6-[(2*R*)-2-amino-2-phenylacetamino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrochloride [37661-08-8]

Bacampicillin Hydrochloride is a hydrochloride of ampicillin ethoxycarbonyloxyethyl ester.

It contains not less than 626  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Bacampicillin Hydrochloride is expressed as mass (potency) of ampicillin ( $\text{C}_{16}\text{H}_{19}\text{N}_3\text{O}_4\text{S}$ : 349.40).

**Description** Bacampicillin Hydrochloride occurs as a white to pale yellow crystalline powder. It has a characteristic odor.

It is freely soluble in methanol and in ethanol (95), and soluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Bacampicillin Hydrochloride in methanol (1 in 1000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of Bacampicillin Hydrochloride Reference Standard: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bacampicillin Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Bacampicillin Hydrochloride Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Bacampicillin Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +140 – +170° (0.1 g calculated on the anhydrous basis, ethanol (95), 25 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Bacampicillin Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Bacampicillin Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(3) Free ampicillin—Weigh accurately about 0.1 g of Bacampicillin Hydrochloride, transfer into a 100-mL separator, add exactly 15 mL of ice-cold water to dissolve, add and mix with exactly 10 mL of ice-cold 0.05 mol/L phosphate buffer solution, pH 7.0, then add 25 mL of ice-cold chloroform, shake, and abandon the chloroform layer. Repeat the procedure twice with two 25-mL portions of ice-cold chloroform. Centrifuge the water layer, filter the supernatant, and use the filtrate as the sample solution. Separately, weigh accurately an amount of Ampicillin Reference Standard, equivalent to about 20 mg, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add 10 mL of 0.05 mol/L phosphate buffer solution, pH 7.0 and water to make exactly 25 mL, and use this solution as the standard solution. To exactly 10 mL each of the sample solution and standard solution add exactly 2 mL of sodium hydroxide TS, allow to stand for exactly 15 minutes, add exactly 2 mL of 1 mol/L hydrochloric acid TS, exactly 10 mL of 0.3 mol/L potassium hydrogen phthalate buffer solution, pH 4.6, and exactly 10 mL of 0.005 mol/L iodine VS, allow to stand for exactly 20 minutes without exposure to light. Titrate <2.50> these solutions with 0.01 mol/L sodium thiosulfate VS until the color of the solution changes to colorless. Separately, to exactly 10 mL each of the sample solution and the standard solution add exactly 10 mL of 0.3 mol/L potassium hydrogen phthalate buffer solution, pH 4.6 and exactly 10 mL of 0.005 mol/L iodine VS, and perform a blank determination with the same manner. Determine the consumed amounts (mL) of 0.005 mol/L iodine VS,  $V_T$  and  $V_S$ , of the sample solution and the standard solution: the amount of ampicillin is not more than 1.0%.

$$\begin{aligned} &\text{Amount (mg) of ampicillin (C}_{16}\text{H}_{19}\text{N}_3\text{O}_4\text{S)} \\ &= W_S \times (V_T/V_S) \times (1/20) \end{aligned}$$

$W_S$ : Amount (mg) of Ampicillin Reference Standard

**Water** <2.48> Not more than 1.0% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 1.5% (1 g).

**Assay** Weigh accurately an amount of Bacampicillin Hydrochloride and Bacampicillin Hydrochloride Reference Standard, equivalent to about 40 mg (potency), dissolve each in water to make exactly 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak areas,  $A_T$  and  $A_S$ , of bacampicillin of these solutions.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of ampicillin (C}_{16}\text{H}_{19}\text{N}_3\text{O}_4\text{S)} \\ &= W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Bacampicillin Hydrochloride Reference Standard

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle

diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** To 500 mL of diluted 2 mol/L sodium dihydrogen phosphate TS (1 in 100), add diluted 0.05 mol/L disodium hydrogen phosphate TS (2 in 5) to adjust the pH to 6.8. To 500 mL of this solution add 500 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of bacampicillin is about 6.5 minutes.

**System suitability**—

**System performance:** When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of bacampicillin are not less than 10,000 and not more than 2, respectively.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of peak areas of bacampicillin is not more than 2.0%.

**Containers and storage** Containers—Tight containers.

## Bacitracin

バシトラシン

[1405-87-4]

Bacitracin is a mixture of peptide substances having antibacterial activity including bacitracin A as the main component produced by the growth of *Bacillus subtilis* or *Bacillus licheniformis*.

It contains not less than 60 Units per mg. The potency of Bacitracin is expressed as unit calculated from the amount of bacitracin A (C<sub>66</sub>H<sub>103</sub>N<sub>17</sub>O<sub>16</sub>S: 1422.69). One unit of Bacitracin is equivalent to 23.8  $\mu$ g of bacitracin A (C<sub>66</sub>H<sub>103</sub>N<sub>17</sub>O<sub>16</sub>S).

**Description** Bacitracin occurs as a white to light brown powder.

It is freely soluble in water, and slightly soluble in ethanol (99.5).

**Identification** (1) To 3 mL of a solution of Bacitracin (1 in 100) add 3 mL of 4-dimethylaminobenzaldehyde TS, shake until red-rosy to red-purple color appears, then add several drops of a solution of sodium nitrite (1 in 100), and shake: a green to dark green color is produced.

(2) Dissolve 60 mg each of Bacitracin and Bacitracin Reference Standard in 10 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 1  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatograph. Develop the plate with a mixture of 1-butanol, acetic acid (100), water, pyridine and ethanol (99.5) (30:15:10:6:5) to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin TS on the plate, and heat at 110 °C for 5 minutes: the spots obtained from the sample solution and standard solution show the same R<sub>f</sub> value.

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Bacitracin according to Method 2, and perform the test. Pre-

pare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.15 g of Bacitracin in 0.05 mol/L sulfuric acid TS to make 100 mL. To 2 mL of this solution add 0.05 mol/L sulfuric acid TS to make 10 mL, and determine the absorbances of this solution,  $A_1$  and  $A_2$ , at 252 nm and 290 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>:  $A_2/A_1$  is not more than 0.20.

**Loss on drying** <2.41> Not more than 5.0% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 1.0% (1 g).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Micrococcus luteus* ATCC 10240.

(ii) Culture medium—Use the medium iii in 3) under (1) Agar media for seed and base layer.

(iii) Standard solutions—Weigh accurately an amount of Bacitracin Reference Standard, equivalent to about 400 units, dissolve in phosphate buffer solution, pH 6.0 to make exactly 20 mL, and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 10°C and use within 2 days. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 2 units and 0.5 units, and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Bacitracin, equivalent about 400 units, dissolve in phosphate buffer solution, pH 6.0 to make exactly 20 mL. Take exactly a suitable amount of this solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 2 units and 0.5 units, and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

Storage—In a cold place.

## Baclofen

バクロフェン

$C_{10}H_{12}ClNO_2$ : 213.66

(3*RS*)-4-Amino-3-(4-chlorophenyl)butanoic acid

[1134-47-0]

Baclofen contains not less than 98.5% of  $C_{10}H_{12}ClNO_2$ , calculated on the anhydrous basis.

**Description** Baclofen occurs as a white to pale yellowish white, crystalline powder.

It is freely soluble in acetic acid (100), slightly soluble in water, very slightly soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether.

It dissolves in dilute hydrochloric acid.

**Identification** (1) To 5 mL of a solution of Baclofen (1 in 1000) add 1 mL of ninhydrin TS, and heat on a water bath for 3 minutes: a blue-purple color develops.

(2) Determine the absorption spectrum of a solution of Baclofen in 0.1 mol/L hydrochloric acid TS (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Baclofen Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Perform the test with Baclofen as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Purity** (1) Chloride <1.03>—Dissolve 0.5 g of Baclofen in 50 mL of acetic acid (100), and add water to make 100 mL. To 10 mL of this solution add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.30 mL of 0.01 mol/L hydrochloric acid VS add 5 mL of acetic acid (100), 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.21%).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Baclofen according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Baclofen according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 50 mg of Baclofen in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1.0 mL and 1.5 mL of the sample solution, to each add the mobile phase to make exactly 100 mL, and use these solutions as the standard solutions (1) and (2), respectively. Perform the test with exactly 25  $\mu$ L each of the sample solution and standard solutions (1) and (2) as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak height of these solutions: each height of the peaks other than the peak of baclofen from the sample solution is not larger than the peak height of baclofen from the standard solution (1), and the total height of these peaks is not larger than the peak height of baclofen from the standard solution (2).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 268 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol and diluted acetic acid (100) (1 in 900) (3:2).

Flow rate: Adjust the flow rate so that the retention time of baclofen is about 4 minutes.

Time span of measurement: About 3 times as long as the retention time of baclofen beginning after the solvent peak. **System suitability**—

Test for required detection: Adjust the sensitivity so that the peak height of baclofen obtained from 25  $\mu$ L of the standard solution (1) is between 5 and 10 mm.

System performance: Dissolve 0.40 g of Baclofen and 5 mg

of methyl parahydroxybenzoate in 200 mL of the mobile phase. To 10 mL of this solution add the mobile phase to make 100 mL. When the procedure is run with 25  $\mu$ L of this solution under the above operating conditions, baclofen and methyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 25  $\mu$ L of the standard solution (1) under the above operating conditions, the relative standard deviation of the peak heights of baclofen is not more than 3.0%.

**Water** <2.48> Not more than 1.0% (1 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.3% (1 g).

**Assay** Weigh accurately about 0.5 g of Baclofen, dissolve in 80 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue to greenish blue (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 21.37 mg of  $C_{10}H_{12}ClNO_2$

**Containers and storage** Containers—Well-closed containers.

## Baclofen Tablets

バクロフェン錠

Baclofen Tablets contain not less than 93% and not more than 107% of the labeled amount of baclofen ( $C_{10}H_{12}ClNO_2$ ; 213.66).

**Method of preparation** Prepare as directed under Tablets, with Baclofen.

**Identification (1)** To a portion of powdered Baclofen Tablets, equivalent to 0.01 g of Baclofen according to the labeled amount, add 10 mL of water, shake well, and filter. To 5 mL of the filtrate add 1 mL of ninhydrin TS, and proceed as directed in the Identification (1) under Baclofen.

(2) To a portion of powdered Baclofen Tablets, equivalent to 25 mg of Baclofen according to the labeled amount, add 50 mL of 0.1 mol/L hydrochloric acid TS, shake for 15 minutes, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 257 nm and 261 nm, between 264 nm and 268 nm, and between 272 nm and 276 nm.

(3) To a portion of powdered Baclofen Tablets, equivalent to 0.01 g of Baclofen according to the labeled amount, add 2 mL of a mixture of methanol and acetic acid (100) (4:1), shake well, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 0.01 g of Baclofen Reference Standard in 2 mL of a mixture of methanol and acetic acid (100) (4:1), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-

butanol, water and acetic acid (100) (4:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot from the sample solution and that from the standard solution show the same *R<sub>f</sub>* value.

**Dissolution** <6.10> Perform the test according to the following method: It meets the requirement.

Perform the test with 1 tablet of Baclofen Tablets at 50 revolutions per minute according to the Paddle method using 500 mL of water as the dissolution medium. Take 20 mL or more of the dissolved solution 45 minutes after starting the test, and filter through a membrane filter with pore size of not more than 0.8  $\mu$ m. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent, add water to make exactly *V'* mL so that each mL contains about 10  $\mu$ g of baclofen ( $C_{10}H_{12}ClNO_2$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Baclofen Reference Standard (separately determine the water content <2.48> in the same manner as Baclofen), dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, *A<sub>T</sub>* and *A<sub>S</sub>*, of the sample solution and the standard solution at 220 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

The dissolution rate (%) of Baclofen Tablets in 45 minutes is not less than 70%.

Dissolution rate (%) with respect to the labeled amount of baclofen ( $C_{10}H_{12}ClNO_2$ )

$$= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 50$$

*W<sub>S</sub>*: Amount (mg) of Baclofen Reference Standard.

*C*: Labeled amount (mg) of baclofen ( $C_{10}H_{12}ClNO_2$ ) in 1 tablet.

**Assay** Weigh accurately and powder not less than 20 Baclofen Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of baclofen ( $C_{10}H_{12}ClNO_2$ ), add 130 mL of 0.1 mol/L hydrochloric acid TS, shake for 10 minutes, add 0.1 mol/L hydrochloric acid TS to make exactly 200 mL, and centrifuge. Pipet 10 mL of the supernatant liquid, add 2 drops of phenolphthalein TS, neutralize with dilute sodium hydroxide TS, add water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.25 g of Baclofen Reference Standard (separately determine the water content <2.48> in the same manner as Baclofen), and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 10 mL of this solution, and add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 10 mL of this solution, add 2 drops of phenolphthalein TS, neutralize with dilute sodium hydroxide TS, add water to make exactly 50 mL, and use this solution as the standard solution. Pipet 2 mL each of the sample solution and the standard solution, to each add 4 mL of ninhydrin-stannous chloride TS, shake, heat on a water bath for 20 minutes, and shake at once vigorously for 2 minutes. After cooling, to each solution add a mixture of water and 1-propanol (1:1) to make exactly 25 mL. Determine the absorbances, *A<sub>T</sub>* and *A<sub>S</sub>*, of these solutions at 570 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a blank prepared with 2 mL of water in the same manner.

Amount (mg) of baclofen ( $C_{10}H_{12}ClNO_2$ )

$$= W_s \times (A_T/A_S) \times (1/5)$$

$W_s$ : Amount (mg) of Baclofen Reference Standard, calculated on the anhydrous basis

**Containers and storage** Containers—Well-closed containers.

## Bamethan Sulfate

バメタン硫酸塩

$(C_{12}H_{19}NO_2)_2 \cdot H_2SO_4$ : 516.65  
(1*RS*)-2-Butylamino-1-(4-hydroxyphenyl)ethanol hemisulfate [5716-20-1]

Bamethan Sulfate, when dried, contains not less than 99.0% of  $(C_{12}H_{19}NO_2)_2 \cdot H_2SO_4$ .

**Description** Bamethan Sulfate occurs as white crystals or crystalline powder. It is odorless, and has a bitter taste.

It is freely soluble in water and in acetic acid (100), soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 169°C (with decomposition).

**Identification (1)** To 1 mL of a solution of Bamethan Sulfate (1 in 1000) add 5 mL of a solution of 4-nitrobenzenediazonium fluoroborate (1 in 2000) and 10 mL of boric acid-potassium chloride-sodium hydroxide buffer solution, pH 9.2: an orange-red color develops.

**(2)** Determine the absorption spectrum of a solution of Bamethan Sulfate in 0.01 mol/L hydrochloric acid TS (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(3)** Determine the infrared absorption spectrum of Bamethan Sulfate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave numbers of about 1618, 1597, 1518, 1118 and 833  $cm^{-1}$ .

**(4)** A solution of Bamethan Sulfate (1 in 100) responds to the Qualitative Tests <1.09> for sulfate.

**pH** <2.54> Dissolve 1.0 g of Bamethan Sulfate in 10 mL of water: the pH of this solution is between 4.0 and 5.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Bamethan Sulfate in 20 mL of water: the solution is clear, and has no more color than the following control solution.

Control solution: To 1.5 mL of Matching Fluid O add diluted hydrochloric acid (1 in 40) to make 200 mL.

**(2)** Chloride <1.03>—Perform the test with 3.5 g of Bamethan Sulfate. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.002%).

**(3)** Heavy metals <1.07>—Proceed with 2.0 g of Bamethan Sulfate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(4)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Bamethan Sulfate according to Method 3, and perform the test (not more than 2 ppm).

**(5)** Related substances—Dissolve 0.10 g of Bamethan Sulfate in 2 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu L$  each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (7:2) in a developing vessel saturated with ammonia vapor to a distance of about 12 cm, and air-dry the plate. Spray evenly Dragendorff's TS for spraying on the plate, air-dry for 15 minutes, spray Dragendorff's TS for spraying again, then, after 1 minute, spray evenly a solution of sodium nitrite (1 in 20), and immediately put a glass plate on the plate. Examine the plate after 30 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.75 g of Bamethan Sulfate, previously dried, dissolve in 80 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 51.67 mg of  $(C_{12}H_{19}NO_2)_2 \cdot H_2SO_4$

**Containers and storage** Containers—Tight containers.

## Barbitol

バルビタール

$C_8H_{12}N_2O_3$ : 184.19  
5,5-Diethylpyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione  
[57-44-3]

Barbitol, when dried, contains not less than 99.0% of  $C_8H_{12}N_2O_3$ .

**Description** Barbitol occurs as colorless or white crystals or a white, crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in acetone and in pyridine, soluble in ethanol (95), sparingly soluble in diethyl ether, and slightly soluble in water and in chloroform.

It dissolves in sodium hydroxide TS and in ammonia TS.

The pH of its saturated solution is between 5.0 and 6.0.

**Identification (1)** Boil 0.2 g of Barbitol with 10 mL of sodium hydroxide TS: the gas evolved changes moistened red

litmus paper to blue.

(2) Dissolve 0.05 g of Barbitol in 5 mL of diluted pyridine (1 in 10), add 0.3 mL of copper (II) sulfate TS, shake, and allow to stand for 5 minutes: a red-purple precipitate is formed. Shake the mixture with 5 mL of chloroform: a red-purple color develops in the chloroform layer. Separately, dissolve 0.05 g of Barbitol in 2 to 3 drops of ammonia-ammonium chloride buffer solution, pH 10.7, and 5 mL of diluted pyridine (1 in 10). Add 5 mL of chloroform and 0.3 mL of copper (II) sulfate TS to the solution: a red-purple precipitate is produced in the aqueous layer. The red-purple precipitate is not dissolved in the chloroform by shaking.

(3) To 0.4 g of Barbitol add 0.1 g of anhydrous sodium carbonate and 4 mL of water, shake, and add a solution of 0.3 g of 4-nitrobenzyl chloride in 7 mL of ethanol (95). Heat the mixture on a water bath under a reflux condenser for 30 minutes, and allow to stand for 1 hour. Collect the separated crystals, wash with 7 mL of sodium hydroxide TS and a small amount of water, recrystallize from a mixture of ethanol (95) and chloroform (1:1), and dry at 105°C for 30 minutes: the crystals melt <2.60> between 192°C and 196°C.

**Melting point** <2.60> 189 – 192°C

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Barbitol in 5 mL of sodium hydroxide TS: the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 0.30 g of Barbitol in 20 mL of acetone, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: take 0.30 mL of 0.01 mol/L hydrochloric acid VS, 20 mL of acetone and 6 mL of dilute nitric acid, and add water to make 50 mL (not more than 0.035%).

(3) Sulfate <1.14>—Dissolve 0.40 g of Barbitol in 20 mL of acetone, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: take 0.40 mL of 0.005 mol/L sulfuric acid VS, 20 mL of acetone, and 1 mL of dilute hydrochloric acid, and add water to make 50 mL (not more than 0.048%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of Barbitol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead solution (not more than 20 ppm).

(5) Readily carbonizable substances <1.15>—Perform the test with 0.5 g of Barbitol. The solution is not more colored than Matching Fluid A.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Barbitol, previously dried, and dissolve in 5 mL of ethanol (95) and 50 mL of chloroform. Titrate <2.50> with 0.1 mol/L potassium hydroxide-ethanol VS until the color of the solution changes from yellow through light blue to purple (indicator: 1 mL of alizarin yellow GG-thymolphthalein TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS  
= 18.42 mg of C<sub>8</sub>H<sub>12</sub>N<sub>2</sub>O<sub>3</sub>

**Containers and storage** Containers—Well-closed contain-

ers.

## Barium Sulfate

硫酸バリウム

BaSO<sub>4</sub>: 233.39

**Description** Barium Sulfate occurs as a white powder. It is odorless and tasteless.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It does not dissolve in hydrochloric acid, in nitric acid and in sodium hydroxide TS.

**Identification (1)** Mix 0.5 g of Barium Sulfate with 2 g each of anhydrous sodium carbonate and potassium carbonate in a crucible, heat the mixture until fusion is complete, treat the cooled mass with hot water, and filter. The filtrate, acidified with hydrochloric acid, responds to the Qualitative Tests <1.09> for sulfate.

(2) Wash the hot water-insoluble residue obtained in (1) with water, dissolve in 2 mL of acetic acid (31), and filter, if necessary: the solution responds to the Qualitative Tests <1.09> for barium salt.

**Purity (1)** Acidity or alkalinity—Agitate 1.0 g of Barium Sulfate with 20 mL of water for 5 minutes: the solution is neutral.

(2) Phosphate—Boil 1.0 g of Barium Sulfate with 3 mL of nitric acid and 5 mL of water for 5 minutes, cool, and add water to restore the original volume. Filter through a filter paper, previously washed with dilute nitric acid, to the filtrate add an equal volume of hexaammonium heptamolybdate TS, and allow to stand between 50°C and 60°C for 1 hour: no yellow precipitate is produced.

(3) Sulfide—Place 10 g of Barium Sulfate in a 250-mL conical flask, add 10 mL of dilute hydrochloric acid and water to make 100 mL, and boil for 10 minutes: the gas evolved does not darken moistened lead (II) acetate paper.

(4) Heavy metals <1.07>—Boil 5.0 g of Barium Sulfate with 2.5 mL of acetic acid (100) and 50 mL of water for 10 minutes, cool, add 0.5 mL of ammonia TS and water to make 100 mL, and filter. Perform the test with a 50-mL portion of this filtrate. Prepare the control solution with 2.5 mL of Standard Lead Solution, 1.25 mL of acetic acid (100), 0.25 mL of ammonia TS and water to make 50 mL (not more than 10 ppm).

(5) Arsenic <1.11>—Prepare the test solution with 2.0 g of Barium Sulfate according to Method 1, and perform the test (not more than 1 ppm).

(6) Hydrochloric acid-soluble substances and soluble barium salts—Cool the solution obtained in (3), add water to make 100 mL, and filter. Evaporate 50 mL of the filtrate on a water bath to dryness, add 2 drops of hydrochloric acid and 10 mL of warm water, filter through filter paper for assay, and wash with 10 mL of warm water. Evaporate the combined filtrate and washings on a water bath to dryness, and dry the residue at 105°C for 1 hour: the residue weighs not more than 15 mg. Shake the residue, if any, with 10 mL of water, and filter. To the filtrate add 0.5 mL of dilute sulfuric acid, and allow to stand for 30 minutes: no turbidity is

produced.

**Containers and storage** Containers—Well-closed containers.

## Freeze-dried BCG Vaccine (for Percutaneous Use)

乾燥 BCG ワクチン

Freeze-dried BCG Vaccine (for Percutaneous Use) is a preparation for injection which is dissolved before use.

It contains live bacteria derived from a culture of the bacillus of Calmette and Guérin.

It conforms to the requirements of Freeze-dried BCG Vaccine (for Percutaneous Use) in the Minimum Requirements for Biological Products.

**Description** Freeze-dried BCG Vaccine (for Percutaneous Use) becomes a white to light yellow, turbid liquid on addition of solvent.

## Beclometasone Dipropionate

ベクロメタゾンプロピオン酸エステル

$C_{28}H_{37}ClO_7$ : 521.04

9-Chloro-11 $\beta$ ,17,21-trihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione 17,21-dipropanoate [5534-09-8]

Beclometasone Dipropionate, when dried, contains not less than 97.0% and not more than 103.0% of  $C_{28}H_{37}ClO_7$ .

**Description** Beclometasone Dipropionate occurs as a white to pale yellow powder. It is odorless.

It is freely soluble in chloroform, soluble in methanol, sparingly soluble in ethanol (95) and in 1,4-dioxane, slightly soluble in diethyl ether, and practically insoluble in water.

Melting point: about 208°C (with decomposition).

**Identification (1)** Dissolve 2 mg of Beclometasone Dipropionate in 2 mL of sulfuric acid: initially a yellowish color develops, and gradually changes through orange to dark red-brown. To this solution add carefully 10 mL of water: the color changes to bluish green, and a flocculent precipitate is formed.

(2) Dissolve 0.01 g of Beclometasone Dipropionate in 1 mL of methanol, add 1 mL of Fehling's TS, and heat: a red to red-brown precipitate is formed.

(3) Prepare the test solution with 0.02 g of Beclometasone Dipropionate as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 1 mL of sodium hydroxide TS and 20 mL of water as an absorbing liquid: the test solution responds to the Qualitative Tests <1.09> for chloride.

(4) Determine the infrared absorption spectrum of Beclometasone Dipropionate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Beclometasone Dipropionate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Beclometasone Dipropionate and Beclometasone Dipropionate Reference Standard in ethanol (95), respectively, then evaporate the ethanol to dryness, and repeat the test on the residues.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +88 – +94° (after drying, 0.1 g, 1,4-dioxane, 10 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 0.5 g of Beclometasone Dipropionate according to Method 2, and perform the test. Prepare the control solution with 1.5 mL of Standard Lead Solution (not more than 30 ppm).

(2) Related substances—Dissolve 20 mg of Beclometasone Dipropionate in 5 mL of a mixture of chloroform and methanol (9:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (9:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1,2-dichloroethane, methanol and water (475:25:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 20 mg each of Beclometasone Dipropionate and Beclometasone Dipropionate Reference Standard, previously dried, and dissolve each in methanol to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 10 mL of the internal standard solution and methanol to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of beclometasone dipropionate to that of the internal standard, respectively.

$$\begin{aligned} \text{Amount (mg) of } C_{28}H_{37}ClO_7 \\ = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Beclometasone Dipropionate Reference Standard

**Internal standard solution**—A solution of testosterone propionate in methanol (1 in 4000).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of acetonitrile and water (3:2).

Flow rate: Adjust the flow rate so that the retention time of beclometasone dipropionate is about 6 minutes.

**System suitability—**

System performance: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, beclometasone dipropionate and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of beclometasone dipropionate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Beef Tallow

### *Sevum Bovinum*

#### 牛脂

Beef Tallow is a purified fat obtained by wet steam rendering from the fresh fatty tissues of *Bos taurus* Linné var. *domesticus* Gmelin (*Bovidae*).

**Description** Beef Tallow occurs as a white, uniform mass. It has a characteristic odor and a mild taste.

It is freely soluble in diethyl ether and in petroleum ether, very slightly soluble in ethanol (95), and practically insoluble in water.

It is breakable at a low temperature, but softens above 30°C.

Melting point: 42 – 50°C

**Acid value** <1.13> Not more than 2.0.

**Saponification value** <1.13> 193 – 200

**Iodine value** <1.13> 33–50 (When the sample is insoluble in 20 mL of cyclohexane, dissolve it by shaking a glass-stoppered flask in warm water. Then, if insoluble, increase the volume of solvent.)

**Purity** (1) Moisture and coloration—Beef Tallow (5.0 g), melted by heating on a water bath, forms a clear liquid, from which no water separates. In a 10-mm thick layer of the liquid, it is colorless or slightly yellow.

(2) Alkalinity—To 2.0 g of Beef Tallow add 10 mL of water, melt by heating on a water bath, and shake vigorously. After cooling, add 1 drop of phenolphthalein TS to the separated water layer: no color develops.

(3) Chloride—To 1.5 g of Beef Tallow add 30 mL of ethanol (95), boil for 10 minutes under a reflux condenser,

and filter after cooling. To 20 mL of the filtrate add 5 drops of a solution of silver nitrate in ethanol (95) (1 in 50): the turbidity of the mixture does not exceed that of the following control solution.

Control solution: To 1.0 mL of 0.01 mol/L hydrochloric acid VS add ethanol (95) to make 20 mL, then add 5 drops of an ethanolic solution of silver nitrate (1 in 50).

**Containers and storage** Containers—Well-closed containers.

## White Beeswax

### *Cera Alba*

#### サラシミツロウ

White Beeswax is bleached Yellow Beeswax.

**Description** White Beeswax occurs as white to yellowish white masses. It has a characteristic odor. It is comparatively brittle when cooled, and the fractured surface is granular, and non-crystalline.

It is slightly soluble in diethyl ether, and practically insoluble in water and in ethanol (99.5).

**Acid value** <1.13> 5 – 9 or 17 – 22 Weigh accurately about 6 g of White Beeswax, place in a glass-stoppered 250-mL flask, and add 50 mL of ethanol (99.5). Warm the mixture to dissolve the wax, add 1 mL of phenolphthalein TS, and proceed as directed in the Acid value. Perform a blank determination using solvent which is not previously neutralized, and make any necessary correction.

**Saponification value** <1.13> 80 – 100 Weigh accurately about 3 g of White Beeswax, place in a glass-stoppered 250-mL flask, and add exactly 25 mL of 0.5 mol/L potassium hydroxide-ethanol VS and 50 mL of ethanol (95), heat for 4 hours on a water bath under a reflux condenser, and proceed as directed in the Saponification value.

**Melting point** <1.13> 60 – 67°C.

**Purity** Paraffin, fat, Japan wax or resin—Melt White Beeswax at the lowest possible temperature, drip the liquid into a vessel containing ethanol (95) to form granules, and allow them to stand in air for 24 hours. Drop the granules into two mixtures of ethanol (95) and water, one adjusted so as to have a specific gravity of 0.95 and the other 0.97: the granules sink or are suspended in the mixture with the specific gravity of 0.95, and float or are suspended in the other mixture.

**Containers and storage** Containers—Well-closed containers.

## Yellow Beeswax

### *Cera Flava*

#### ミツロウ

Yellow Beeswax is the purified wax obtained from honeycombs such as those of *Apis indica*

Radoszkowski or *Apis mellifera* Linné (*Apidae*).

**Description** Yellow Beeswax occurs as light yellow to brownish yellow masses. It has a characteristic odor, which is not rancid. It is comparatively brittle when cooled, and the fractured surface is granular, and non-crystalline.

**Acid value** <1.13> 5 – 9 or 17 – 22 Weigh accurately about 6 g of Yellow Beeswax, place in a glass-stoppered 250-mL flask, and add 50 mL of ethanol (99.5). Warm the mixture to dissolve the wax, add 1 mL of phenolphthalein TS, and proceed as directed in the Acid value. Perform a blank determination using solvent which is not previously neutralized, and make any necessary correction.

**Saponification value** <1.13> 80 – 100 Weigh accurately about 3 g of Yellow Beeswax, place in a 250-mL glass-stoppered flask, and add 25 mL of 0.5 mol/L potassium hydroxide-ethanol and 50 mL of ethanol (95), insert a reflux condenser, heat for 4 hours on a water bath, and proceed as directed in the Saponification value.

**Melting point** <1.13> 60 – 67°C.

**Purity** Paraffin, fat, Japan wax or resin—Melt Yellow Beeswax at the lowest possible temperature, drip the liquid into a glass vessel containing ethanol (95) to form granules, and allow them to stand in air for 24 hours. Drop the granules into two mixtures of ethanol (95) and water, one adjusted so as to have a specific gravity of 0.95 and the other 0.97: the granules sink or are suspended in the mixture with the specific gravity of 0.95, and float or are suspended in the other mixture.

**Containers and storage** Containers—Well-closed containers.

## Bekanamycin Sulfate

ベカナマイシン硫酸塩

$C_{18}H_{37}N_5O_{10} \cdot xH_2SO_4$

3-Amino-3-deoxy- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 6)-[2,6-diamino-2,6-dideoxy- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)]-2-deoxy-D-streptomine sulfate [70550-99-1]

Bekanamycin Sulfate is the sulfate of an aminoglycoside substance having antibacterial activity produced by the growth of the mutant of *Streptomyces kanamyceticus*.

It contains not less than 680  $\mu$ g (potency) and not

more than 770  $\mu$ g (potency) per mg, calculated on the dried basis. The potency of Bekanamycin Sulfate is expressed as mass (potency) of bekanamycin ( $C_{18}H_{37}N_5O_{10}$ : 483.51).

**Description** Bekanamycin Sulfate occurs as a white powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

**Identification** (1) Dissolve 20 mg of Bekanamycin Sulfate in 2 mL of 1/15 mol/L phosphate buffer solution, pH 5.6, add 1 mL of ninhydrin TS, and boil: a blue-purple color develops.

(2) Dissolve 30 mg each of Bekanamycin Sulfate and Bekanamycin Sulfate Reference Standard in 5 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a solution of potassium dihydrogen phosphate (3 in 40) to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS, and heat at 100°C for 10 minutes: the principal spots obtained from the sample solution and the standard solution show a purple-brown color and the same *R<sub>f</sub>* value.

(3) To a solution of Bekanamycin Sulfate (1 in 5) add 1 drop of barium chloride TS: a white turbidity is produced.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +102 – +116° (after drying, 0.25 g, water, 25 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 0.50 g of Bekanamycin Sulfate in 10 mL of water is between 6.0 and 8.5.

**Purity** (1) Clarity and color of solution—Dissolve 0.5 g of Bekanamycin Sulfate in 5 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Bekanamycin Sulfate according to Method 4, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 2.0 g of Bekanamycin Sulfate according to Method 1, and perform the test (not more than 1 ppm).

(4) Related substances—Dissolve 60 mg of Bekanamycin Sulfate in 10 mL of water, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a solution of potassium dihydrogen phosphate (3 in 40) to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate, and heat at 100°C for 10 minutes: the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 5.0% (0.5 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.5% (1 g).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) under (1) Agar media for seed and base layer having pH <2.54> 7.8 to 8.0 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Bekanamycin Sulfate Reference Standard, previously dried, equivalent to about 20 mg (potency), dissolve in diluted phosphate buffer solution, pH 6.0 (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5 to 15°C and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 10 µg (potency) and 2.5 µg (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Bekanamycin Sulfate, equivalent to about 20 mg (potency), and dissolve in water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 10 µg (potency) and 2.5 µg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Benidipine Hydrochloride

ベニジピン塩酸塩

$C_{28}H_{31}N_3O_6 \cdot HCl$ : 542.02

3-[(3*RS*)-1-Benzylpiperidin-3-yl] 5-methyl (4*RS*)-2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate monohydrochloride [91599-74-5]

Benidipine Hydrochloride, when dried, contains not less than 99.0% and not more than 101.0% of  $C_{28}H_{31}N_3O_6 \cdot HCl$ .

**Description** Benidipine Hydrochloride occurs as a yellow crystalline powder.

It is very soluble in formic acid, soluble in methanol, sparingly soluble in ethanol (99.5), and practically insoluble in water.

A solution of Benidipine Hydrochloride in methanol (1 in 100) shows no optical rotation.

Melting point: about 200°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Benidipine Hydrochloride in methanol (1 in

100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Benidipine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 5 mL of a solution of Benidipine Hydrochloride (1 in 10) add 5 mL of ammonia TS, heat on a water bath for 5 minutes, cool, and filter. The filtrate, which is acidified with dilute nitric acid, responds to the Qualitative Tests <1.09> (2) for chloride.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Benidipine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 20 mg of Benidipine Hydrochloride in 100 mL of a mixture of water and methanol (1:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mixture of water and methanol (1:1) to make exactly 500 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of bisbenzylpiperidyl ester having the relative retention time of about 0.35 with respect to benidipine, dehydro derivative having the relative retention time of about 0.75 and other related substances are not larger than 1/2 times the peak area of benidipine with the standard solution, and the total area of the peaks other than benidipine is not larger than the peak area of benidipine with the standard solution. For this calculation, use the peak areas of bisbenzylpiperidyl ester and dehydro derivative after multiplying by their response factors, 1.6, respectively.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 237 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS, pH 3.0, methanol and tetrahydrofuran (65:27:8).

Flow rate: Adjust the flow rate so that the retention time of benidipine is about 20 minutes.

Time span of measurement: About 2 times as long as the retention time of benidipine beginning after the solvent peak.

**System suitability—**

Test for required detectability: Measure exactly 5 mL of the standard solution, and add the mixture of water and methanol (1:1) to make exactly 20 mL. Confirm that the peak area of benidipine obtained with 10 µL of this solution is equivalent to 18 to 32% of that with 10 µL of the standard solution.

**System performance:** Dissolve 6 mg of Benidipine Hydrochloride and 5 mg of benzoin in 200 mL of the mixture of water and methanol (1:1). When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, benzoin and benidipine are eluted in this order with the resolution between these peaks being not less than 8.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of benidipine is not more than 3.5%.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.7 g of Benidipine Hydrochloride, previously dried, dissolve in 10 mL of formic acid, add 70 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 54.20 mg of  $C_{28}H_{31}N_3O_6 \cdot HCl$

**Containers and storage** Containers—Tight containers.

## Benidipine Hydrochloride Tablets

ベニジピン塩酸塩錠

Benidipine Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of benidipine hydrochloride ( $C_{28}H_{31}N_3O_6 \cdot HCl$ ; 542.02).

**Method of preparation** Prepare as directed under Tablets, with Benidipine Hydrochloride.

**Identification** Shake well a quantity of powdered Benidipine Hydrochloride Tablets, equivalent to 10 mg of Benidipine Hydrochloride according to the labeled amount, with 100 mL of methanol, and centrifuge. To 10 mL of the supernatant liquid add methanol to make 100 mL, and use this solution as the sample solution. Determine the absorption spectrum of the sample solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 235 nm and 239 nm, and between 350 nm and 360 nm.

**Purity** Dehydro derivative—Powder Benidipine Hydrochloride Tablets in an agate mortar. To an amount of the powder, equivalent to 20 mg of Benidipine Hydrochloride, add about 80 mL of a mixture of diluted phosphoric acid (1 in 500) and methanol (1:1), shake well, and add the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make exactly 100 mL. Filter through a membrane filter with pore size of 0.45  $\mu$ m, and use the filtrate as the sample solution. Separately, dissolve 20 mg of benidipine hydrochloride for assay in the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make exactly 100 mL. Pipet 1 mL of this solution, add the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution

as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of dehydro derivative having the relative retention time of about 0.75 with respect to benidipine is not larger than 1/2 times the peak area of benidipine with the standard solution. For this calculation, use the peak area of dehydro derivative after multiplying by the relative response factor, 1.6.

**Operating conditions**—

Perform as directed in the operating conditions in the Assay.

**System suitability**—

Test for required detectability: Measure exactly 2 mL of the standard solution, and add the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make exactly 20 mL. Confirm that the peak area of benidipine obtained with 10  $\mu$ L of this solution is equivalent to 7 to 13% of that with 10  $\mu$ L of the standard solution.

**System performance:** Dissolve 6 mg of benidipine hydrochloride and 5 mg of benzoin in 200 mL of a mixture of water and methanol (1:1). When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, benzoin and benidipine are eluted in this order with the resolution between these peaks being not less than 8.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of benidipine is not more than 2.0%.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Benidipine Hydrochloride Tablets add 40 mL of a mixture of diluted phosphoric acid (1 in 500) and methanol (1:1), shake to disintegrate, and add a suitable amount of the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make exactly  $V$  mL of a solution, containing 40  $\mu$ g of benidipine hydrochloride ( $C_{28}H_{31}N_3O_6 \cdot HCl$ ) per mL. Centrifuge the solution, pipet 20 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make 50 mL, and use this solution as the sample solution. Proceed as directed in the Assay.

Amount (mg) of benidipine hydrochloride ( $C_{28}H_{31}N_3O_6 \cdot HCl$ )  
=  $W_S \times (Q_T/Q_S) \times (V/1000)$

$W_S$ : Amount (mg) of benidipine hydrochloride for assay

**Internal standard solution**—A solution of benzoin in a mixture of water and methanol (1:1) (13 in 200,000).

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Benidipine Hydrochloride Tablets at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of 1st fluid for dissolution test as the dissolution medium. Withdraw 20 mL or more of the dissolution medium 30 minutes after starting the test for 2-mg and 4-mg tablets and 45 minutes after starting the test for 8-mg tablet, and filter through a membrane filter with a pore size not exceeding 0.45  $\mu$ m. Discard the first 10 mL of the filtrate pipet the subsequent  $V$  mL, and add 1st fluid for dissolution test to make exactly  $V'$  mL so that each mL contains about 2.2  $\mu$ g of benidipine hydrochloride ( $C_{28}$

$\text{H}_{31}\text{N}_3\text{O}_6\cdot\text{HCl}$ ) according to the labeled amount. Pipet 5 mL of this solution, add exactly 5 mL of the mobile phase, and use this solution as the sample solution. Separately, weigh accurately about 22 mg of benidipine hydrochloride for assay, previously dried at 105°C for 2 hours, and dissolve in the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, and add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, and add the mobile phase to make exactly 20 mL. Pipet 5 mL of this solution, add exactly 5 mL of 1st fluid for dissolution test, and use this solution as the standard solution. Perform the test with exactly 50  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of benidipine: the dissolution rates for 2-mg or 4-mg tablet in 30 minutes and for 8-mg tablet in 45 minutes are not less than 80% and not less than 85%, respectively.

Dissolution rate (%) of benidipine hydrochloride ( $\text{C}_{28}\text{H}_{31}\text{N}_3\text{O}_6\cdot\text{HCl}$ ) with respect to the labeled amount  
 $= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 9$

$W_S$ : Amount (mg) of benidipine hydrochloride for assay  
 C: Labeled amount (mg) of benidipine hydrochloride ( $\text{C}_{28}\text{H}_{31}\text{N}_3\text{O}_6\cdot\text{HCl}$ ) in 1 tablet.

#### Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 237 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS, pH 3.0 and acetonitrile (11:9).

Flow rate: Adjust the flow rate so that the retention time of benidipine is about 5 minutes.

#### System suitability—

System performance: When the procedure is run with 50  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of benidipine are not less than 3000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 50  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of benidipine is not more than 1.5%.

**Assay** Weigh accurately the mass of not less than 20 Benidipine Hydrochloride Tablets, and powder using an agate mortar. Weigh accurately a part of the powder, equivalent to about 8 mg of benidipine hydrochloride ( $\text{C}_{28}\text{H}_{31}\text{N}_3\text{O}_6\cdot\text{HCl}$ ), add about 150 mL of a mixture of diluted phosphoric acid (1 in 500) and methanol (1:1), shake, then add the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make exactly 200 mL, and centrifuge. Pipet 20 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 40 mg of benidipine hydrochloride for assay, previously dried at 105°C for 2 hours, and dissolve in the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make exactly

100 mL. Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution and the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make 50 mL, and use this solution as the standard solution. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of benidipine to that of the internal standard.

Amount (mg) of benidipine hydrochloride ( $\text{C}_{28}\text{H}_{31}\text{N}_3\text{O}_6\cdot\text{HCl}$ )  
 $= W_S \times (Q_T/Q_S) \times (1/5)$

$W_S$ : Amount (mg) of benidipine hydrochloride for assay

**Internal standard solution**—A solution of benzoin in a mixture of water and methanol (1:1) (13 in 200,000).

#### Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 237 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS, pH 3.0, methanol and tetrahydrofuran (65:27:8).

Flow rate: Adjust the flow rate so that the retention time of benidipine is about 20 minutes.

#### System suitability—

System performance: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the internal standard and benidipine are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of benidipine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

## Benserazide Hydrochloride

ベンセラジド塩酸塩

$\text{C}_{10}\text{H}_{15}\text{N}_3\text{O}_5\cdot\text{HCl}$ : 293.70  
 (2*RS*)-2-Amino-3-hydroxy-*N'*-(2,3,4-trihydroxybenzyl)propanoylhydrazide monohydrochloride [14919-77-8]

Benserazide Hydrochloride contains not less than 98.0% of  $\text{C}_{10}\text{H}_{15}\text{N}_3\text{O}_5\cdot\text{HCl}$ , calculated on the anhydrous basis.

**Description** Benserazide Hydrochloride occurs as a white to

grayish white, crystalline powder.

It is freely soluble in water and in formic acid, soluble in methanol, very slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution of Benserazide Hydrochloride (1 in 100) is between 4.0 and 5.0.

It is hygroscopic.

It is gradually colored by light.

A solution of Benserazide Hydrochloride (1 in 100) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Benserazide Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Benserazide Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** To 10 mL of a solution of Benserazide Hydrochloride (1 in 30) add silver nitrate TS: a white precipitate is formed. To a portion of this precipitate add dilute nitric acid: the precipitation does not dissolve.

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Benserazide Hydrochloride in 10 mL of water, and perform the test with this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbance of this solution at 430 nm is not more than 0.10.

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of Benserazide Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.25 g of Benserazide Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL and 3 mL of the sample solution, add methanol to make exactly 200 mL, and use these solutions as the standard solution (1) and (2), respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of cellulose for thin-layer chromatography. Develop the plate with a solution of formic acid in sodium chloride TS (1 in 1000) to a distance of about 10 cm, and air-dry the plate. Spray evenly sodium carbonate TS, air-dry, and then spray evenly Folin's TS on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (2), and the number of the spots which intense more than the spot from the standard solution (1) are not more than 2.

**Water <2.48>** Not more than 2.5% (0.5 g, direct titration). Use a solution of salicylic acid in methanol for Karl Fischer method (3 in 20) instead of methanol for Karl Fischer method.

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Benserazide Hydrochloride, dissolve in 5 mL of formic acid, add 50 mL

of acetic acid (100), and titrate <2.50> immediately with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 29.37 mg of  $C_{10}H_{15}N_3O_5 \cdot HCl$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Bentonite

ベントナイト

Bentonite is a natural, colloidal, hydrated aluminum silicate.

**Description** Bentonite occurs as a very fine, white to light yellow-brown powder. It is odorless. It has a slightly earthy taste.

It is practically insoluble in water and in diethyl ether.

It swells in water.

**Identification (1)** Add 0.5 g of Bentonite to 3 mL of diluted sulfuric acid (1 in 3), and heat until white fumes are evolved. Cool, add 20 mL of water, and filter. To 5 mL of the filtrate add 3 mL of ammonia TS: a white, gelatinous precipitate is produced, which turns red on the addition of 5 drops of alizarin red S TS.

**(2)** Wash the residue obtained in (1) with water, add 2 mL of a solution of methylene blue trihydrate (1 in 10,000), and wash again with water: the residue is blue in color.

**pH <2.54>** To 1.0 g of Bentonite add 50 mL of water, and shake: the pH of the suspension is between 9.0 and 10.5.

**Purity (1)** Heavy metals <1.07>—To 1.5 g of Bentonite add 80 mL of water and 5 mL of hydrochloric acid, and boil gently for 20 minutes with thorough stirring. Cool, centrifuge, collect the supernatant liquid, wash the residue with two 10-mL portions of water, and centrifuge each. Combine the supernatant liquid and the washings, and add dropwise ammonia solution (28). When a precipitate is produced, add dropwise dilute hydrochloric acid with vigorous stirring, and dissolve. To the solution add 0.45 g of hydroxylammonium chloride, and heat. Cool, and add 0.45 g of sodium acetate trihydrate, 6 mL of dilute acetic acid and water to make 150 mL. Pipet 50 mL of the solution, and perform the test using this solution as the test solution. Prepare the control solution as follows: mix 2.5 mL of Standard Lead Solution, 0.15 g of hydroxylammonium chloride, 0.15 g of sodium acetate trihydrate, and 2 mL of dilute acetic acid, and add water to make 50 mL (not more than 50 ppm).

**(2)** Arsenic <1.11>—To 1.0 g of Bentonite add 5 mL of dilute hydrochloric acid, and gently heat to boil while stirring well. Cool immediately, and centrifuge. To the residue add 5 mL of dilute hydrochloric acid, shake well, and centrifuge. To the residue add 10 mL of water, and perform the same operations. Combine all the extracts, and heat on a water bath to concentrate to 5 mL. Perform the test with this solution as the test solution (not more than 2 ppm).

**(3)** Foreign matter—Place 2.0 g of Bentonite in a mortar, add 20 mL of water to swell, disperse evenly with a pestle, and dilute with water to 100 mL. Pour the suspension

through a No. 200 (74  $\mu$ m) sieve, and wash the sieve thoroughly with water. No grit is felt when the fingers are rubbed over the wire mesh of the sieve.

**Loss on drying** <2.41> 5.0 – 10.0% (2 g, 105°C, 2 hours).

**Gel formation** Mix 6.0 g of Bentonite with 0.30 g of magnesium oxide. Add the mixture, in several portions, to 200 mL of water contained in a glass-stoppered 500-mL cylinder. Agitate for 1 hour, transfer 100 mL of the suspension to a 100-mL graduated cylinder, and allow to stand for 24 hours: not more than 2 mL of supernatant appears on the surface.

**Swelling power** To 100 mL of water in a glass-stoppered 100-mL cylinder add 2.0 g of Bentonite in ten portions, allowing each portion to settle before adding the next, and allow to stand for 24 hours: the apparent volume of the sediment at the bottom is not less than 20 mL.

**Containers and storage** Containers—Well-closed containers.

## Benzalkonium Chloride

ベンザルコニウム塩化物

Benzalkonium Chloride is represented by the formula  $[C_6H_5CH_2N(CH_3)_2R]Cl$ , in which R extends from  $C_8H_{17}$  to  $C_{18}H_{37}$ , with  $C_{12}H_{25}$  and  $C_{14}H_{29}$  comprising the major portion.

It contains not less than 95.0% and not more than 105.0% of benzalkonium chloride (as  $C_{22}H_{40}ClN$ : 354.01), calculated on the anhydrous basis.

**Description** Benzalkonium Chloride occurs as a white to yellowish white powder, colorless to light yellow, gelatinous pieces, or jelly-like fluid or mass. It has a characteristic odor.

It is very soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

A solution of Benzalkonium Chloride foams strongly when shaken.

**Identification (1)** Dissolve 0.2 g of Benzalkonium Chloride in 1 mL of sulfuric acid, add 0.1 g of sodium nitrate, and heat for 5 minutes on a water bath. After cooling, add 10 mL of water and 0.5 g of zinc powder, heat for 5 minutes, cool, and filter: the filtrate responds to the Qualitative Tests <1.09> for primary aromatic amines. The color of the solution is red.

(2) To 2 mL of a solution of Benzalkonium Chloride (1 in 1000) add a mixture of 0.2 mL of a solution of bromophenol blue (1 in 2000) and 0.5 mL of sodium hydroxide TS: a blue color develops. Add 4 mL of chloroform to this solution, and shake vigorously: the blue color shifts to the chloroform layer. Collect the chloroform layer, and add dropwise, with stirring, a solution of sodium lauryl sulfate (1 in 1000): the chloroform layer turns colorless.

(3) Determine the absorption spectrum of a solution of Benzalkonium Chloride in 0.1 mol/L hydrochloric acid TS (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) To 1 mL of a solution of Benzalkonium Chloride (1 in 100) add 2 mL of ethanol (95), 0.5 mL of dilute nitric acid

and 1 mL of silver nitrate TS: a white precipitate is produced. This precipitate does not dissolve on the addition of dilute nitric acid, but dissolves on the addition of ammonia TS.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Benzalkonium Chloride in 10 mL of water: the solution is clear and colorless to light yellow.

(2) Petroleum ether-soluble substances—To 3.0 g of Benzalkonium Chloride add water to make 50 mL, then add 50 mL of ethanol (99.5) and 5 mL of 0.5 mol/L sodium hydroxide TS, and extract with three 50-mL portions of petroleum ether. Combine the petroleum ether extracts, and wash with three 50-mL portions of dilute ethanol. After shaking well with 10 g of anhydrous sodium sulfate, filter through a dry filter paper, and wash the filter paper with two 10-mL portions of petroleum ether. Evaporate the petroleum ether on a water bath by heating, and dry the residue at 105°C for 1 hour: the residue is not more than 1.0%.

**Water** <2.48> Not more than 15.0%.

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.15 g of Benzalkonium Chloride, and dissolve in 75 mL of water. Adjust the pH between 2.6 and 3.4 by adding dropwise diluted dilute hydrochloric acid (1 in 2), add 1 drop of methyl orange TS, and titrate <2.50> with 0.02 mol/L sodium tetraphenylboron VS until the color of the solution becomes red.

Each mL of 0.02 mol/L sodium tetraphenylboron VS  
= 7.080 mg of  $C_{22}H_{40}ClN$

**Containers and storage** Containers—Tight containers.

## Benzalkonium Chloride Solution

ベンザルコニウム塩化物液

Benzalkonium Chloride Solution is an aqueous solution containing not more than 50.0 w/v% of benzalkonium chloride.

It contains not less than 93% and not more than 107% of the labeled amount of benzalkonium chloride ( $C_{22}H_{40}ClN$ : 354.01).

**Method of preparation** Dissolve Benzalkonium Chloride in Water or Purified Water. It is also prepared by diluting Concentrated Benzalkonium Chloride Solution 50 with Water or Purified Water.

**Description** Benzalkonium Chloride Solution is a clear, colorless to light yellow liquid, having a characteristic odor.

It foams strongly on shaking.

**Identification (1)** Evaporate a volume of Benzalkonium Chloride Solution, equivalent to 0.2 g of Benzalkonium Chloride according to the labeled amount, on a water bath to dryness, and proceed with the residue as directed in the Identification (1) under Benzalkonium Chloride.

(2) To a volume of Benzalkonium Chloride Solution, equivalent to 0.01 g of Benzalkonium Chloride according to the labeled amount, add water to make 10 mL. Proceed with 2 mL of this solution as directed in the Identification (2) under Benzalkonium Chloride.

(3) To a volume of Benzalkonium Chloride Solution, equivalent to 1 g of Benzalkonium Chloride according to the labeled amount, add water or concentrate on a water bath, if necessary, to make 10 mL. To 1 mL of this solution add 0.1 mol/L hydrochloric acid VS to make 200 mL, and proceed as directed in the Identification (3) under Benzalkonium Chloride.

(4) To a volume of Benzalkonium Chloride Solution, equivalent to 0.1 g of Benzalkonium Chloride according to the labeled amount, add water or concentrate on a water bath, if necessary, to make 10 mL. Proceed with 1 mL of this solution as directed in the Identification (4) under Benzalkonium Chloride.

**Assay** Pipet a volume of Benzalkonium Chloride Solution, equivalent to about 0.15 g of benzalkonium chloride ( $C_{22}H_{40}ClN$ ), dilute with water to make 75 mL, if necessary, and proceed as directed in the Assay under Benzalkonium Chloride.

Each mL of 0.02 mol/L sodium tetraphenylboron VS  
= 7.080 mg of benzalkonium chloride ( $C_{22}H_{40}ClN$ )

**Containers and storage** Containers—Tight containers.

## Benzalkonium Chloride Concentrated Solution 50

濃ベンザルコニウム塩化物液 50

Benzalkonium Chloride Concentrated Solution 50 is an aqueous solution, presented as  $[C_6H_5CH_2N(CH_3)_2R]Cl$ , where R ranges from  $C_8H_{17}$  to  $C_{18}H_{37}$ , and mainly consisting of  $C_{12}H_{25}$  and  $C_{14}H_{29}$ .

It contains more than 50.0 w/v% and not more than 55.0 w/v% of benzalkonium chloride ( $C_{22}H_{40}ClN$ ; 354.01).

**Description** Benzalkonium Chloride Concentrated Solution 50 is a colorless to light yellow liquid or jelly-like fluid, and has a characteristic odor.

It is very soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

A solution prepared by adding water to it vigorously foams when shaken.

**Identification (1)** Dissolve 0.4 g of Benzalkonium Chloride Concentrated Solution 50 in 1 mL of sulfuric acid, add 0.1 g of sodium nitrate, and heat for 5 minutes on a water bath. After cooling, add 10 mL of water and 0.5 g of zinc powder, heat for 5 minutes, cool, and filter: the filtrate responds to the Qualitative Tests <1.09> for primary aromatic amines. The color of the solution is red.

(2) To 2 mL of a solution of Benzalkonium Chloride Concentrated Solution 50 (1 in 500) add a mixture of 0.2 mL of a solution of bromophenol blue (1 in 2000) and 0.5 mL of sodium hydroxide TS: a blue color develops. Add 4 mL of chloroform to this solution, and shake vigorously: the blue color shifts to the chloroform layer. Collect the chloroform layer, and add dropwise, with stirring, a solution of sodium lauryl sulfate (1 in 1000): the chloroform layer turns colorless.

(3) Determine the absorption spectrum of a solution of Benzalkonium Chloride Concentrated Solution 50 in 0.1 mol

/L hydrochloric acid TS (1 in 1000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) To 1 mL of a solution of Benzalkonium Chloride Concentrated Solution 50 (1 in 50) add 2 mL of ethanol (95), 0.5 mL of dilute nitric acid and 1 mL of silver nitrate TS: a white precipitate is produced. This precipitate does not dissolve on the addition of dilute nitric acid, but dissolves on the addition of ammonia TS.

**Purity (1)** Clarity and color of solution—Dissolve 2.0 g of Benzalkonium Chloride Concentrated Solution 50 in 10 mL of water: the solution is clear and colorless to light yellow.

(2) Petroleum ether-soluble substances—To 6.0 g of Benzalkonium Chloride Concentrated Solution 50 add water to make 50 mL, then add 50 mL of ethanol (99.5) and 5 mL of 0.5 mol/L sodium hydroxide TS, and extract with three 50-mL portions of petroleum ether. Combine the petroleum ether extracts, and wash with three 50-mL portions of dilute ethanol. After shaking well with 10 g of anhydrous sodium sulfate, filter through a dry filter paper, and wash the filter paper with two 10-mL portions of petroleum ether. Evaporate the petroleum ether on a water bath by heating, and dry the residue at 105°C for 1 hour: the residue is not more than 1.0%.

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.3 g of Benzalkonium Chloride Concentrated Solution 50, and dissolve in 75 mL of water. Adjust the pH to between 2.6 and 3.4 by adding dropwise diluted dilute hydrochloric acid (1 in 2), add 1 drop of methyl orange TS, and titrate <2.50> with 0.02 mol/L sodium tetraphenylboron VS until the color of the solution becomes red.

Each mL of 0.02 mol/L sodium tetraphenylborate VS  
= 7.080 mg of benzalkonium chloride ( $C_{22}H_{40}ClN$ )

**Containers and storage** Containers—Tight containers.

## Benzbromarone

ベンズブロマロン

$C_{17}H_{12}Br_2O_3$ : 424.08  
3,5-Dibromo-4-hydroxyphenyl 2-ethylbenzo[b]furan-3-yl ketone [3562-84-3]

Benzbromarone, when dried, contains not less than 98.5% and not more than 101.0% of  $C_{17}H_{12}Br_2O_3$ .

**Description** Benzbromarone occurs as a white to light yellow, crystalline powder.

It is very soluble in *N,N*-dimethylformamide, freely soluble in acetone, sparingly soluble in ethanol (99.5), and practically insoluble in water.

It dissolves in dilute sodium hydroxide TS.

**Identification (1)** Determine the absorption spectrum of a solution of Benzbromarone in 0.01 mol/L sodium hydroxide TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Benzbromarone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 149 – 153°C

**Purity (1) Sulfate** <1.14>—Dissolve 1.0 g of Benzbromarone in 40 mL of acetone, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.40 mL of 0.005 mol/L sulfuric acid VS add 40 mL of acetone, 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.019%).

(2) Soluble halides—Dissolve 0.5 g of Benzbromarone in 40 mL of acetone, and add 6 mL of dilute nitric acid and water to make 50 mL. Proceed with this solution as directed under Chloride Limit Test <1.03>. Prepare the control solution as follows: to 0.25 mL of 0.01 mol/L hydrochloric acid VS add 40 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL.

(3) Heavy metals <1.07>—Proceed with 2.0 g of Benzbromarone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Iron <1.10>—Prepare the test solution with 1.0 g of Benzbromarone according to Method 3, and perform the test according to Method A. Prepare the control solution with 2.0 mL of Standard Iron Solution (not more than 20 ppm).

(5) Related substances—Dissolve 0.10 g of Benzbromarone in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of cyclohexane, 4-methyl-2-pentanone, ethanol (99.5) and acetic acid (100) (100:20:2:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum at a pressure not exceeding 0.67 kPa, phosphorus (V) oxide, 50°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Benzbromarone, previously dried, dissolve in 30 mL of *N,N*-dimethylformamide, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide VS (indicator: 5 drops of thymol blue-dimethylformamide TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS

= 42.41 mg of  $C_{17}H_{12}Br_2O_3$

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

## Benzethonium Chloride

ベンゼトニウム塩化物

$C_{27}H_{42}ClNO_2$ : 448.08

*N*-Benzyl-*N,N*-dimethyl-2-[2-[4-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethylammonium chloride [I21-54-0]

Benzethonium Chloride, when dried, contains not less than 97.0% of  $C_{27}H_{42}ClNO_2$ .

**Description** Benzethonium Chloride occurs as colorless or white crystals. It is odorless.

It is very soluble in ethanol (95), freely soluble in water, and practically insoluble in diethyl ether.

A solution of Benzethonium Chloride foams strongly when shaken.

**Identification (1)** Dissolve 0.2 g of Benzethonium Chloride in 1 mL of sulfuric acid, add 0.1 g of sodium nitrate, and heat for 5 minutes on a water bath. After cooling, add 10 mL of water and 0.5 g of zinc powder, heat for 5 minutes, cool, and filter: the filtrate responds to the Qualitative Tests <1.09> for primary aromatic amines, developing a red color.

(2) To 2 mL of a solution of Benzethonium Chloride (1 in 1000) add a mixture of 0.2 mL of a solution of bromophenol blue (1 in 2000) and 0.5 mL of sodium hydroxide TS: a blue color develops. Add 4 mL of chloroform to this solution, and shake vigorously: the blue color shifts to the chloroform layer. Collect the chloroform layer, and add dropwise a solution of sodium lauryl sulfate (1 in 1000) with stirring: the chloroform layer turns colorless.

(3) Determine the absorption spectrum of a solution of Benzethonium Chloride in 0.1 mol/L hydrochloric acid TS (1 in 5000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) To 1 mL of a solution of Benzethonium Chloride (1 in 100) add 2 mL of ethanol (95), 0.5 mL of dilute nitric acid and 1 mL of silver nitrate TS: a white precipitate is produced. This precipitate does not dissolve on addition of dilute nitric acid, but dissolves on addition of ammonia TS.

**Melting point** <2.60> 158 – 164°C (after drying).

**Purity Ammonium**—Dissolve 0.10 g of Benzethonium Chloride in 5 mL of water, and boil with 3 mL of sodium hydroxide TS: the evolving gas does not change moistened red litmus paper to blue.

**Loss on drying** <2.41> Not more than 5.0% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Benzethonium Chloride, previously dried, dissolve in 75 mL of water, add diluted dilute hydrochloric acid (1 in 2) dropwise to adjust the pH to 2.6–3.4, then add 1 drop of methyl orange TS, and titrate <2.50> with 0.02 mol/L tetraphenylboron VS until the solution develops a red.

Each mL of 0.02 mol/L sodium tetraphenylboron VS  
= 8.962 mg of  $C_{27}H_{42}ClNO_2$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Benzethonium Chloride Solution

ベンゼトニウム塩化物液

Benzethonium Chloride Solution contains not less than 93% and not more than 107% of the labeled amount of benzethonium chloride ( $C_{27}H_{42}ClNO_2$ ; 448.08).

**Method of preparation** Dissolve Benzethonium Chloride in Water or Purified Water.

**Description** Benzethonium Chloride Solution is a clear, colorless liquid. It is odorless.

It foams strongly when shaken.

**Identification (1)** Evaporate a volume of Benzethonium Chloride Solution, equivalent to 0.2 g of Benzethonium Chloride according to the labeled amount, on a water bath to dryness, and proceed with the residue as directed in the Identification (1) under Benzethonium Chloride.

**(2)** To a volume of Benzethonium Chloride Solution, equivalent to 0.01 g of Benzethonium Chloride according to the labeled amount, add water to make 10 mL, proceed with 2 mL of this solution as directed in the Identification (2) under Benzethonium Chloride.

**(3)** To a volume of Benzethonium Chloride Solution, equivalent to 1 g of Benzethonium Chloride according to the labeled amount, and add water or concentrate on a water bath to make 10 mL. To 1 mL of this solution add 0.1 mol/L hydrochloric acid TS to make 500 mL, and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 262 nm and 264 nm, between 268 nm and 270 nm, and between 274 nm and 276 nm.

**(4)** To a volume of Benzethonium Chloride Solution, equivalent to 0.1 g of Benzethonium Chloride according to the labeled amount, add water, or concentrate on a water bath, if necessary, to make 10 mL, and proceed with 1 mL of this solution as directed in the Identification (4) under Benzethonium Chloride.

**Purity (1)** Nitrite—Add 1.0 mL of Benzethonium Chloride Solution to a mixture of 1 mL of a solution of glycine (1 in 10) and 0.5 mL of acetic acid (31): no gas is evolved.

**(2)** Oxidizing substances—To 5 mL of Benzethonium

Chloride Solution add 0.5 mL of potassium iodide TS and 2 to 3 drops of dilute hydrochloric acid: no yellow color is produced.

**Assay** Pipet a volume of Benzethonium Chloride Solution, equivalent to about 0.2 g of benzethonium chloride ( $C_{27}H_{42}ClNO_2$ ), dilute with water to make 75 mL, if necessary, and proceed as directed in the Assay under Benzethonium Chloride.

Each mL of 0.02 mol/L sodium tetraphenylboron VS  
= 8.962 mg of benzethonium chloride ( $C_{27}H_{42}ClNO_2$ )

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Benzoic Acid

安息香酸

$C_7H_6O_2$ : 122.12  
Benzoic acid [65-85-0]

Benzoic Acid, when dried, contains not less than 99.5% of  $C_7H_6O_2$ .

**Description** Benzoic Acid occurs as white crystals or crystalline powder. It is odorless, or has a faint, benzaldehyde-like odor.

It is freely soluble in ethanol (95), in acetone and in diethyl ether, soluble in hot water, and slightly soluble in water.

**Identification** Dissolve 1 g of Benzoic Acid in 8 mL of sodium hydroxide TS, and add water to make 100 mL. This solution responds to the Qualitative Tests <1.09> (2) for benzoate.

**Melting point** <2.60> 121 – 124°C

**Purity (1)** Heavy metals <1.07>—Dissolve 1.0 g of Benzoic Acid in 25 mL of acetone, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 2 mL of dilute acetic acid, 25 mL of acetone and water to make 50 mL (not more than 20 ppm).

**(2)** Chlorinated compounds—Take 0.5 g of Benzoic Acid and 0.7 g of calcium carbonate in a crucible, mix with a small amount of water, and dry. Ignite it at about 600°C, dissolve in 20 mL of dilute nitric acid, and filter. Wash the residue with 15 mL of water, combine the filtrate and the washing, add water to make 50 mL, and add 0.5 mL of silver nitrate TS: this solution has not more turbid than the following control solution.

Control solution: Dissolve 0.7 g of calcium carbonate in 20 mL of dilute nitric acid, and filter. Wash the residue with 15 mL of water, combine the filtrate and the washings, add 1.2 mL of 0.01 mol/L hydrochloric acid VS and water to make 50 mL, and add 0.5 mL of silver nitrate TS.

**(3)** Potassium permanganate-reducing substances—Add 0.02 mol/L potassium permanganate VS dropwise to a boiling mixture of 100 mL of water and 1.5 mL of sulfuric acid, until a red color persists for 30 seconds. Dissolve 1.0 g of

Benzoic Acid in this boiling solution, and add 0.50 mL of 0.02 mol/L potassium permanganate VS: a red color persists for at least 15 seconds.

(4) Phthalic acid—To 0.10 g of Benzoic Acid add 1 mL of water and 1 mL of resorcinol-sulfuric acid TS, and heat the mixture in an oil bath heated at a temperature between 120°C and 125°C. After evaporating the water, heat the residue for 90 minutes, cool, and dissolve in 5 mL of water. To 1 mL of the solution add 10 mL of a solution of sodium hydroxide (43 in 500), shake, then examine under light at a wavelength between 470 nm and 490 nm: the green fluorescence of the solution is not more intense than that of the following control solution.

Control solution: Dissolve 61 mg of potassium hydrogen phthalate in water to make exactly 1000 mL. Measure exactly 1 mL of the solution, add 1 mL of resorcinol-sulfuric acid TS, and proceed as directed above.

(5) Readily carbonizable substances <1.15>—Perform the test with 0.5 g of Benzoic Acid. The solution is not more colored than Matching Fluid Q.

**Loss on drying** <2.41> Not more than 0.5% (1 g, silica gel, 3 hours).

**Residue on ignition** <2.44> Not more than 0.05% (1 g).

**Assay** Weigh accurately about 0.5 g of Benzoic Acid, previously dried, dissolve in 25 mL of neutralized ethanol and 25 mL of water, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS).

Each mL of 0.1 mol/L sodium hydroxide VS  
= 12.21 mg of C<sub>7</sub>H<sub>6</sub>O<sub>2</sub>

**Containers and storage** Containers—Well-closed containers.

## Benzyl Alcohol

ベンジルアルコール

C<sub>7</sub>H<sub>8</sub>O: 108.14

Benzyl alcohol [100-51-6]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols (♦ ◆).

Benzyl Alcohol contains not less than 98.0% and not more than 100.5% of C<sub>7</sub>H<sub>8</sub>O.

♦The label states, where applicable, that it is suitable for use in the manufacture of injection forms.◆

♦**Description** Benzyl Alcohol is a clear, colorless oily liquid.

It is miscible with ethanol (95), with fatty oils and with essential oils.

It is soluble in water.

Specific gravity  $d_{20}^{20}$ : 1.043 – 1.049◆

♦**Identification** Determine the infrared absorption spectrum of Benzyl Alcohol as directed in the liquid film method

under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.◆

**Refractive index** <2.45>  $n_D^{20}$ : 1.538 – 1.541

**Purity** (1) Clarity and color of solution—Dissolve 2.0 mL of Benzyl Alcohol in 60 mL of water: the solution is clear and colorless.

(2) Acidity—To 10 mL of Benzyl Alcohol add 10 mL of neutralized ethanol, 2 drops of phenolphthalein TS and 1.0 mL of 0.1 mol/L sodium hydroxide VS: a red color develops.

(3) Benzaldehyde and other related substances—Use Benzyl Alcohol as the sample solution. Separately, weigh exactly 0.750 g of benzaldehyde and 0.500 g of cyclohexylmethanol, and add Benzyl Alcohol to make exactly 25 mL. Pipet 1 mL of this solution, add exactly 2 mL of ethylbenzene internal standard solution and exactly 3 mL of dicyclohexyl internal standard solution, then add Benzyl Alcohol to make exactly 20 mL, and use this solution as the standard solution (1). Perform the test with 0.1 μL each of the sample solution and standard solution (1) as directed under Gas Chromatography <2.02> according to the following conditions: no peaks of ethylbenzene and dicyclohexyl appear on the chromatogram obtained with the sample solution. When 0.1 μL of the standard solution (1) is injected, adjust the sensitivity of the detector so that the peak height of ethylbenzene is not more than 30% of the full scale of the recorder. The peak area of benzaldehyde obtained with the sample solution is not more than the difference between the peak areas of benzaldehyde of the sample solution and the standard solution (1) (0.15%), and the peak area of cyclohexylmethanol with the sample solution is not more than the difference between the peak areas of cyclohexylmethanol of the sample solution and the standard solution (1) (0.10%). The total area of the peaks having smaller retention time than benzyl alcohol and other than benzaldehyde and cyclohexylmethanol obtained with the sample solution is not more than 4 times the peak area of ethylbenzene with the standard solution (1) (0.04%). The total area of the peaks having larger retention time than benzyl alcohol obtained with the sample solution is not more than the peak area of dicyclohexyl with the standard solution (1) (0.3%). For these calculations the peak areas less than 1/100 times the peak area of ethylbenzene with the standard solution (1) are excluded.

Benzyl Alcohol labeled that it is suitable for use in the manufacture of injection forms meets the following requirements.

Use Benzyl Alcohol as the sample solution. Separately, weigh exactly 0.250 g of benzaldehyde and 0.500 g of cyclohexylmethanol, and add Benzyl Alcohol to make exactly 25 mL. Pipet 1 mL of this solution, add exactly 2 mL of the ethylbenzene internal standard solution and exactly 2 mL of the dicyclohexyl internal standard solution, then add Benzyl Alcohol to make exactly 20 mL, and use this solution as the standard solution (2). Perform the test with 0.1 μL each of the sample solution and standard solution (2) as directed under Gas Chromatography <2.02> according to the following conditions: no peaks of ethylbenzene and dicyclohexyl appear on the chromatogram obtained with the sample solution. When 0.1 μL of the standard solution (2) is injected, adjust the sensitivity of the detector so that the peak height of ethylbenzene is not more than 30% of the full scale of the recorder. The peak area of benzaldehyde of obtained with the

sample solution is not more than the difference between the peak areas of benzaldehyde of the sample solution and the standard solution (2) (0.05%), and the peak area of cyclohexylmethanol with the sample solution is not more than the difference between the peak areas of cyclohexylmethanol of the sample solution and the standard solution (2) (0.10%). The total area of the peaks having smaller retention time than benzyl alcohol and other than benzaldehyde and cyclohexylmethanol obtained with the sample solution is not more than 2 times the peak area of ethylbenzene with the standard solution (2) (0.02%). The total area of the peaks having larger retention time than benzyl alcohol obtained with the sample solution is not more than the peak area of dicyclohexyl with the standard solution (2) (0.2%). For these calculation the peak areas less than 1/100 times the peak area of ethylbenzene with the standard solution (2) are excluded.

**Ethylbenzene internal standard solution:** Dissolve exactly 0.100 g of ethylbenzene in Benzyl Alcohol to make exactly 10 mL. Pipet 2 mL of this solution, and add Benzyl Alcohol to make exactly 20 mL.

**Dicyclohexyl internal standard solution:** Dissolve exactly 2.000 g of dicyclohexyl in Benzyl Alcohol to make exactly 10 mL. Pipet 2 mL of this solution, and add Benzyl Alcohol to make exactly 20 mL.

**Operating conditions—**

**Detector:** A hydrogen flame – ionization detector

**Column:** A fused silica column 0.32 mm in inside diameter and 30 m in length, coated inside with polyethylene glycol 20 M for gas chromatography in 0.5  $\mu$ m thickness.

**Column temperature:** Raise the temperature at a rate of 5°C per minutes from 50°C to 220°C, and maintain at 220°C for 35 minutes.

**Temperature of injection port:** A constant temperature of about 200°C.

**Temperature of detector:** A constant temperature of about 310°C.

**Carrier gas:** Helium

**Flow rate:** Adjust the flow rate so that the retention time of benzyl alcohol is between 24 and 28 minutes.

**Split ratio:** Splitless

**System suitability—**

**System performance:** When the procedure is run with the standard solution (1) under the above operating conditions, the relative retention times of ethylbenzene, dicyclohexyl, benzaldehyde and cyclohexylmethanol with respect to benzyl alcohol are about 0.28, about 0.59, about 0.68 and about 0.71, respectively, and the resolution between the peaks of benzaldehyde and cyclohexylmethanol is not less than 3.0. In the case of Benzyl Alcohol labeled to use for injection, proceed with the standard solution (2) instead of the standard solution (1).

(4) **Peroxide value—**Dissolve 5 g of Benzyl Alcohol in 30 mL of a mixture of acetic acid (100) and chloroform (3:2) in a 250-mL glass-stoppered conical flask. Add 0.5 mL of potassium iodide saturated solution, shake exactly for 1 minute, add 30 mL of water, and titrate <2.50> with 0.01 mol/L sodium thiosulfate VS until the blue color of the solution disappears after addition of 10 mL of starch TS near the end point where the solution is a pale yellow color. Perform a blank determination in the same manner. Calculate the amount of peroxide by the following formula: not more than 5.

$$\text{Amount (mEq/kg) of peroxide} = \{10 \times (V_1 - V_0)\} / W$$

$V_1$ : Volume (mL) of 0.01 mol/L sodium thiosulfate VS consumed in the test

$V_0$ : Volume (mL) of 0.01 mol/L sodium thiosulfate VS consumed in the blank

$W$ : Amount (g) of the sample

(5) **Residue on evaporation—**Perform the test after conformation that the sample meets the requirement of the peroxide value. Transfer 10.0 g of Benzyl Alcohol to a porcelain or quartz crucible or platinum dish, previously weighed accurately, and heat on a hot-plate at not exceeding 200°C, taking care to avoid boiling, to evaporate to dryness. Dry the residue on the hot-plate for 1 hour, and allow to cool in a desiccator: not more than 5 mg.

**Assay** Weigh accurately about 0.9 g of Benzyl Alcohol, add exactly 15.0 mL of a mixture of pyridine and acetic anhydride (7:1), and heat on a water bath under a reflux condenser for 30 minutes. Cool, add 25 mL of water, and titrate <2.50> the excess acetic acid with 1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination.

$$\begin{aligned} \text{Each mL of 1 mol/L sodium hydroxide VS} \\ = 108.1 \text{ mg of C}_7\text{H}_8\text{O} \end{aligned}$$

♦ **Containers and storage** Containers—Tight containers. Storage—Light-resistant. ♦

## Benzyl Benzoate

安息香酸ベンジル

$\text{C}_{14}\text{H}_{12}\text{O}_2$ : 212.24

Benzyl benzoate [120-51-4]

Benzyl Benzoate contains not less than 99.0% of  $\text{C}_{14}\text{H}_{12}\text{O}_2$ .

**Description** Benzyl Benzoate is a colorless, clear, viscous liquid. It has a faint, aromatic odor and a pungent, burning taste.

It is miscible with ethanol (95) and with diethyl ether.

It is practically insoluble in water.

Congealing point: about 17°C

Specific gravity  $d_{20}^{20}$ : about 1.123

Boiling point: about 323°C

**Identification** (1) Heat gently 1 mL of Benzyl Benzoate with 5 mL of sodium carbonate TS and 2 mL of potassium permanganate TS: the odor of benzaldehyde is perceptible.

(2) Warm the titrated mixture obtained in the Assay on a water bath to remove ethanol, and add 0.5 mL of iron (III) chloride TS: a light yellow-red precipitate is produced, which turns white on the addition of dilute hydrochloric acid.

**Refractive index** <2.45>  $n_D^{20}$ : 1.568 – 1.570

**Purity** Acidity—Dissolve 5.0 mL of Benzyl Benzoate in 25 mL of neutralized ethanol, and add 0.50 mL of 0.1 mol/L so-

dium hydroxide VS: a red color develops.

**Residue on ignition** <2.44> Not more than 0.05% (2 g).

**Assay** Weigh accurately about 2 g of Benzyl Benzoate, add exactly 50 mL of 0.5 mol/L potassium hydroxide-ethanol VS, and boil gently for 1 hour under a reflux condenser with a carbon dioxide-absorbing tube (soda lime). Cool, and titrate <2.50> the excess potassium hydroxide with 0.5 mol/L hydrochloric acid VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination.

Each mL of 0.5 mol/L potassium hydroxide-ethanol VS = 106.1 mg of  $C_{14}H_{12}O_2$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Benzylpenicillin Benzathine Hydrate

ベンジルペニシリンベンザチン水和物

$(C_{16}H_{18}N_2O_4S)_2 \cdot C_{16}H_{20}N_2 \cdot 4H_2O$ : 981.18  
(2*S*,5*R*,6*R*)-3,3-Dimethyl-7-oxo-6-[(phenylacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid hemi(*N,N'*-dibenzylethylenediamine) dihydrate [41372-02-5]

Benzylpenicillin Benzathine Hydrate is the *N,N'*-dibenzylethylenediamine salt of a penicillin compound having antibacterial activity produced by the growth of *Penicillium* species.

It contains not less than 1213 Units and not more than 1333 Units per mg, calculated on the anhydrous basis. The potency of Benzylpenicillin Benzathine Hydrate is expressed as unit calculated from the amount of benzylpenicillin sodium ( $C_{16}H_{17}N_2NaO_4S$ : 356.37). 1 Unit of Benzylpenicillin Benzathine Hydrate is equivalent to 0.6  $\mu$ g of benzylpenicillin sodium ( $C_{16}H_{17}N_2NaO_4S$ ). It contains not less than 24.0% and not more than 27.0% of *N,N'*-dibenzylethylenediamine ( $C_{16}H_{20}N_2$ : 240.34), calculated on the anhydrous basis.

**Description** Benzylpenicillin Benzathine Hydrate occurs as a white crystalline powder.

It is slightly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Benzylpenicillin Benzathine Hydrate in methanol (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Benzylpenicillin Benzathine Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference

Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +217 – +233° (0.1 g calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Benzylpenicillin Benzathine Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Benzylpenicillin Benzathine Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 70 mg of Benzylpenicillin Benzathine Hydrate in 25 mL of methanol, add a solution prepared by dissolving 1.02 g of disodium hydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in water to make 1000 mL to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase A to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak having the relative retention time of about 2.4 with respect to benzylpenicillin is not more than 2 times the total area of the peaks of benzylpenicillin and *N,N'*-dibenzylethylenediamine obtained from the standard solution, and the area of the peak other than benzylpenicillin, *N,N'*-dibenzylethylenediamine and the peak having the relative retention time of about 2.4 is not more than the total area of the peaks of benzylpenicillin and *N,N'*-dibenzylethylenediamine obtained from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.0 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase A: A mixture of water, methanol and 0.25 mol/L potassium dihydrogen phosphate TS, pH 3.5 (6:3:1).

Mobile phase B: A mixture of methanol, water and 0.25 mol/L potassium dihydrogen phosphate TS, pH 3.5 (6:3:1).

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 – 10	75	25
10 – 20	75 → 0	25 → 100
20 – 55	0	100

Flow rate: 1.0 mL/min

Time span of measurement: About 3 times as long as the retention time of benzylpenicillin beginning after the solvent peak.

**System suitability**—

Test for required detectability: To exactly 1 mL of the standard solution add the mobile phase A to make exactly 20 mL. Confirm that the peak area of benzylpenicillin obtained from 20  $\mu$ L of this solution is equivalent to 3.5 to 6.5% of that from the standard solution.

System performance: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, *N,N'*-dibenzylethylenediamine and benzylpenicillin are eluted in this order with the resolution between these peaks being not less than 25.

System repeatability: When the test is repeated 3 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of benzylpenicillin is not more than 2.0%.

**Water** <2.48> 5.0 – 8.0% (1 g, volumetric titration, direct titration).

**Assay (1)** Benzylpenicillin—Weigh accurately an amount of Benzylpenicillin Benzathine Hydrate, equivalent to about 85,000 Units, dissolve in 25 mL of methanol, and add a solution containing 1.02 g of disodium hydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in 1000 mL of water to make exactly 50 mL. Pipet 5 mL of this solution, add a mixture of the solution containing 1.02 g of disodium hydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in 1000 mL of water and methanol (1:1) to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Benzylpenicillin Potassium Reference Standard, equivalent to about 85,000 Units, and about 25 mg of *N,N'*-dibenzylethylenediamine diacetate, dissolve in 25 mL of methanol, and add the solution containing 1.02 g of disodium hydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in 1000 mL of water to make exactly 50 mL. Pipet 5 mL of this solution, add a mixture of the solution containing 1.02 g of disodium hydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in 1000 mL of water and methanol (1:1) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of benzylpenicillin.

Amount (unit) of benzylpenicillin sodium ( $C_{16}H_{17}N_2NaO_4S$ )  
 $= W_S \times (A_T/A_S)$

$W_S$ : Amount (unit) of Benzylpenicillin Potassium Reference Standard

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 220 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** A mixture of water, methanol and 0.25 mol/L potassium dihydrogen phosphate TS, pH 3.5 (11:7:2).

**Flow rate:** Adjust the flow rate so that the retention time of benzylpenicillin is about 18 minutes.

**System suitability**—

System performance: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating

conditions, *N,N'*-dibenzylethylenediamine and benzylpenicillin are eluted in this order with the resolution between these peaks being not less than 20.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviations of the peak areas of *N,N'*-dibenzylethylenediamine and benzylpenicillin are not more than 2.0%, respectively.

(2) *N,N'*-Dibenzylethylenediamine—Determine the areas,  $A_T$  and  $A_S$ , of the peak corresponding to *N,N'*-dibenzylethylenediamine on the chromatograms obtained in (1) with the sample solution and standard solution.

Amount (%) of *N,N'*-dibenzylethylenediamine ( $C_{16}H_{20}N_2$ )  
 $= (W_S/W_T) \times (A_T/A_S) \times 100 \times 0.667$

$W_S$ : Amount (mg) of *N,N'*-dibenzylethylenediamine diacetate

$W_T$ : Amount (mg) of the sample

0.667: Conversion factor for the molecular mass of *N,N'*-dibenzylethylenediamine diacetate ( $C_{16}H_{20}N_2 \cdot 2CH_3COOH$ ) to that of *N,N'*-dibenzylethylenediamine (benzathine,  $C_{16}H_{20}N_2$ )

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Benzylpenicillin Potassium

### Penicillin G Potassium

ベンジルペニシリンカリウム

$C_{16}H_{17}KN_2O_4S$ : 372.48

Monopotassium (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[(phenylacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [113-98-4]

Benzylpenicillin Potassium is the potassium salt of a penicillin substance having antibacterial activity produced by the growth of *Penicillium* species.

It contains not less than 1430 units and not more than 1630 units per mg, calculated on the dried basis. The potency of Benzylpenicillin Potassium is expressed as mass unit of benzylpenicillin potassium ( $C_{16}H_{17}KN_2O_4S$ ). One unit of Benzylpenicillin Potassium is equivalent to 0.57  $\mu$ g of benzylpenicillin potassium.

**Description** Benzylpenicillin Potassium occurs as white, crystals or crystalline powder.

It is very soluble in water, and slightly soluble in ethanol (99.5).

**Identification (1)** Determine the absorption spectrum of a solution of Benzylpenicillin Potassium (1 in 1000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Benzylpenicillin Potassium Refer-

ence Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Benzylpenicillin Potassium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Benzylpenicillin Potassium Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Benzylpenicillin Potassium responds to the Qualitative Tests <1.09> (1) for potassium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +270 – +300° (1.0 g calculated on the dried basis, water, 50 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 1.0 g of Benzylpenicillin Potassium in 100 mL of water is between 5.0 and 7.5.

**Purity** (1) Clarity and color of solution—A solution obtained by dissolving 1 g of Benzylpenicillin Potassium in 10 mL of water is clear, and colorless or light yellow.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Benzylpenicillin Potassium according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution by incinerating 1.0 g of Benzylpenicillin Potassium according to Method 4, and perform the test. In the incineration, use a crucible of porcelain, and after addition of 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) add 1 mL of hydrogen peroxide (30), then burn the ethanol (not more than 2 ppm).

(4) Related substances—Dissolve 40 mg of Benzylpenicillin Potassium in 20 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than benzylpenicillin obtained from the sample solution is not more than the peak area of benzylpenicillin from the standard solution, and the total area of the peaks other than benzylpenicillin from the sample solution is not more than 3 times the peak area of benzylpenicillin from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of a solution of diammonium hydrogen phosphate (33 in 5000) and acetonitrile (19:6), adjusted the pH to 8.0 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of benzylpenicillin is about 7.5 minutes.

Time span of measurement: About 5 times as long as the

retention time of benzylpenicillin.

**System suitability**—

Test for required detection: Pipet 10 mL of the standard solution, and add water to make exactly 100 mL. Confirm that the peak area of benzylpenicillin obtained from 20  $\mu$ L of this solution is equivalent to 7 to 13% of that from 20  $\mu$ L of the standard solution.

System performance: Dissolve 40 mg of Benzylpenicillin Potassium in 20 mL of water. Separately, dissolve 10 mg of methyl parahydroxybenzoate in 20 mL of acetonitrile. To 1 mL of this solution add water to make 20 mL. Mix 1 mL each of these solutions, and add water to make 100 mL. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, benzylpenicillin and methyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 5 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of benzylpenicillin is not more than 2.0%.

**Loss on drying** <2.41> Not more than 1.0% (3 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Staphylococcus aureus* ATCC 6538 P

(ii) Culture medium—Use the medium iii in 3) under (1) Agar media for seed and base layer.

(iii) Standard solutions—Weigh accurately an amount of Benzylpenicillin Potassium Reference Standard, equivalent to about 40,000 units, dissolve in phosphate buffer solution, pH 6.0 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 5°C and use within 2 days. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 2 units and 0.5 units, and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Benzylpenicillin Potassium, equivalent to about 40,000 units, and dissolve in phosphate buffer solution, pH 6.0 to make exactly 100 mL. Take exactly a suitable amount of this solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 2 units and 0.5 units, and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Berberine Chloride Hydrate

ベルベリン塩化物水和物

$C_{20}H_{18}ClNO_4 \cdot xH_2O$   
9,10-Dimethoxy-5,6-dihydro[1,3]dioxolo[4,5-g]isoquino[3,2-a]isoquinolin-7-ium chloride hydrate [633-65-8, anhydride]

Berberine Chloride Hydrate contains not less than 95.0% and not more than 102.0% of berberine chloride ( $C_{20}H_{18}ClNO_4$ ; 371.81), calculated on the anhydrous basis.

**Description** Berberine Chloride Hydrate occurs as yellow crystals or crystalline powder. It is odorless or has a faint, characteristic odor. It has a very bitter taste.

It is sparingly soluble in methanol, slightly soluble in ethanol (95), and very slightly soluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Berberine Chloride Hydrate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Berberine Chloride Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Berberine Chloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Berberine Chloride Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 0.1 g of Berberine Chloride Hydrate in 20 mL of water by warming, add 0.5 mL of nitric acid, cool, and filter after allowing to stand for 10 minutes. To 3 mL of the filtrate add 1 mL of silver nitrate TS, and collect the produced precipitate: the precipitate does not dissolve in dilute nitric acid, but it dissolves in an excess amount of ammonia TS.

**Purity (1) Acidity**—Shake thoroughly 0.10 g of Berberine Chloride Hydrate with 30 mL of water, and filter. To the filtrate add 2 drops of phenolphthalein TS and 0.10 mL of 0.1 mol/L sodium hydroxide VS: the yellow color changes to an orange to red color.

(2) Sulfate <1.14>—Shake 1.0 g of Berberine Chloride Hydrate with 48 mL of water and 2 mL of dilute hydrochloric acid for 1 minute, and filter. Discard the first 5 mL of the filtrate, take the subsequent 25 mL of the filtrate, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS, 1 mL of dilute hydrochloric

acid, 5 to 10 drops of bromophenol blue TS and water to make 50 mL (not more than 0.048%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Berberine Chloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(4) Related substances—Dissolve 10 mg of Berberine Chloride Hydrate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 4 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total of the peak of the areas other than berberine of the sample solution is not larger than the peak area of berberine of the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, flow rate, and selection of column: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of berberine beginning after the solvent peak.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of berberine obtained from 10  $\mu$ L of the standard solution is about 10% of the full scale.

**Water** <2.48> 8 – 12% (0.1 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately 10 mg of Berberine Chloride Hydrate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Berberine Chloride Reference Standard (separately, determine the water content <2.48> in the same manner as Berberine Chloride Hydrate), and dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine the peak areas,  $A_T$  and  $A_S$  of berberine in each solution.

$$\begin{aligned} \text{Amount (mg) of berberine chloride (C}_{20}\text{H}_{18}\text{ClNO}_4) \\ = W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Berberine Chloride Reference Standard, calculated on the anhydrous basis

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 345 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 25 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 3.4 g of monobasic potassium phosphate and 1.7 g of sodium lauryl sulfate in 1000 mL of a mixture of water and acetonitrile (1:1).

Flow rate: Adjust the flow rate so that the retention time of berberine is about 10 minutes.

Selection of column: Dissolve each 1 mg of berberine

chloride and palmatin chloride in the mobile phase to make 10 mL. Proceed with 10  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of palmatin and berberine in this order with the resolution between these peaks being not less than 1.5.

**System repeatability:** When the test is repeated 5 times with the standard solution under the above operating conditions, the relative standard deviation of the peak areas of berberine is not more than 1.5%.

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Berberine Tannate

タンニン酸ベルベリン

Berberine Tannate is a compound of berberine and tannic acid.

It contains not less than 27.0% and not more than 33.0% of berberine ( $C_{20}H_{19}NO_5$ ; 353.37), calculated on the anhydrous basis.

**Description** Berberine Tannate occurs as a yellow to light yellow-brown powder. It is odorless or has a faint, characteristic odor, and is tasteless.

It is practically insoluble in water, in acetonitrile, in methanol and in ethanol (95).

**Identification** (1) To 0.1 g of Berberine Tannate add 10 mL of ethanol (95), and heat in a water bath for 3 minutes with shaking. Cool, filter, and to 5 mL of the filtrate add 1 drop of iron (III) chloride TS: a blue-green color is produced, and on allowing to stand, a bluish black precipitate is formed.

(2) Dissolve 0.01 g of Berberine Tannate in 10 mL of methanol and 0.4 mL of 1 mol/L hydrochloric acid TS, and add water to make 200 mL. To 8 mL of the solution add water to make 25 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Berberine Tannate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Berberine Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity** (1) Acidity—To 0.10 g of Berberine Tannate add 30 mL of water, and filter after shaking well. To the filtrate add 2 drops of phenolphthalein TS and 0.10 mL of 0.1 mol/L sodium hydroxide VS: the color of the solution changes from yellow to orange to red.

(2) Chloride <1.03>—Shake 1.0 g of Berberine Tannate with 38 mL of water and 12 mL of dilute nitric acid for 5 minutes, and filter. Discard the first 5 mL of the filtrate, to 25 mL of the subsequent filtrate add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.01 mol/L hydrochloric acid VS by adding 6 mL of dilute nitric acid, 10

to 15 drops of bromophenol blue TS and water to make 50 mL (not more than 0.035%).

(3) Sulfate <1.14>—Shake 1.0 g of Berberine Tannate with 48 mL of water and 2 mL of dilute hydrochloric acid for 1 minute, and filter. Discard the first 5 mL of the filtrate, take the subsequent 25 mL of the filtrate, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS, 1 mL of dilute hydrochloric acid, 5 to 10 drops of bromophenol blue TS and water to make 50 mL (not more than 0.048%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of Berberine Tannate according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(5) Related substances—Dissolve 10 mg of Berberine Tannate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 4 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total of the peak areas other than berberine of the sample solution is not larger than the peak area of berberine of the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of berberine beginning after the solvent peak.

**System suitability**—

Test for required detectability: To exactly 2 mL of the standard solution add the mobile phase to make exactly 20 mL. Confirm that the peak area of berberine obtained with 10  $\mu$ L of this solution is equivalent to 7 to 13% of that with 10  $\mu$ L of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of berberine is not more than 3.0%.

**Water** <2.48> Not more than 6.0% (0.7 g, direct titration).

**Residue on ignition** <2.44> Not more than 1.0% (1 g).

**Assay** Weigh accurately about 30 mg of Berberine Tannate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Berberine Chloride Reference Standard (separately, determine the water content <2.48> in the same manner as Berberine Chloride Hydrate), dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine the peak areas,  $A_T$  and  $A_S$ , of berberine in each solution.

$$\begin{aligned} &\text{Amount (mg) of berberine (C}_{20}\text{H}_{19}\text{NO}_5) \\ &= W_S \times (A_T/A_S) \times 0.9504 \end{aligned}$$

$W_5$ : Amount (mg) of Berberine Chloride Reference Standard, calculated on the dehydrated basis

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 345 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Dissolve 3.4 g of potassium dihydrogen phosphate and 1.7 g of sodium lauryl sulfate in 1000 mL of a mixture of water and acetonitrile (1:1).

**Flow rate:** Adjust the flow rate so that the retention time of berberine is about 10 minutes.

**System suitability—**

**System performance:** Dissolve 1 mg each of berberine chloride and palmatin chloride in the mobile phase to make 10 mL. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, palmatin and berberine are eluted in this order with the resolution between these peaks being not less than 1.5.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of berberine is not more than 1.5%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Betahistine Mesilate

ベタヒスチンメシル酸塩

$C_8H_{12}N_2 \cdot 2CH_4O_3S$ : 328.41

*N*-Methyl-2-pyridin-2-ylethylamine dimethanesulfonate [5638-76-6, Betahistine]

Betahistine Mesilate, when dried, contains not less than 98.0% and not more than 101.0% of  $C_8H_{12}N_2 \cdot 2CH_4O_3S$ .

**Description** Betahistine Mesilate occurs as white crystals or crystalline powder.

It is very soluble in water, freely soluble in acetic acid (100), and sparingly soluble in ethanol (99.5).

It dissolves in dilute hydrochloric acid.

It is hygroscopic.

**Identification (1)** Determine the absorption spectrum of a solution of Betahistine Mesilate in 0.1 mol/L hydrochloric acid (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Betahistine Mesilate, previously dried, as directed in the potassi-

um bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** To 30 mg of Betahistine Mesilate add 0.1 g of sodium nitrate and 0.1 g of anhydrous sodium carbonate, mix well, and heat gradually. After cooling, dissolve the residue in 2 mL of dilute hydrochloric acid and 10 mL of water, filter if necessary, and to the filtrate add 1 mL of barium chloride TS: a white precipitate is formed.

**Melting point** <2.60> 110 – 114°C (after drying).

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Betahistine Mesilate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(2)** Related substances—Dissolve 50 mg of Betahistine Mesilate in 10 mL of a mixture of water and acetonitrile (63:37), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mixture of water and acetonitrile (63:37) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than betahistine with the sample solution is not larger than 1/10 times the peak area of betahistine with the standard solution, and the total area of the peaks other than the peak of betahistine with the sample solution is not larger than 1/2 times the peak area of betahistine with the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 261 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 35°C.

**Mobile phase:** To 5 mL of diethyl amine and 20 mL of acetic acid (100) add water to make 1000 mL. Dissolve 2.3 g of sodium lauryl sulfate in 630 mL of this solution, and add 370 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of betahistine is about 5 minutes.

**Time span of measurement:** About 3 times as long as the retention time of betahistine beginning after the solvent peak.

**System suitability—**

**Test for required detectability:** To exactly 5 mL of the standard solution add the mixture of water and acetonitrile (63:37) to make exactly 50 mL. Confirm that the peak area of betahistine obtained with 20  $\mu$ L of this solution is equivalent to 7 to 13% of that with 20  $\mu$ L of the standard solution.

**System performance:** Dissolve 10 mg of betahistine mesilate and 10 mg of 2-vinylpyridine in 50 mL of the mixture of water and acetonitrile (63:37). To 2 mL of this solution add the mixture of water and acetonitrile (63:37) to make 50 mL. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, 2-vinylpyridine and betahistine are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with

20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betahistine is not more than 1.0%

**Loss on drying** <2.41> Not more than 1.0% (1 g, in vacuum, phosphorus (V) oxide, 70°C, 24 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Betahistine Mesilate, previously dried, dissolve in 1 mL of acetic acid (100), add 50 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 16.42 mg of  $\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{CH}_4\text{O}_3\text{S}$

**Containers and storage** Containers—Tight containers.

## Betahistine Mesilate Tablets

ベタヒスチンメシル酸塩錠

Betahistine Mesilate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of betahistine mesilate ( $\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{CH}_4\text{O}_3\text{S}$ ; 328.41).

**Method of preparation** Prepare as directed under Tablets, with Betahistine Mesilate.

**Identification** To 5 mL of the sample solution obtained in the Assay add 0.1 mol/L hydrochloric acid TS to make 100 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 259 nm and 263 nm.

**Purity** Related substances—Powder not less than 20 Betahistine Mesilate Tablets. To a portion of the powder, equivalent to about 50 mg of Betahistine Mesilate, add 10 mL of a mixture of water and acetonitrile (63:37), agitate for 10 minutes with the aid of ultrasonic waves, centrifuge, and use the supernatant liquid as the sample solution. Pipet 1 mL of this solution, add the mixture of water and acetonitrile (63:37) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak, having the relative retention time of about 1.9 with respect to betahistine, is not more than 3/5 times the peak area of betahistine obtained from the standard solution, and the total area of the peaks other than betahistine is not more than the peak area of betahistine from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the Assay.

Time span of measurement: About 8 times as long as the retention time of betahistine beginning after the solvent peak.

**System suitability**—

Test for required detectability: To exactly 5 mL of the standard solution add the mixture of water and acetonitrile (63:37) to make exactly 50 mL. Confirm that the peak area of

betahistine obtained with 20  $\mu\text{L}$  of this solution is equivalent to 7 to 13% of that with 20  $\mu\text{L}$  of the standard solution.

**System performance:** Dissolve 10 mg of betahistine mesilate and 10 mg of 2-vinylpyridine in 50 mL of the mixture of water and acetonitrile (63:37). To 2 mL of this solution add the mixture of water and acetonitrile (63:37) to make 50 mL. When the procedure is run with 20  $\mu\text{L}$  of this solution under the above operating conditions, 2-vinylpyridine and betahistine are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betahistine is not more than 1.0%.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Betahistine Mesilate Tablets add exactly  $V$  mL of 0.1 mol/L hydrochloric acid TS so that each mL contains about 0.4 mg of betahistine mesilate ( $\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{CH}_4\text{O}_3\text{S}$ ), agitate for about 10 minutes with the aid of ultrasonic waves to disintegrate the tablet, then centrifuge, and use the supernatant liquid as the sample solution. Proceed as directed in the Assay

Amount (mg) of betahistine mesilate ( $\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{CH}_4\text{O}_3\text{S}$ )  
=  $W_s \times (A_T/A_S) \times (V/250)$

$W_s$ : Amount (mg) of betahistine mesilate for assay

**Dissolution** <6.10> Perform the test according to the following method: It meets the requirement.

Perform the test with 1 tablet of Betahistine Mesilate Tablets at 50 revolutions per minute according to the Paddle method using 900 mL of water as the dissolution medium. Withdraw 20 mL or more of the dissolution medium 15 minutes after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet  $V'$  mL of the subsequent filtrate, add water to make exactly  $V''$  mL so that each mL contains about 6.7  $\mu\text{g}$  of betahistine mesilate ( $\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{CH}_4\text{O}_3\text{S}$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 17 mg of betahistine mesilate for assay, previously dried under reduced pressure with phosphorous (V) oxide at 70°C for 24 hours, and dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of betahistine. The dissolution rate in 15 minutes is not less than 85%.

Dissolution rate (%) with respect to the labeled amount of betahistine mesilate ( $\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{CH}_4\text{O}_3\text{S}$ )

=  $W_s \times (A_T/A_S) \times (V'/V) \times (1/C) \times 36$

$W_s$ : Amount (mg) of betahistine mesilate for assay

$C$ : Labeled amount (mg) of betahistine mesilate ( $\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{CH}_4\text{O}_3\text{S}$ ) in 1 tablet

**Operating conditions**—

Proceed as directed in the Assay.

**System suitability**—

**System performance:** When the procedure is run with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of betahistine are not less than 2000 and not more than 1.5, respectively.

**System repeatability:** When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betahistine is not more than 2.0%.

**Assay** Weigh accurately the mass of not less than 20 Betahistine Mesilate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 20 mg of betahistine mesilate ( $\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{CH}_4\text{O}_3\text{S}$ ), add 40 mL of 0.1 mol/L hydrochloric acid TS, agitate for 10 minutes with the aid of ultrasonic waves, and add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 0.1 g of betahistine mesilate for assay, previously dried under reduced pressure with phosphorous (V) oxide at 70°C for 24 hours, and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Pipet 10 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 5  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01>, according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of betahistine.

$$\begin{aligned} \text{Amount (mg) of betahistine mesilate (C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{CH}_4\text{O}_3\text{S)} \\ = W_S \times (A_T/A_S) \times (1/5) \end{aligned}$$

$W_S$ : Amount (mg) of betahistine mesilate for assay

#### Operating conditions—

**Detector:** An ultraviolet absorption photometer (wavelength: 261 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 35°C.

**Mobile phase:** To 5 mL of diethylamine and 20 mL of acetic acid (100) add water to make 1000 mL. In 630 mL of this solution dissolve 2.3 g of sodium lauryl sulfate, and add 370 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of betahistine is about 5 minutes.

#### System suitability—

**System performance:** When the procedure is run with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of betahistine are not less than 2000 and not more than 1.5, respectively.

**System repeatability:** When the test is repeated 6 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betahistine is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Betamethasone

ベタメタゾン

$\text{C}_{22}\text{H}_{29}\text{FO}_5$ : 392.46

9-Fluoro-11 $\beta$ ,17,21-trihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione [378-44-9]

Betamethasone, when dried, contains not less than 96.0% and not more than 103.0% of  $\text{C}_{22}\text{H}_{29}\text{FO}_5$ .

**Description** Betamethasone occurs as a white to pale yellowish white, crystalline powder.

It is sparingly soluble in methanol, in ethanol (95) and in acetone, and practically insoluble in water.

Melting point: about 240°C (with decomposition).

**Identification (1)** Proceed 10 mg of Betamethasone as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbing liquid, and prepare the test solution: the test solution so obtained responds to the Qualitative Tests <1.09> for fluoride.

**(2)** Dissolve 1.0 mg of Betamethasone in 10 mL of ethanol (95). Mix 2.0 mL of the solution with 10 mL of phenylhydrazinium hydrochloride TS, heat in a water bath at 60°C for 20 minutes, and cool the solution. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using as the blank the solution prepared with 2.0 mL of ethanol (95) in the same manner as the former solution, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Betamethasone Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(3)** Determine the infrared absorption spectrum of Betamethasone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Betamethasone Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Betamethasone and Betamethasone Reference Standard in acetone, respectively, then evaporate the acetone to dryness, and repeat the test on the residues.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +118 – +126° (after drying, 0.1 g, methanol, 20 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 0.5 g of Betamethasone according to Method 2, and perform the test. Prepare the control solution with 1.5 mL of Standard Lead Solution (not more than 30 ppm).

**(2)** Related substances—Dissolve 10 mg of Betamethasone in 5 mL of a mixture of chloroform and methanol (9:1),

and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (9:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, diethyl ether, methanol and water (385:75:40:6) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Residue on ignition** <2.44> Not more than 0.5% (0.1 g, platinum crucible).

**Assay** Dissolve about 20 mg each of Betamethasone and Betamethasone Reference Standard, previously dried and accurately weighed, in methanol to make exactly 50 mL. Pipet 5 mL each of these solutions, add exactly 5 mL each of the internal standard solution, then add methanol to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10  $\mu\text{L}$  each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of betamethasone to that of the internal standard, respectively.

$$\begin{aligned} &\text{Amount (mg) of } C_{22}H_{29}FO_5 \\ &= W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Betamethasone Reference Standard

**Internal standard solution**—A solution of butyl parahydroxybenzoate in methanol (2 in 3500).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 240 nm).

**Column**: A stainless steel column about 4.0 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature**: A constant temperature of about 25°C.

**Mobile phase**: A mixture of water and acetonitrile (3:2).

**Flow rate**: Adjust the flow rate so that the retention time of betamethasone is about 4 minutes.

**System suitability**—

**System performance**: When proceed the test with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, betamethasone and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

**System repeatability**: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Betamethasone Tablets

ベタメタゾン錠

Betamethasone Tablets contain not less than 90.0% and not more than 107.0% of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ; 392.46).

**Method of preparation** Prepare as directed under Tablets, with Betamethasone.

**Identification** Pulverize Betamethasone Tablets. To a portion of the powder, equivalent to 2 mg of Betamethasone according to the labeled amount, add 20 mL of methanol, shake for 5 minutes, and filter. Evaporate the filtrate on a water bath to dryness, dissolve the residue after cooling in 2 mL of methanol, filter if necessary, and use this as the sample solution. Separately, dissolve 2 mg of Betamethasone Reference Standard in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop with a mixture of 1-butanol, water and acetic anhydride (3:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the principal spot obtained with the sample solution and the spot with the standard solution show the same Rf value.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirements of the Content uniformity test.

To 1 tablet of Betamethasone Tablets add  $V$  mL of water so that each mL contains about 50  $\mu\text{g}$  of betamethasone ( $C_{22}H_{29}FO_5$ ) according to the labeled amount, add exactly an amount of the internal standard solution equivalent to 2 mL per 50  $\mu\text{g}$  of betamethasone, shake vigorously for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 20 mg of Betamethasone Reference Standard, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 4 hours, and dissolve in acetonitrile to make exactly 200 mL. Pipet 5 mL of this solution, add exactly 20 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 50  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of betamethasone to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of betamethasone } (C_{22}H_{29}FO_5) \\ &= W_S \times (Q_T/Q_S) \times (V/400) \end{aligned}$$

$W_S$ : Amount (mg) of Betamethasone Reference Standard

**Internal standard solution**—A solution of butyl parahydroxybenzoate in acetonitrile (1 in 40,000)

**Operating conditions**—

Proceed as directed in the Assay

**System suitability**—

**System performance**: When the procedure is run with 50  $\mu\text{L}$  of the standard solution under the above operating condi-

tions, betamethasone and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

**System repeatability:** When the test is repeated 6 times with 50  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone to that of the internal standard is not more than 1.0%.

**Dissolution <6.10>** Perform the test according the following method: it meets the requirement.

Perform the test with 1 tablet of Betamethasone Tablets at 50 revolutions per minute according to the Paddle method using 900 mL of water as the dissolution medium. Withdraw 20 mL or more of the dissolution medium 30 minutes after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet the subsequent  $V$  mL of the filtrate, add water to make exactly  $V'$  mL so that each mL contains about 0.56  $\mu\text{g}$  of betamethasone ( $\text{C}_{22}\text{H}_{29}\text{FO}_5$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of Betamethasone Reference Standard, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 4 hours, dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, and add water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 100  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of betamethasone. The dissolution rate in 30 minutes is not less than 85%.

Dissolution rate (%) with respect to the labeled amount of betamethasone ( $\text{C}_{22}\text{H}_{29}\text{FO}_5$ )

$$= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times (9/5)$$

$W_S$ : Amount (mg) of Betamethasone Reference Standard

$C$ : Labeled amount (mg) of betamethasone ( $\text{C}_{22}\text{H}_{29}\text{FO}_5$ ) in 1 tablet

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 241 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of methanol and water (3:2).

**Flow rate:** Adjust the flow rate so that the retention time of betamethasone is about 7 minutes.

**System suitability—**

**System performance:** When the procedure is run with 100  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of betamethasone are not less than 3000 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 100  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betamethasone is not more than 2.0%.

**Assay** Weigh accurately the mass of not less than 20 Be-

tamethasone Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 5 mg of betamethasone ( $\text{C}_{22}\text{H}_{29}\text{FO}_5$ ), add 25 mL of water, then add exactly 50 mL of the internal standard solution, and shake vigorously for 10 minutes. Filter through a membrane filter with pore size of not more than 0.5  $\mu\text{m}$ , discard the first 5 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg of Betamethasone Reference Standard, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 4 hours, and dissolve in acetonitrile to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 20 mL of the internal standard solution and 5 mL of water, and use this solution as the standard solution. Perform the test with 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of betamethasone to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of betamethasone (C}_{22}\text{H}_{29}\text{FO}_5) \\ &= W_S \times (Q_T/Q_S) \times (1/4) \end{aligned}$$

$W_S$ : Amount (mg) of Betamethasone Reference Standard

**Internal standard solution—**A solution of butyl parahydroxybenzoate in acetonitrile (1 in 10,000).

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 240 nm).

**Column:** A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of water and acetonitrile (3:2).

**Flow rate:** Adjust the flow rate so that the retention time of betamethasone is about 4 minutes.

**System suitability—**

**System performance:** When the procedure is run with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, betamethasone and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

**System repeatability:** When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Betamethasone Dipropionate

ベタメタゾンジプロピオン酸エステル

$C_{28}H_{37}FO_7$ : 504.59

9-Fluoro-11 $\beta$ ,17,21-trihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione 17,21-dipropanoate [5593-20-4]

Betamethasone Dipropionate, when dried, contains not less than 97.0% and not more than 103.0% of  $C_{28}H_{37}FO_7$ , and not less than 3.4% and not more than 4.1% of fluorine (F:19.00).

**Description** Betamethasone Dipropionate occurs as a white to pale yellowish white, crystalline powder. It is odorless.

It is freely soluble in acetone, in 1,4-dioxane and in chloroform, soluble in methanol, sparingly soluble in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water and in hexane.

It is affected gradually by light.

**Identification** (1) To 1 mL of a solution of Betamethasone Dipropionate in methanol (1 in 10,000) add 4 mL of isoniazid TS, and heat on a water bath for 2 minutes: a yellow color develops.

(2) Proceed with 0.01 g of Betamethasone Dipropionate as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the test solution so obtained responds to the Qualitative Tests <1.09> for fluoride.

(3) Determine the absorption spectrum of a solution of Betamethasone Dipropionate in methanol (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Betamethasone Dipropionate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 176 – 180°C

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +63 – +70° (after drying, 50 mg, 1,4-dioxane, 10 mL, 100 mm).

**Purity** (1) Fluoride—To 0.10 g of Betamethasone Dipropionate add 10.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), shake for 10 minutes, and filter through a membrane filter (0.4- $\mu$ m pore size). Place 5.0 mL of the filtrate in a 20-mL volumetric flask, and add 10 mL of

a mixture of alizalin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3, and cerium (III) nitrate TS (1:1:1), add water to make 20 mL, allow to stand for 1 hour, and use this solution as the sample solution. Separately, place 1.0 mL of Standard Fluorine Solution in a 20-mL volumetric flask, add 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), then 10 mL of a mixture of alizalin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3, and cerium (III) nitrate TS (1:1:1), proceed in the same manner as the preparation of the sample solution, and use this solution as the standard solution. Place 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) in a 20-mL volumetric flask, and proceed in the same manner as the preparation of the sample solution. Using this solution as the blank, determine the absorbances of the sample solution and standard solution at 600 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbance of the sample solution is not greater than that of the standard solution (not more than 0.012%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Betamethasone Dipropionate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.010 g of Betamethasone Dipropionate in 10 mL of chloroform, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution. Perform the test as directed under Thin-layer Chromatography <2.03> with these solutions. Spot 20  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and acetone (7:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (0.5 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (0.5 g, platinum crucible).

**Assay** (1) Betamethasone dipropionate—Weigh accurately about 15 mg of Betamethasone Dipropionate, previously dried, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, and dilute with methanol to exactly 50 mL. Determine the absorbance  $A$  of this solution at the wavelength of maximum absorption at about 239 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

$$\begin{aligned} \text{Amount (mg) of } C_{28}H_{37}FO_7 \\ = (A/312) \times 10,000 \end{aligned}$$

(2) Fluorine—Weigh accurately about 10 mg of Betamethasone Dipropionate, previously dried, and proceed as directed in the procedure of determination for fluorine under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Betamethasone Sodium Phosphate

ベタメタゾンリン酸エステルナトリウム

$C_{22}H_{28}FNa_2O_8P$ : 516.40

Disodium 9-fluoro-11 $\beta$ ,17,21-trihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione 21-phosphate [151-73-5]

Betamethasone Sodium Phosphate contains not less than 97.0% and not more than 103.0% of  $C_{22}H_{28}FNa_2O_8P$ , calculated on the anhydrous basis.

**Description** Betamethasone Sodium Phosphate occurs as white to pale yellowish white, crystalline powder or masses. It is odorless.

It is freely soluble in water, sparingly soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

It is hygroscopic.

Melting point: about 213°C (with decomposition).

**Identification (1)** Dissolve 2 mg of Betamethasone Sodium Phosphate in 2 mL of sulfuric acid: a brown color develops, and gradually changes to blackish brown.

**(2)** Prepare the test solution with 0.01 g of Betamethasone Sodium Phosphate as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbing liquid: the test solution responds to the Qualitative Tests <1.09> (2) for fluoride.

**(3)** Take 0.04 g of Betamethasone Sodium Phosphate in a platinum crucible, and carbonize by heating. After cooling, add 5 drops of nitric acid, and incinerate by heating. To the residue add 10 mL of diluted nitric acid (1 in 50), and boil for several minutes. After cooling, neutralize the solution with ammonia TS, filter if necessary, and use this solution as the sample solution. The sample solution responds to the Qualitative Tests <1.09> for sodium salt and for phosphate.

**(4)** Determine the infrared absorption spectrum of Betamethasone Sodium Phosphate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Betamethasone Sodium Phosphate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +99 – +105° (0.1 g, calculated on the anhydrous basis, water, 10 mL, 100 mm).

**pH** <2.54> Dissolve 0.10 g of Betamethasone Sodium Phosphate in 20 mL of water: the pH of this solution is between 7.5 and 9.0.

**Purity (1)** Clarity and color of solution—Dissolve 0.25 g of Betamethasone Sodium Phosphate in 10 mL of water: the

solution is clear and colorless.

**(2)** Free phosphoric acid—Weigh accurately about 20 mg of Betamethasone Sodium Phosphate, dissolve in 20 mL of water, and use this solution as the sample solution. Separately, pipet 4 mL of Standard Phosphoric Acid Solution, add 20 mL of water, and use this solution as the standard solution. To each of the sample solution and the standard solution add exactly 7 mL of dilute sulfuric acid, exactly 2 mL of hexaammonium heptamolybdate-sulfuric acid TS and exactly 2 mL of *p*-methylaminophenol sulfate TS, shake well, and allow to stand at 20 ± 1°C for 15 minutes. To each add water to make exactly 50 mL, and allow to stand at 20 ± 1°C for 15 minutes. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared with 20 mL of water in the same manner as the blank. Determine the absorbances,  $A_T$  and  $A_S$ , of each solution from the sample solution and standard solution at 730 nm: the amount of free phosphoric acid is not more than 0.5 %.

$$\begin{aligned} \text{Amount (\% of free phosphoric acid (H}_3\text{PO}_4)) \\ = (A_T/A_S) \times (1/W) \times 10.32 \end{aligned}$$

$W$ : Amount (mg) of Betamethasone Sodium Phosphate, calculated on the anhydrous basis.

**(3)** Betamethasone—Dissolve 20 mg of Betamethasone Sodium Phosphate in exactly 2 mL of methanol, and use this solution as the sample solution. Separately, dissolve 20 mg of Betamethasone Reference Standard in exactly 10 mL of methanol. Pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a freshly prepared mixture of 1-butanol, water and acetic anhydride (3:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot from the sample solution corresponding to the spot from the standard solution is not more intense than the spot from the standard solution.

**Water** <2.48> Not more than 10.0% (0.2 g, back titration).

**Assay** Weigh accurately about 20 mg each of Betamethasone Sodium Phosphate and Betamethasone Sodium Phosphate Reference Standard (determine its water content <2.48> before using in the same manner as Betamethasone Sodium Phosphate), and dissolve each in methanol to make exactly 20 mL. Pipet 5 mL each of these solutions, and exactly 5 mL of the internal standard solution, then add methanol to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of betamethasone phosphate to that of the internal standard, respectively.

$$\text{Amount (mg) of } C_{22}H_{28}FNa_2O_8P = W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of Betamethasone Sodium Phosphate Reference Standard, calculated on the anhydrous basis

**Internal standard solution**—A solution of butyl parahydrox-

ybenzoate in methanol (1 in 5000).

*Operating conditions*—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.0 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 1.6 g of tetra-*n*-butylammonium bromide, 3.2 g of disodium hydrogen phosphate dodecahydrate and 6.9 g of potassium dihydrogen phosphate in 1000 mL of water, and add 1500 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of betamethasone phosphate is about 5 minutes.

*System suitability*—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, betamethasone phosphate and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of betamethasone phosphate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Betamethasone Valerate

ベタメタゾン吉草酸エステル

$C_{27}H_{37}FO_6$ : 476.58

9-Fluoro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17-pentanoate [2152-44-5]

Betamethasone Valerate, when dried, contains not less than 97.0% and not more than 103.0% of  $C_{27}H_{37}FO_6$ .

**Description** Betamethasone Valerate occurs as a white, crystalline powder. It is odorless.

It is freely soluble in chloroform, soluble in ethanol (95), sparingly soluble in methanol, slightly soluble in diethyl ether, and practically insoluble in water.

Melting point: about 190°C (with decomposition).

**Identification** (1) Proceed with 0.01 g of Betamethasone Valerate as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid, and prepare the test solution: the test solution so obtained responds to the Qualitative Tests <1.09> for fluoride.

(2) Determine the infrared absorption spectrum of

Betamethasone Valerate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Betamethasone Valerate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +77 – +83° (after drying, 0.1 g, methanol, 20 mL, 100 mm).

**Purity** Related substances—Conduct this procedure without exposure to daylight. Dissolve 0.02 g of Betamethasone Valerate in 5 mL of a mixture of chloroform and methanol (9:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (9:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (9:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (0.5 g, platinum crucible).

**Assay** Dissolve about 10 mg each of Betamethasone Valerate and Betamethasone Valerate Reference Standard, previously dried and accurately weighed, in methanol to make exactly 100 mL. Pipet 10 mL each of these solutions, add 10 mL each of the internal standard solution, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of betamethasone valerate to that of the internal standard, respectively.

$$\text{Amount (mg) of } C_{27}H_{37}FO_6 = W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of Betamethasone Valerate Reference Standard

*Internal standard solution*—A solution of isoamyl benzoate in methanol (1 in 1000).

*Operating conditions*—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.0 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol and water (7:3).

Flow rate: Adjust the flow rate so that the retention time of betamethasone valerate is about 10 minutes.

*System suitability*—

System performance: When the procedure is run with

10  $\mu$ L of the standard solution under the above operating conditions, betamethasone valerate and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone valerate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Betamethasone Valerate and Gentamicin Sulfate Cream

ベタメタゾン吉草酸エステル・ゲンタマイシン硫酸塩クリーム

Betamethasone Valerate and Gentamicin Sulfate Cream contains not less than 90.0% and not more than 110.0% of the labeled amount of betamethasone valerate ( $C_{27}H_{37}FO_6$ : 476.58) and not less than 90.0% and not more than 115.0% of the labeled amount of gentamicin  $C_1(C_{21}H_{43}N_5O_7$ : 477.60).

**Method of preparation** Prepare as directed under Cream, with Betamethasone Valerate and Gentamicin Sulfate.

**Identification (1)** To a quantity of Betamethasone Valerate and Gentamicin Sulfate Cream, equivalent to about 1.2 mg of Betamethasone Valerate according to the labeled amount, add 20 mL of methanol and 20 mL of hexane, shake vigorously for 10 minutes, and allow to stand. Take 15 mL of the lower layer, evaporate the layer to dryness on a water bath under a current of nitrogen. To the residue add 1 mL of ethyl acetate, mix, and use as the sample solution. Separately, dissolve about 18 mg of Betamethasone Valerate Reference Standard in 20 mL of ethyl acetate, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography, develop the plate with ethyl acetate to a distance of about 10 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate, and heat at 100°C: the principal spot with the sample solution and the spot with the standard solution are purple in color, and their  $R_f$  values are the same.

(2) To a quantity of Betamethasone Valerate and Gentamicin Sulfate Cream, equivalent to about 2 mg (potency) of Gentamicin Sulfate according to the labeled amount, add 20 mL of ethyl acetate and 10 mL of water, shake vigorously for 10 minutes, and centrifuge. To 3 mL of the lower layer add 1 mL of dilute sodium hydroxide TS and 2 mL of ninhydrin TS, and heat in a water bath at 90–95°C for 10 minutes: a purple to dark purple color develops.

**pH** <2.54> To a quantity of Betamethasone Valerate and Gentamicin Sulfate Cream, equivalent to 6 mg of Betamethasone Valerate according to the labeled amount, add 15 mL of water, and mix while warming on a water bath to make a milky liquid: the pH of the cooled liquid is between 4.0 and 6.0.

**Purity** Related substances—Weigh accurately an amount of Betamethasone Valerate and Gentamicin Sulfate Cream, equivalent to about 1 mg of Betamethasone Valerate according to the labeled amount, and add 10 mL of a mixture of methanol and water (7:3). Warm in a water bath at 60°C for 5 minutes, and shake vigorously for 20 minutes. Repeat this procedure 2 times. After cooling for 15 minutes with ice, centrifuge for 5 minutes, take away the bubbles from the upper surface, and filter the remaining liquid. Discard first 2 mL of the filtrate, and use the subsequent filtrate as the sample solution. Perform the test with 150  $\mu$ L of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, determine each peak area by the automatic integration method, and calculate these amounts by the area percentage method: the amount of the substance other than betamethasone valerate is not more than 3.5%, and the total amount of them is not more than 7.0%.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 45°C.

Mobile phase: A mixture of water, acetonitrile and methanol (12:7:1)

Flow rate: Adjust the flow rate so that the retention time of betamethasone valerate is about 16 minutes.

Time span of measurement: About 2.5 times as long as the retention time of betamethasone valerate beginning after the solvent peak. The peaks of the compounding ingredients are not determined.

**System suitability**—

Test for required detectability: Dissolve 20 mg of Betamethasone Valerate in 100 mL of a mixture of methanol and water (7:3). To exactly 1 mL of this solution add the mixture of methanol and water (7:3) to make exactly 100 mL, and use this solution as the solution for system suitability test. To exactly 2.5 mL of the solution add the mixture of methanol and water (7:3) to make exactly 50 mL. Confirm that the peak area of betamethasone valerate obtained with 150  $\mu$ L of this solution is equivalent to 3.5 to 6.5% of that with 150  $\mu$ L of the solution for system suitability test.

System performance: When the procedure is run with 150  $\mu$ L of the solution for system suitability test under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of betamethasone valerate are not less than 4000 and 0.8 to 1.3, respectively.

System repeatability: When the test is repeated 6 times with 150  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of betamethasone valerate is not more than 2.0%.

**Assay (1)** Betamethasone valerate—Weigh accurately an amount of Betamethasone Valerate and Gentamicin Sulfate Cream, equivalent to about 1 mg of betamethasone valerate ( $C_{27}H_{37}FO_6$ ), add 10 mL of a mixture of methanol and water (7:3), and add exactly 10 mL of the internal standard solution. After warming in a water bath at 60°C for 5 minutes, shake vigorously for 20 minutes. Repeat this procedure twice,

cool with ice for 15 minutes, centrifuge for 5 minutes, then filter the supernatant liquid, discard the first 5 mL of filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg of Betamethasone Valerate Reference Standard, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 25 mL. Pipet 5 mL of this solution, and add the mixture of methanol and water (7:3) to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, mix, and use this solution as the standard solution. Perform the test with 3  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of betamethasone valerate to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of betamethasone valerate (C}_{27}\text{H}_{37}\text{FO}_6) \\ &= W_S \times (Q_T/Q_S) \times (1/25) \end{aligned}$$

$W_S$ : Amount (mg) of Betamethasone Valerate Reference Standard

**Internal standard solution**—Dissolve 20 mg of beclomethasone dipropionate in 10 mL of methanol, and add the mixture of methanol and water (7:3) to make 200 mL.

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Column**: A stainless steel column 2.1 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3.5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 25°C.

**Mobile phase**: A mixture of methanol and water (13:7).

**Flow rate**: Adjust the flow rate so that the retention time of betamethasone valerate is about 16 minutes.

**System suitability**—

**System performance**: When the procedure is run with 3  $\mu$ L of the standard solution under the above operating conditions, betamethasone valerate and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability**: When the test is repeated 6 times with 3  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone valerate to that of the internal standard is not more than 1.0%.

(2) **Gentamicin sulfate**—Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) **Test organism, agar media for base layer and seed layer, agar medium for transferring test organisms, and standard solutions**—Proceed as directed in the Assay under Gentamicin Sulfate.

(ii) **Sample solutions**—Weigh accurately an amount of Betamethasone Valerate and Gentamicin Sulfate Cream, equivalent to about 1 mg (potency) of Gentamicin Sulfate, add 100 mL of 0.1 mol/L phosphate buffer solution, pH 8.0, previously warmed to about 85°C, and shake well to dissolve. After cooling, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 250 mL to make the high concentration sample solution, which contains 4  $\mu$ g (potency) per mL. Pipet a suitable amount of the high concentration sample solution, add 0.1 mol/L phosphate buffer so-

lution, pH 8.0 so that each mL contains 1  $\mu$ g (potency), and use this solution as the low concentration sample solution.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Betamethasone Valerate and Gentamicin Sulfate Ointment

ベタメタゾン吉草酸エステル・ゲンタマイシン硫酸塩軟膏

Betamethasone Valerate and Gentamicin Sulfate Ointment contains not less than 95.0% and not more than 110.0% of the labeled amount of betamethasone valerate (C<sub>27</sub>H<sub>37</sub>FO<sub>6</sub>: 476.58) and not less than 90.0% and not more than 115.0% of the labeled potency of gentamicin C<sub>1</sub> (C<sub>21</sub>H<sub>43</sub>N<sub>5</sub>O<sub>7</sub>: 477.60).

**Method of preparation** Prepare as directed under Ointment, with Betamethasone Valerate and Gentamicin Sulfate.

**Identification (1)** To a quantity of Betamethasone Valerate and Gentamicin Sulfate Ointment, equivalent to 1.2 mg of Betamethasone Valerate according to the labeled amount, add 20 mL of methanol and 20 mL of hexane, and disperse the ointment with the aid of ultrasonic. Shake vigorously for 5 minutes, centrifuge for 5 minutes, cool for 15 minutes with ice, and take 15 mL of the lower layer. Evaporate the layer to dryness on a water bath under a current of nitrogen. To the residue add 1 mL of ethyl acetate, apply ultrasonic waves, filter, if necessary, and use the filtrate as the sample solution. Separately, dissolve 18 mg of Betamethasone Valerate Reference Standard in 20 mL of ethyl acetate, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography, develop the plate with ethyl acetate to a distance of about 10 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate, and heat at 100°C: the principal spot from the sample solution and the spot from the standard solution are purple in color, and their R<sub>f</sub> values are the same.

(2) To a quantity of Betamethasone Valerate and Gentamicin Sulfate Ointment, equivalent to 2 mg (potency) of Gentamicin Sulfate according to the labeled amount, add 20 mL of hexane and 10 mL of water, shake vigorously for 10 minutes, and centrifuge. To 3 mL of the lower layer add 1 mL of dilute sodium hydroxide TS and 2 mL of ninhydrin TS, and heat in a water bath at 90 – 95°C for 10 minutes: a red-brown color develops.

**pH** <2.54> To a quantity of Betamethasone Valerate and Gentamicin Sulfate Ointment, equivalent to 6 mg of Betamethasone Valerate according to the labeled amount, add 15 mL of water, and warm on a water bath to dissolve. After cooling, separate the water layer: the pH of the layer is between 4.0 and 7.0.

**Assay (1)** Betamethasone valerate—Weigh accurately an amount of Betamethasone Valerate and Gentamicin Sulfate Ointment, equivalent to about 1 mg of betamethasone valerate (C<sub>27</sub>H<sub>37</sub>FO<sub>6</sub>), add 10 mL of a mixture of methanol and

water (7:3), and add exactly 10 mL of the internal standard solution. After warming in a water bath at 75°C for 5 minutes, shake vigorously for 10 minutes. Repeat this procedure once more, cool with ice for 15 minutes, filter, discard the first 5 mL of filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg of Betamethasone Valerate Reference Standard, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 25 mL. Pipet 5 mL of this solution, and add the mixture of methanol and water (7:3) to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, mix, and use this solution as the standard solution. Perform the test with 3  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of betamethasone valerate to that of the internal standard.

$$\begin{aligned} \text{Amount (mg) of betamethasone valerate (C}_{27}\text{H}_{37}\text{FO}_6) \\ = W_S \times (Q_T/Q_S) \times (1/25) \end{aligned}$$

$W_S$ : Amount (mg) of Betamethasone Valerate Reference Standard

**Internal standard solution**—Dissolve 20 mg of beclomethasone dipropionate in 10 mL of methanol, and add the mixture of methanol and water (7:3) to make 200 mL.

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Column**: A stainless steel column 2.1 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3.5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 25°C.

**Mobile phase**: A mixture of methanol and water (13:7).

**Flow rate**: Adjust the flow rate so that the retention time of betamethasone valerate is about 16 minutes.

**System suitability**—

**System performance**: When the procedure is run with 3  $\mu$ L of the standard solution under the above operating conditions, betamethasone valerate and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability**: When the test is repeated 6 times with 3  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone valerate to that of the internal standard is not more than 1.0%.

(2) **Gentamicin sulfate**—Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) **Test organism, agar media for base layer and seed layer, agar medium for transferring test organisms, and standard solutions**—Proceed as directed in the Assay under Gentamicin Sulfate.

(ii) **Sample solutions**—Weigh accurately an amount of Betamethasone Valerate and Gentamicin Sulfate Ointment, equivalent to about 1 mg (potency) of Gentamicin Sulfate, transfer to a separator, add 50 mL of petroleum ether and exactly 100 mL of 0.1 mol/L phosphate buffer solution, pH 8.0, shake for 10 minutes, and allow to stand. Pipet a suitable amount of the water layer, add 0.1 mol/L phosphate buffer

solution, pH 8.0 to make solutions so that each mL contains 4  $\mu$ g (potency) and 1  $\mu$ g (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Bethanechol Chloride

ベタネコール塩化物

$C_7H_{17}ClN_2O_2$ : 196.68  
(2*RS*)-2-Carbamoyloxy-*N,N,N*-trimethylpropylaminium chloride [590-63-6]

Bethanechol Chloride, when dried, contains not less than 98.0% and not more than 101.0% of  $C_7H_{17}ClN_2O_2$ .

**Description** Bethanechol Chloride occurs as colorless or white crystals or a white, crystalline powder.

It is very soluble in water, freely soluble in acetic acid (100), and sparingly soluble in ethanol (99.5).

A solution of Bethanechol Chloride (1 in 10) shows no optical rotation.

It is hygroscopic.

**Identification** (1) To 2 mL of a solution of Bethanechol Chloride (1 in 40) add 0.1 mL of a solution of cobalt (II) chloride hexahydrate (1 in 100), then add 0.1 mL of potassium hexacyanoferrate (II) TS: A green color is produced, and almost entirely fades within 10 minutes.

(2) To 1 mL of a solution of Bethanechol Chloride (1 in 100) add 0.1 mL of iodine TS: a brown precipitate is produced, and the solution shows a greenish brown color.

(3) Determine the infrared absorption spectrum of Bethanechol Chloride as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Bethanechol Chloride (1 in 100) responds to the Qualitative Tests <1.09> for chloride.

**Melting point** <2.60> 217 – 221°C (after drying).

**Purity** (1) **Heavy metals** <1.07>—Proceed with 1.0 g of Bethanechol Chloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) **Related substances**—Dissolve 1.0 g of Bethanechol Chloride in 2.5 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 1  $\mu$ L each of the sample solution and standard solution on a plate of cellulose for thin-layer chromatography. Develop the plate with a mixture of a solution of ammonium acetate (1 in 100), acetone, 1-butanol and formic acid (20:20:20:1) to a distance of

about 10 cm, and dry the plate at 105°C for 15 minutes. Spray evenly hydrogen hexachloroplatinate (IV)-potassium iodide TS on the plate, and allow to stand for 30 minutes: the spot other than the principal spot from the sample solution is not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Bethanechol Chloride, previously dried, dissolve in 2 mL of acetic acid (100), add 40 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 19.67 mg of C<sub>7</sub>H<sub>17</sub>ClN<sub>2</sub>O<sub>2</sub>

**Containers and storage** Containers—Tight containers.

## Bezafibrate

ベザフィブラート

C<sub>19</sub>H<sub>20</sub>ClNO<sub>4</sub>: 361.82

2-(4-{2-[(4-Chlorobenzoyl)amino]ethyl}phenoxy)-2-methylpropanoic acid  
[41859-67-0]

Bezafibrate, when dried, contains not less than 98.5% and not more than 101.0% of C<sub>19</sub>H<sub>20</sub>ClNO<sub>4</sub>.

**Description** Bezafibrate occurs as a white crystalline powder.

It is freely soluble in *N,N*-dimethylformamide, soluble in methanol, slightly soluble in ethanol (99.5), and practically insoluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Bezafibrate in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bezafibrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Bezafibrate as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Melting point** <2.60> 181 – 186°C

**Purity** (1) Chloride <1.03>—Dissolve 3.0 g of Bezafibrate in 15 mL of *N,N*-dimethylformamide, add water to make 60 mL, shake well, allow to stand for more than 12 hours, and filter. To 40 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this so-

lution as the test solution. Prepare the control solution as follows: To 0.70 mL of 0.01 mol/L hydrochloric acid VS add 10 mL of *N,N*-dimethylformamide, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.012%).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Bezafibrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.10 g of Bezafibrate in 35 mL of methanol, add diluted 0.5 mol/L ammonium acetate TS (1 in 50) to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add 70 mL of methanol and diluted 0.5 mol/L ammonium acetate TS (1 in 50) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the areas of the peaks having the relative retention times of about 0.65 and 1.86 with respect to bezafibrate obtained from the sample solution are not larger than 1/2 times the peak area of bezafibrate from the standard solution, the area of the peak other than those and other than bezafibrate from the sample solution is not larger than 1/5 times the peak area of bezafibrate from the standard solution, and the total area of the peaks other than the peak of bezafibrate from the sample solution is not larger than 3/4 times the peak area of bezafibrate from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol and diluted acetic acid (100) (1 in 100) (9:4).

Flow rate: Adjust the flow rate so that the retention time of bezafibrate is about 6 minutes.

Time span of measurement: About 2.5 times as long as the retention time of bezafibrate beginning after the solvent peak.

**System suitability**—

Test for required detectability: Measure exactly 5 mL of the standard solution, and add a mixture of methanol and diluted 0.5 mol/L ammonium acetate TS (1 in 50) (7:3) to make exactly 50 mL. Confirm that the peak area of bezafibrate obtained with 5 μL of this solution is equivalent to 7 to 13% of that with 5 μL of the standard solution.

System performance: Dissolve 20 mg of Bezafibrate and 10 mg of 4-chlorobenzoate in 70 mL of methanol, and add diluted 0.5 mol/L ammonium acetate TS (1 in 50) to make 100 mL. When the procedure is run with 5 μL of this solution under the above operating conditions, 4-chlorobenzoate and bezafibrate are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of bezafibrate is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.7 g of Bezafibrate, previously dried, dissolve in 50 mL of ethanol (99.5), and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 36.18 mg of  $C_{19}H_{20}ClNO_4$

**Containers and storage** Containers—Tight containers.

## Bezafibrate Sustained Release Tablets

ベザフィブラート徐放錠

Bezafibrate Sustained Release Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of bezafibrate ( $C_{19}H_{20}ClNO_4$ ; 361.82).

**Method of preparation** Prepare as directed under Tablets, with Bezafibrate.

**Identification** Mix well an amount of powdered Bezafibrate Sustained Release Tablets, equivalent to 0.1 g of Bezafibrate according to the labeled amount, with 100 mL of methanol, and filter. To 1 mL of the filtrate and add methanol to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 227 nm and 231 nm.

**Uniformity of dosage units** <6.02> It meets the requirement of the Mass variation test.

**Dissolution** <6.10> Perform the test according to the following method: It meets the requirement.

Perform the test with 1 tablet of Bezafibrate Sustained Release Tablets at 50 revolutions per minute according to the Paddle method using 900 mL of disodium hydrogen phosphate-citric acid buffer solution, pH 7.2 as the dissolution medium. Withdraw exactly 20 mL of the dissolution medium 1.5 hours, 2.5 hours and 8 hours after starting the test, and immediately fill up the dissolution medium each time with exactly 20 mL of disodium hydrogen phosphate-citric acid buffer solution, pH 7.2, previously warmed to  $37 \pm 0.5^\circ\text{C}$ . Filter these media through a membrane filter with a pore size not exceeding  $0.45 \mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet the subsequent  $V$  mL, add disodium hydrogen phosphate-citric acid buffer solution, pH 7.2 to make exactly  $V'$  mL so that each mL contains about  $13 \mu\text{g}$  of bezafibrate ( $C_{19}H_{20}ClNO_4$ ) according to the labeled amount, and use these solutions as the sample solutions. Separately, weigh accurately about 66 mg of bezafibrate for assay, previously dried at  $105^\circ\text{C}$  for 3 hours, and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution, add disodium hydrogen phosphate-citric acid buffer solution, pH 7.2 to make exactly 200 mL, and use this solution as the standard solution. Determine the absorbances,  $A_{T(n)}$  ( $n=1,2,3$ ) and  $A_S$ , of the sample solutions and standard solution at 228 nm as directed under

Ultraviolet-visible Spectrophotometry <2.24>: the dissolution rates of a 100-mg tablet in 1.5 hours, in 2.5 hours and in 8 hours are 15 – 45%, 35 – 65% and not less than 80%, respectively, and those of a 200-mg tablet in 1.5 hours, in 2.5 hours and in 8 hours are 15 – 45%, 30 – 60% and not less than 75 %, respectively.

Dissolution rate (%) in each case of  $n$  with respect to the labeled amount of bezafibrate ( $C_{19}H_{20}ClNO_4$ )

$$= W_S \times \left[ \frac{A_{T(n)}}{A_S} + \sum_{i=1}^{n-1} \left( \frac{A_{T(i)}}{A_S} \times \frac{1}{45} \right) \right] \times \frac{V'}{V} \times \frac{1}{C} \times 18$$

$W_S$ : Amount (mg) of bezafibrate for assay

$C$ : Labeled amount (mg) of bezafibrate ( $C_{19}H_{20}ClNO_4$ ) in 1 tablet

**Assay** Weigh accurately, and powder not less than 20 Bezafibrate Sustained Release Tablets. Weigh accurately a portion of the powder, equivalent to about 20 mg of bezafibrate ( $C_{19}H_{20}ClNO_4$ ), add 60 mL of methanol and exactly 10 mL of the internal standard solution, and shake for 20 minutes. Add diluted 0.5 mol/L ammonium acetate TS (1 in 50) to make 100 mL, filter, and use the filtrate as the sample solution. Separately, weigh accurately about 20 mg of bezafibrate for assay, previously dried at  $105^\circ\text{C}$  for 3 hours, dissolve in 60 mL of methanol, add exactly 10 mL of the internal standard solution and diluted 0.5 mol/L ammonium acetate TS (1 in 50) to make 100 mL, and use this solution as the standard solution. Perform the test with  $2 \mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of bezafibrate to that of the internal standard.

Amount (mg) of bezafibrate ( $C_{19}H_{20}ClNO_4$ ) =  $W_S \times (Q_T/Q_S)$

$W_S$ : Amount (mg) of bezafibrate for assay

**Internal standard solution**—A solution of 4-nitrophenol in methanol (1 in 500).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 230 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography ( $5 \mu\text{m}$  in particle diameter).

**Column temperature**: A constant temperature of about  $25^\circ\text{C}$ .

**Mobile phase**: A mixture of methanol and diluted acetic acid (100) (1 in 100) (9:4).

**Flow rate**: Adjust the flow rate so that the retention time of bezafibrate is about 6 minutes.

**System suitability**—

**System performance**: When the procedure is run with  $2 \mu\text{L}$  of the standard solution under the above operating conditions, the internal standard and bezafibrate are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability**: When the test is repeated 6 times with  $2 \mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of bezafibrate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Bifonazole

ビホナゾール

$C_{22}H_{18}N_2$ : 310.39

1-[(*RS*)-(Biphenyl-4-yl)(phenyl)methyl]-1*H*-imidazole  
[60628-96-8]

Bifonazole, when dried, contains not less than 98.5% of  $C_{22}H_{18}N_2$ .

**Description** Bifonazole occurs as a white to pale yellow powder. It is odorless and tasteless.

It is freely soluble in dichloromethane, soluble in methanol, sparingly soluble in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water.

A solution of Bifonazole in methanol (1 in 100) does not show optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Bifonazole in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Bifonazole, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 147 – 151°C

**Purity (1) Chloride** <1.03>—To 2.0 g of Bifonazole add 40 mL of water, warm for 5 minutes, and after cooling, filter. To 10 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

**(2) Sulfate** <1.14>—To 10 mL of the filtrate obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (0.048%).

**(3) Heavy metals** <1.07>—Proceed with 2.0 g of Bifonazole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(4) Related substances**—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.10 g of Bifonazole in 10 mL of methanol, and use this solution as the sample solution. Pipet 3 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 25 mL and 5 mL of this solution, add methanol to make exactly 50

mL each, and use these solutions as the standard solutions (1) and (2), respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and ammonia solution (28) (49:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot with *R<sub>f</sub>* value of about 0.20 from the sample solution is not more intense than the spot from the standard solution (1). And the spots other than the spot mentioned above and the principal spot from the sample solution are not more intense than the spot from the standard solution (2).

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.15 g of Bifonazole, previously dried, and dissolve in dichloromethane to make exactly 50 mL. Pipet 5 mL of this solution in a glass-stoppered conical flask, add 10 mL of water, 5 mL of dilute sulfuric acid and 25 mL of dichloromethane, and add 2 to 3 drops of a solution of methyl yellow in dichloromethane (1 in 500) as indicator, and titrate <2.50>, while shaking vigorously, with 0.01 mol/L sodium lauryl sulfate VS by a buret with 0.02-mL minimum graduation. The end point is reached when the color of the dichloromethane layer changes from yellow to orange-red after dropwise addition of 0.01 mol/L sodium lauryl sulfate VS, strong shaking, and standing for a while.

Each mL of 0.01 mol/L sodium lauryl sulfate VS  
= 3.104 mg of  $C_{22}H_{18}N_2$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Biperiden Hydrochloride

ビペリデン塩酸塩

$C_{21}H_{29}NO \cdot HCl$ : 347.92

1-(Bicyclo[2.2.1]hept-5-en-2-yl)-1-phenyl-3-(piperidin-1-yl)propan-1-ol monohydrochloride [1235-82-1]

Biperiden Hydrochloride, when dried, contains not less than 99.0% of  $C_{21}H_{29}NO \cdot HCl$ .

**Description** Biperiden Hydrochloride occurs as a white to brownish and yellowish white, crystalline powder.

It is freely soluble in formic acid, slightly soluble in water, in methanol and in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 270°C (with decomposition).

**Identification (1)** Dissolve 0.02 g of Biperiden Hydrochloride in 5 mL of phosphoric acid: a green color develops.

(2) Dissolve 0.01 g of Biperiden Hydrochloride in 5 mL of water by heating, cool, and add 5 to 6 drops of bromine TS: a yellow precipitate is formed.

(3) Determine the absorption spectrum of a solution of Biperiden Hydrochloride (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Biperiden Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(5) Dissolve 0.02 g of Biperiden Hydrochloride in 10 mL of water by heating, and cool: the solution responds to the Qualitative Tests <1.09> for chloride.

**Purity (1)** Acidity or alkalinity—To 1.0 g of Biperiden Hydrochloride add 50 mL of water, shake vigorously, filter, and to 20 mL of the filtrate add 1 drop of methyl red TS: no red to yellow color develops.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Biperiden Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Biperiden Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.10 g of Biperiden Hydrochloride in 20 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 50  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia solution (28) (80:15:2) to a distance of about 15 cm, and air-dry the plate. Spray evenly Dragendorff's TS for spraying on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Biperiden Hydrochloride, previously dried, dissolve in 5 mL of formic acid, add 60 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L perchloric acid VS} \\ = 34.79 \text{ mg of } C_{21}H_{29}NO.HCl \end{aligned}$$

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Bisacodyl

ビスアコジル

$C_{22}H_{19}NO_4$ : 361.39

4,4'-(Pyridin-2-ylmethylene)bis(phenyl acetate) [603-50-9]

Bisacodyl, when dried, contains not less than 98.5% of  $C_{22}H_{19}NO_4$ .

**Description** Bisacodyl occurs as a white, crystalline powder.

It is freely soluble in acetic acid (100), soluble in acetone, slightly soluble in ethanol (95) and in diethyl ether, and practically insoluble in water.

It dissolves in dilute hydrochloric acid.

**Identification (1)** Determine the absorption spectrum of a solution of Bisacodyl in ethanol (95) (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Bisacodyl Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bisacodyl, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Bisacodyl Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 132 – 136°C

**Purity (1)** Chloride <1.03>—Dissolve 1.0 g of Bisacodyl in 30 mL of acetone, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.35 mL of 0.01 mol/L hydrochloric acid VS add 30 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.012%).

(2) Sulfate <1.14>—Dissolve 1.0 g of Bisacodyl in 2 mL of dilute hydrochloric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.35 mL of 0.005 mol/L sulfuric acid VS add 2 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.017%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Bisacodyl according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Dissolve 0.20 g of Bisacodyl in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 200 mL, and use this solution as the standard solu-

tion. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 2-butanone, chloroform and xylene (1:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Bisacodyl, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from orange-yellow to green (indicator: 0.5 mL of *p*-naphtholbenzein TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 36.14 mg of  $\text{C}_{22}\text{H}_{19}\text{NO}_4$

**Containers and storage** Containers—Well-closed containers.

## Bisacodyl Suppositories

ビサコジル坐剤

Bisacodyl Suppositories contain not less than 90% and not more than 110% of the labeled amount of bisacodyl ( $\text{C}_{22}\text{H}_{19}\text{NO}_4$ ; 361.39).

**Method of preparation** Prepare as directed under Suppositories, with Bisacodyl.

**Identification (1)** To a quantity of Bisacodyl Suppositories, equivalent to 6 mg of Bisacodyl according to the labeled amount, add 20 mL of ethanol (95), warm on a water bath for 10 minutes, shake vigorously for 10 minutes, and allow to stand in ice water for 1 hour. Centrifuge the solution, filter the supernatant liquid, and to 2 mL of the filtrate add ethanol (95) to make 20 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 261 nm and 265 nm.

(2) Use the filtrate obtained in (1) as the sample solution. Separately, dissolve 6 mg of Bisacodyl Reference Standard in 20 mL of ethanol (95), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 2-butanone, chloroform and xylene (1:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot from the sample solution and that from the standard solution show the same *R<sub>f</sub>* value.

**Assay** Weigh accurately not less than 20 Bisacodyl Suppositories, make them fine fragments carefully, and mix

uniformly. Weigh accurately a portion of the fragments, equivalent to about 10 mg of bisacodyl ( $\text{C}_{22}\text{H}_{19}\text{NO}_4$ ), add 40 mL of tetrahydrofuran, warm to 40°C, dissolve by shaking, cool, and add tetrahydrofuran to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and add the mobile phase to make 100 mL. Cool this solution in ice for 30 minutes, centrifuge, filter the supernatant liquid through a membrane filter with pore size of 0.5  $\mu\text{m}$ , discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 10 mg of Bisacodyl Reference Standard, previously dried at 105°C for 2 hours, and dissolve in tetrahydrofuran to make exactly 50 mL. Pipet 5 mL of this solution, proceed in the same manner as the sample solution, and use this solution as the standard solution. Perform the test with 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of bisacodyl to that of the internal standard, respectively.

Amount (mg) of bisacodyl ( $\text{C}_{22}\text{H}_{19}\text{NO}_4$ ) =  $W_S \times (Q_T/Q_S)$

$W_S$ : Amount (mg) of Bisacodyl Reference Standard

**Internal standard solution**—A solution of ethyl parahydroxybenzoate in acetonitrile (3 in 100,000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.01 mol/L citric acid TS, acetonitrile and methanol (2:1:1).

Flow rate: Adjust the flow rate so that the retention time of bisacodyl is about 8 minutes.

**System suitability**—

System performance: When the procedure is run with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the internal standard and bisacodyl are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of bisacodyl to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Bismuth Subgallate

Dermatol

次没食子酸ビスマス

Bismuth Subgallate, when dried, contains not less than 47.0% and not more than 51.0% of bismuth (Bi; 208.98).

**Description** Bismuth Subgallate occurs as a yellow powder.

It is odorless and tasteless.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It dissolves in dilute hydrochloric acid, in dilute nitric acid and in dilute sulfuric acid on warming. It dissolves in sodium hydroxide TS, forming a clear, yellow solution, which turns red immediately.

It is affected by light.

**Identification (1)** Ignite 0.5 g of Bismuth Subgallate: it chars at first, and leaves finally a yellow residue. The residue responds to the Qualitative Tests <1.09> for bismuth salt.

(2) To 0.5 g of Bismuth Subgallate add 25 mL of water and 20 mL of hydrogen sulfide TS, and shake well. Filter off the blackish brown precipitate, and add 1 drop of iron (III) chloride TS to the filtrate: a blue-black color is produced.

**Purity (1)** Clarity of solution—Dissolve 1.0 g of Bismuth Subgallate in 40 mL of diluted sodium hydroxide TS (1 in 8): the solution is clear.

(2) Sulfate—Ignite 3.0 g of Bismuth Subgallate in a porcelain crucible, and cautiously dissolve the residue in 2.5 mL of nitric acid by warming. Pour the solution into 100 mL of water, shake, and filter. Evaporate 50 mL of the filtrate on a water bath to 15 mL. Add water to make 20 mL, filter again, and use the filtrate as the sample solution. To 5 mL of the sample solution add 2 to 3 drops of barium nitrate TS: no turbidity is produced.

(3) Nitrate—To 0.5 g of Bismuth Subgallate add 5 mL of dilute sulfuric acid and 25 mL of iron (II) sulfate TS, shake well, and filter. Superimpose carefully 5 mL of the filtrate on sulfuric acid: no red-brown color develops at the zone of contact.

(4) Ammonium—Dissolve 1.0 g of Bismuth Subgallate in 5 mL of sodium hydroxide TS, and heat: the gas evolved does not change moistened red litmus paper to blue.

(5) Copper—To 5 mL of the sample solution obtained in (2) add 1 mL of ammonia TS, and filter: no blue color develops in the filtrate.

(6) Lead—Ignite 1.0 g of Bismuth Subgallate at about 500°C in a porcelain crucible, dissolve the residue in a smallest possible amount of nitric acid added dropwise, evaporate over a low flame to dryness, and cool. Add 5 mL of a solution of potassium hydroxide (1 in 6) to the residue, boil carefully for 2 minutes, cool, and centrifuge. Take the supernatant liquid in a test tube, add 10 drops of potassium chromate TS, and acidify the solution by adding acetic acid (100) dropwise: neither turbidity nor a yellow precipitate is produced.

(7) Silver—To 5 mL of the sample solution obtained in (2) add 0.5 mL of nitric acid and 2 to 3 drops of dilute hydrochloric acid: no turbidity is produced.

(8) Alkaline earth metals and alkali metals—Boil 1.0 g of Bismuth Subgallate with 40 mL of diluted acetic acid (31) (1 in 2) for 2 minutes, cool, add water to make 40 mL, and filter. To 20 mL of the filtrate add 2 mL of dilute hydrochloric acid, boil, immediately pass hydrogen sulfide thoroughly through the solution, filter the precipitate produced, and wash with water. Combine the filtrate and the washings, add 5 drops of sulfuric acid, and evaporate to dryness. Ignite as directed under Residue on Ignition <2.44>: the mass of the residue does not more than 5.0 mg.

(9) Arsenic <1.11>—Mix well 0.20 g of Bismuth Subgallate with 0.20 g of calcium hydroxide, and ignite the mixture.

Dissolve the residue in 5 mL of dilute hydrochloric acid, use this solution as the test solution, and perform the test (not more than 10 ppm).

(10) Gallic acid—To 1.0 g of Bismuth Subgallate add 20 mL of ethanol (95), shake for 1 minute, and filter. Evaporate the filtrate on a water bath to dryness: the mass of the residue does not more than 5.0 mg.

**Loss on drying** <2.41> Not more than 6.0% (1 g, 105°C, 3 hours).

**Assay** Weigh accurately about 0.5 g of Bismuth Subgallate, previously dried, ignite at about 500°C for 30 minutes, and cool. Dissolve the residue in 5 mL of diluted nitric acid (2 in 5) by warming, and add water to make exactly 100 mL. Measure exactly 30 mL of this solution, add 200 mL of water, and titrate <2.50> with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to yellow (indicator: 2 to 3 drops of xylenol orange TS).

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 4.180 mg of Bi

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Bismuth Subnitrate

次硝酸ビスマス

Bismuth Subnitrate, when dried, contains not less than 71.5% and not more than 74.5% of bismuth (Bi: 208.98).

**Description** Bismuth Subnitrate occurs as a white powder.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It readily dissolves in hydrochloric acid and in nitric acid without effervescence.

It is slightly hygroscopic, and changes moistened blue litmus paper to red.

**Identification** Bismuth Subnitrate responds to the Qualitative Tests <1.09> for bismuth salt and nitrate.

**Purity (1)** Chloride <1.03>—Dissolve 0.7 g of Bismuth Subnitrate in 2 mL of water and 2 mL of nitric acid, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: evaporate 2 mL of nitric acid on a water bath to dryness, add 0.70 mL of 0.01 mol/L hydrochloric acid VS, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.035%).

(2) Sulfate—Dissolve 3.0 g of Bismuth Subnitrate in 3.0 mL of warmed nitric acid, pour this solution into 100 mL of water, shake, and filter. Concentrate the filtrate on a water bath to 30 mL, filter, and use this filtrate as the sample solution. To 5 mL of the sample solution add 2 to 3 drops of barium nitrate TS: no turbidity is produced.

(3) Ammonium—Boil 0.10 g of bismuth Subnitrate with 5 mL of sodium hydroxide TS: the gas evolved does not

change moistened red litmus paper to blue.

(4) **Copper**—To 5 mL of the sample solution obtained in (2) add 2 mL of ammonia TS, and filter: no blue color develops.

(5) **Lead**—To 1.0 g of Bismuth Subnitrate add 5 mL of a solution of sodium hydroxide (1 in 6), boil carefully for 2 minutes, cool and centrifuge. Transfer the supernatant liquid to a test tube, add 10 drops of potassium chromate TS, and add dropwise acetic acid (31) to render the solution acid: no turbidity or yellow precipitate is produced.

(6) **Silver**—To 5 mL of the sample solution obtained in (2) add 0.5 mL of nitric acid and 2 to 3 drops of dilute hydrochloric acid: no turbidity is produced.

(7) **Alkaline earth metals and alkali metals**—Boil 2.0 g of Bismuth Subnitrate with 40 mL of diluted acetic acid (31) (1 in 2) for 2 minutes, cool, add water to make 40 mL, and filter. To 20 mL of the filtrate add 2 mL of dilute hydrochloric acid, boil, immediately pass hydrogen sulfide thoroughly through the solution, filter, and wash the residue with water. Combine the filtrate and the washings, add 5 drops of sulfuric acid, evaporate to dryness, and ignite as directed under Residue on Ignition <2.44>: the residue does not exceed 5.0 mg

(8) **Arsenic** <1.11>—To 0.20 g of Bismuth Subnitrate add 2 mL of sulfuric acid, heat until white fumes evolve, dilute cautiously with water to 5 mL, use this solution as the test solution, and perform the test (not more than 10 ppm).

**Loss on drying** <2.41> Not more than 3.0% (2 g, 105°C, 2 hours).

**Assay** Weigh accurately about 0.4 g of Bismuth Subnitrate, previously dried, dissolve in 5 mL of diluted nitric acid (2 in 5) by warming, and add water to make exactly 100 mL. Pipet 25 mL of the solution, add 200 mL of water and titrate <2.50> with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to yellow (indicator: 5 drops of xylenol orange TS)

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 4.180 mg of Bi

**Containers and storage** Containers—Well-closed containers.

[11056-06-7, Bleomycin]

Bleomycin Hydrochloride is the hydrochloride of a

mixture of substances having antitumor activity produced by the growth of *Streptomyces verticillus*.

It contains not less than 1400  $\mu\text{g}$  (potency) and not more than 2000  $\mu\text{g}$  (potency) per mg, calculated on the dried basis. The potency of Bleomycin Hydrochloride is expressed as mass (potency) of bleomycin A<sub>2</sub> (C<sub>55</sub>H<sub>84</sub>ClN<sub>17</sub>O<sub>21</sub>S<sub>3</sub>; 1451.00).

**Description** Bleomycin Hydrochloride occurs as a white to yellowish white powder.

It is freely soluble in water, and slightly soluble in ethanol (95).

It is hygroscopic.

**Identification (1)** To 4 mg of Bleomycin Hydrochloride add 5  $\mu\text{L}$  of copper (II) sulfate TS, and dissolve in water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Bleomycin Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Bleomycin Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> (2) for chloride.

**pH** <2.54> The pH of a solution obtained by dissolving 0.10 g of Bleomycin Hydrochloride in 20 mL of water is between 4.5 and 6.0.

**Content ratio of the active principle** Dissolve 10 mg of Bleomycin Hydrochloride in 20 mL of water, and use this solution as the sample solution. Perform the test with 20  $\mu\text{L}$  of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of bleomycin A<sub>2</sub> (the first principal peak) is between 55% and 70%, that of bleomycin B<sub>2</sub> (the second principal peak) is between 25% and 32%, the total peak area of bleomycin A<sub>2</sub> and bleomycin B<sub>2</sub> is not less than 85%, the peak area of demethylbleomycin A<sub>2</sub> (a peak having the relative retention time of 1.5 – 2.5 to bleomycin A<sub>2</sub>) is not more than 5.5%, and the total area of the rest peaks is not more than 9.5%.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase stock solution:** Dissolve 0.96 g of sodium 1-pentanesulfonate and 1.86 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate in 1000 mL of water and 5 mL of acetic acid (100), and adjust the pH to 4.3 with ammonia TS.

**Mobile phase A:** A mixture of the mobile phase stock solution and methanol (9:1).

**Mobile phase B:** A mixture of the mobile phase stock solu-

tion and methanol (3:2).

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 – 60	100 → 0	0 → 100
60 – 75	0	100

Flow rate: About 1.2 mL per minute.

Time span of measurement: 20 minutes after elution of the peak of demethylbleomycin A<sub>2</sub> beginning after the solvent peak.

**System suitability—**

**System performance:** When the procedure is run with 20  $\mu\text{L}$  of the sample solution under the above operating conditions, bleomycin A<sub>2</sub> and bleomycin B<sub>2</sub> are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 20  $\mu\text{L}$  of the sample solution under the above operating conditions, the relative standard deviation of the peak area of bleomycin A<sub>2</sub> is not more than 2.0%.

**Purity (1)** Clarity and color of solution—A solution obtained by dissolving 80 mg of Bleomycin Hydrochloride in 4 mL of water is clear and colorless.

**(2) Copper—**Dissolve exactly 75 mg of Bleomycin Hydrochloride in exactly 10 mL of diluted nitric acid (1 in 100), and use this solution as the sample solution. Separately, to exactly 15 mL of Standard Copper Solution add diluted nitric acid (1 in 100) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Atomic Absorption Spectrophotometry <2.23> according to the following conditions: the absorbance of the sample solution is not more than that of the standard solution (not more than 200 ppm).

Gas: Combustible gas—Acetylene

Supporting gas—Air

Lamp: Copper hollow-cathode lamp

Wavelength: 324.8 nm

**Loss on drying** <2.41> Not more than 5.0% (60 mg, in vacuum, phosphorus (V) oxide, 60°C, 3 hours). Take the sample to be tested while avoiding moisture absorption.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Mycobacterium smegmatis* ATCC 607

(ii) Agar medium for seed, base layer and transferring the test organism

Glycerin	10.0 g
Peptone	10.0 g
Meat extract	10.0 g
Sodium chloride	3.0 g
Agar	15.0 g
Water	1000 mL

Mix all the components, and sterilize. Adjust the pH after sterilization to 6.9 – 7.1 with sodium hydroxide TS.

(iii) Liquid media for suspending the test organism

Glycerin	10.0 g
Peptone	10.0 g
Meat extract	10.0 g
Sodium chloride	3.0 g
Water	1000 mL

Mix all the components, and sterilize. Adjust the pH after sterilization to 6.9 - 7.1 with sodium hydroxide TS.

(iv) Preparation of seeded agar layer—Cultivate the test organism on the slant of the agar medium for transferring the test organism at 27°C for 40 to 48 hours, then inoculate the test organism thus obtained in 100 mL of the liquid media for suspending the test organism, cultivate with shaking at between 25°C and 27°C for 5 days, and use this as the suspension of test organism. Store the suspension of test organism at a temperature not exceeding 5°C, and use within 14 days. Add 0.5 mL of the suspension of test organism in 100 mL of the agar medium for seed previously kept at 48°C, mix thoroughly, and use as the seeded agar layer.

(v) Preparation of cylinder-agar plate—Proceed as directed in the Preparation of cylinder-agar plate under the Microbial Assay for Antibiotics, dispensing 5.0 mL of agar medium for base layer and 8.0 mL of the agar medium for seed into the Petri dish.

(vi) Standard solutions—Weigh accurately an amount of Bleomycin A<sub>2</sub> Hydrochloride Reference Standard, previously dried under reduced pressure not exceeding 0.67 kPa at an ordinary temperature for 3 hours, equivalent to about 15 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 6.8 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below, and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 6.8 to make solutions so that each mL contains 30 μg (potency) and 15 μg (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(vii) Sample solutions—Weigh accurately an amount of Bleomycin Hydrochloride, equivalent to about 15 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 6.8 to make exactly 100 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 6.8 to make solutions so that each mL contains 30 μg (potency) and 15 μg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Bleomycin Sulfate

ブレオマイシン硫酸塩

Bleomycinoic Acid

1-Bleomycinoic acid sulfate

*N*<sup>1</sup>-(4-Guanidinobutyl)bleomycinamide sulfate

Bleomycin B<sub>4</sub>

*N*<sup>1</sup>-{4-[3-(4-Guanidinobutyl)guanidino]butyl}-bleomycinamide sulfate

[9041-93-4, Bleomycin Sulfate]

Bleomycin Sulfate is the sulfate of a mixture of substances having antitumor activity produced by the growth of *Streptomyces verticillus*.

It contains not less than 1400  $\mu\text{g}$  (potency) and not more than 2000  $\mu\text{g}$  (potency) per mg, calculated on the dried basis. The potency of Bleomycin Sulfate is expressed as mass (potency) of bleomycin A<sub>2</sub> (C<sub>55</sub>H<sub>84</sub>ClN<sub>17</sub>O<sub>21</sub>S<sub>3</sub>: 1451.00).

**Description** Bleomycin Sulfate occurs as a white to yellowish white powder.

It is freely soluble in water, and slightly soluble in ethanol (95).

It is hygroscopic.

**Identification (1)** To 4 mg of Bleomycin Sulfate add 5  $\mu\text{L}$  of copper (II) sulfate TS, and dissolve in water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Bleomycin Sulfate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Bleomycin Sulfate (1 in 200) responds to the Qualitative Tests <1.09> (1) and (2) for sulfate.

**pH** <2.54> The pH of a solution obtained by dissolving 10 mg of Bleomycin Sulfate in 20 mL of water is between 4.5 and 6.0.

**Content ratio of the active principle** Dissolve 10 mg of Bleomycin Sulfate in 20 mL of water, and use this solution as the sample solution. Perform the test with 20  $\mu\text{L}$  of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of bleomycin A<sub>2</sub> (the first principal peak) is between 55% and 70%, that of bleomycin B<sub>2</sub> (the second principal peak) is between 25% and 32%, the total peak area of bleomycin A<sub>2</sub> and bleomycin B<sub>2</sub> is not less than 85%, the peak area of demethylbleomycin A<sub>2</sub> (a peak having the relative retention time of 1.5 – 2.5 against bleomycin A<sub>2</sub>) is not more than 5.5%, and the total area of the rest peaks is not more than 9.5%.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase stock solution:** Dissolve 0.96 g of sodium 1-pentanesulfonate and 1.86 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate in 1000 mL of water and 5 mL of acetic acid (100), and adjust the pH to 4.3 with ammonia TS.

**Mobile phase A:** A mixture of the mobile phase stock solution and methanol (9:1).

**Mobile phase B:** A mixture of the mobile phase stock solution and methanol (3:2).

**Flowing of the mobile phase:** Control the gradient by mixing the mobile phases A and B as directed in the following

table.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 – 60	100 → 0	0 → 100
60 – 75	0	100

**Flow rate:** About 1.2 mL/min

**Time span of measurement:** Twenty minutes after elution of the peak of demethylbleomycin A<sub>2</sub> beginning after the solvent peak.

**System suitability—**

**System performance:** When the procedure is run with 20  $\mu\text{L}$  of the sample solution under the above operating conditions, bleomycin A<sub>2</sub> and bleomycin B<sub>2</sub> are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 20  $\mu\text{L}$  of the sample solution under the above operating conditions, the relative standard deviation of the peak area of bleomycin A<sub>2</sub> is not more than 2.0%.

**Purity (1)** Clarity and color of solution—A solution obtained by dissolving 80 mg of Bleomycin Sulfate in 4 mL of water is clear and colorless.

**(2) Copper—**Dissolve exactly 75 mg of Bleomycin Sulfate in 10 mL of diluted nitric acid (1 in 100), and use this solution as the sample solution. Separately, to exactly 15 mL of Standard Copper Solution add diluted nitric acid (1 in 100) to make exactly 100 mL, and use this solution as the standard solution. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 6.8 to make solutions so that each mL contains 30 µg (potency) and 15 µg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Boric Acid

ホウ酸

H<sub>3</sub>BO<sub>3</sub>: 61.83

Boric Acid, when dried, contains not less than 99.5% of H<sub>3</sub>BO<sub>3</sub>.

**Description** Boric Acid occurs as colorless or white crystals or crystalline powder. It is odorless, and has a slight, characteristic taste.

It is freely soluble in warm water, in hot ethanol (95) and in glycerin, soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution of Boric Acid (1 in 20) is between 3.5 and 4.1.

**Identification** A solution of Boric Acid (1 in 20) responds to the Qualitative Tests <1.09> for borate.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Boric Acid in 25 mL of water or in 10 mL of hot ethanol (95): the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Boric Acid according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 0.40 g of Boric Acid according to Method 1, and perform the test (not more than 5 ppm).

**Loss on drying** <2.41> Not more than 0.5% (2 g, silica gel, 5 hours).

**Assay** Weigh accurately about 1.5 g of Boric Acid, previously dried, add 15 g of D-sorbitol and 50 mL of water, and dissolve by warming. After cooling, titrate <2.50> with 1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS).

Each mL of 1 mol/L sodium hydroxide VS  
= 61.83 mg of H<sub>3</sub>BO<sub>3</sub>

**Containers and storage** Containers—Well-closed containers.

## Freeze-dried Botulism Antitoxin, Equine

乾燥ボツリヌスウマ抗毒素

Freeze-dried Botulism Antitoxin, Equine, is a preparation for injection which is dissolved before use.

It contains botulism antitoxin type A, botulism antitoxin type B, botulism antitoxin type E and botulism antitoxin type F in immunoglobulin of horse origin. It may contain one, two or three of these four antitoxins.

It conforms to the requirements of Freeze-dried Botulism Antitoxin, Equine, in the Minimum Requirements for Biological Products.

**Description** Freeze-dried Botulism Antitoxin, Equine, becomes a colorless or yellow-brown, clear liquid or a slightly white-turbid liquid on the addition of solvent.

## Bromazepam

ブロマゼパム

C<sub>14</sub>H<sub>10</sub>BrN<sub>3</sub>O: 316.15  
7-Bromo-5-(pyridin-2-yl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one [1812-30-2]

Bromazepam, when dried, contains not less than 99.0% and not more than 101.0% of  $C_{14}H_{10}BrN_3O$ .

**Description** Bromazepam occurs as white to light yellowish white crystals or crystalline powder.

It is freely soluble in acetic acid (100), slightly soluble in methanol, in ethanol (99.5) and in acetone, and practically insoluble in water.

Melting point: about 245°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Bromazepam in ethanol (99.5) (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bromazepam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Bromazepam in a platinum crucible according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Bromazepam in 5 mL of a mixture of acetone and methanol (3:2), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mixture of acetone and methanol (3:2) to make exactly 50 mL. Pipet 5 mL of this solution, add the mixture of acetone and methanol (3:2) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, ammonia solution (28) and ethanol (99.5) (38:1:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution and the spot of the starting point are not more than 2, and not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.20% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Bromazepam, previously dried, dissolve in 80 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 31.62 mg of  $C_{14}H_{10}BrN_3O$

**Containers and storage** Containers—Well-closed containers.

## Bromhexine Hydrochloride

ブロムヘキシン塩酸塩

$C_{14}H_{20}Br_2N_2 \cdot HCl$ : 412.59

2-Amino-3,5-dibromo-*N*-cyclohexyl-*N*-methylbenzylamine monohydrochloride [611-75-6]

Bromhexine Hydrochloride, when dried, contains not less than 98.5% of  $C_{14}H_{20}Br_2N_2 \cdot HCl$ .

**Description** Bromhexine Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in formic acid, sparingly soluble in methanol, and slightly soluble in water and in ethanol (95).

The pH of its saturated solution is between 3.0 and 5.0.

Melting point: about 239°C (with decomposition).

**Identification (1)** Dissolve 3 mg of Bromhexine Hydrochloride in 0.01 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bromhexine Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Infrared Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Add 20 mL of water to 1 g of Bromhexine Hydrochloride. After thorough shaking, add 3 mL of sodium hydroxide TS, and extract with four 20-mL portions of diethyl ether. Neutralize the water layer with dilute nitric acid: the solution responds to the Qualitative Tests <1.09> (2) for chloride.

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Bromhexine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 50 mg of Bromhexine Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 20 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 25 mL, and use this solution as the standard solution. Perform the test with exactly 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than bromhexine is not larger than the peak area of bromhexine of the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 245 nm).

**Column:** A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Dissolve 1.0 g of potassium dihydrogen phosphate in 900 mL of water, adjust the pH to 7.0 with 0.5 mol/L sodium hydroxide TS, and add water to make 1000 mL. To 200 mL of this solution add 800 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of bromhexine is about 6 minutes.

**Selection of column:** To 0.05 g of bamethane sulfate add 0.5 mL of the sample solution, and add the mobile phase to make 10 mL. Proceed with 5  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of bamethane and bromhexine in this order with the resolution between these peaks being not less than 7.

**Detection sensitivity:** Adjust the detection sensitivity so that the peak height of bromhexine from 5  $\mu$ L of the standard solution is between 5 mm and 15 mm.

**Time span of measurement:** About 2 times as long as the retention time of bromhexine beginning after the solvent peak.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Bromhexine Hydrochloride, previously dried, dissolve in 2 mL of formic acid, add 60 mL of acetic anhydride, and warm in a water bath at 50°C for 15 minutes. After cooling, titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue-green to yellow-green (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 41.26 mg of C<sub>14</sub>H<sub>20</sub>Br<sub>2</sub>N<sub>2</sub>·HCl

**Containers and storage** Containers—Well-closed containers.  
Storage—Light-resistant.

**Bromocriptine Mesilate**

ブロモクリプチンメシル酸塩

C<sub>32</sub>H<sub>40</sub>BrN<sub>5</sub>O<sub>5</sub>·CH<sub>4</sub>O<sub>3</sub>S: 750.70  
(5'S)-2-Bromo-12'-hydroxy-2'-(1-methylethyl)-5'-

(2-methylpropyl)ergotaman-3',6',18-trione  
monomethanesulfonate [22260-51-1]

Bromocriptine Mesilate contains not less than 98.0% of C<sub>32</sub>H<sub>40</sub>BrN<sub>5</sub>O<sub>5</sub>·CH<sub>4</sub>O<sub>3</sub>S, calculated on the dried basis.

**Description** Bromocriptine Mesilate occurs as a white to pale yellowish white or pale brownish white, crystalline powder. It is odorless, or has a faint characteristic odor.

It is very soluble in acetic acid (100), freely soluble in methanol, sparingly soluble in ethanol (95), very slightly soluble in acetic anhydride, in dichloromethane and in chloroform, and practically insoluble in water and in diethyl ether.

It is gradually colored by light.

**Identification (1)** Dissolve 2 mg of Bromocriptine Mesilate in 1 mL of methanol, add 2 mL of 4-dimethylaminobenzaldehyde-ferric chloride TS, and shake: a purplish blue color develops.

**(2)** Determine the absorption spectrum of a solution of Bromocriptine Mesilate in methanol (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(3)** Determine the infrared absorption spectrum of Bromocriptine Mesilate as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(4)** Perform the test with Bromocriptine Mesilate as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Optical rotation** <2.49> [ $\alpha$ ]<sub>D</sub><sup>20</sup>: +95 – +105° [0.1 g, calculated on the dried basis, a mixture of methanol and dichloromethane (1:1), 10 mL, 100 mm].

**Purity (1)** Clarity and color of solution—Dissolve 0.10 g of Bromocriptine Mesilate in 10 mL of methanol: the solution is clear, and has no more color than the following control solution.

**Control solution:** To 2.5 mL of Cobalt (II) Chloride Colorimetric Stock Solution, 6.0 mL of Iron (III) Chloride Colorimetric Stock Solution and 1.0 mL of Copper (II) Sulfate Colorimetric Stock Solution add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of Bromocriptine Mesilate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.10 g of Bromocriptine Mesilate in 10 mL of a mixture of methanol and chloroform (1:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of methanol and chloroform (1:1) to make exactly 200 mL, and use this solution as the standard solution (1). Pipet 10 mL of the standard solution (1), add a mixture of methanol and chloroform (1:1) to make exactly 20 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution

and standard solutions (1) and (2), as a band with 1 cm in width, on a plate of silica gel for thin-layer chromatography. Develop the plate immediately with a mixture of dichloromethane, 1,4-dioxane, ethanol (95) and ammonia solution (28) (1800:150:50:1) to a distance of about 10 cm, and dry the plate under reduced pressure for 30 minutes. Spray evenly Dragendorff's TS for spraying on the plate, then spray evenly hydrogen peroxide TS, cover the plate with a glass plate, and examine: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (1), and the spot other than the principal spot, which is more intense than the spot from the standard solution (2), is not more than one.

**Loss on drying** <2.41> Not more than 3.0% (1 g, in vacuum at a pressure not exceeding 0.67 kPa, 80°C, 5 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Bromocriptine Mesilate, dissolve in 80 mL of a mixture of acetic anhydride and acetic acid (100) (7:1), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 75.07 mg of  $C_{32}H_{40}BrN_5O_5 \cdot CH_4O_3S$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and not exceeding -18°C.

## Bromovalerylurea

ブロモバレリル尿素

$C_6H_{11}BrN_2O_2$ : 223.07

(*2RS*)-(2-Bromo-3-methylbutanoyl)urea [496-67-3]

Bromovalerylurea, when dried, contains not less than 98.0% of  $C_6H_{11}BrN_2O_2$ .

**Description** Bromovalerylurea occurs as colorless or white crystals or crystalline powder. It is odorless, and has a slightly bitter taste.

It is soluble in ethanol (95), sparingly soluble in diethyl ether, and very slightly soluble in water.

It dissolves in sulfuric acid, in nitric acid and in hydrochloric acid, and precipitates are produced on the addition of water.

It dissolves in sodium hydroxide TS.

**Identification** (1) Boil 0.2 g of Bromovalerylurea with 5 mL of a solution of sodium hydroxide (1 in 10); the gas evolved changes moistened red litmus paper to blue. Boil this solution with an excess of dilute sulfuric acid: the odor of valeric acid is perceptible.

(2) To 0.1 g of Bromovalerylurea add 0.5 g of anhydrous sodium carbonate, and decompose thoroughly by gentle heating. Dissolve the residue in 5 mL of hot water, cool, acidify with acetic acid (31), and filter: the filtrate responds to the Qualitative Tests <1.09> (2) for bromide.

**Melting point** <2.60> 151 - 155°C

**Purity** (1) Acidity or alkalinity—To 1.5 g of Bromovalerylurea add 30 mL of water, shake for 5 minutes, and filter: the filtrate is neutral.

(2) Chloride <1.03>—Perform the test with a 10-mL portion of the filtrate obtained in (1). Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.028%).

(3) Sulfate <1.14>—Perform the test with 10 mL of the filtrate obtained in (1). Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.038%).

(4) Heavy metals <1.07>—Proceed with 2.0 g of Bromovalerylurea according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Arsenic <1.11>—Dissolve 0.5 g of Bromovalerylurea in 5 mL of sodium hydroxide TS, use this solution as the test solution, and perform the test (not more than 4 ppm).

(6) Readily carbonizable substances <1.15>—Perform the test with 0.5 g of Bromovalerylurea: the solution is not more colored than Matching Fluid A.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 80°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Bromovalerylurea, previously dried, in a 300-mL conical flask, add 40 mL of sodium hydroxide TS, and boil gently for 20 minutes under a reflux condenser. Cool, wash the lower part of the reflux condenser and the mouth of the flask with 30 mL of water, and combine the washings with the solution in the conical flask. Add 5 mL of nitric acid and exactly 30 mL of 0.1 mol/L silver nitrate VS, and titrate <2.50> the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination.

Each mL of 0.1 mol/L silver nitrate VS  
= 22.31 mg of  $C_6H_{11}BrN_2O_2$

**Containers and storage** Containers—Well-closed containers.

## Bucillamine

ブシラミン

$C_7H_{13}NO_3S_2$ : 223.31

(*2R*)-2-(2-Methyl-2-sulfanylpropanoylamino)-3-sulfanylpropanoic acid  
[65002-17-7]

Bucillamine, when dried, contains not less than 98.5% and not more than 101.0% of  $C_7H_{13}NO_3S_2$ .

**Description** Bucillamine occurs as white, crystals or crystal-

line powder.

It is freely soluble in methanol and in ethanol (95), and slightly soluble in water.

**Identification (1)** To 5 mL of a solution of Bucillamine (1 in 250) add 2 mL of sodium hydroxide TS and 2 drops of sodium pentacyanonitrosylferrate (III) TS: the solution reveals a red-purple color.

(2) Determine the infrared absorption spectrum of Bucillamine as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +33.0 – +36.5° (after drying, 2 g, ethanol (95), 50 mL, 100 mm).

**Melting point** <2.60> 136 – 140°C

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Bucillamine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Bucillamine according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 60 mg of Bucillamine in 20 mL of a mixture of water and methanol (1:1), and use this solution as the sample solution. Pipet 3 mL of the sample solution, add the mixture of water and methanol (1:1) to make exactly 200 mL, and use this solution as the standard solution. Immediately perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of related substances, having the relative retention time of about 2.3 and 3.1 with respect to the peak of bucillamine, obtained from the sample solution are not larger than 8/15 times and 2/5 times the peak area of bucillamine from the standard solution, respectively, and the area of the peak other than the peaks of bucillamine and two of the related substances mentioned above from the sample solution is not larger than 1/5 times the peak area of bucillamine from the standard solution. The total area of the peaks other than bucillamine from the sample solution is not larger than the peak area of bucillamine from the standard solution.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 6.0 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** A mixture of 0.01 mol/L citric acid TS and methanol (1:1).

**Flow rate:** Adjust the flow rate so that the retention time of bucillamine is about 5 minutes.

**Time span of measurement:** About 7 times as long as the retention time of bucillamine beginning after the solvent peak.

**System suitability**—

**Test for required detectability:** To exactly 1 mL of the stan-

dard solution add the mixture of water and methanol (1:1) to make exactly 10 mL. Confirm that the peak area of bucillamine obtained with 20  $\mu$ L of this solution is equivalent to 7 to 13% of that obtained with 20  $\mu$ L of the standard solution.

**System performance:** Dissolve 0.10 g of bucillamine and 10 mg of 4-fluorobenzoic acid in 100 mL of methanol. To 10 mL of this solution add water to make exactly 50 mL. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, bucillamine and 4-fluorobenzoic acid are eluted in this order with the resolution between these peaks being not less than 3.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of bucillamine is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 60°C, 6 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.25 g of Bucillamine, dissolve in 35 mL of methanol, add 15 mL of water, and titrate <2.50> with 0.05 mol/L iodine VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L iodine VS  
= 11.17 mg of C<sub>7</sub>H<sub>13</sub>NO<sub>3</sub>S<sub>2</sub>

**Containers and storage** Containers—Tight containers.

## Bucumolol Hydrochloride

ブクモロール塩酸塩

C<sub>17</sub>H<sub>23</sub>NO<sub>4</sub>.HCl: 341.83

8-[(2*RS*)-3-[(1,1-Dimethylethyl)amino]-2-hydroxypropoxy]-5-methylchromen-2-one monohydrochloride [36556-75-9]

Bucumolol Hydrochloride, when dried, contains not less than 99.0% of C<sub>17</sub>H<sub>23</sub>NO<sub>4</sub>.HCl.

**Description** Bucumolol Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in water, sparingly soluble in methanol and in ethanol (95), slightly soluble in acetic acid (100), and practically insoluble in diethyl ether.

**Melting point:** about 228°C (with decomposition).

**Identification (1)** Dissolve 0.01 g of Bucumolol Hydrochloride in 10 mL of diluted ethanol (95) (1 in 2), and observe under ultraviolet light (main wavelength: 365 nm): the solution shows a yellow-green fluorescence. Render this solution alkaline by adding sodium hydroxide TS: the fluorescence disappears. Acidify the solution by adding dilute hydrochloric acid: the fluorescence reappears.

(2) Dissolve 0.1 g of Bucumolol Hydrochloride in 5 mL

of water, and add 5 drops of Reinecke salt TS: a light red precipitate is formed.

(3) Determine the absorption spectrum of a solution of Bucumolol Hydrochloride (1 in 60,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Bucumolol Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(5) A solution of Bucumolol Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (296 nm): 330 – 360 (after drying, 40 mg, water, 2500 mL).

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Bucumolol Hydrochloride in 20 mL of water: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Bucumolol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Bucumolol Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.10 g of Bucumolol Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add methanol to make exactly 25 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol and ammonia-ammonium chloride buffer solution, pH 10.7, (30:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 5 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Bucumolol Hydrochloride, previously dried, add 45 mL of acetic acid (100), dissolve by warming at 60°C, and cool. Add 105 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L perchloric acid VS} \\ = 34.18 \text{ mg of } \text{C}_{17}\text{H}_{23}\text{NO}_4\cdot\text{HCl} \end{aligned}$$

**Containers and storage** Containers—Well-closed containers.

## Bufetolol Hydrochloride

ブフェトロール塩酸塩

$\text{C}_{18}\text{H}_{29}\text{NO}_4\cdot\text{HCl}$ ; 359.89

1-(1,1-Dimethylethyl)amino-3-[2-(tetrahydrofuran-2-ylmethoxy)phenoxy]propan-2-ol monohydrochloride  
[35108-88-4]

Bufetolol Hydrochloride, when dried, contains not less than 98.5% of  $\text{C}_{18}\text{H}_{29}\text{NO}_4\cdot\text{HCl}$ .

**Description** Bufetolol Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in water and in methanol, soluble in ethanol (95) and in acetic acid (100), and practically insoluble in diethyl ether.

A solution of Bufetolol Hydrochloride (1 in 10) is optically inactive.

**Identification** (1) To 5 mL of a solution of Bufetolol Hydrochloride (1 in 100) add 5 drops of Reinecke salt TS: a light red precipitate is formed.

(2) Determine the absorption spectrum of a solution of Bufetolol Hydrochloride (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Bufetolol Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Bufetolol Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**Melting point** <2.60> 153 – 157°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Bufetolol Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Perform the test with 0.5 g of Bufetolol Hydrochloride. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.038%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Bufetolol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Dissolve 0.20 g of Bufetolol Hydrochloride in 5 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot

10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, acetone, ethanol (95) and ammonia solution (28) (40:20:5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Bufetolol Hydrochloride, previously dried, dissolve in 10 mL of acetic acid (100), add 50 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 35.99 mg of  $C_{18}H_{29}NO_4 \cdot HCl$

**Containers and storage** Containers—Tight containers.

## Bufexamac

ブフェキサマク

$C_{12}H_{17}NO_3$ : 223.27

2-(4-Butyloxyphenyl)-*N*-hydroxy acetamide [2438-72-4]

Bufexamac, when dried, contains not less than 98.0% of  $C_{12}H_{17}NO_3$ .

**Description** Bufexamac occurs as white to pale yellowish white crystals or crystalline powder. It has a faint, characteristic odor, and is tasteless.

It is freely soluble in *N,N*-dimethylformamide, sparingly soluble in methanol and in ethanol (95), and practically insoluble in water and in diethyl ether.

Melting point: about 162°C (with decomposition).

**Identification** (1) To 5 mL of a solution of Bufexamac in methanol (1 in 5000) add 1 drop of iron (III) chloride-methanol TS, and shake: a dark red color develops.

(2) Determine the absorption spectrum of a solution of Bufexamac in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Bufexamac as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity** (1) Clarity and color of solution—Dissolve 0.20 g of Bufexamac in 20 mL of ethanol (95): the solution is clear

and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Bufexamac according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Bufexamac according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.20 g of Bufexamac in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Use a plate of silica gel with fluorescent indicator for thin-layer chromatography, moisten the surface of the plate evenly by spraying with 0.1 mol/L disodium dihydrogen ethylenediamine tetraacetate TS, and dry at 110°C for about 30 minutes. Spot 15  $\mu$ L each of the sample solution and standard solution on the plate. Develop the plate with a mixture of chloroform, cyclohexane, methanol and acetic acid (100) (6:4:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Bufexamac, previously dried, dissolve in 40 mL of *N,N*-dimethylformamide, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide-methanol VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide-methanol VS  
= 22.33 mg of  $C_{12}H_{17}NO_3$

**Containers and storage** Containers—Tight containers.

## Bufexamac Cream

ブフェキサマククリーム

Bufexamac Cream contains not less than 90% and not more than 110% of the labeled amount of bufexamac ( $C_{12}H_{17}NO_3$ : 223.27).

**Method of preparation** Prepared as directed under Ointments, with Bufexamac.

**Description** Bufexamac Cream is white.  
pH: 4.0 – 6.0

**Identification** To a quantity of Bufexamac Cream, equivalent to 0.05 g of Bufexamac according to the labeled amount, add 10 mL of tetrahydrofuran, shake well, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 0.05 g of bufexamac for assay in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Use a plate of silica gel for thin-layer

chromatography, moisten the surface of the plate evenly by spraying with 0.1 mol/L disodium dihydrogen ethylenediamine tetraacetate TS, and dry the plate at 110°C for about 30 minutes. Spot 5  $\mu$ L each of the sample solution and standard solution on the plate. Develop the plate with a mixture of pentane, ethyl acetate and acetic acid (100) (7:4:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly iron (III) chloride TS on the plate: the spot from the sample solution and that from the standard solution show a red-brown color and the same Rf value.

**Assay** Weigh accurately a quantity of Bufexamac Cream, equivalent to about 50 mg of bufexamac ( $C_{12}H_{17}NO_3$ ), dissolve in 40 mL of methanol, and add methanol to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution and add the mobile phase to make 100 mL, filter, and use the filtrate as the sample solution. Separately, weigh accurately about 50 mg of bufexamac for assay, previously dried at 105°C for 4 hours, and dissolve in methanol to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of bufexamac to that of the internal standard, respectively.

$$\begin{aligned} &\text{Amount (mg) of bufexamac (C}_{12}\text{H}_{17}\text{NO}_3\text{)} \\ &= W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of bufexamac for assay

**Internal standard solution**—A solution of diphenylimidazole in methanol (1 in 5000).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 275 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 2.5 g of sodium 1-octane sulfonate and 0.6 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate in 850 mL of water, and add 400 mL of methanol, 400 mL of acetonitrile and 8 mL of acetic acid (100).

**Flow rate:** Adjust the flow rate so that the retention time of bufexamac is about 6 minutes.

**System suitability**—

**System performance:** When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, bufexamac and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of bufexamac to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Bufexamac Ointment

ブフェキサマク軟膏

Bufexamac Ointment contains not less than 90% and not more than 110% of the labeled amount of bufexamac ( $C_{12}H_{17}NO_3$ ; 223.27).

**Method of preparation** Prepare as directed under Ointments, with Bufexamac.

**Identification** To a quantity of Bufexamac Ointment, equivalent to 0.05 g of Bufexamac according to the labeled amount, add 5 mL of tetrahydrofuran, shake well, add 5 mL of ethanol (99.5), shake, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 0.05 g of bufexamac for assay in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Use a plate of silica gel for thin-layer chromatography, moisten the surface of the plate evenly by spraying with 0.1 mol/L disodium dihydrogen ethylenediamine tetraacetate TS, and dry the plate at 110°C for about 30 minutes. Spot 5  $\mu$ L each of the sample solution and standard solution on the plate. Develop the plate with a mixture of pentane, ethyl acetate and acetic acid (100) (7:4:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly iron (III) chloride TS on the plate: the spot from the sample solution and that from the standard solution show a red-brown color and the same Rf value.

**Assay** Weigh accurately a quantity of Bufexamac Ointment, equivalent to about 50 mg of bufexamac ( $C_{12}H_{17}NO_3$ ), add 40 mL of tetrahydrofuran, warm to 40°C, dissolve by shaking, cool, and add tetrahydrofuran to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution and the mobile phase to make 100 mL, and filter, if necessary, through a membrane filter of 0.45- $\mu$ m porosity. Discard the first 20 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 50 mg of bufexamac for assay, previously dried at 105°C for 4 hours, and dissolve in tetrahydrofuran to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution and the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of bufexamac to that of the internal standard, respectively.

$$\begin{aligned} &\text{Amount (mg) of bufexamac (C}_{12}\text{H}_{17}\text{NO}_3\text{)} \\ &= W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of bufexamac for assay

**Internal standard solution**—A solution of diphenylimidazole in methanol (1 in 5000).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 275 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle di-

ameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2.5 g of sodium 1-octane sulfonate and 0.6 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate in 850 mL of water, and add 400 mL of methanol, 400 mL of acetonitrile and 8 mL of acetic acid (100).

Flow rate: Adjust the flow rate so that the retention time of bumetanide is about 6 minutes.

*System suitability*—

System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, bumetanide and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of bumetanide to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Bumetanide

ブメタニド

$C_{17}H_{20}N_2O_5S$ : 364.42

3-Butylamino-4-phenoxy-5-sulfamoylbenzoic acid  
[28395-03-1]

Bumetanide, when dried, contains not less than 98.5% of  $C_{17}H_{20}N_2O_5S$ .

**Description** Bumetanide occurs as white crystals or crystalline powder.

It is freely soluble in pyridine, soluble in methanol and in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water.

It dissolves in potassium hydroxide TS.

It is gradually colored by light.

**Identification (1)** Dissolve 0.01 g of Bumetanide in 1 mL of pyridine, add 2 drops of copper (II) sulfate TS, shake, add 3 mL of water and 5 mL of chloroform, shake, and allow to stand: a light blue color develops in the chloroform layer.

(2) Dissolve 0.04 g of Bumetanide in 100 mL of phosphate buffer solution, pH 7.0, and dilute 10 mL of the solution with water to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Bumetanide, previously dried, as directed in the potassium

bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 232 – 237°C

**Purity (1)** Clarity and color of solution—Dissolve 50 mg of Bumetanide in 2 mL of a solution of potassium hydroxide (1 in 30) and 8 mL of water: the solution is clear, and is not more colored than the following control solution.

Control solution: Pipet 0.5 mL each of Cobalt (II) Chloride Colorimetric Stock Solution, Iron (III) Chloride Colorimetric Stock Solution and Copper (II) Sulfate Colorimetric Stock Solution, mix them, and add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

(2) Chloride <1.03>—Mix well 0.5 g of Bumetanide with 0.7 g of potassium nitrate and 1.2 g of anhydrous sodium carbonate, transfer, in small portions, to a red-hot platinum crucible, and heat to red-hot until the reaction is complete. After cooling, to the residue add 14 mL of dilute sulfuric acid and 6 mL of water, boil for 5 minutes, filter, wash the residue with 10 mL of water, combine the filtrate and the washing, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Bumetanide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Bumetanide according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.10 g of Bumetanide in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 2 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, acetic acid (100), cyclohexane and methanol (32:4:4:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Bumetanide, previously dried, dissolve in 50 mL of ethanol (95), and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 36.44 mg of  $C_{17}H_{20}N_2O_5S$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Bunazosin Hydrochloride

ブナゾシン塩酸塩

$C_{19}H_{27}N_5O_3 \cdot HCl$ : 409.91

4-Amino-2-(4-butanoyl-1,4-diazepan-1-yl)-6,7-dimethoxyquinazoline monohydrochloride [72712-76-2]

Bunazosin Hydrochloride, when dried, contains not less than 98.0% of  $C_{19}H_{27}N_5O_3 \cdot HCl$ .

**Description** Bunazosin Hydrochloride occurs as a white crystalline powder.

It is very soluble in formic acid, slightly soluble in water and in methanol, very slightly soluble in ethanol (99.5), and practically insoluble in diethyl ether.

Melting point: about 273°C (with decomposition).

**Identification (1)** Dissolve 0.1 g of Bunazosin Hydrochloride in 10 mL of 0.2 mol/L hydrochloric acid TS, and boil for 3 minutes over a flame: butyric acid like odor is perceptible.

(2) Determine the infrared absorption spectrum of Bunazosin Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Bunazosin Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> for chloride.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Bunazosin Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.05 g of Bunazosin Hydrochloride in 50 mL of the mobile phase, and use this solution as the sample solution. To exactly 1 mL of the sample solution add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of the peaks other than the peak of bunazosin from the sample solution is not larger than the peak area of bunazosin from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in parti-

cle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: Dissolve 1.44 g of sodium lauryl sulfate in a suitable amount of water, add 10 mL of acetic acid (100), 500 mL of acetonitrile and water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of bunazosin is about 5 minutes.

Selection of column: Proceed with 20  $\mu$ L of a mixture of the standard solution and a solution of procaine hydrochloride in the mobile phase (1 in 20,000) (1:1) under the above operating conditions, and calculate the resolution. Use a column giving elution of procaine and bunazosin in this order with the resolution between these peaks being not less than 3.0.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of bunazosin obtained from 20  $\mu$ L of the standard solution is 20 to 60% of the full-scale.

Time span of measurement: About 6 times of the retention time of bunazosin.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Bunazosin Hydrochloride, previously dried, dissolve in 6 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid, and heat for 20 minutes on a water bath. After cooling, add 20 mL of acetic acid (100), and titrate <2.50> the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS  
= 40.99 mg of  $C_{19}H_{27}N_5O_3 \cdot HCl$

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Bupranolol Hydrochloride

ブプラノロール塩酸塩

$C_{14}H_{22}ClNO_2 \cdot HCl$ : 308.24

(2RS)-3-(2-Chloro-5-methylphenoxy)-1-(1,1-dimethylethyl)aminopropan-2-ol monohydrochloride [15148-80-8]

Bupranolol Hydrochloride, when dried, contains not less than 98.0% of  $C_{14}H_{22}ClNO_2 \cdot HCl$ .

**Description** Bupranolol Hydrochloride occurs as a white, crystalline powder.

It is sparingly soluble in methanol, slightly soluble in water, in ethanol (95) and in acetic acid (100), very slightly soluble in acetic anhydride, and practically insoluble in diethyl ether.

The pH of a solution of Bupranolol Hydrochloride (1 in

1000) is between 5.2 and 6.2.

**Identification (1)** Take 0.01 g of Bupranolol Hydrochloride in a test tube, mix with 25 mg of potassium iodide and 25 mg of oxalic acid dihydrate, cover the mouth of the test tube with filter paper moistened with a solution of 2,6-dibromo-*N*-chloro-1,4-benzoquinone monoimine in ethanol (95) (1 in 100), and heat gently for several minutes. Expose the filter paper to ammonia gas: the filter paper acquires a blue color.

(2) Determine the absorption spectrum of a solution of Bupranolol Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Bupranolol Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Bupranolol Hydrochloride (1 in 200) responds to the Qualitative Tests <1.09> for chloride.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (275 nm): 57 – 60 (after drying, 50 mg, 0.1 mol/L hydrochloric acid TS, 500 mL).

**Melting point** <2.60> 223 – 226°C

**Purity (1)** Clarity and color of solution—Dissolve 0.10 g of Bupranolol Hydrochloride in 15 mL of water: the solution is clear and colorless.

(2) Acidity—Dissolve 0.10 g of Bupranolol Hydrochloride in 15 mL of freshly boiled and cooled water, and add 1 drop of methyl red TS: a light red color develops. To this solution add 0.05 mL of 0.01 mol/L sodium hydroxide VS: the color changes to yellow.

(3) Sulfate <1.14>—Perform the test with 0.10 g of Bupranolol Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.168%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of Bupranolol Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(5) Arsenic <1.11>—Prepare the test solution with 1.0 g of Bupranolol Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(6) Related substances—Dissolve 0.30 g of Bupranolol Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu\text{L}$  each of the sample solution and standard solution on a plate of polyamide with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol, ammonia solution (28) and water (16:4:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.18 g of Bupranolol Hydrochloride, previously dried, dissolve in 60 mL of a mixture of acetic anhydride and acetic acid (100) (2:1) by warming, cool, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 30.82 mg of  $\text{C}_{14}\text{H}_{22}\text{ClNO}_2 \cdot \text{HCl}$

**Containers and storage** Containers—Well-closed containers.

## Busulfan

ブスルファン

$\text{C}_6\text{H}_{14}\text{O}_6\text{S}_2$ : 246.30

Tetramethylenedimethanesulfonate [55-98-1]

Busulfan contains not less than 98.5% of  $\text{C}_6\text{H}_{14}\text{O}_6\text{S}_2$ , calculated on the dried basis.

**Description** Busulfan occurs as a white, crystalline powder.

It is slightly soluble in diethyl ether, very slightly soluble in ethanol (95), and practically insoluble in water.

**Identification (1)** To 0.1 g of Busulfan add 10 mL of water and 5 mL of sodium hydroxide TS, dissolve by heating, and use this solution as the sample solution.

(i) To 7 mL of the sample solution add 1 drop of potassium permanganate TS: the red-purple color of potassium permanganate TS changes from blue-purple through blue to green.

(ii) Acidify 7 mL of the sample solution with dilute sulfuric acid, and add 1 drop of potassium permanganate TS: the color of potassium permanganate TS remains.

(2) Determine the infrared absorption spectrum of Busulfan, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 115 – 118°C

**Purity (1)** Sulfate <1.14>—To 1.0 g of Busulfan add 40 mL of water, and dissolve by heating. Cool in ice for 15 minutes, and filter. Wash the residue with 5 mL of water, combine the washings with the filtrate, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.019%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Busulfan according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** <2.41> Not more than 2.0% (1 g, in vacuum,

phosphorus (V) oxide, 60°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Busulfan, add 40 mL of water, and boil gently under a reflux condenser for 30 minutes. Cool, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS).

Each mL of 0.1 mol/L sodium hydroxide VS  
= 12.32 mg of C<sub>6</sub>H<sub>14</sub>O<sub>6</sub>S<sub>2</sub>

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Butropium Bromide

ブトロピウム臭化物

C<sub>28</sub>H<sub>38</sub>BrNO<sub>4</sub>: 532.51

(1*R*,3*r*,5*S*)-8-(4-Butoxybenzyl)-3-[(2*S*)-hydroxy-2-phenylpropanoyloxy]-8-methyl-8-azoniabicyclo[3.2.1]octane bromide [29025-14-7]

Butropium Bromide, when dried, contains not less than 98.0% of C<sub>28</sub>H<sub>38</sub>BrNO<sub>4</sub>.

**Description** Butropium Bromide occurs as white crystals or crystalline powder.

It is very soluble in formic acid, freely soluble in methanol, soluble in ethanol (95), slightly soluble in water, and practically insoluble in diethyl ether and in acetic anhydride.

**Identification** (1) To 1 mg of Butropium Bromide add 3 drops of fuming nitric acid, and evaporate on a water bath to dryness. Dissolve the residue in 1 mL of *N,N*-dimethylformamide, and add 5 to 6 drops of tetraethylammonium hydroxide TS: a red-purple color develops.

(2) Determine the absorption spectrum of a solution of Butropium Bromide in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Butropium Bromide in methanol (1 in 5000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) A solution of Butropium Bromide in methanol (1 in 20) responds to the Qualitative Tests <1.09> (1) for bromide.

**Optical rotation** <2.49> [ $\alpha$ ]<sub>D</sub><sup>20</sup>: -14.0 - -17.0° (after drying, 0.5 g, methanol, 20 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Dissolve 1.0 g of Butropium Bromide in 40 mL of ethanol (95), add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test, using this solution as the test solution. Prepare the control solution

with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Butropium Bromide in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the peak area having a ratio of the retention time about 0.5 to butropium from the sample solution is not larger than 1/4 of the peak area from the standard solution, and the total area of all peaks other than the peak eluted first, the peak having a ratio of the retention time to butropium about 0.5 and butropium peak from the sample solution is not larger than the peak area from the standard solution.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 220 nm).

**Column:** A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Dissolve 1.15 g of sodium lauryl sulfate in 1000 mL of a mixture of acetonitrile and 0.005 mol/L sulfuric acid (3:2).

**Flow rate:** Adjust the flow rate so that the retention time of butropium is about 5 minutes.

**Selection of column:** Dissolve 0.50 g of Butropium Bromide in 9 mL of ethanol (99.5) and 1 mL of 0.1 mol/L potassium hydroxide-ethanol TS, and heat at 70°C for 15 minutes. After cooling, to 1 mL of this solution add the mobile phase to make 100 mL. Proceed with 5  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of the peak of butropium and the peak having a ratio of the retention time about 0.7 to butropium with the resolution between these peaks being not less than 2.5.

**Detection sensitivity:** Adjust the detection sensitivity so that the peak height of the butropium obtained from 5  $\mu$ L of the standard solution is between 10 mm and 30 mm.

**Time span of measurement:** About twice as long as the retention time of butropium.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.8 g of Butropium Bromide, previously dried, dissolve in 5 mL of formic acid, add 100 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid-dioxane VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid-dioxane VS  
= 53.25 mg of C<sub>28</sub>H<sub>38</sub>BrNO<sub>4</sub>

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Butyl Parahydroxybenzoate

パラオキシ安息香酸ブチル

$C_{11}H_{14}O_3$ : 194.23  
Butyl 4-hydroxybenzoate [94-26-8]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols (♦ ◆).

Butyl Parahydroxybenzoate contains not less than 98.0% and not more than 102.0% of  $C_{11}H_{14}O_3$ .

♦**Description** Butyl Parahydroxybenzoate occurs as colorless crystals or white, crystalline powder.

It is freely soluble in ethanol (95) and in acetone, and practically insoluble in water. ◆

**Identification (1)** The melting point <2.60> of Butyl Parahydroxybenzoate is between 68°C and 71°C.

♦(2) Determine the infrared absorption spectrum of Butyl Parahydroxybenzoate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers. ◆

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Butyl Parahydroxybenzoate in 10 mL of ethanol (95); the solution is clear and not more intensely colored than the following control solution.

Control solution: To 5.0 mL of cobalt (II) chloride colorimetric stock solution, 12.0 mL of iron (III) chloride colorimetric stock solution and 2.0 mL of copper (II) sulfate colorimetric stock solution add water to make 1000 mL.

(2) Acidity—Dissolve 0.20 g of Butyl Parahydroxybenzoate in 5 mL of ethanol (95), add 5 mL of freshly boiled and cooled water and 0.1 mL of bromocresol green-sodium hydroxide-ethanol TS, then add 0.1 mL of 0.1 mol/L sodium hydroxide VS: the solution shows a blue color.

♦(3) Heavy metals <1.07>—Dissolve 1.0 g of Butyl Parahydroxybenzoate in 25 mL of acetone, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 25 mL of acetone, 2 mL of dilute acetic acid, and water to make 50 mL (not more than 20 ppm). ◆

(4) Related substances—Dissolve 0.10 g of Butyl Parahydroxybenzoate in 10 mL of acetone, and use this solution as the sample solution. Pipet 0.5 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of

methanol, water and acetic acid (100) (70:30:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot other than the principal spot is not more intense than the spot obtained with the standard solution.

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 1 g of Butyl Parahydroxybenzoate, add exactly 20 mL of 1 mol/L sodium hydroxide VS, heat at about 70°C for 1 hour, and immediately cool in ice. Titrate <2.50> the excess sodium hydroxide with 0.5 mol/L sulfuric acid VS up to the second equivalent point (potentiometric titration). Perform a blank determination.

Each mL of 1 mol/L sodium hydroxide VS  
= 194.2 mg of  $C_{11}H_{14}O_3$

♦**Containers and storage** Containers—Well-closed containers. ◆

## Cacao Butter

*Oleum Cacao*

カカオ脂

Cacao Butter is the fat obtained from the seed of *Theobroma cacao* Linné (*Sterculiaceae*).

**Description** Cacao Butter occurs as a yellowish white, hard, brittle mass. It has a slight, chocolate-like odor, and has no odor of rancidity.

It is freely soluble in diethyl ether and in petroleum ether, soluble in boiling ethanol (99.5), and very slightly soluble in ethanol (95).

Congeeing point of the fatty acids: 45 – 50°C

Melting point 31–35°C (Cram the sample into a capillary tube without melting the sample).

**Specific gravity** <1.13>  $d_{20}^{40}$ : 0.895 – 0.904

**Acid value** <1.13> Not more than 3.0.

**Saponification value** <1.13> 188 – 195

**Iodine value** <1.13> 35 – 43

**Containers and storage** Containers—Well-closed containers.

## Anhydrous Caffeine

無水カフェイン

$C_8H_{10}N_4O_2$ : 194.19  
1,3,7-Trimethyl-1*H*-purine-2,6-(3*H*,7*H*)-dione  
[58-08-2]

Anhydrous Caffeine, when dried, contains not less

than 98.5% of  $C_8H_{10}N_4O_2$ .

**Description** Anhydrous Caffeine occurs as white crystals or powder. It is odorless, and has a bitter taste.

It is freely soluble in chloroform, sparingly soluble in water, in acetic anhydride and in acetic acid (100), and slightly soluble in ethanol (95) and in diethyl ether.

The pH of a solution of Anhydrous Caffeine (1 in 100) is between 5.5 and 6.5

**Identification (1)** To 2 mL of a solution of Anhydrous Caffeine (1 in 500) add tannic acid TS dropwise: a white precipitate, which dissolves upon the dropwise addition of tannic acid TS, is produced.

(2) To 0.01 g of Anhydrous Caffeine add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, and evaporate on a water bath to dryness: the residue acquires a yellow-red color. Invert the residue over a vessel containing 2 to 3 drops of ammonia TS: the color turns red-purple, and disappears upon the addition of 2 to 3 drops of sodium hydroxide TS.

(3) Dissolve 0.01 g of Anhydrous Caffeine in water to make 50 mL. To 5 mL of this solution add 3 mL of diluted acetic acid (31) (3 in 100) and 5 mL of pyridine (1 in 10), mix, add 2 mL of diluted sodium hypochlorite TS (1 in 5), and allow to stand for 1 minute. Add 2 mL of sodium thiosulfate TS and 5 mL of sodium hydroxide TS to the solution: a yellow color develops.

**Melting point** <2.60> 235 – 238°C

**Purity (1)** Chloride <1.03>—Dissolve 2.0 g of Anhydrous Caffeine in 80 mL of hot water, cool rapidly to 20°C, add water to make 100 mL, and use this solution as the sample solution. To 40 mL of the sample solution add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).

(2) Sulfate <1.14>—To 40 mL of the sample solution obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Anhydrous Caffeine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Dissolve 0.10 g of Anhydrous Caffeine in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 100 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and ethanol (95) (9:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

(5) Readily carbonizable substances <1.15>—Perform the test using 0.5 g of Anhydrous Caffeine: the solution is not

more colored than Matching Fluid D.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 80°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 0.4 g of Anhydrous Caffeine, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100) (6:1), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the solution changes from purple through green to yellow (indicator: 3 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 19.42 mg of  $C_8H_{10}N_4O_2$

**Containers and storage** Containers—Tight containers.

## Caffeine Hydrate

カフェイン水和物

$C_8H_{10}N_4O_2 \cdot H_2O$ : 212.21  
1,3,7-Trimethyl-1*H*-purine-2,6-(3*H*,7*H*)-dione  
monohydrate [5743-12-4]

Caffeine Hydrate, when dried, contains not less than 98.5% of caffeine ( $C_8H_{10}N_4O_2$ : 194.19).

**Description** Caffeine Hydrate occurs as white, soft crystals or powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in chloroform, sparingly soluble in water, in acetic acid (100) and in acetic anhydride, slightly soluble in ethanol (95), and very slightly soluble in diethyl ether.

The pH of a solution of Caffeine Hydrate (1 in 100) is between 5.5 and 6.5.

It effloresces in dry air.

**Identification (1)** To 2 mL of a solution of Caffeine Hydrate (1 in 500) add tannic acid TS dropwise: a white precipitate, which dissolves upon the dropwise addition of tannic acid TS, is produced.

(2) To 0.01 g of Caffeine Hydrate add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, and evaporate to dryness on a water bath: the residue acquires a yellow-red color. Invert the residue over a vessel containing 2 to 3 drops of ammonia TS: the color turns red-purple, and disappears upon the addition of 2 to 3 drops of sodium hydroxide TS.

(3) Dissolve 0.01 g of Caffeine Hydrate in water to make 50 mL. To 5 mL of this solution add 3 mL of diluted acetic acid (31) (3 in 100) and 5 mL of a solution of pyridine (1 in 10), mix, add 2 mL of diluted sodium hypochlorite TS (1 in 5), and allow to stand for 1 minute. Add 2 mL of sodium thiosulfate TS and 5 mL of sodium hydroxide TS to the solution: a yellow color develops.

**Melting point** <2.60> 235 – 238°C (after drying).

**Purity (1) Chloride** <1.03>—Dissolve 2.0 g of Caffeine Hydrate in 80 mL of hot water, cool rapidly to 20°C, add water to make 100 mL, and use this solution as the sample solution. To 40 mL of the sample solution add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).

(2) **Sulfate** <1.14>—To 40 mL of the sample solution obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(3) **Heavy metals** <1.07>—Proceed with 2.0 g of Caffeine Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) **Related substances**—Dissolve 0.10 g of Caffeine Hydrate in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 100 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. Perform the test as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and ethanol (95) (9:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

(5) **Readily carbonizable substances** <1.15>—Perform the test using 0.5 g of Caffeine Hydrate: the solution is not more colored than Matching Fluid D.

**Loss on drying** <2.41> 0.5 – 8.5% (1 g, 80°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 0.4 g of Caffeine Hydrate, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100) (6:1), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the solution changes from purple through green to yellow (indicator: 3 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 19.42 mg of C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>

**Containers and storage** Containers—Tight containers.

## Caffeine and Sodium Benzoate

安息香酸ナトリウムカフェイン

Caffeine and Sodium Benzoate, when dried, contains not less than 48.0% and not more than 50.0% of caffeine (C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>: 194.19), and not less than 50.0% and not more than 52.0% of sodium benzoate (C<sub>7</sub>H<sub>5</sub>NaO<sub>2</sub>: 144.10).

**Description** Caffeine and Sodium Benzoate occurs as a

white powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in water, soluble in acetic acid (100) and in acetic anhydride, sparingly soluble in ethanol (95), and practically insoluble in diethyl ether.

**Identification (1)** Dissolve 1 g of Caffeine and Sodium Benzoate in 10 mL of water in a separator, add 1 drop of phenolphthalein TS, and add carefully 0.01 mol/L sodium hydroxide VS dropwise until a faint red color develops. Extract with three 20-mL portions of chloroform by thorough shaking, and separate the chloroform layer from the water layer. [Use the water layer for test (2).] Filter the combined chloroform extracts, evaporate the filtrate to dryness on a water bath, and proceed the following tests with the residue:

(i) To 2 mL of a solution of the residue (1 in 500) add tannic acid TS dropwise: a white precipitate, which dissolves upon the dropwise addition of tannic acid TS, is produced.

(ii) To 0.01 g of the residue add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, evaporate to dryness on a water bath: the residue acquires a yellow-red color. Invert the residue over a vessel containing 2 to 3 drops of ammonia TS: the color turns red-purple, and disappears upon the addition of 2 to 3 drops of sodium hydroxide TS.

(iii) Dissolve 0.01 g of the residue in water to make 50 mL. To 5 mL of this solution add 3 mL of diluted acetic acid (31) (3 in 100) and 5 mL of a solution of pyridine (1 in 10), mix, add 2 mL of diluted sodium hypochlorite TS (1 in 5), and allow to stand for 1 minute. Add 2 mL of sodium thiosulfate TS and 5 mL of sodium hydroxide TS to the solution: a yellow color develops.

(2) To 5 mL of the water layer obtained in (1) add 5 mL of water: the solution responds to the Qualitative Tests <1.09> (2) for benzoate.

(3) Heat Caffeine and Sodium Benzoate: white fumes are evolved. Ignite furthermore, and to the residue add hydrochloric acid: bubbles are produced, and the solution responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Caffeine and Sodium Benzoate in 5 mL of water: the solution is clear and colorless.

(2) **Alkalinity**—Dissolve 1.0 g of Caffeine and Sodium Benzoate in 20 mL of water, and add 1 or 2 drops of phenolphthalein TS: no red color develops.

(3) **Chloride** <1.03>—Dissolve 0.5 g of Caffeine and Sodium Benzoate in 10 mL of water, and add 30 mL of ethanol (95), 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.70 mL of 0.01 mol/L hydrochloric acid VS, 30 mL of ethanol (95) and water to make 50 mL (not more than 0.050%).

(4) **Chlorinated compounds**—Dissolve 1.0 g of Caffeine and Sodium Benzoate in 40 mL of water, add 10 mL of dilute sulfuric acid, and extract with two 20-mL portions of diethyl ether. Allow the combined diethyl ether extracts to evaporate at room temperature to dryness. Place this residue and 0.7 g of calcium carbonate in a crucible, mix with a small amount of water, and dry. Ignite at about 600°C, dissolve the residue in 20 mL of dilute nitric acid, and filter. Wash the residue with 15 mL of water, combine the filtrate and the washings, and add water to make 50 mL. To this solution add 0.5 mL of silver nitrate TS: the solution is not more turbid than the following control solution to which 0.5 mL of silver nitrate TS has been added.

Control solution: Dissolve 0.7 g of calcium carbonate in 20 mL of dilute nitric acid, and filter. Wash the residue with 15 mL of water, combine the filtrate and the washings, and add 1.2 mL of 0.01 mol/L hydrochloric acid VS and water to make 50 mL.

(5) Heavy metals <1.07>—Dissolve 2.0 g of Caffeine and Sodium Benzoate in 47 mL of water, add slowly, with vigorous stirring, 3 mL of dilute hydrochloric acid, and filter. Discard the first 5 mL of the filtrate, neutralize the subsequent 25 mL of the filtrate with ammonia TS, and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution by adding 2 mL of dilute acetic acid and water to make 50 mL (not more than 20 ppm).

(6) Arsenic <1.11>—Prepare the test solution with 1.0 g of Caffeine and Sodium Benzoate according to Method 1, and perform the test (not more than 2 ppm).

(7) Phthalic acid—To 0.10 g of Caffeine and Sodium Benzoate add 1 mL of water and 1 mL of resorcinol-sulfuric acid TS, and heat the mixture in an oil bath heated at a temperature between 120°C and 125°C to evaporate the water, then heat the residue for further 90 minutes, cool, and dissolve in 5 mL of water. To 1 mL of the solution add 10 mL of a solution of sodium hydroxide (43 in 500), shake, then examine under light at a wavelength between 470 nm and 490 nm: the green fluorescence of the solution is not more intense than that of the following control solution.

Control solution: Dissolve 61 mg of potassium hydrogen phthalate in water to make exactly 1000 mL. Pipet exactly 1 mL of the solution, add 1 mL of resorcinol-sulfuric acid TS, and proceed as directed above.

(8) Readily carbonizable substances <1.15>—Proceed with 0.5 g of Caffeine and Sodium Benzoate, and perform the test: the solution is not more colored than Matching Fluid A.

**Loss on drying** <2.41> Not more than 3.0% (2 g, 80°C, 4 hours).

**Assay (1) Sodium benzoate**—Weigh accurately about 0.2 g of Caffeine and Sodium Benzoate, previously dried, dissolve by warming in 50 mL of a mixture of acetic anhydride and acetic acid for nonaqueous titration (6:1), cool, and titrate <2.50> with 0.1 mol/L perchloric acid-dioxane VS to the first equivalence point (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid-dioxane VS  
= 14.41 mg of C<sub>7</sub>H<sub>5</sub>NaO<sub>2</sub>

(2) Caffeine—Continue the titration <2.50> in (1) with 0.1 mol/L perchloric acid-dioxane VS from the first equivalence point to the second equivalence point (potentiometric titration).

Each mL of 0.1 mol/L perchloric acid-dioxane VS  
= 19.42 mg of C<sub>8</sub>H<sub>10</sub>N<sub>4</sub>O<sub>2</sub>

**Containers and storage** Containers—Well-closed containers.

## Precipitated Calcium Carbonate

沈降炭酸カルシウム

CaCO<sub>3</sub>: 100.09

Precipitated Calcium Carbonate, when dried, contains not less than 98.5% of calcium carbonate (CaCO<sub>3</sub>).

**Description** Precipitated Calcium Carbonate occurs as a white, fine crystalline powder. It is odorless and tasteless.

It is practically insoluble in water, but its solubility in water is increased in the presence of carbon dioxide.

It is practically insoluble in ethanol (95) and in diethyl ether.

It dissolves with effervescence in dilute acetic acid, in dilute hydrochloric acid and in dilute nitric acid.

**Identification (1)** Dissolve 0.5 g of Precipitated Calcium Carbonate in 10 mL of dilute hydrochloric acid, boil, then cool, and neutralize with ammonia TS: the solution responds to the Qualitative Tests <1.09> for calcium salt.

(2) Precipitated Calcium Carbonate responds to the Qualitative Tests <1.09> (1) for carbonate.

**Purity (1) Acid-insoluble substances**—To 5.0 g of Precipitated calcium Carbonate add 50 mL of water, then add 20 mL of hydrochloric acid dropwise with stirring, boil for 5 minutes, cool, add water to make 200 mL, and filter through filter paper for quantitative analysis. Wash the residue until the last washing shows no turbidity with silver nitrate TS, and ignite the residue together with the filter paper: the mass of the residue is not more than 10.0 mg.

(2) Heavy metals <1.07>—Mix 2.0 g of Precipitated Calcium Carbonate with 5 mL of water, add slowly 6 mL of dilute hydrochloric acid, and evaporate on a water bath to dryness. Dissolve the residue in 50 mL of water, and filter. To 25 mL of the filtrate add 2 mL of dilute acetic acid, 1 drop of ammonia TS and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: evaporate 3 mL of hydrochloric acid on a water bath to dryness, and add 2 mL of dilute acetic acid, 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 20 ppm).

(3) Barium—Mix 1.0 g of Precipitated Calcium Carbonate with 10 mL of water, add dropwise 4 mL of hydrochloric acid with stirring, boil for 5 minutes, cool, add water to make 40 mL, and filter. With the filtrate, perform the test as directed under Flame Coloration Test <1.04> (1): no green color appears.

(4) Magnesium and alkali metals—Dissolve 1.0 g of Precipitated Calcium Carbonate in a mixture of 20 mL of water and 10 mL of dilute hydrochloric acid, boil, neutralize with ammonia TS, and add ammonium oxalate TS until precipitation of calcium oxalate is completed. Heat the mixture on a water bath for 1 hour, cool, dilute with water to 100 mL, shake well, and filter. To 50 mL of the filtrate add 0.5 mL of sulfuric acid, evaporate to dryness, and ignite at 600°C to constant mass: the mass of the residue is not more than 5.0 mg.

(5) Arsenic <1.11>—Moisten 0.40 g of Precipitated Calcium Carbonate with 1 mL of water, then dissolve in 4 mL of dilute hydrochloric acid, use this solution as the test solution, and perform the test (not more than 5 ppm).

**Loss on drying** <2.41> Not more than 1.0% (1 g, 180°C, 4 hours).

**Assay** Weigh accurately about 0.12 g of Precipitated Calcium Carbonate, previously dried, and dissolve in 20 mL of water and 3 mL of dilute hydrochloric acid. Add 80 mL of water, 15 mL of a solution of potassium hydroxide (1 in 10) and 0.05 g of NN indicator, and titrate <2.50> immediately with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to blue.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 5.004 mg of CaCO<sub>3</sub>

**Containers and storage** Containers—Tight containers.

## Calcium Chloride Hydrate

塩化カルシウム水和物

CaCl<sub>2</sub>·2H<sub>2</sub>O: 147.01

Calcium Chloride Hydrate contains not less than 96.7% and not more than 103.3% of CaCl<sub>2</sub>·2H<sub>2</sub>O.

**Description** Calcium Chloride Hydrate occurs as white granules or masses. It is odorless.

It is very soluble in water, and soluble in ethanol (95), and practically insoluble in diethyl ether.

It is deliquescent.

**Identification** A solution of Calcium Chloride Hydrate (1 in 10) responds to the Qualitative Tests <1.09> for calcium salt and for chloride.

**pH** <2.54> The pH of a solution of 1.0 g of Calcium Chloride Hydrate in 20 mL of freshly boiled and cooled water is between 4.5 and 9.2.

**Purity (1)** Clarity and color of solution—A solution of 1.0 g of Calcium Chloride Hydrate in 20 mL of water is clear and colorless.

(2) Sulfate <1.14>—Take 1.0 g of Calcium Chloride Hydrate, and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(3) Hypochlorite—Dissolve 0.5 g of Calcium Chloride Hydrate in 5 mL of water, add 2 to 3 drops of dilute hydrochloric acid and 2 to 3 drops of zinc iodide-starch TS: no blue color develops immediately.

(4) Heavy metals <1.07>—Proceed with 2.0 g of Calcium Chloride Hydrate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Iron, aluminum or phosphate—Dissolve, in a Nessler tube, 1.0 g of Calcium Chloride Hydrate in 20 mL of water and 1 drop of dilute hydrochloric acid, boil, then cool, add 3 drops of ammonia TS, and heat the solution to boil: no turbidity or precipitate is produced.

idity or precipitate is produced.

(6) Barium—Dissolve 0.5 g of Calcium Chloride Hydrate in 5 mL of water, add 2 drops of dilute hydrochloric acid and 2 mL of potassium sulfate TS, and allow to stand for 10 minutes: no turbidity is produced.

(7) Arsenic <1.11>—Prepare the test solution with 1.0 g of Calcium Chloride Hydrate according to Method 1, and perform the test (not more than 2 ppm).

**Assay** Weigh accurately about 0.4 g of Calcium Chloride Hydrate, and dissolve in water to make exactly 200 mL. Measure exactly 20 mL of this solution, add 40 mL of water, 2 mL of 8 mol/L potassium hydroxide TS and 0.1 g of NN indicator, and titrate <2.50> immediately with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to blue.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 2.940 mg of CaCl<sub>2</sub>·2H<sub>2</sub>O

**Containers and storage** Containers—Tight containers.

## Calcium Chloride Injection

塩化カルシウム注射液

Calcium Chloride Injection is an aqueous solution for injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of calcium chloride (CaCl<sub>2</sub>: 110.98).

The concentration of Calcium Chloride Injection is expressed as the quantity of calcium chloride (CaCl<sub>2</sub>).

**Method of preparation** Prepare as directed under Injection, with Calcium Chloride Hydrate.

**Description** Calcium Chloride Injection is a clear, colorless liquid.

**Identification** Calcium Chloride Injection responds to the Qualitative Tests <1.09> for calcium salt and for chloride.

**pH** <2.54> 4.5 – 7.5

**Bacterial endotoxins** <4.01> Less than 0.30 EU/mg.

**Extractable volume** <6.05> It meets the requirement.

**Assay** Measure exactly a volume of Calcium Chloride Injection, equivalent to about 0.4 g of calcium chloride (CaCl<sub>2</sub>), and proceed as directed in the Assay under Calcium Chloride Hydrate.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 2.220 mg of CaCl<sub>2</sub>

**Containers and storage** Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

## Calcium Folate

### Calcium Leucovorin

ホリナートカルシウム

$C_{20}H_{21}CaN_7O_7$ : 511.50

Monocalcium *N*-{4-[(2-amino-5-formyl-4-oxo-1,4,5,6,7,8-hexahydropteridin-6-yl)methylamino]benzoyl}-L-glutamate [1492-18-8]

Calcium Folate contains not less than 95.0% and not more than 102.0% of  $C_{20}H_{21}CaN_7O_7$ , calculated on the anhydrous basis.

**Description** Calcium Folate occurs as a light yellow to yellow powder. It is odorless and tasteless.

It is very soluble in water, freely soluble in acetic acid (100), and practically insoluble in ethanol (95) and in diethyl ether.

It is gradually affected by light.

**Identification (1)** Determine the absorption spectrum of a solution of Calcium Folate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Calcium Folate Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Calcium Folate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Calcium Folate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Calcium Folate (1 in 100) responds to the Qualitative Tests <1.09> (2), (3) and (4) for calcium salt.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Calcium Folate in 10 mL of water: the solution is clear and yellow.

**(2)** Heavy metals <1.07>—Proceed with 0.40 g of Calcium Folate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 50 ppm).

**Water** <2.48> Weigh accurately about 0.2 g of Calcium Folate in a dried titration flask, and dissolve in 25 mL of acetic acid (100). Add 10.0 mL of Standard Water-Methanol Solution, titrate with Karl Fischer TS to the end point and perform the test: it is not more than 17.0%. Perform a blank determination, and make any necessary correction.

**Assay** Weigh accurately about 20 mg of Calcium Folate, dissolve in the mobile phase to make exactly 100 mL, and use

this solution as the sample solution. Separately, weigh accurately about 17.5 mg of Calcium Folate Reference Standard, calculated on the anhydrous basis, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of folinate in each solution.

$$\begin{aligned} \text{Amount (mg) of } C_{20}H_{21}CaN_7O_7 \\ = W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Calcium Folate Reference Standard, calculated on the anhydrous basis

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column about 4 mm in inside diameter and about 25 cm in length, packed with octadecyl-silicized silica gel for liquid chromatography (5 to 10  $\mu$ m in particle diameter).

**Column temperature:** Room temperature.

**Mobile phase:** To 860 mL of water add 100 mL of acetonitrile and 15 mL of tetrabutylammonium hydroxide-methanol TS, adjust the pH to 7.5 with 2 mol/L sodium dihydrogenphosphate TS, and add water to make 1000 mL.

**Flow rate:** Adjust the flow rate so that the retention time of folinate is about 10 minutes.

**Selection of column:** Dissolve 17.5 mg of folic acid in 100 mL of the mobile phase, and to 5 mL of this solution add 20 mL of the standard solution. Proceed with 20  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of folinate and folic acid in this order with the resolution of these peaks being not less than 3.6.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of each peak area of folinate is not more than 2.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Calcium Gluconate Hydrate

グルコン酸カルシウム水和物

$C_{12}H_{22}CaO_{14} \cdot H_2O$ : 448.39

Monocalcium di-D-gluconate monohydrate [299-28-5]

Calcium Gluconate Hydrate, when dried, contains not less than 99.0% and not more than 104.0% of  $C_{12}H_{22}CaO_{14} \cdot H_2O$ .

**Description** Calcium Gluconate Hydrate occurs as a white, crystalline powder or granules.

It is soluble in water, and practically insoluble in ethanol (99.5).

**Identification (1)** To separately 10 mg each of Calcium Gluconate Hydrate and calcium gluconate for thin-layer chromatography add 1 mL of water, dissolve by warming, and use these solutions as the sample solution and standard solution, respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethanol (95), water, ammonia solution (28) and ethyl acetate (5:3:1:1) to a distance of about 10 cm, air-dry the plate, and heat the plate at 110°C for 20 minutes. After cooling, spray evenly hexaammonium heptamolybdate-cerium (IV) sulfate TS on the plate, air-dry, and heat at 110°C for 10 minutes: the spots with the sample solution and the standard solution are the same in the  $R_f$  value and color tone.

(2) A solution of Calcium Gluconate Hydrate (1 in 40) responds to the Qualitative Tests <1.09> (1), (2) and (3) for calcium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +6 – +11° (after drying, 0.5 g, water, warming, after cooling, 25 mL, 100 mL).

**pH** <2.54> Dissolve 1.0 g of Calcium Gluconate Hydrate in 20 mL of water by warming: the pH of the solution is between 6.0 and 8.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Calcium Gluconate Hydrate in 50 mL of water by warming: the solution is clear and colorless.

(2) Chloride <1.03>—Take 0.40 g of Calcium Gluconate Hydrate, and perform the test. Prepare the control solution with 0.80 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.071%).

(3) Sulfate <1.14>—Take 1.0 g of Calcium Gluconate Hydrate, and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048 %).

(4) Heavy metals <1.07>—Dissolve 1.0 g of Calcium Gluconate Hydrate in 30 mL of water and 2 mL of dilute acetic acid by warming, cool, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution, 2 mL of dilute acetic acid, and water to make 50 mL (not more than 20 ppm).

(5) Arsenic <1.11>—Dissolve 0.6 g of Calcium Gluconate Hydrate in 5 mL of water by warming, add 5 mL of dilute sulfuric acid and 1 mL of bromine TS, and concentrate on a water bath to 5 mL. Perform the test with this solution as the test solution (not more than 3.3 ppm).

(6) Sucrose and reducing sugars—To 0.5 g of Calcium Gluconate Hydrate add 10 mL of water and 2 mL of dilute hydrochloric acid, and boil the solution for 2 minutes. After cooling, add 5 mL of sodium carbonate TS, allow to stand for 5 minutes, add water to make 20 mL, and filter. To 5 mL of the filtrate add 2 mL of Fehling's TS, and boil for 1 minute: no orange-yellow to red precipitate is formed immediately.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 80°C, 2 hours).

**Assay** Weigh accurately about 0.4 g of Calcium Gluconate Hydrate, previously dried, dissolve in 100 mL of water, add 2 mL of 8 mol/L potassium hydroxide TS and 0.1 g of NN in-

dicator, and titrate <2.50> immediately with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to blue.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 22.42 mg of  $\text{C}_{12}\text{H}_{22}\text{CaO}_{14}\cdot\text{H}_2\text{O}$

**Containers and storage** Containers—Well-closed containers.

## Calcium Hydroxide

### Slaked Lime

水酸化カルシウム

$\text{Ca}(\text{OH})_2$ : 74.09

Calcium Hydroxide contains not less than 90.0% of  $\text{Ca}(\text{OH})_2$ .

**Description** Calcium Hydroxide occurs as a white powder. It has a slightly bitter taste.

It is slightly soluble in water, very slightly soluble in boiling water, and practically insoluble in ethanol (95) and in diethyl ether.

It dissolves in dilute acetic acid, in dilute hydrochloric acid and in dilute nitric acid.

It absorbs carbon dioxide from air.

**Identification (1)** Mix Calcium Hydroxide with 3 to 4 times its mass of water: the mixture is slushy and is alkaline.

(2) Dissolve 1 g of Calcium Hydroxide in 30 mL of dilute acetic acid, and boil. After cooling, neutralize with ammonia TS: the solution responds to the Qualitative tests <1.09> (2) and (3) for calcium salt.

**Purity (1)** Acid-insoluble substances—To 5 g of Calcium Hydroxide add 100 mL of water, add hydrochloric acid dropwise with string until the solution becomes acidic, and further add 1 mL of hydrochloric acid. Boil this solution for 5 minutes, cool, and filter through a tared glass filter (G4). Wash the residue with boiling water until the last washing exhibits no turbidity upon addition of silver nitrate TS, and dry at 105°C to constant mass: the mass is not more than 25 mg.

(2) Heavy metals <1.07>—Dissolve 1.0 g of Calcium Hydroxide in 10 mL of dilute hydrochloric acid, evaporate on a water bath to dryness, dissolve the residue in 40 mL of water, and filter. To 20 mL of the filtrate add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: evaporate 5 mL of dilute hydrochloric acid on a water bath to dryness, and add 2 mL of dilute acetic acid, 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 40 ppm).

(3) Magnesium and alkali metals—Dissolve 1.0 g of Calcium Hydroxide in a mixture of 20 mL of water and 10 mL of dilute hydrochloric acid, boil, neutralize with ammonia TS, and precipitate calcium oxalate completely by adding dropwise ammonium oxalate TS. Heat the mixture on a water bath for 1 hour, cool, dilute with water to 100 mL, shake, and filter. To 50 mL of the filtrate add 0.5 mL of sul-

furic acid, evaporate to dryness, and ignite at 600°C to constant mass: the mass of the residue does not exceed 24 mg.

(4) Arsenic <1.11>—Dissolve 0.5 g of Calcium Hydroxide in 5 mL of dilute hydrochloric acid, and perform the test with this solution as the test solution (not more than 4 ppm).

**Assay** Weigh accurately about 1 g of Calcium Hydroxide, dissolve by adding 10 mL of dilute hydrochloric acid, and add water to make 100 mL. Measure 10 mL of this solution, add 90 mL of water and 1.5 mL of 8 mol/L potassium hydroxide TS, shake, allow to stand for 3 to 5 minutes, and then add 0.1 g of NN indicator. Titrate <2.50> immediately with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, until the red-purple color of the solution changes to blue.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 3.705 mg of Ca(OH)<sub>2</sub>

**Containers and storage** Containers—Tight containers.

## Calcium Lactate Hydrate

乳酸カルシウム水和物

C<sub>6</sub>H<sub>10</sub>CaO<sub>6</sub>·5H<sub>2</sub>O: 308.29

Monocalcium bis[(2*RS*)-2-hydroxypropanoate] pentahydrate [63690-56-2]

Calcium Lactate Hydrate, when dried, contains not less than 97.0% of calcium lactate (C<sub>6</sub>H<sub>10</sub>CaO<sub>6</sub>: 218.22).

**Description** Calcium Lactate Hydrate occurs as white powder or granules. It is odorless, and has a slightly acid taste.

A 1 g portion of it dissolves gradually in 20 mL of water, and it is slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

It is partly efflorescent at ordinary temperature, and yields the anhydride at 120°C.

**Identification** A solution of Calcium Lactate Hydrate (1 in 20) responds to the Qualitative Tests <1.09> for calcium salt and for lactate.

**Purity (1)** Clarity of solution—Dissolve 1.0 g of Calcium Lactate Hydrate in 20 mL of water by warming: the solution is clear.

(2) Acidity or alkalinity—To the solution obtained in (1) add 2 drops of phenolphthalein TS: no red color is produced. Then add 0.50 mL of 0.1 mol/L sodium hydroxide VS: a red color develops.

(3) Heavy metals <1.07>—Dissolve 1.0 g of Calcium Lactate Hydrate in 30 mL of water and 5 mL of dilute acetic acid by warming, cool, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution from 2.0 mL of Standard Lead Solution and 2 mL of dilute acetic acid, and dilute with water to 50 mL (not more than 20 ppm).

(4) Magnesium or alkali metals—Dissolve 1.0 g of Calci-

um Lactate Hydrate in 40 mL of water, add 0.5 g of ammonium chloride, boil, then add 20 mL of ammonium oxalate TS. Heat the mixture on a water bath for 1 hour, cool, dilute with water to 100 mL, and filter. To 50 mL of the filtrate add 0.5 mL of sulfuric acid, evaporate to dryness, and ignite between 450°C and 550°C to constant mass: the mass of the residue is not more than 5 mg.

(5) Arsenic <1.11>—Dissolve 0.5 g of Calcium Lactate Hydrate in 2 mL of water and 3 mL of hydrochloric acid, and perform the test with this solution as the test solution (not more than 4 ppm).

(6) Volatile fatty acid—Warm 1.0 g of Calcium Lactate Hydrate with 2 mL of sulfuric acid: an odor of acetic acid or butyric acid is not perceptible.

**Loss on drying** <2.41> 25.0 – 30.0% (1 g, 80°C, 1 hour at first, then 120°C, 4 hours).

**Assay** Weigh accurately about 0.5 g of Calcium Lactate, previously dried, add water, dissolve by heating on a water bath, cool, and add water to make exactly 100 mL. Pipet 20 mL of this solution, then 80 mL of water and 1.5 mL of 8 mol/L potassium hydroxide TS, and allow to stand for 3 to 5 minutes. Add 0.1 g of NN indicator, and titrate <2.50> immediately with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red to blue.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 4.364 mg of C<sub>6</sub>H<sub>10</sub>CaO<sub>6</sub>

**Containers and storage** Containers—Tight containers.

## Calcium Oxide

### Quick Lime

酸化カルシウム

CaO: 56.08

Calcium Oxide, when incinerated, contains not less than 98.0% of CaO.

**Description** Calcium Oxide occurs as hard, white masses, containing a powder. It is odorless.

It is very slightly soluble in boiling water, and practically insoluble in ethanol (95).

One gram of Calcium Oxide dissolves almost completely in 2500 mL of water.

It slowly absorbs moisture and carbon dioxide from air.

**Identification (1)** Moisten Calcium Oxide with water: heat is generated and a white powder is obtained. Mix the powder with about 5 times its mass of water: the mixture is alkaline.

(2) Dissolve 1 g of Calcium Oxide in 20 mL of water by adding a few drops of acetic acid (31): the solution responds to the Qualitative Tests <1.09> for calcium salt.

**Purity (1)** Acid-insoluble substances—Disintegrate 5.0 g of Calcium Oxide with a small amount of water, add 100 mL of water, add dropwise hydrochloric acid with stirring until the solution becomes acidic, and further add 1 mL of

hydrochloric acid. Boil the solution for 5 minutes, cool, filter through a glass filter (G4), wash the residue with boiling water until no turbidity is produced when silver nitrate TS is added to the last washing, and dry at 105°C to constant mass: the mass of the residue is not more than 10.0 mg.

(2) Carbonate—Disintegrate 1.0 g of Calcium Oxide with a small amount of water, mix thoroughly with 50 mL of water, allow to stand for a while, remove most of the supernatant milky liquid by decantation, and add an excess of dilute hydrochloric acid to the residue: no vigorous effervescence is produced.

(3) Magnesium and alkali metals—Dissolve 1.0 g of Calcium Oxide in 75 mL of water by adding dropwise hydrochloric acid, and further add 1 mL of hydrochloric acid. Boil for 1 to 2 minutes, neutralize with ammonia TS, add dropwise an excess of hot ammonium oxalate TS, heat the mixture on a water bath for 2 hours, cool, add water to make 200 mL, mix thoroughly, and filter. Evaporate 50 mL of the filtrate with 0.5 mL of sulfuric acid to dryness, and heat the residue strongly at 600°C to constant mass: the mass of the residue is not more than 15 mg.

**Loss on ignition** <2.43> Not more than 10.0% (1 g, 900°C, constant mass).

**Assay** Weigh accurately about 0.7 g of Calcium Oxide, previously incinerated at 900°C to constant mass and cooled in a desiccator (silica gel), and dissolve in 50 mL of water and 8 mL of diluted hydrochloric acid (1 in 3) by heating. Cool, and add water to make exactly 250 mL. Pipet 10 mL of the solution, add 50 mL of water, 2 mL of 8 mol/L potassium hydroxide TS and 0.1 g of NN indicator, and titrate <2.50> with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, until the red-purple color of the solution changes to blue.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 1.122 mg of CaO

**Containers and storage** Containers—Tight containers.

## Calcium Pantothenate

パントテン酸カルシウム

$C_{18}H_{32}CaN_2O_{10}$ : 476.53

Monocalcium bis{3-[(2*R*)-2,4-dihydroxy-3,3-dimethylbutanoylamino]propanoate} [137-08-6]

Calcium Pantothenate, when dried, contains not less than 5.7% and not more than 6.0% of nitrogen (N: 14.01), and not less than 8.2% and not more than 8.6% of calcium (Ca: 40.08).

**Description** Calcium Pantothenate occurs as a white powder. It is odorless, and has a bitter taste.

It is freely soluble in water, very slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution of Calcium Pantothenate (1 in 20) is

between 7.0 and 9.0.

It is hygroscopic.

**Identification** (1) Dissolve 0.05 g of Calcium Pantothenate in 5 mL of sodium hydroxide TS, and filter. To the filtrate add 1 drop of copper (II) sulfate TS: a deep blue color develops.

(2) To 0.05 g of Calcium Pantothenate add 5 mL of sodium hydroxide TS, and boil for 1 minute. After cooling, add diluted hydrochloric acid (1 in 10) to adjust the solution to a pH between 3 and 4, and add 2 drops of iron (III) chloride TS: a yellow color is produced.

(3) A solution of Calcium Pantothenate (1 in 10) responds to the Qualitative Tests <1.09> for calcium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +25.0 – +28.5° (after drying, 1 g, water, 20 mL, 100 mm).

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Calcium Pantothenate in 20 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Calcium Pantothenate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Alkaloids—Dissolve 0.05 g of Calcium Pantothenate in 5 mL of water, add 0.5 mL of hexaammonium heptamolybdate TS and 0.5 mL of a solution of phosphoric acid (1 in 10): no white turbidity is produced.

**Loss on drying** <2.41> Not more than 5.0% (1 g, 105°C, 4 hours).

**Assay** (1) Nitrogen—Proceed with about 50 mg of Calcium Pantothenate, previously dried and accurately weighed, as directed under Nitrogen Determination <1.08>.

(2) Calcium—Weigh accurately about 0.4 g of Calcium Pantothenate, previously dried, and dissolve in 30 mL of water by warming. After cooling, add exactly 25 mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, then 10 mL of ammonia-ammonium chloride buffer solution, pH 10.7, and 0.04 g of eriochrome black T-sodium chloride indicator, and titrate <2.50> the excess disodium dihydrogen ethylenediamine tetraacetate with 0.05 mol/L magnesium chloride VS until the color of the solution changes from blue-purple to red-purple. Perform a blank determination.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 2.004 mg of Ca

**Containers and storage** Containers—Tight containers.

## Calcium Paraaminosalicylate Granules

### Pas-calcium Granules

パラアミノサリチル酸カルシウム顆粒

Calcium Paraaminosalicylate Granules contain not less than 95.0% and not more than 105.0% of the labeled amount of calcium paraaminosalicylate hydrate

( $C_7H_5CaNO_3 \cdot 3 \frac{1}{2}H_2O$ : 254.25).

**Method of preparation** Prepare as directed under Granules, with Calcium Paraaminosalicylate Hydrate.

**Identification** Powder Calcium Paraaminosalicylate Granules, weigh a portion of the powder, equivalent to 50 mg of Calcium Paraaminosalicylate Hydrate according to the labeled amount, add 100 mL of water, shake, and filter. To 10 mL of the filtrate add 1 mL of 1 mol/L hydrochloric acid TS, shake, and add 1 drop of iron (III) chloride TS: a red-purple color develops.

**Particle size** <6.03> It meets the requirement.

**Assay** Powder Calcium Paraaminosalicylate Granules, weigh accurately a portion of the powder, equivalent to about 0.2 g of calcium paraaminosalicylate hydrate ( $C_7H_5CaNO_3 \cdot 3 \frac{1}{2}H_2O$ ), add 60 mL of water and 0.75 mL of dilute hydrochloric acid, and dissolve by heating on a water bath. After cooling, add water to make exactly 100 mL, and filter. Pipet 30 mL of the filtrate, transfer to an iodine flask, and proceed as directed in the Assay under Calcium Paraaminosalicylate Hydrate.

Each mL of 0.05 mol/L bromine VS  
= 4.238 mg of  $C_7H_5CaNO_3 \cdot 3 \frac{1}{2}H_2O$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Calcium Paraaminosalicylate Hydrate

### Pas-calcium Hydrate

パラアミノサリチル酸カルシウム水和物

$C_7H_5CaNO_3 \cdot 3 \frac{1}{2} H_2O$ : 254.25

Monocalcium 4-amino-2-oxidobenzoate hemiheptahydrate  
[133-15-3, anhydride]

Calcium Paraaminosalicylate Hydrate contains not less than 97.0% and not more than 103.0% of calcium para-aminosalicylic acid ( $C_7H_5CaNO_3$ : 191.20), calculated on the anhydrous basis.

**Description** Calcium Paraaminosalicylate Hydrate occurs as a white to slightly colored powder. It has a slightly bitter taste.

It is very slightly soluble in water, and practically insoluble in methanol and in ethanol (99.5).

It is gradually colored to brown by light.

**Identification** (1) To 50 mg of Calcium Paraaminosalicylate Hydrate add 100 mL of water, shake well, and filter. To 10 mL of the filtrate add 1 mL of 1 mol/L hydrochloric acid TS, shake, and add 1 drop of iron (III) chloride TS: a red-purple color develops.

(2) Determine the infrared absorption spectrum of Calci-

um Paraaminosalicylate Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 3 g of Calcium Paraaminosalicylate Hydrate add 15 mL of ammonium chloride TS and 15 mL of water, heat on a water bath until almost dissolved, and filter after cooling: the filtrate responds to the Qualitative Tests <1.09> (1), (2) and (3) for calcium salt.

**Purity** (1) Chloride <1.03>—Dissolve 1.0 g of Calcium Paraaminosalicylate Hydrate in 15 mL of dilute nitric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.70 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.025%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Calcium Paraaminosalicylate Hydrate according to method 3, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Dissolve 0.40 g of Calcium Paraaminosalicylate Hydrate in 20 mL of 0.1 mol/L hydrochloric acid TS by warming on a water bath, use this solution as the test solution, and perform the test (not more than 5 ppm).

(4) 3-Aminophenol—To 0.10 g of Calcium Paraaminosalicylate Hydrate add 5 mL of 0.1 mol/L disodium dihydrogen ethylenediamine tetraacetate TS, previously cooled in ice-water, and dissolve by shaking vigorously. Add immediately 3 mL of ammonia-ammonium chloride buffer solution, pH 11.0, previously cooled in ice water, and shake. Add 2 mL of 4-amino-*N,N*-diethylaniline sulfate TS, shake, add 10.0 mL of cyclohexane and 4 mL of diluted potassium hexacyanoferrate (III) TS (1 in 10), and shake immediately for 20 seconds. Centrifuge this solution, wash the separated cyclohexane layer with two 5-mL portions of diluted ammonia TS (1 in 14), add 1 g of anhydrous sodium sulfate, shake, and allow to stand for 5 minutes: the clear cyclohexane layer is not more colored than the following control solution.

Control solution: Dissolve 50 mg of 3-aminophenol in water, and dilute with water to exactly 500 mL. Measure exactly 20 mL of this solution, and add water to make exactly 100 mL. Take 5.0 mL of this solution, add 3 mL of ammonia-ammonium chloride buffer solution, pH 11.0, previously cooled in ice-water, and treat this solution in the same manner as the sample.

**Water** <2.48> 23.3 – 26.3% (0.1 g, volumetric titration, direct titration)

**Assay** Weigh accurately about 0.2 g of Calcium Paraaminosalicylate Hydrate, dissolve in 60 mL of water and 0.75 mL of dilute hydrochloric acid by warming on a water bath. After cooling, add water to make exactly 100 mL, and use this solution as the sample solution. Measure exactly 30 mL of the sample solution, transfer to an iodine flask, and add exactly 25 mL of 0.05 mol/L bromine VS and 20 mL of a solution of potassium bromide (1 in 4). Add immediately 14 mL of a mixture of acetic acid (100) and hydrochloric acid (5:2), stopper the flask immediately, and allow to stand for 10 minutes with occasional shaking. Add cautiously 6 mL of potassium iodide TS, and shake gently. After 5 minutes, titrate <2.50> the produced iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a

blank determination.

Each mL of 0.05 mol/L bromine VS  
= 3.187 mg of  $C_7H_5CaNO_3$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Dibasic Calcium Phosphate Hydrate

リン酸水素カルシウム水和物

$CaHPO_4 \cdot 2H_2O$ : 172.09

Dibasic Calcium Phosphate Hydrate, when dried, contains not less than 98.0% of dibasic calcium phosphate ( $CaHPO_4$ : 136.06).

**Description** Dibasic Calcium Phosphate Hydrate occurs as a white, crystalline powder. It is colorless and tasteless.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It dissolves in dilute hydrochloric acid and in dilute nitric acid.

**Identification (1)** Dissolve 0.1 g of Dibasic Calcium Phosphate Hydrate in 10 mL of diluted hydrochloric acid (1 in 6) by warming, add 2.5 mL of ammonia TS dropwise with shaking, and add 5 mL of ammonium oxalate TS: a white precipitate is produced.

**(2)** Dissolve 0.1 g of Dibasic Calcium Phosphate Hydrate in 5 mL of dilute nitric acid, and add 2 mL of hexaammonium heptamolybdate TS after warming for 1 to 2 minutes at 70°C: a yellow precipitate is produced.

**Purity (1)** Acid-insoluble substance—Dissolve 5.0 g of Dibasic Calcium Phosphate Hydrate in 40 mL of water and 10 mL of hydrochloric acid, and boil for 5 minutes. After cooling, collect the insoluble substance using filter paper for assay. Wash with water until no more turbidity of the washing is produced when silver nitrate is added. Ignite to incinerate the residue and filter paper: the mass is not more than 2.5 mg (not more than 0.05%).

**(2)** Chloride <1.03>—Dissolve 0.20 g of Dibasic Calcium Phosphate Hydrate in 20 mL of water and 13 mL of dilute nitric acid, add water to make 100 mL, and filter, if necessary. Perform the test using a 50-mL portion of this solution as the test solution. Prepare the control solution with 0.70 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.248%).

**(3)** Sulfate <1.14>—Dissolve by warming 1.0 g of Dibasic Calcium Phosphate Hydrate in 5 mL of water and 5 mL of dilute hydrochloric acid, add water to make 100 mL, and filter, if necessary. Take 30 mL of the filtrate, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.160%).

**(4)** Carbonate—Mix 1.0 g of Dibasic Calcium Phosphate Hydrate with 5 mL of water, and add immediately 2 mL of hydrochloric acid: no effervescence occurs.

**(5)** Heavy metals <1.07>—Dissolve 0.65 g of Dibasic Calcium Phosphate Hydrate in a mixture of 5 mL of water and 5 mL of dilute hydrochloric acid by warming, cool, and add

ammonia TS until precipitates begin to form in the solution. Dissolve the precipitates by adding a small amount of dilute hydrochloric acid dropwise, add 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 31 ppm).

**(6)** Barium—Heat 0.5 g of Dibasic Calcium Phosphate Hydrate with 10 mL of water, add 1 mL of hydrochloric acid dropwise with stirring, and filter, if necessary. Add 2 mL of potassium sulfate TS to the filtrate, and allow to stand for 10 minutes: no turbidity forms.

**(7)** Arsenic <1.11>—Dissolve 1.0 g of Dibasic Calcium Phosphate Hydrate in 5 mL of dilute hydrochloric acid, and perform the test with this solution as the test solution (not more than 2 ppm).

**Loss on drying** <2.41> 19.5 – 22.0% (1 g, 200°C, 3 hours).

**Assay** Weigh accurately about 0.4 g of Dibasic Calcium Phosphate Hydrate, previously dried, dissolve in 12 mL of dilute hydrochloric acid, and add water to make exactly 200 mL. Pipet 20 mL of this solution, add exactly 25 mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, 50 mL of water and 5 mL of ammonia-ammonium chloride buffer solution, pH 10.7, and titrate <2.50> the excess disodium dihydrogen ethylenediamine tetraacetate with 0.02 mol/L zinc acetate VS (indicator: 25 mg of eriochrome black T-sodium chloride indicator). Perform a blank determination.

Each mL of 0.02 mol/L disodium dihydrogen  
ethylenediamine tetraacetate VS  
= 2.721 mg of  $CaHPO_4$

**Containers and storage** Containers—Well-closed containers.

## Anhydrous Dibasic Calcium Phosphate

無水リン酸水素カルシウム

$CaHPO_4$ : 136.06

Anhydrous Dibasic Calcium Phosphate, when dried, contains not less than 98.0% of  $CaHPO_4$ .

**Description** Anhydrous Dibasic Calcium Phosphate occurs as white, crystalline powder or granules. It is odorless and tasteless.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It dissolves in dilute hydrochloric acid and in dilute nitric acid.

**Identification (1)** Dissolve 0.1 g of Anhydrous Dibasic Calcium Phosphate in 10 mL of diluted hydrochloric acid (1 in 6) by warming, add 2.5 mL of ammonia TS dropwise with shaking, and add 5 mL of ammonium oxalate TS: a white precipitate is produced.

(2) Dissolve 0.1 g of Anhydrous Dibasic Calcium Phosphate in 5 mL of dilute nitric acid, and add 2 mL of hexaammonium heptamolybdate TS after warming for 1 to 2 minutes at 70°C: a yellow precipitate is produced.

**Purity (1) Acid-insoluble substances**—Dissolve 5.0 g of Anhydrous Dibasic Calcium Phosphate in 40 mL of water and 10 mL of hydrochloric acid, and boil for 5 minutes. After cooling, collect the insoluble substance using filter paper for assay. Wash with water until no more turbidity of the washing is produced when silver nitrate is added. Ignite to incinerate the residue with the filter paper: the mass is not more than 2.5 mg (not more than 0.05%).

(2) Chloride <1.03>—Dissolve 0.20 g of Anhydrous Dibasic Calcium Phosphate in 20 mL of water and 13 mL of dilute nitric acid, add water to make 100 mL, and filter, if necessary. Perform the test using a 50-mL portion of this solution as the test solution. Prepare the control solution with 0.70 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.248%).

(3) Sulfate <1.14>—Dissolve by warming 0.80 g of Anhydrous Dibasic Calcium Phosphate in 5 mL of water and 5 mL of dilute hydrochloric acid, add water to make 100 mL, and filter, if necessary. Take 30 mL of the filtrate, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.200%).

(4) Carbonate—Mix 1.0 g of Anhydrous Dibasic Calcium Phosphate with 5 mL of water, and add immediately 2 mL of hydrochloric acid: no effervescence occurs.

(5) Heavy metals <1.07>—Dissolve 0.65 g of Anhydrous Dibasic Calcium Phosphate in a mixture of 5 mL of water and 5 mL of dilute hydrochloric acid by warming, cool, and add ammonia TS until precipitates begin to form in the solution. Dissolve the precipitates by adding a small amount of dilute hydrochloric acid dropwise, add 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 31 ppm).

(6) Barium—Heat 0.5 g of Anhydrous Dibasic Calcium Phosphate with 10 mL of water, add 1 mL of hydrochloric acid dropwise with stirring, and filter, if necessary. Add 2 mL of potassium sulfate TS to the filtrate, and allow to stand for 10 minutes: no turbidity forms.

(7) Arsenic <1.11>—Dissolve 0.5 g of Anhydrous Dibasic Calcium Phosphate in 5 mL of dilute hydrochloric acid, and perform the test with this solution as the test solution (not more than 2 ppm).

**Loss on drying** <2.41> Not more than 1.0% (1 g, 200°C, 3 hours).

**Assay** Weigh accurately about 0.4 g of Anhydrous Dibasic Calcium Phosphate, previously dried, dissolve in 12 mL of dilute hydrochloric acid, and add water to make exactly 200 mL. Pipet 20 mL of this solution, add exactly 25 mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, 50 mL of water and 5 mL of ammonia-ammonium chloride buffer solution, pH 10.7, and titrate <2.50> the excess disodium dihydrogen ethylenediamine tetraacetate with 0.02

mol/L zinc acetate VS (indicator: 0.025 g of eriochrome black T-sodium chloride indicator). Perform a blank determination.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 2.721 mg of CaHPO<sub>4</sub>

**Containers and storage** Containers—Well-closed containers.

## Monobasic Calcium Phosphate Hydrate

リン酸二水素カルシウム水和物

Ca(H<sub>2</sub>PO<sub>4</sub>)<sub>2</sub>·H<sub>2</sub>O: 252.07

Monobasic Calcium Phosphate Hydrate, when dried, contains not less than 90.0% of Ca(H<sub>2</sub>PO<sub>4</sub>)<sub>2</sub>·H<sub>2</sub>O.

**Description** Monobasic Calcium Phosphate Hydrate occurs as white crystals or crystalline powder. It is odorless and has an acid taste.

It is sparingly soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

It dissolves in dilute hydrochloric acid and in dilute nitric acid.

It is slightly deliquescent.

**Identification (1)** Dissolve 0.1 g of Monobasic Calcium Phosphate Hydrate in 10 mL of diluted hydrochloric acid (1 in 6) by warming, add 2.5 mL of ammonia TS dropwise with shaking, and add 5 mL of ammonium oxalate TS: a white precipitate is produced.

(2) Dissolve 0.1 g of Monobasic Calcium Phosphate Hydrate in 5 mL of dilute nitric acid, and add 2 mL of hexaammonium heptamolybdate TS after warming for 1 to 2 minutes at 70°C: a yellow precipitate is produced.

**Purity (1) Clarity and color of solution**—Dissolve 1.0 g of Monobasic Calcium Phosphate Hydrate in 19 mL of water and 2 mL of diluted hydrochloric acid (3 in 4), and heat on a water bath for 5 minutes with occasional shaking: the solution is clear and colorless.

(2) Dibasic phosphate and acid—Triturate 1.0 g of Monobasic Calcium Phosphate Hydrate with 3 mL of water, and add 100 mL of water and 1 drop of methyl orange TS: a red color develops. Then add 1.0 mL of 1 mol/L sodium hydroxide VS: the color changes to yellow.

(3) Chloride <1.03>—Dissolve 1.0 g of Monobasic Calcium Phosphate Hydrate in 20 mL of water and 12 mL of dilute nitric acid, add water to make exactly 100 mL, and filter, if necessary. Perform the test using 50 mL of this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.018%).

(4) Sulfate <1.14>—Dissolve 1.0 g of Monobasic Calcium Phosphate Hydrate in 20 mL of water and 1 mL of hydrochloric acid, add water to make 100 mL, and filter, if necessary. Perform the test using 50 mL of this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(5) Heavy metals <1.07>—Dissolve 0.65 g of Monobasic Calcium Phosphate Hydrate in a mixture of 5 mL of water and 5 mL of dilute hydrochloric acid by warming, cool, and add ammonia TS until precipitates begin to form in the solution. Dissolve the precipitates by adding a small amount of dilute hydrochloric acid dropwise, add 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 31 ppm).

(6) Arsenic <1.11>—Dissolve 1.0 g of Monobasic Calcium Phosphate Hydrate in 5 mL of dilute hydrochloric acid, and perform the test with this solution as the test solution (not more than 2 ppm).

**Loss on drying** <2.41> Not more than 3.0% (1 g, silica gel, 24 hours).

**Assay** Weigh accurately about 0.4 g of Monobasic Calcium Phosphate Hydrate, previously dried, dissolve in 3 mL of dilute hydrochloric acid, and add water to make exactly 100 mL. Pipet 20 mL of this solution, add exactly 25 mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, 50 mL of water and 5 mL of ammonia-ammonium chloride buffer solution, pH 10.7, and titrate <2.50> the excess disodium dihydrogen ethylenediamine tetraacetate with 0.02 mol/L zinc acetate VS (indicator: 25 mg of eriochrome black T-sodium chloride indicator). Perform a blank determination.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 5.041 mg of  $\text{Ca}(\text{H}_2\text{PO}_4)_2 \cdot \text{H}_2\text{O}$

**Containers and storage** Containers—Tight containers.

## Calcium Polystyrene Sulfonate

ポリスチレンスルホン酸カルシウム

Calcium Polystyrene Sulfonate is a cation exchange resin prepared as the calcium form of the sulfonated styrene divinylbenzene copolymer.

When dried, it contains not less than 7.0% and not more than 9.0% of calcium (Ca: 40.08).

Each g of Calcium Polystyrene Sulfonate, when dried, exchanges with 0.053 to 0.071 g of potassium (K: 39.10).

**Description** Calcium Polystyrene Sulfonate occurs as a pale yellowish white to light yellow powder. It is odorless and tasteless.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

**Identification** (1) Determine the infrared absorption spectrum of Calcium Polystyrene Sulfonate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Mix 0.5 g of Calcium Polystyrene Sulfonate with 10

mL of dilute hydrochloric acid, filter, and neutralize the filtrate with ammonia TS: the solution responds to the Qualitative Tests <1.09> for calcium salt.

**Purity** (1) Ammonium—Place 1.0 g of Calcium Polystyrene Sulfonate in a flask, add 5 mL of sodium hydroxide TS, cover the flask with a watch glass having a moistened strip of red litmus paper on the underside, and boil for 15 minutes: the gas evolved does not change the red litmus paper to blue (not less than 5 ppm).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Calcium Polystyrene Sulfonate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Calcium Polystyrene Sulfonate according to Method 3, and perform the test (not more than 2 ppm).

(4) Styrene—To 10.0 g of Calcium Polystyrene Sulfonate add 10 mL of acetone, shake for 30 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 10 mg of styrene in acetone to make exactly 100 mL. Pipet 1 mL of this solution, dilute with acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5  $\mu\text{L}$  each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions. Determine the peak heights,  $H_T$  and  $H_S$ , of styrene in each solution:  $H_T$  is not larger than  $H_S$ .

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A stainless steel column 3 mm in inside diameter and 2 m in length, having polyethylene glycol 20 M coated at the ratio of 15% on siliceous earth for gas chromatography (150 to 180  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 90°C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of styrene is about 9 minutes.

**System suitability**—

System performance: Mix 10 mg of styrene with 1000 mL of acetone. When the procedure is run with 5  $\mu\text{L}$  of this solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of styrene are not less than 800 and 0.8 to 1.2, respectively.

System repeatability: When the test is repeated 6 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak heights of styrene is not more than 5%.

(5) Sodium—Pipet 2 mL of the 50-mL solution obtained in the Assay (1), add 0.02 mol/L hydrochloric acid TS to make exactly 500 mL, and use this solution as the sample solution. Separately, weigh accurately 0.2542 g of sodium chloride, previously dried at 130°C for 2 hours, and dissolve in 0.02 mol/L hydrochloric acid TS to make exactly 1000 mL. Pipet a suitable volume of this solution, and dilute with 0.02 mol/L hydrochloric acid TS to make a solution containing 1 to 3  $\mu\text{g}$  of sodium (Na: 22.99) per mL, and use these solutions as the standard solutions. Perform the test with the sample solution and standard solutions according to the Atomic Absorption Spectrophotometry <2.23> under the following conditions, and determine the amount of sodium in the sample solution using the calibration curve obtained from the stan-

Actual volume to the mark of 20 cm at which the sedimentation tube is inserted: 550 mL

Single suction volume: 10 mL

- A: Mark of pipet bulb
- B: Pipet bulb for suction
- C: Two-way stopcock
- D: Vent-hole
- E: Suction part of pipet
- F: Mark of 20 cm
- G: Base line of 0 cm
- H: Outlet of pipet
- I: Capillary tube of pipet
- J: Sedimentation tube

Fig. Andreasen pipet

dard solutions: the amount of sodium is not more than 1%.

Gas: Combustible gas—Acetylene

Supporting gas—Air

Lamp: A sodium hollow-cathode lamp

Wavelength: 589.0 nm

**Loss on drying** <2.41> Not more than 10.0% (1 g, in vacuum, 80°C, 5 hours).

**Microparticles** (i) Apparatus: Use an apparatus as shown in the illustration.

(ii) Procedure: Weigh accurately about 5.5 g of Calcium Polystyrene Sulfonate, previously dried, add 300 mL of water of 25°C, and mix for 5 minutes. Transfer this turbid solution to the sedimentation tube J, keeping a temperature at 25°C, add water of 25°C to 2 mm below the mark F of 20 cm of the sedimentation tube J, and then insert the pipet. Open the two-way stopcock C, exhaust air, add exactly water from the vent-hole D to the mark F of 20 cm, and close the two-way stopcock C. Shake the apparatus well vertically and horizontally, disperse Calcium Polystyrene Sulfonate in water, and then open the two-way stopcock, and allow to stand at 25 ± 1°C for 5 hours and 15 minutes.

Then, draw exactly the meniscus of the turbid solution in sedimentation tube J up to the mark of pipet bulb A by suction, open the two-way stopcock C to the outlet of pipet H,

and transfer exactly measured 20 mL of the turbid solution to a weighing bottle. Repeat the procedure, and combine exactly measured 20 mL of the turbid solution. Evaporate 20 mL of this turbid solution on a water bath to dryness, dry to constant mass at 105°C, and weigh the residue as  $W_S$  (g). Pipet 20 mL of used water, and weigh the residue in the same manner as  $W_B$  (g). Calculate the difference  $mi$  (g) between  $W_S$  and  $W_B$ , and calculate the amount of microparticles ( $S$ ) by the following equation: the amount of microparticles is not more than 0.1%.

$$S (\%) = \{(mi \times V)/(20 \times W_T)\} \times 100$$

$W_T$ : Amount (g) of Calcium Polystyrene Sulfonate

$V$ : Actual volume (mL) to the mark of 20 cm at which the suction part of pipet is inserted.

**Assay (1) Calcium**—Weigh accurately about 1 g of Calcium Polystyrene Sulfonate, previously dried, and disperse in 5 mL of 3 mol/L hydrochloric acid TS. Transfer this mixture, and wash out completely with the aid of a small quantity of 3 mol/L hydrochloric acid TS to a column 12 mm in inside diameter and 70 mm in length, packed with a pledget of fine glass wool in the bottom of it, placing a 50-mL volumetric flask as a receiver under the column. Then collect about 45 mL of eluate, adding 3 mol/L hydrochloric acid TS to the column, and add water to make exactly 50 mL. Pipet 20 mL of this solution, adjust with ammonia TS to a pH of exactly 10. Titrate <2.50> immediately with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the red-purple color of the solution disappears, and a blue color develops (indicator: 0.04 g eriochrome black T-sodium chloride indicator). Perform a blank determination, and make any necessary correction.

$$\begin{aligned} &\text{Each mL of 0.05 mol/L disodium dihydrogen} \\ &\text{ethylenediamine tetraacetate VS} \\ &= 2.004 \text{ mg of Ca} \end{aligned}$$

(2) Potassium exchange capacity—Pipet 50 mL of Standard Potassium Stock Solution into a glass-stoppered flask containing about 1.0 g of dried Calcium Polystyrene Sulfonate, accurately weighed, stir for 120 minutes, filter, and discard the first 20 mL of the filtrate. Pipet 5 mL of the subsequent filtrate, and add 0.02 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 10 mL of this solution, add 0.02 mol/L hydrochloric acid TS to make exactly 1000 mL, and use this solution as the sample solution. Separately, measure exactly a suitable volume of Standard Potassium Stock Solution, dilute with 0.02 mol/L hydrochloric acid TS to make solutions containing 0.5 to 2.5 μg of potassium (K: 39.10) per mL, and use these solutions as the standard solutions. Perform the test with the sample solution and standard solutions as directed under Atomic Absorption Spectrophotometry <2.23> according to the following conditions, and determine the amount,  $Y$  (mg), of potassium in 1000 mL of the sample solution, using the calibration curve obtained from the standard solutions. The exchange quantity for potassium per g of dried Calcium Polystyrene Sulfonate is 53 to 71 mg, calculating by the following equation.

$$\begin{aligned} &\text{Exchange quantity (mg) for potassium (K) per g of} \\ &\text{dried Calcium Polystyrene Sulfonate} \\ &= (X - 100 Y)/W \end{aligned}$$

$X$ : The amount (mg) of potassium in 50 mL of Standard

Potassium Stock Solution before exchange.

W: The amount (g) of dried Calcium Polystyrene Sulfonate.

Gas: Combustible gas—Acetylene

Supporting gas—Air

Lamp: A potassium hollow-cathode lamp

Wavelength: 766.5 nm

**Containers and storage** Containers—Tight containers.

## Calcium Stearate

ステアリン酸カルシウム

Calcium Stearate mainly consists of calcium salts of stearic acid ( $C_{18}H_{36}O_2$ : 284.48) and palmitic acid ( $C_{16}H_{32}O_2$ : 256.42).

Calcium Stearate, when dried, contains not less than 6.4% and not more than 7.1% of calcium (Ca: 40.08).

**Description** Calcium Stearate occurs as a white, light, bulky powder. It feels smooth when touched, and is adhesive to the skin. It is odorless or has a faint, characteristic odor.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

**Identification (1)** Shake vigorously 3 g of Calcium Stearate with 20 mL of diluted hydrochloric acid (1 in 2) and 30 mL of diethyl ether for 3 minutes, and allow to stand: the separated aqueous layer responds to the Qualitative Tests <1.09> (1), (2) and (4) for calcium salt.

**(2)** Wash the diethyl ether layer obtained in (1) with 20 mL and 10 mL of dilute hydrochloric acid and 20 mL of water successively, and evaporate the diethyl ether on a water bath: the residue melts <1.13> at a temperature not below 54°C.

**Purity (1)** Heavy metals <1.07>—Heat gently 1.0 g of Calcium Stearate with caution at the beginning, and heat further, gradually raising the temperature, to incineration. After cooling, add 2 mL of hydrochloric acid, evaporate on a water bath to dryness, warm the residue with 20 mL of water and 2 mL of dilute acetic acid for 2 minutes, cool, filter, and wash the residue with 15 mL of water. Combine the filtrate and the washings, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution by evaporating 2 mL of hydrochloric acid on a water bath to dryness and by adding 2 mL of dilute acetic acid, 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 20 ppm).

**(2)** Arsenic <1.11>—To 1.0 g of Calcium Stearate add 5 mL of diluted hydrochloric acid (1 in 2) and 20 mL of chloroform, shake vigorously for 3 minutes, allow to stand, and separate the water layer. Perform the test with the water layer as the test solution (not more than 2 ppm).

**Loss on drying** <2.41> Not more than 4.0% (1 g, 105°C, 3 hours).

**Assay** Weigh accurately about 0.5 g of Calcium Stearate, previously dried, heat gently with caution at first, and then ignite gradually to ash. Cool, add 10 mL of dilute hydrochloric acid to the residue, warm for 10 minutes on a water bath, and transfer the contents to a flask with the aid of 10-mL, 10-mL,

and 5-mL portions of hot water. Add sodium hydroxide TS until the solution becomes slightly turbid, and then add 25 mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, 10 mL of ammonia-ammonium chloride buffer solution, pH 10.7, 4 drops of eriochrome black T TS and 5 drops of methyl yellow TS, and titrate <2.50> rapidly the excess disodium dihydrogen ethylenediamine tetraacetate with 0.05 mol/L magnesium chloride VS, until the green color of the solution disappears and a red color develops. Perform a blank determination.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS  
= 2.004 mg of Ca

**Containers and storage** Containers—Well-closed containers.

## Camellia Oil

*Oleum Camelliae*

ツバキ油

Camellia Oil is the fixed oil obtained from the peeled seeds of *Camellia japonica* Linné (*Theaceae*).

**Description** Camellia Oil is a colorless or pale yellow, clear oil. It is nearly odorless and tasteless.

It is miscible with diethyl ether and with petroleum ether.

It is slightly soluble in ethanol (95).

It congeals partly at  $-10^{\circ}\text{C}$ , and completely at  $-15^{\circ}\text{C}$ .

Specific gravity  $d_{25}^{25}$ : 0.910 – 0.914

**Identification** To 2 mL of Camellia Oil add dropwise 10 mL of a mixture of fuming nitric acid, sulfuric acid, and water (1:1:1), previously cooled to room temperature: a bluish green color develops at the zone of contact.

**Acid value** <1.13> Not more than 2.8.

**Saponification value** <1.13> 188 – 194

**Unsaponifiable matters** <1.13> Not more than 1.0%.

**Iodine value** <1.13> 78 – 83

**Containers and storage** Containers—Tight containers.

## Camostat Mesilate

カモスタットメシル酸塩

$C_{20}H_{22}N_4O_5 \cdot CH_4O_3S$ : 494.52

Dimethylcarbamoylmethyl

4-(4-guanidinobenzoyloxy)phenylacetate

monomethanesulfonate [59721-29-8]

Camostat Mesilate, when dried, contains not less

than 98.5% of  $C_{20}H_{22}N_4O_5 \cdot CH_4O_3S$ .

**Description** Camostat Mesilate occurs as white crystals or crystalline powder.

It is sparingly soluble in water, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

**Identification (1)** To 4 mL of a solution of Camostat Mesilate (1 in 2000) add 2 mL of 1-naphthol TS and 1 mL of diacetyl TS, and allow to stand for 10 minutes: a red color develops.

(2) Determine the absorption spectrum of a solution of Camostat Mesilate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Camostat Mesilate Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) To 0.1 g of Camostat Mesilate add 0.2 g of sodium hydroxide, fuse by gentle heating, and continue to heat for 20 to 30 seconds. After cooling, add 0.5 mL of water and 3 mL of dilute hydrochloric acid, and heat: the gas evolved changes moistened potassium iodate-starch paper to blue.

**Melting point** <2.60> 194 – 198°C

**Purity (1)** Heavy metals <1.07>—Dissolve 1.0 g of Camostat Mesilate in 40 mL of water by warming, and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution and 2 mL of dilute acetic acid (not more than 20 ppm).

(2) Arsenic <1.11>—Dissolve 2.0 g of Camostat Mesilate in 20 mL of 2 mol/L hydrochloric acid TS by heating in a water bath, and continue to heat for 20 minutes. After cooling, centrifuge, take 10 mL of the supernatant liquid, and use this solution as the test solution. Perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 30 mg of Camostat Mesilate in 10 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand overnight in iodine vapor: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (1 g, silica gel, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 50 mg each of Camostat Mesilate and Camostat Mesilate Reference Standard, previously dried, and dissolve each in water to make exactly 50 mL. Pipet 5 mL each of these solutions, add exactly 5 mL of the internal standard solution, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 2  $\mu$ L each of the sample solution and standard

solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of camostat to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of } C_{20}H_{22}N_4O_5 \cdot CH_4O_3S \\ &= W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Camostat Mesilate Reference Standard

**Internal standard solution**—A solution of butyl parahydroxybenzoate in ethanol (95) (1 in 1500).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 265 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of methanol, a solution of sodium 1-heptane sulfonate (1 in 500), a solution of sodium lauryl sulfate (1 in 1000) and acetic acid (100) (200:100:50:1).

**Flow rate:** Adjust the flow rate so that the retention time of camostat is about 10 minutes.

**System suitability**—

**System performance:** When the procedure is run with 2  $\mu$ L of the standard solution under the above operating conditions, camostat and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 2  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of camostat to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## *d*-Camphor

*d*-カンフル

$C_{10}H_{16}O$ : 152.23  
(1*R*,4*R*)-1,7,7-Trimethylbicyclo[2.2.1]heptan-2-one  
[464-49-3]

*d*-Camphor contains not less than 96.0% of  $C_{10}H_{16}O$ .

**Description** *d*-Camphor occurs as colorless or white, translucent crystals, crystalline powder or masses. It has a characteristic, agreeable odor, and a slightly bitter taste, followed by a pleasant, cooling sensation.

It is freely soluble in ethanol (95), in diethyl ether and in carbon disulfide, and slightly soluble in water.

It slowly volatilizes at room temperature.

**Identification** Dissolve 0.1 g of *d*-Camphor in 2 mL of methanol, add 1 mL of 2,4-dinitrophenylhydrazine TS, and heat for 5 minutes on a water bath: an orange-red precipitate is formed.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +41.0 – +43.0° (5 g, ethanol (95), 50 mL, 100 mm).

**Melting point** <2.60> 177 – 182°C

**Purity (1)** Water—Shake 1.0 g of *d*-Camphor with 10 mL of carbon disulfide: the solution is clear.

(2) Chlorinated compounds—Mix 0.20 g of finely powdered *d*-Camphor with 0.4 g of sodium peroxide in a dried porcelain crucible. Heat the crucible gently by the open flame until the incineration is complete. Dissolve the residue in 20 mL of warm water, acidify with 12 mL of dilute nitric acid, and filter the solution into a Nessler tube. Wash the filter paper with three 5-mL portions of hot water, adding the washings to the filtrate. After cooling, add water to make 50 mL, then add 1 mL of silver nitrate TS, mix well, and allow to stand for 5 minutes: the turbidity of the solution does not exceed that of the following control solution.

Control solution: Prepare in the same manner as described above, using 0.20 mL of 0.01 mol/L hydrochloric acid VS.

(3) Non-volatile residue—Heat 2.0 g of *d*-Camphor on a water bath until sublimation is complete, then dry the residue at 105°C for 3 hours: the mass of the residue does not exceed 1.0 mg.

**Assay** Weigh accurately about 0.1 g each of *d*-Camphor and *d*-Camphor Reference Standard, add exactly 5 mL each of the internal standard solution, dissolve in dehydrated methanol to make 100 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 2  $\mu$ L each of these solutions as directed under Gas Chromatography <2.02> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of *d*-camphor to that of the internal standard.

$$\begin{aligned} \text{Amount (mg) of } C_{10}H_{16}O \\ = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of *d*-Camphor Reference Standard

**Internal standard solution**—A solution of methyl salicylate in ethanol (99.5) (1 in 25).

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A glass column 3 mm in inside diameter and 3 m in length, which is packed with 10% of polyethylene glycol 20 M for gas chromatography supported on 180 to 250  $\mu$ m mesh silanized siliceous earth for gas chromatography.

Column temperature: A constant temperature of about 160°C

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of *d*-camphor is about 6 minutes.

**System suitability**—

System performance: When the procedure is run with 2  $\mu$ L of the standard solution under the above operating conditions, *d*-camphor and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 2  $\mu$ L of the standard solution under the above operating con-

ditions, the relative standard deviation of the ratios of the peak area of *d*-camphor to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## *dl*-Camphor

### Synthetic Camphor

*dl*-カンフル

and enantiomer

$C_{10}H_{16}O$ : 152.23  
(1*R*,4*R*)-1,7,7-Trimethylbicyclo[2.2.1]heptan-2-one  
[76-22-2]

*dl*-Camphor contains not less than 96.0% of  $C_{10}H_{16}O$ .

**Description** *dl*-Camphor occurs as colorless or white, translucent crystals, crystalline powder or masses. It has a characteristic, agreeable odor, and has a slightly bitter taste followed by a pleasant, cooling sensation.

It is freely soluble in ethanol (95), in diethyl ether and in carbon disulfide, and slightly soluble in water.

It slowly volatilizes at room temperature.

**Identification** Dissolve 0.1 g of *dl*-Camphor in 2 mL of methanol, add 1 mL of 2,4-dinitrophenylhydrazine TS, and heat for 5 minutes on a water bath: an orange-red precipitate is formed.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : –1.5 – +1.5° (5 g, ethanol (95), 50 mL, 100 mm).

**Melting point** <2.60> 175 – 180°C

**Purity (1)** Water—Shake 1.0 g of *dl*-Camphor with 10 mL of carbon disulfide: the solution is clear.

(2) Chlorinated compounds—Mix 0.20 g of finely powdered *dl*-Camphor with 0.4 g of sodium peroxide in a dried porcelain crucible. Heat the crucible gently by the open flame until the incineration is complete. Dissolve the residue in 20 mL of warm water, acidify with 12 mL of dilute nitric acid, and filter the solution into a Nessler tube. Wash the filter paper with three 5-mL portions of hot water, adding the washings to the filtrate. After cooling, add water to make 50 mL, then add 1 mL of silver nitrate TS, mix well, and allow to stand for 5 minutes: the turbidity of the solution does not exceed that of the following control solution.

Control solution: Prepare in the same manner as described above, using 0.20 mL of 0.01 mol/L hydrochloric acid VS.

(3) Non-volatile residue—Heat 2.0 g of *dl*-Camphor on a water bath until sublimation is complete, then dry the residue at 105°C for 3 hours: the mass of the residue does not exceed 1.0 mg.

**Assay** Weigh accurately about 0.1 g each of *dl*-Camphor and *dl*-Camphor Reference Standard, add exactly 5 mL each of the internal standard solution, dissolve in dehydrated methanol to make 100 mL, and use these solutions as the

sample solution and standard solution, respectively. Perform the test with 2  $\mu$ L each of these solutions as directed under Gas Chromatography <2.02> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of *dl*-camphor to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of } C_{10}H_{16}O \\ & = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of *dl*-Camphor Reference Standard

**Internal standard solution**—A solution of methyl salicylate in ethanol (99.5) (1 in 25).

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A glass column 3 mm in inside diameter and 3 m in length, which is packed with 10% of polyethylene glycol 20 M for gas chromatography supported on 180 to 250  $\mu$ m mesh silanized siliceous earth for gas chromatography.

Column temperature: A constant temperature of about 160°C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of *dl*-camphor is about 6 minutes.

**System suitability**—

System performance: When the procedure is run with 2  $\mu$ L of the standard solution under the above operating conditions, *dl*-camphor and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 2  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of *dl*-camphor to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Capsules

カプセル

Capsules are made of gelatin or a suitable material, and their shape is a pair of cylinders with one end closed which can be overlapped on each other.

**Method of preparation** Dissolve Gelatin or the like in water by warming, add Glycerin or D-Sorbitol, emulsifier, preservatives, coloring substances and so forth, if necessary, to make a thick gluey solution, and form into capsules while warm.

Capsules may be coated with a lubricant, if necessary.

**Description** Capsules are odorless and elastic.

**Purity** Odor, solubility, and acidity or alkalinity—Place, without overlapping of the parts, 1 piece (1 pair) of Capsules in a 100-mL conical flask, add 50 mL of water, and shake often, keeping the temperature at  $37 \pm 2^\circ\text{C}$ . Perform this test 5 times: they all dissolve within 10 minutes. All these solutions are odorless, and neutral or slightly acidic.

**Containers and storage** Containers—Well-closed containers.

## Captopril

カプトプリル

$C_9H_{15}NO_3S$ : 217.29

(2*S*)-1-[(2*S*)-2-Methyl-3-sulfanylpropanoyl]pyrrolidine-2-carboxylic acid [62571-86-2]

Captopril contains not less than 98.0% of  $C_9H_{15}NO_3S$ , calculated on the dried basis.

**Description** Captopril occurs as white crystals or crystalline powder.

It is very soluble in methanol, freely soluble in ethanol (99.5), and soluble in water.

**Identification** Determine the infrared absorption spectrum of Captopril as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{25}$ :  $-125 - -134^\circ$  (after drying, 0.1 g, ethanol (99.5), 10 mL, 100 mm).

**Melting point** <2.60>  $105 - 110^\circ\text{C}$

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Captopril according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Captopril according to Method 1, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.20 g of Captopril in methanol to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 15 mg of 1,1'-[3,3'-dithiobis(2-methyl-1-oxopropyl)]-L-dipropylene in methanol to make exactly 250 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop with a mixture of toluene and acetic acid (100) (13:7) to a distance of about 15 cm, and air-dry the plate. Place the plate in a chamber filled with iodine vapor, and allow to stand for 30 minutes: the number of the spots other than the spot corresponding to that from the standard solution and the principal spot from the sample solution is not more than two, and they are not more intense than the spot from the standard solution.

(4) 1,1'-[3,3'-Dithiobis(2-methyl-1-oxopropyl)]-L-dipropylene—Dissolve 0.10 g of Captopril in methanol to make exactly 20 mL, and use this solution as the sample solution. Separately, dissolve 25 mg of 1,1'-[3,3'-dithiobis(2-methyl-1-oxopropyl)]-L-dipropylene in methanol to make exactly 250 mL, and use this solution as the standard solution. Perform the

test with exactly 20  $\mu\text{L}$  each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak area,  $A_T$  and  $A_S$ , of 1,1'-[3,3'-dithiobis(2-methyl-1-oxopropyl)]-L-diproline of these solutions:  $A_T$  is not larger than  $A_S$ .

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 220 nm).

**Column:** A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (10  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of water, methanol and phosphoric acid (1000:1000:1).

**Flow rate:** Adjust the flow rate so that the retention time of 1,1'-[3,3'-dithiobis(2-methyl-1-oxopropyl)]-L-diproline is about 10 minutes.

**System suitability—**

**System performance:** Dissolve 25 mg each of Captopril and 1,1'-[3,3'-dithiobis(2-methyl-1-oxopropyl)]-L-diproline in 200 mL of methanol. When the procedure is run with 20  $\mu\text{L}$  of this solution under the above operating conditions, captopril and 1,1'-[3,3'-dithiobis(2-methyl-1-oxopropyl)]-L-diproline are eluted in this order with the resolution between these peaks being not less than 3.

**System repeatability:** When the test is repeated 5 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of 1,1'-[3,3'-dithiobis(2-methyl-1-oxopropyl)]-L-diproline is not more than 2.0%.

**Loss on drying** <2.41> Not more than 1.0% (1 g, in vacuum, 80°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.3 g of Captopril, dissolve in 100 mL of water, add 20 mL of dilute sulfuric acid and 1 g of potassium iodide, and shake. Titrate <2.50> with 1/60 mol/L potassium iodate VS (indicator: 2 mL of starch TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 1/60 mol/L potassium iodate VS  
= 21.73 mg of  $\text{C}_9\text{H}_{15}\text{NO}_3\text{S}$

**Containers and storage** Containers—Tight containers.

## Carbamazepine

カルバマゼピン

$\text{C}_{15}\text{H}_{12}\text{N}_2\text{O}$ : 236.27

5*H*-Dibenz[*b,f*]azepine-5-carboxamide [298-46-4]

Carbamazepine, when dried, contains not less than 97.0% and not more than 103.0% of  $\text{C}_{15}\text{H}_{12}\text{N}_2\text{O}$ .

**Description** Carbamazepine occurs as a white to slightly yellowish white powder. It is odorless and tasteless at first, and leaves a slightly bitter aftertaste.

It is freely soluble in chloroform, sparingly soluble in ethanol (95) and in acetone, and very slightly soluble in water and in diethyl ether.

**Identification (1)** To 0.1 g of Carbamazepine add 2 mL of nitric acid, and heat on a water bath for 3 minutes: an orange-red color is produced.

**(2)** To 0.1 g of Carbamazepine add 2 mL of sulfuric acid, and heat on a water bath for 3 minutes: a yellow color is produced with a green fluorescence.

**(3)** Examine Carbamazepine under ultraviolet light: the solution shows an intense blue fluorescence.

**(4)** Determine the absorption spectrum of the solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Melting point** <2.60> 189 – 193°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Carbamazepine in 10 mL of chloroform: the solution is clear and colorless to pale yellow.

**(2)** Acidity—To 2.0 g of Carbamazepine add exactly 40 mL of water, stir well for 15 minutes, and filter through a glass filter (G3). To 10 mL of this filtrate add 1 drop of phenolphthalein TS and 0.50 mL of 0.01 mol/L sodium hydroxide VS: a red color is produced.

**(3)** Alkalinity—To 10 mL of the filtrate obtained in (2) add 1 drop of methyl red TS and 0.50 mL of 0.01 mol/L hydrochloric acid VS: a red color is produced.

**(4)** Chloride <1.03>—Dissolve 0.25 g of Carbamazepine in 30 mL of acetone, add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.20 mL of 0.01 mol/L hydrochloric acid VS add 30 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.028%).

**(5)** Heavy metals <1.07>—Proceed with 2.0 g of Carbamazepine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(6)** Related substances—Dissolve 0.25 g of Carbamazepine in 10 mL of chloroform, and use this solution as the sample solution. Separately, dissolve 5.0 mg of iminodibenzyl in chloroform to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene and methanol (19:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly potassium dichromate-sulfuric acid TS on the plate: the spots other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Dissolve about 50 mg of Carbamazepine, previously

dried and accurately weighed, in ethanol (95) to make exactly 250 mL. Dilute 5 mL of this solution with ethanol (95) to exactly 100 mL. Perform the test as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbance  $A$  of this solution at the wavelength of maximum absorption at about 285 nm.

$$\text{Amount (mg) of } C_{15}H_{12}N_2O = (A/490) \times 50,000$$

**Containers and storage** Containers—Tight containers.

## Carbazochrome Sodium Sulfonate Hydrate

カルバゾクロムスルホン酸ナトリウム水和物

$C_{10}H_{11}N_4NaO_5S \cdot 3H_2O$ : 376.32

Monosodium (2*RS*)-1-methyl-6-oxo-5-semicarbazono-2,3,5,6-tetrahydroindole-2-sulfonate trihydrate [52422-26-5, anhydride]

Carbazochrome Sodium Sulfonate Hydrate contains not less than 98.0% and not more than 102.0% of carbazochrome sodium sulfonate ( $C_{10}H_{11}N_4NaO_5S$ : 322.27), calculated on the anhydrous basis.

**Description** Carbazochrome Sodium Sulfonate Hydrate occurs as orange-yellow, crystals or crystalline powder.

It is sparingly soluble in water, very slightly soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether.

A solution of Carbazochrome Sodium Sulfonate (1 in 100) shows no optical rotation.

Melting point: about 210°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Carbazochrome Sodium Sulfonate Hydrate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Carbazochrome Sodium Sulfonate Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Carbazochrome Sodium Sulfonate Hydrate (1 in 100) responds to the Qualitative Tests <1.09> (1) for sodium salt.

**pH** <2.54> Dissolve 0.8 g of Carbazochrome Sodium Sulfonate Hydrate in 50 mL of water by warming, and cool: the pH of this solution is between 5.0 and 6.0.

**Purity** (1) Clarity of solution—Dissolve 1.0 g of Carbazochrome Sodium Sulfonate Hydrate in 50 mL of water by warming, and allow to cool: the solution is clear. Perform the test with this solution as directed under Ultraviolet-visible

Spectrophotometry <2.24>: the absorbance at 590 nm is not more than 0.070.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Carbazochrome Sodium Sulfonate Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 50 mg of Carbazochrome Sodium Sulfonate Hydrate in 100 mL of water, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the total area of the peaks other than the peak of carbazochrome sulfonate from the sample solution is not larger than the peak area of carbazochrome sulfonate from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 360 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.2 g of ammonium dihydrogen phosphate in 1000 mL of water, and filter through a membrane filter (0.4  $\mu$ m in pore size) if necessary. To 925 mL of this solution add 75 mL of ethanol (95), shake, and adjust the pH to 3 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of carbazochrome sulfonate is about 7 minutes.

Time span of measurement: About 3 times as long as the retention time of carbazochrome sulfonate beginning after the solvent peak.

**System suitability**—

Test for required detection: To exactly 2 mL of the standard solution add the mobile phase to make exactly 20 mL. Confirm that the peak area of carbazochrome sulfonate obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that of carbazochrome sulfonate obtained from 10  $\mu$ L of the standard solution.

System performance: Dissolve 10 mg each of Carbazochrome Sodium Sulfonate and carbazochrome in 100 mL of water by warming. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, carbazochrome sulfonate and carbazochrome are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of carbazochrome sulfonate is not more than 2.0%.

**Water** <2.48> 13.0 – 16.0% (0.3 g, direct titration).

**Assay** Weigh accurately about 0.25 g of Carbazochrome Sodium Sulfonate Hydrate, dissolve in 50 mL of water, apply to a chromatographic column, 10 mm in diameter, previously prepared with 20 mL of strongly acidic ion exchange resin for column chromatography (type H), and allow to flow at a rate

of 4 mL per minute. Wash the column with 150 mL of water, combine the washing and the former effluent solution, and titrate <2.50> with 0.05 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L sodium hydroxide VS  
= 16.11 mg of C<sub>10</sub>H<sub>11</sub>N<sub>4</sub>NaO<sub>5</sub>S

**Containers and storage** Containers—Well-closed containers.

## Carbidopa Hydrate

カルビドパ水和物

C<sub>10</sub>H<sub>14</sub>N<sub>2</sub>O<sub>4</sub>·H<sub>2</sub>O: 244.24  
(2*S*)-2-(3,4-Dihydroxybenzyl)-2-hydrazinopropanoic acid monohydrate [38821-49-7]

Carbidopa Hydrate contains not less than 98.0% of C<sub>10</sub>H<sub>14</sub>N<sub>2</sub>O<sub>4</sub>·H<sub>2</sub>O.

**Description** Carbidopa Hydrate occurs as a white to yellowish white powder.

It is sparingly soluble in methanol, slightly soluble in water, very slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 197°C (with decomposition).

**Identification (1)** Dissolve 0.01 g of Carbidopa Hydrate in 250 mL of a solution of hydrochloric acid in methanol (9 in 1000). Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24> at the wavelengths between 240 nm and 300 nm, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Carbidopa Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Carbidopa Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Carbidopa Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> [α]<sub>D</sub><sup>20</sup>: -21.0 - -23.5° (1 g, aluminum (III) chloride TS, 100 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Carbidopa Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Carbidopa Hydrate in 70 mL of the mobile phase, by warming and using ultrasonication, if necessary. After cooling, add the mobile phase to make 100 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each

of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area from both solutions by the automatic integration method: the total area of all peaks other than the peak of carbidopa from the sample solution is not larger than the peak area of carbidopa from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of carbidopa.

**System suitability**—

Test for required detection: To exactly 2 mL of the standard solution add the mobile phase to make exactly 20 mL. Confirm that the peak area of carbidopa obtained from 20 μL of this solution is equivalent to 7 to 13% of that of carbidopa obtained from 20 μL of the standard solution.

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

**Loss on drying** <2.41> 6.9 - 7.9% (1 g, in vacuum not exceeding 0.67 kPa, 100°C, 6 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 50 mg each of Carbidopa Hydrate and Carbidopa Reference Standard (determine separately the loss on drying <2.41> in the same manner as Carbidopa Hydrate), and dissolve each in 70 mL of the mobile phase, by warming and using ultrasonication if necessary. After cooling, add the mobile phase to make exactly 100 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A<sub>T</sub> and A<sub>S</sub>, of carbidopa in each solution.

$$\begin{aligned} \text{Amount (mg) of C}_{10}\text{H}_{14}\text{N}_2\text{O}_4\cdot\text{H}_2\text{O} \\ = W_S \times (A_T/A_S) \times 1.0796 \end{aligned}$$

W<sub>S</sub>: Amount (mg) of Carbidopa Reference Standard, calculated on the dried basis

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To 950 mL of 0.05 mol/L sodium dihydrogen phosphate TS add 50 mL of ethanol (95), and adjust the pH to 2.7 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of carbidopa is about 6 minutes.

**System suitability**—

System performance: Dissolve 50 mg each of Carbidopa and methylidopa in 100 mL of the mobile phase. When the procedure is run with 20 μL of this solution under the above operating conditions, methylidopa and carbidopa are eluted in this order with the resolution between these peaks being not less than 0.9.

System repeatability: When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of carbidopa is not more than 1.0%.

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## L-Carbocisteine

L-カルボシステイン

$\text{C}_5\text{H}_9\text{NO}_4\text{S}$ : 179.19  
(2*R*)-2-Amino-3-carboxymethylsulfanylpropanoic acid  
[638-23-3]

L-Carbocisteine, when dried, contains not less than 98.5% of  $\text{C}_5\text{H}_9\text{NO}_4\text{S}$ .

**Description** L-Carbocisteine occurs as a white crystalline powder. It is odorless, and has a slightly acid taste.

It is very slightly soluble in water, and practically insoluble in ethanol (95).

It dissolves in dilute hydrochloric acid or in sodium hydroxide TS.

Melting point: about 186°C (with decomposition).

**Identification (1)** To 0.2 g of L-Carbocisteine add 1 mL of lead acetate TS and 3 mL of water, shake, add 0.2 g of sodium hydroxide, and heat over a flame for 1 minute: a dark brown to black precipitate is formed.

**(2)** Determine the infrared absorption spectrum of L-Carbocisteine as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ :  $-33.5 - -36.5^\circ$  Weigh accurately about 5 g of L-Carbocisteine, previously dried, dissolve in 20 mL of water and a suitable amount of a solution of sodium hydroxide (13 in 100), and adjust the pH with 1 mol/L hydrochloric acid TS or 0.1 mol/L hydrochloric acid TS to 6.0, and add water to make exactly 50 mL. Determine the optical rotation of this solution in a 100-mm cell.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of L-Carbocisteine in 10 mL of sodium hydroxide TS: the solution is clear and colorless.

**(2)** Chloride <1.03>—Dissolve 0.20 g of L-Carbocisteine in 10 mL of water and 20 mL of nitric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows. To 0.40 mL of 0.01 mol/L hydrochloric acid VS add 20 mL of nitric acid and water to make 50 mL (not more than 0.071%).

**(3)** Ammonium <1.02>—Perform the test with 0.25 g of L-Carbocisteine using the distillation under reduced pressure. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

**(4)** Heavy metals <1.07>—Proceed with 1.0 g of L-Carbocisteine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solu-

tion (not more than 20 ppm).

**(5)** Arsenic <1.11>—Prepare the test solution with 1.0 g of L-Carbocisteine according to Method 3, and perform the test (not more than 2 ppm).

**(6)** Related substances—Dissolve 0.30 g of L-Carbocisteine in 10 mL of 0.2 mol/L sodium hydroxide TS, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add 0.2 mol/L sodium hydroxide TS to make exactly 100 mL. Pipet 1 mL of this solution, and add 0.2 mol/L sodium hydroxide TS to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution, in 15 mm length along the starting line on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and heat at 80°C for 5 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.30% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.25 g of L-Carbocisteine, previously dried, dissolve in exactly 20 mL of 0.1 mol/L perchloric acid VS and 50 mL of acetic acid (100), and titrate <2.50> the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS  
= 17.92 mg of  $\text{C}_5\text{H}_9\text{NO}_4\text{S}$

**Containers and storage** Containers—Tight containers.

## Carbon Dioxide

二酸化炭素

$\text{CO}_2$ : 44.01

Carbon Dioxide contains not less than 99.5 vol% of  $\text{CO}_2$ .

**Description** Carbon Dioxide is a colorless gas at room temperature and under atmospheric pressure. It is odorless.

A 1 mL volume of Carbon Dioxide dissolves in 1 mL of water, and the solution is slightly acid.

1000 mL of Carbon Dioxide at 0°C and under a pressure of 101.3 kPa weighs about 1.978 g.

**Identification (1)** Put a flaming wood splinter into Carbon Dioxide: the flame is extinguished immediately.

**(2)** Pass Carbon Dioxide into calcium hydroxide TS: a white precipitate is produced. Collect the precipitate, and add acetic acid (31): it dissolves with effervescence.

**Purity** Maintain containers of Carbon Dioxide between 18°C and 22°C for not less than 6 hours prior to the test, and correct the volume of Carbon Dioxide to 20°C and under a

pressure of 101.3 kPa.

(1) Acidity—Place 50 mL of freshly boiled and cooled water in a Nessler tube, and pass 1000 mL of Carbon Dioxide into it for 15 minutes through an introducing tube about 1 mm in diameter extending to 2 mm from the bottom of the Nessler tube, then add 0.10 mL of methyl orange TS: the solution is not more colored than the following control solution.

Control solution: To 50 mL of freshly boiled and cooled water in a Nessler tube add 0.10 mL of methyl orange TS and 1.0 mL of 0.01 mol/L hydrochloric acid VS.

(2) Hydrogen phosphide, hydrogen sulfide or reducing organic substances—Place 25 mL of silver nitrate-ammonia TS and 3 mL of ammonia TS in each of two Nessler tubes A and B, and designate the solution in each tube as solution A and solution B, respectively. Pass 1000 mL of Carbon Dioxide into solution A in the same manner as directed in (1): the turbidity and color of this solution are the same as that of solution B.

(3) Carbon monoxide—Introduce 5.0 mL of Carbon Dioxide into a gas-cylinder or a syringe for gas chromatography from a metal cylinder holding gas under pressure and fitted with a pressure-reducing valve, through a directly connected polyvinyl tube. Perform the test with this according to the Gas Chromatography <2.02> under the following conditions: no peak is observed at the same retention time as that of carbon monoxide.

*Operating conditions—*

Detector: A thermal-conductivity detector.

Column: A column about 3 mm in inside diameter and about 3 m in length, packed with 300 to 500  $\mu\text{m}$  zeolite for gas chromatography (0.5 nm in porous size).

Column temperature: A constant temperature of about 50°C.

Carrier gas: Hydrogen or helium.

Flow rate: Adjust the flow rate so that the retention time of carbon monoxide is about 20 minutes.

Selection of column: To 0.1 mL each of carbon monoxide and air in a gas mixer add carrier gas to make 100 mL, and mix well. Proceed with 5.0 mL of the mixed gas under the above operating conditions. Use a column giving elution of oxygen, nitrogen and carbon monoxide in this order with a well-resolving of their peaks.

Detection sensitivity: Adjust the sensitivity so that the peak height of carbon monoxide obtained from 5.0 mL of the mixed gas used in the selection of column is about 10 cm.

(4) Oxygen and nitrogen—Introduce 1.0 mL of Carbon Dioxide into a gas-measuring tube or syringe for gas chromatography from a metal cylinder under pressure with a pressure-reducing valve through a directly connected polyvinyl chloride tube. Perform the test as directed under Gas Chromatography <2.02> according to the following conditions, and determine the peak area  $A_T$  of air. Separately, introduce 0.50 mL of nitrogen into the gas mixer, draw carrier gas into the mixer to make exactly 100 mL, allow to mix thoroughly, and use this mixture as the standard gas mixture. Perform the test with 1.0 mL of this mixture in the same manner as directed in the case of Carbon Dioxide, and determine the peak area  $A_S$  of nitrogen:  $A_T$  is smaller than  $A_S$ , and no other peak appears.

*Operating conditions—*

Detector: A thermal-conductivity detector.

Column: A column about 3 mm in inside diameter and

about 3 m in length, packed with silica gel for gas chromatography (300 to 500  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 50°C.

Carrier gas: Hydrogen or helium.

Flow rate: Adjust the flow rate so that the retention time of nitrogen is about 2 minutes.

Selection of column: Collect 0.5 mL of nitrogen in a gas mixer, add Carbon Dioxide to make 100 mL, mix well, and proceed with 1.0 mL of the mixture under the above operating conditions. Use a column giving well-resolved peaks of nitrogen and Carbon Dioxide in this order.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of nitrogen obtained from 1.0 mL of the standard gas mixture composes about 50% of the full scale.

**Assay** For the withdrawing of Carbon Dioxide, proceed as directed in the Purity. Place 125 mL of a solution of potassium hydroxide (1 in 2) in a gas pipet of suitable capacity. Measure exactly about 100 mL of Carbon Dioxide in a 100-mL gas buret filled with water. Force the entire volume of gas into the gas pipet, and shake for 5 minutes. Draw some of the unabsorbed gas into the gas buret, measure the volume, force the residual back upon the surface of the liquid in the gas pipet, and repeat this procedure until a constant volume of the residual reading is obtained. Determine the volume  $V$  (mL) of the residual gas, and correct its volume  $V$  to 20°C and under a pressure of 101.3 kPa.

Volume (mL) of  $\text{CO}_2$

= calculated volume (mL) of the sample

– calculated volume  $V$  (mL)

**Containers and storage** Containers—Pressure resistant metal cylinders.

Storage—Not exceeding 40°C.

## Carmellose

### Carboxymethylcellulose

#### CMC

カルメロース

Carmellose is a polycarboxymethylether of cellulose.

**Description** Carmellose occurs as a white powder. It is odorless and tasteless.

It is practically insoluble in ethanol (95) and in diethyl ether.

It swells with water to form suspension.

It becomes viscid in sodium hydroxide TS.

The pH of a suspension, obtained by shaking 1.0 g of Carmellose with 100 mL of water, is between 3.5 and 5.0.

It is hygroscopic.

**Identification** (1) Shake well 0.1 g of Carmellose with 10 mL of water, add 2 mL of sodium hydroxide TS, shake, and allow to stand for 10 minutes. Use this solution as the sample solution. To 1 mL of the sample solution add water to make 5 mL. To 1 drop of this solution add 0.5 mL of concentrated disodium chlorotropeate TS, and heat in a water bath for 10 minutes: a red-purple color develops.

(2) Shake 5 mL of the sample solution obtained in (1)

with 10 mL of acetone: a white, flocculent precipitate is produced.

(3) Shake 5 mL of the sample solution obtained in (1) with 1 mL of iron (III) chloride TS: a brown, flocculent precipitate is produced.

**Purity (1) Chloride <1.03>**—Shake well 0.8 g of Carmellose with 50 mL of water, dissolve in 10 mL of sodium hydroxide TS, and add water to make 100 mL. Heat 20 mL of this solution with 10 mL of dilute nitric acid on a water bath until a flocculent precipitate is produced, cool, centrifuge, and take out the supernatant liquid. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant liquid and the washings, and add water to make 100 mL. Take 25 mL of this solution, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.360%).

(2) Sulfate <1.14>—Shake well 0.40 g of Carmellose with 25 mL of water, dissolve in 5 mL of sodium hydroxide TS, and add 20 mL of water. Heat this solution with 2.5 mL of hydrochloric acid in a water bath until a flocculent precipitate is produced. Cool, centrifuge, and take out the supernatant liquid. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant liquid and the washings, and add water to make 100 mL. Filter this solution, discard 5 mL of the first filtrate, take 25 mL of the subsequent filtrate, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.5 mL of 0.005 mol/L sulfuric acid VS (not more than 0.720%).

(3) Silicate—Weigh accurately about 1 g of Carmellose, ignite in a platinum dish, add 20 mL of dilute hydrochloric acid, cover with a watch glass, and boil gently for 30 minutes. Remove the watch glass, and evaporate on a water bath to dryness with the aid of a current of air. Continue heating further for 1 hour, add 10 mL of hot water, stir well, and filter through a filter paper for quantitative analysis. Wash the residue with hot water, dry the residue together with the filter paper when no turbidity is produced on the addition of silver nitrate TS to the last washing, and ignite to constant mass: the amount of residue is not more than 0.5%.

(4) Heavy metals <1.07>—Proceed with 1.0 g of Carmellose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(5) Arsenic <1.11>—Take 1.0 g of Carmellose, prepare the test solution according to Method 3, and perform the test (not more than 2 ppm).

**Loss on drying <2.41>** Not more than 8.0% (1 g, 105°C, 4 hours).

**Residue on ignition <2.44>** Not more than 1.5% (after drying, 1 g).

**Containers and storage** Containers—Tight containers.

## Carmellose Calcium

### Carboxymethylcellulose Calcium CMC Calcium

カルメロースカルシウム

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols (♦ ◆).

Carmellose Calcium is the calcium salt of a polycarboxymethylether of cellulose.

♦**Description** Carmellose Calcium occurs as a white to yellowish white powder.

It is practically insoluble in ethanol (95) and in diethyl ether.

It swells with water to form a suspension.

The pH of a suspension, obtained by shaking 1.0 g of Carmellose Calcium with 100 mL of water, is between 4.5 and 6.0.

It is hygroscopic. ◆

**Identification (1)** Shake thoroughly 0.1 g of Carmellose Calcium with 10 mL of water, followed by 2 mL of sodium hydroxide TS, allow to stand for 10 minutes, and use this solution as the sample solution. To 1 mL of the sample solution add water to make 5 mL. To 1 drop of this solution add 0.5 mL of chromotropic acid TS, and heat in a water bath for 10 minutes: a red-purple color develops.

(2) Shake 5 mL of the sample solution obtained in (1) with 10 mL of acetone: a white, flocculent precipitate is produced.

(3) Shake 5 mL of the sample solution obtained in (1) with 1 mL of iron (III) chloride TS: a brown, flocculent precipitate is produced.

(4) Ignite 1 g of Carmellose Calcium to ash, dissolve the residue in 10 mL of water and 6 mL of acetic acid (31), and filter, if necessary. Boil the filtrate, cool, and neutralize with ammonia TS: the solution responds to the Qualitative Tests <1.09> (1) and (3) for calcium salt.

**Purity (1) Alkalinity**—Shake thoroughly 1.0 g of Carmellose Calcium with 50 mL of freshly boiled and cooled water, and add 2 drops of phenolphthalein TS: no red color develops.

(2) Chloride <1.03>—Shake thoroughly 0.80 g of Carmellose Calcium with 50 mL of water, add 10 mL of sodium hydroxide TS to dissolved, add water to make 100 mL, and use this solution as the sample solution. Heat 20 mL of the sample solution with 10 mL of 2 mol/L nitric acid TS on a water bath until a flocculent precipitate is produced. After cooling, centrifuge, and take out the supernatant liquid. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant and the washings, and add water to make 100 mL. Take 25 mL of this solution, and add 1 mL of nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.36%).

(3) Sulfate <1.14>—Heat 10 mL of the sample solution

obtained in (2) with 1 mL of hydrochloric acid in a water bath until a flocculent precipitate is produced. Cool, centrifuge, and take out the supernatant liquid. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant and the washings, and add water to make 100 mL. Perform the test with 25 mL this solution as the test solution. Prepare the control solution with 0.42 mL of 0.005 mol/L sulfuric acid VS. To the test solution and the control solution add 1 mL of 3 mol/L hydrochloric acid and 3 mL of barium chloride TS, then add water to make 50 mL, and mix. Allow to stand for 10 minutes, and compare the turbidity of these solutions: the turbidity obtained with the test solution is not more than that obtained with the control solution (not more than 1.0%).

♦(4) Heavy metals <1.07>—Proceed with 1.0 g of Carmellose Calcium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).♦

**Loss on drying** <2.41> Not more than 10.0% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> 10 – 20% (after drying 1 g).

♦**Containers and storage** Containers—Tight containers.♦

## Carmellose Sodium

### Carboxymethylcellulose Sodium

#### CMC Sodium

カルメロースナトリウム

Carmellose Sodium is the sodium salt of a polycarboxymethylether of cellulose.

It, when dried, contains not less than 6.5% and not more than 8.5% of sodium (Na: 22.99).

**Description** Carmellose Sodium occurs as a white to yellowish white powder or granules. It has no taste.

It is practically insoluble in methanol, in ethanol (95), in acetic acid (100) and in diethyl ether.

It forms a viscid solution in water and in warm water.

It is hygroscopic.

**Identification** (1) Dissolve 0.2 g of Carmellose Sodium in 20 mL of warm water with stirring, cool, and use this solution as the sample solution. To 1 mL of the sample solution add water to make 5 mL. To 1 drop of this solution add 0.5 mL of concentrated disodium chlomotropate TS, and heat in a water bath for 10 minutes: a red-purple color develops.

(2) To 10 mL of the sample solution obtained in test (1) add 1 mL of copper (II) sulfate TS: a blue flocculent precipitate is produced.

(3) To 3 g of Carmellose Sodium add 20 mL of methanol and 2 mL of dilute hydrochloric acid, boil gently on a water bath for 5 minutes, and filter. Evaporate the filtrate to dryness, and add 20 mL of water to the residue: the solution responds to the Qualitative Tests <1.09> for sodium salt.

**pH** <2.54> Add 1.0 g of Carmellose Sodium in small portions to 100 mL of warm water with stirring, dissolve, and cool: the pH of this solution is between 6.0 and 8.0.

**Purity** (1) Clarity and color of solution—Firmly attach a

glass plate of good quality 2 mm in thickness, to the bottom of a glass column 250 mm in height, 25 mm in inner diameter and 2 mm in thickness. This is used as an outer tube. Similarly prepare an inner tube by attaching a glass plate of good quality 2 mm in thickness to the bottom of a glass column 300 mm in height, 15 mm in inner diameter and 2 mm in thickness. Dissolve 1.0 g of Carmellose Sodium in 100 mL of water, pour this solution into the outer tube, and place on a piece of white paper on which 15 parallel black lines 1 mm in width and 1 mm in interval are drawn. Moving the inner tube up and down and observing from the upper part, determine the height of the solution up to the lower edge of the inner tube when the distinction of the lines becomes impossible. Repeat the operation 3 times, and calculate the mean value: it is larger than that calculated from the similar operation, using the following control solution.

**Control solution:** To 5.50 mL of 0.005 mol/L sulfuric acid VS add 1 mL of dilute hydrochloric acid, 5 mL of ethanol (95) and water to make 50 mL. Add 2 mL of barium chloride TS, mix well, and allow to stand for 10 minutes. Shake well this solution before use.

(2) Chloride <1.03>—Dissolve 0.5 g of Carmellose Sodium in 50 mL of water, and use this solution as the sample solution. Shake 10 mL of the sample solution with 10 mL of dilute nitric acid, heat to produce a flocculent precipitate in a water bath, cool, and centrifuge. Separate the supernatant liquid, wash the precipitate with three 10-mL portions of water, centrifuging each time, combine the supernatant liquid with the washings, and dilute with water to 200 mL. Perform the test using 50 mL of this solution as the test solution. Prepare the control solution with 0.45 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.640%).

(3) Sulfate <1.14>—Add 1 mL of hydrochloric acid to 10 mL of the sample solution obtained in (2), shake well, heat to produce a flocculent precipitate in a water bath, cool, and centrifuge. Separate the supernatant liquid, wash the precipitate with three 10-mL portions of water, centrifuging each time, combine the washings with the supernatant liquid mentioned above, and dilute to 50 mL with water. Take 10 mL of this solution, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.960%).

(4) Silicate—Weigh accurately about 1 g of Carmellose Sodium, ignite in a platinum dish, add 20 mL of dilute hydrochloric acid, cover with a watch glass, and boil gently for 30 minutes. Remove the watch glass, and evaporate on a water bath to dryness with the aid of a current of air. Continue heating for further 1 hour, add 10 mL of hot water, stir well, and filter through a filter paper for quantitative analysis. Wash the residue with hot water, dry together with the filter paper after no turbidity is produced on the addition of silver nitrate TS to the last washing, and then ignite to constant mass: the mass of the residue is not more than 0.5%.

(5) Heavy metals <1.07>—Proceed with 1.0 g of Carmellose Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(6) Arsenic <1.11>—To 1.0 g of Carmellose Sodium add 20 mL of nitric acid, heat gently until it becomes fluid, cool, add 5 mL of sulfuric acid, and heat until white fumes are evolved. Add, if necessary, 5 mL of nitric acid after cooling, and heat again. Repeat this operation until the solution

becomes colorless or slightly yellow. After cooling, add 15 mL of a saturated solution of ammonium oxalate monohydrate, and heat until white fumes are evolved again, cool, and dilute with water to 25 mL. Take 5 mL of this solution as the test solution, and perform the test. The solution has no more color than the following standard stain.

Standard stain: Without using Carmellose Sodium, proceed in the same manner, then transfer 5 mL of this solution to a generator bottle, add exactly 2 mL of Standard Arsenic Solution, and proceed as directed for the test with the test solution (not more than 10 ppm).

(7) Starch—Add 2 drops of iodine TS to 10 mL of the sample solution obtained in (2): no blue color develops.

**Loss on drying** <2.41> Not more than 10.0% (1 g, 105°C, 4 hours).

**Assay** Weigh accurately about 0.5 g of Carmellose Sodium, previously dried, add 80 mL of acetic acid (100), connect with a reflux condenser, and heat in an oil bath maintained at 130°C for 2 hours. Cool, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 2.299 mg of Na

**Containers and storage** Containers—Tight containers.

## Carmofur

カルモフル

$C_{11}H_{16}FN_3O_3$ ; 257.26

5-Fluoro-1-(hexylaminocarbonyl)uracil [61422-45-5]

Carmofur, when dried, contains not less than 98.0% of  $C_{11}H_{16}FN_3O_3$ .

**Description** Carmofur occurs as a white crystalline powder.

It is very soluble in *N,N*-dimethylformamide, freely soluble in acetic acid (100), soluble in diethyl ether, sparingly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

Melting point: about 111°C (with decomposition).

**Identification** (1) Proceed with 5 mg of Carmofur as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid, and prepare the test solution: the test solution responds to the Qualitative Tests <1.09> (2) for fluoride.

(2) Determine the absorption spectrum of a solution of Carmofur in a mixture of methanol and phosphoric acid-acetic acid-boric acid buffer solution, pH 2.0, (9:1) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorp-

tion at the same wavelengths.

(3) Determine the infrared absorption spectrum of Carmofur, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity** (1) Heavy metals <1.07>—Proceed with 2.0 g of Carmofur according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 0.20 g of Carmofur in 10 mL of a mixture of methanol and acetic acid (100) (99:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of methanol and acetic acid (100) (99:1) to make exactly 500 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 15  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene and acetone (5:3) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution. After exposure of the plate to bromine vapor for 30 second, spray evenly a solution of fluorescein in ethanol (95) (1 in 2500): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, 50°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Carmofur, previously dried, dissolve in 20 mL of *N,N*-dimethylformamide, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide-methanol VS until the color of the solution changes from yellow through blue-green to blue (indicator: 3 drops of thymol blue-dimethylformamide TS).

Each mL of 0.1 mol/L tetramethylammonium hydroxide-methanol VS  
= 25.73 mg of  $C_{11}H_{16}FN_3O_3$

**Containers and storage** Containers—Tight containers.

## Carnauba Wax

*Cera Carnauba*

カルナウバロウ

Carnauba Wax is the wax obtained from the leaves of *Copernicia cerifera* Mart (*Palmae*).

**Description** Carnauba Wax occurs as light yellow to light brown, hard and brittle masses or white to light yellow powder. It has a slight, characteristic odor. It is tasteless.

It is practically insoluble in water, in ethanol (95), in diethyl ether and in xylene.

Specific gravity  $d_{20}^{20}$ : 0.990 – 1.002

Melting point: 80 – 86°C

**Acid value** <1.13> Not more than 10.0. Use a mixture of xylene and ethanol (95) (2:1) as solvent.

**Saponification value** <1.13> 78 – 95 Weigh accurately about 3 g of Carnauba Wax in a 300-mL flask, add 25 mL of xylene, and dissolve by warming. To this solution add 50 mL of ethanol (95) and exactly 25 mL of 0.5 mol/L potassium hydroxide-ethanol VS, and proceed as directed in the Saponification value. The time of heating should be 2 hours and the titration should be done by warming.

**Iodine value** <1.13> 5 – 14 (Dissolve the sample by shaking a glass-stoppered flask in warm water.)

**Containers and storage** Containers—Well-closed containers.

## Carteolol Hydrochloride

カルテオロール塩酸塩

$C_{16}H_{24}N_2O_3 \cdot HCl$ : 328.83

5-[(2*RS*)-3-(1,1-Dimethylethyl)amino-2-hydroxypropyloxy]-3,4-dihydroquinolin-2(1*H*)-one monohydrochloride [51781-21-6]

Carteolol Hydrochloride, when dried, contains not less than 99.0% of  $C_{16}H_{24}N_2O_3 \cdot HCl$ .

**Description** Carteolol Hydrochloride occurs as white crystals or crystalline powder.

It is soluble in water, sparingly soluble in methanol, very slightly soluble in ethanol (95) and in acetic acid (100), and practically insoluble in diethyl ether.

The pH of a solution of Carteolol Hydrochloride (1 in 100) is between 5.0 and 6.0.

The solution of Carteolol Hydrochloride (1 in 20) shows no optical rotation.

Melting point: about 277°C (with decomposition).

**Identification** (1) Dissolve 0.1 g of Carteolol Hydrochloride in 5 mL of water, and add 5 drops of Reinecke salt TS: a light red precipitate is formed.

(2) Determine the absorption spectrum of a solution of Carteolol Hydrochloride (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Carteolol Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Carteolol Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of

Carteolol Hydrochloride in 30 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Carteolol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Carteolol Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.20 g of Carteolol Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia solution (28) (50:20:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Carteolol Hydrochloride, previously dried, add 30 mL of acetic acid (100), dissolve by heating on a water bath, and cool. After adding 70 mL of acetic anhydride, titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 32.88 mg of  $C_{16}H_{24}N_2O_3 \cdot HCl$

**Containers and storage** Containers—Well-closed containers.

## Carumonam Sodium

カルモナムナトリウム

$C_{12}H_{12}N_6Na_2O_{10}S_2$ : 510.37

Disodium (*Z*)-{(2-aminothiazol-4-yl)[(2*S*,3*S*)-2-carbamoyloxymethyl-4-oxo-1-sulfonatoazetidin-3-ylcarbamoyl]methyleneaminoxy}acetate [86832-68-0]

Carumonam Sodium contains not less than 850  $\mu$ g (potency) and not more than 920  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Carumonam Sodium is expressed as mass (potency) of carumonam ( $C_{12}H_{14}N_6O_{10}S_2$ : 466.40).

**Description** Carumonam Sodium occurs as a white to yellowish white, crystals or crystalline powder.

It is freely soluble in water, soluble in formamide, very slightly soluble in methanol, and practically insoluble in acetic acid (100) and in ethanol (99.5).

**Identification (1)** Determine the absorption spectrum of a solution of Carumonam Sodium (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Carumonam Sodium Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Carumonam Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Carumonam Sodium Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** Determine the spectrum of a solution of Carumonam Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> (<sup>1</sup>H), using sodium 3-trimethylsilylpropionate-d<sub>4</sub> for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a double signal A at around δ5.5 ppm, and a single signal B at around δ7.0 ppm. The ratio of the integrated intensity of these signals, A:B, is about 1:1.

**(4)** Carumonam Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +18.5 – +21.0° (0.1 g calculated on the anhydrous basis, water, 10 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 1.0 g of Carumonam Sodium in 10 mL of water is between 5.0 and 6.5.

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Carumonam Sodium in 5 mL of water: the solution is clear and colorless to pale yellow.

**(2)** Heavy metals <1.07>—Proceed with 2.0 g of Carumonam Sodium according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 15 ppm).

**(3)** Arsenic <1.11>—Prepare the test solution with 2.0 g of Carumonam Sodium according to Method 4, and perform the test (not more than 1 ppm).

**(4)** Related substance 1—Weigh accurately about 0.1 g of Carumonam Sodium, and dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of Carumonam Sodium Reference Standard, and dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, and add the mobile phase to make exactly 25 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration

method. Calculate the amount of the related substances by the following equation: the amount of the related substance having the relative retention time of 0.7 to the peak of carumonam is not more than 4.0%, and each amount of the related substances other than the related substance having the relative retention time of 0.7 to the peak of carumonam is not more than 1.0%.

$$\begin{aligned} \text{Amount (\% of related substance)} \\ = (W_S/W_T) \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (g) of Carumonam Sodium Reference Standard

$W_T$ : Amount (g) of the sample

$A_S$ : Peak area of carumonam from the standard solution

$A_T$ : Each peak area other than carumonam from the sample solution

**Operating conditions—**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of carumonam.

**System suitability—**

Test for required detectability: Measure exactly 5 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of carumonam obtained from 10 μL of this solution is equivalent to 7 to 13% of that from 10 μL of the standard solution.

System performance: Dissolve 40 mg of Carumonam Sodium in 20 mL of the mobile phase. To 5 mL of this solution add 5 mL of a solution of resorcinol in the mobile phase (9 in 1000) and the mobile phase to make 25 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, resorcinol and carumonam are eluted in this order with the resolution between these peaks being not less than 2.5.

System repeatability: When the test is repeated 3 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of carumonam is not more than 2.0%.

**(5)** Related substance 2—Weigh accurately about 0.1 g of Carumonam Sodium, and dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of Carumonam Sodium Reference Standard, and dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, and add the mobile phase to make exactly 25 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of the related substances by the following equation: the amount of each related substance is not more than 1.0%.

$$\begin{aligned} \text{Amount (\% of related substance)} \\ = (W_S/W_T) \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (g) of Carumonam Sodium Reference Standard

$W_T$ : Amount (g) of the sample

$A_S$ : Peak area of carumonam from the standard solution

$A_T$ : Each area of the peaks appeared after the peak of carumonam from the sample solution

**Operating conditions—**

Detector, column, and column temperature: Proceed as directed in the operating conditions in the Assay.

Mobile phase: A mixture of a solution of ammonium sulfate (1 in 10,000), methanol and acetic acid (100) (74:25:1).

Flow rate: Dissolve 0.01 g of phthalic acid in the mobile phase to make 100 mL. Adjust the flow rate so that the retention time of phthalic acid is about 6.5 minutes when the procedure is run with 10  $\mu$ L of this solution.

Time span of measurement: About 10 times as long as the retention time of carumonam.

**System suitability—**

Test for required detectability: Measure exactly 5 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of carumonam obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that from 10  $\mu$ L of the standard solution.

System performance: Dissolve 40 mg of Carumonam Sodium in 20 mL of the mobile phase. To 5 mL of this solution add 5 mL of a solution of resorcinol in the mobile phase (9 in 1000) and the mobile phase to make 25 mL. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, resorcinol and carumonam are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 3 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of carumonam is not more than 2.0%.

(6) Total amount of related substances—The total of the amounts of the related substances obtained in the Related substance 1 and the Related substance 2 is not more than 6.0%.

**Water** <2.48> Not more than 2.0% (0.2 g, volumetric titration, direct titration; Use a mixture of formamide for water determination and methanol for water determination (3:1) instead of methanol for water determination).

**Assay** Weigh accurately an amount of Carumonam Sodium and Carumonam Sodium Reference Standard, equivalent to about 40 mg (potency), and dissolve each in the mobile phase to make exactly 20 mL. Measure exactly 5 mL each of these solutions, add exactly 5 mL of the internal standard solution and the mobile phase to make 25 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of carumonam to that of the internal standard.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of carumonam (C}_{12}\text{H}_{14}\text{N}_6\text{O}_{10}\text{S}_2) \\ &= W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Carumonam Sodium Reference Standard

**Internal standard solution—**A solution of resorcinol in the mobile phase (9 in 1000).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of a solution of ammonium sulfate (1 in 10,000), methanol and acetic acid (100) (97:2:1).

Flow rate: Adjust the flow rate so that the retention time of carumonam is about 10 minutes.

**System suitability—**

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the internal standard and carumonam are eluted in this order with the resolution between these peaks being not less than 2.5.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of carumonam to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

Storage—Light-resistant.

## Castor Oil

### *Oleum Ricini*

ヒマシ油

Castor Oil is the fixed oil obtained by compression from the seeds of *Ricinus communis* Linné (*Euphorbiaceae*).

**Description** Castor Oil is a colorless or pale yellow, clear, viscous oil. It has a slight, characteristic odor, and has a bland at first, and afterwards slightly acrid taste.

It is miscible with ethanol (99.5) and with diethyl ether.

It is freely soluble in ethanol (95), and practically insoluble in water.

When cooled to 0°C, it becomes more viscous, and turbidity is gradually formed.

**Identification** To 3 g of Castor Oil add 1 g of potassium hydroxide, and heat the mixture carefully to fuse: a characteristic odor is perceptible. Dissolve the fused matter in 30 mL of water, add an excess of magnesium oxide, and filter. Acidify the filtrate with hydrochloric acid: white crystals is produced.

**Specific gravity** <1.13>  $d_{25}^{25}$ : 0.953 – 0.965

**Acid value** <1.13> Not more than 1.5.

**Saponification value** <1.13> 176 – 187

**Hydroxyl value** <1.13> 155 – 177

**Iodine value** <1.13> 80 – 90

**Purity** Adulteration—Shake to mix 1.0 g of Castor Oil with 4.0 mL of ethanol (95): it dissolves clearly. Add 15 mL of ethanol (95): no turbidity is produced.

**Containers and storage** Containers—Tight containers.

## Aromatic Castor Oil

加香ヒマシ油

### Method of preparation

Castor Oil	990 mL
Orange Oil	5 mL
Mentha Oil	5 mL
To make 1000 mL	

Mix the above ingredients.

**Description** Aromatic Castor Oil is a colorless or yellowish, clear, viscous liquid. It has an aromatic odor.

**Identification** To 3 g of Aromatic Castor Oil add 1 g of potassium hydroxide, and heat the mixture carefully to fuse: a characteristic odor is perceptible. Dissolve the fused matter in 30 mL of water, add an excess of magnesium oxide, and filter. Acidify the filtrate with hydrochloric acid: white crystals are produced.

**Containers and storage** Containers—Tight containers.

## Cefaclor

セファクロル

$C_{15}H_{14}ClN_3O_4S$ : 367.81

(6*R*,7*R*)-7-[(2*R*)-2-Amino-2-phenylacetamino]-3-chloro-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid [53994-73-3]

Cefaclor contains not less than 950  $\mu$ g (potency) and not more than 1020  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefaclor is expressed as mass (potency) of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ).

**Description** Cefaclor occurs as a white to yellowish white crystalline powder.

It is slightly soluble in water and in methanol, and practically insoluble in *N,N*-dimethylformamide and in ethanol (99.5).

**Identification (1)** Determine the absorption spectrum of a solution of Cefaclor (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefaclor as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 40 mg of Cefaclor in 0.5 mL of heavy water

for nuclear magnetic resonance spectroscopy and 1 drop of deuterated hydrochloric acid for nuclear magnetic resonance spectroscopy, and determine the spectrum of this solution as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits an AB type quartet signal A at around  $\delta$ 3.7 ppm, and a single signal or a sharp multiple signal B at around  $\delta$ 7.6 ppm. The ratio of the integrated intensity of each signal, A:B, is about 2:5.

(4) Perform the test with Cefaclor as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +105 – +120° (0.1 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

**Purity (1) Heavy metals** <1.07>—Proceed with 1.0 g of Cefaclor according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution by suspending 1.0 g of Cefaclor in 10 mL of *N,N*-dimethylformamide, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 50 mg of Cefaclor in 10 mL of sodium dihydrogen phosphate TS, pH 2.5, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add sodium dihydrogen phosphate TS, pH 2.5 to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas other than cefaclor from the sample solution are not more than 1/2 of the peak area of cefaclor from the standard solution, and the total of the peak areas other than cefaclor from the sample solution is not more than 2 times of the peak area of cefaclor from the standard solution. If necessary, proceed with 20  $\mu$ L of sodium dihydrogen phosphate TS, pH 2.5 in the same manner as above to compensate the base line.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: Dissolve 7.8 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water, and adjust the pH to 4.0 with phosphoric acid.

Mobile phase B: To 550 mL of the mobile phase A add 450 mL of acetonitrile for liquid chromatography.

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 – 30	95 → 75	5 → 25
30 – 45	75 → 0	25 → 100
45 – 55	0	100

Flow rate: 1.0 mL per minute.

Time span of measurement: About 2.5 times as long as the retention time of cefaclor beginning after the solvent peak.

*System suitability*—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add sodium dihydrogen phosphate TS, pH 2.5 to make exactly 20 mL. Confirm that the peak area of cefaclor obtained from 20  $\mu$ L of this solution is equivalent to 4 to 6% of that from 20  $\mu$ L of the standard solution.

System performance: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefaclor are not less than 40,000 steps and 0.8 to 1.3, respectively.

System repeatability: When the test is repeated 3 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviations of the peak areas and the retention times of cefaclor are not more than 2.0%, respectively.

**Water** <2.48> Not more than 6.5% (0.2 g, volumetric titration, back titration).

**Assay** Weigh accurately an amount of Cefaclor and Cefaclor Reference Standard, equivalent to about 0.1 g (potency), and dissolve each in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 100 mL. Pipet 10 mL each of these solutions, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution, pH 4.5 to make 50 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefaclor to that of the internal standard.

$$\begin{aligned} & \text{Amount } [\mu\text{g (potency)}] \text{ of } \text{C}_{15}\text{H}_{14}\text{ClN}_3\text{O}_4\text{S} \\ & = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefaclor Reference Standard

*Internal standard solution*—A solution of 4-aminoacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

*Operating conditions*—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 6.8 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust the pH to 3.4 with diluted phosphoric acid (3 in 500). To 940 mL of this solution add 60 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefaclor is about 7 minutes.

*System suitability*—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, cefaclor and the internal standard are eluted in

this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefaclor to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cefaclor Capsules

セファクロルカプセル

Cefaclor Capsules contain not less than 90.0% and not more than 110.0% of the labeled amount of cefaclor ( $\text{C}_{15}\text{H}_{14}\text{ClN}_3\text{O}_4\text{S}$ ; 367.81).

**Method of preparation** Prepare as directed under Capsules, with Cefaclor.

**Identification** Shake vigorously a quantity of the contents of one capsule of Cefaclor Capsules, equivalent to 20 mg (potency) of Cefaclor according to the labeled amount, with 10 mL of water, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 20 mg of Cefaclor Reference Standard in 10 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of acetonitrile, water, ethyl acetate and formic acid (30:10:10:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot from the sample solution and the spot from the standard solution show the same  $R_f$  value.

**Purity** Related substances—Weigh accurately not less than 5 Cefaclor Capsules, open the capsules and carefully take out the contents, mix well, and powder, if necessary. Wash the empty capsules with a little amount of diethyl ether, if necessary, allow the capsules to stand at room temperature to vaporize adhering diethyl ether, and weigh accurately the capsules to calculate the mass of the contents. Weigh accurately a quantity of the contents, equivalent to about 0.25 g (potency) of Cefaclor, shake with 40 mL of 0.1 mol/L phosphate buffer solution, pH 4.5 for 10 minutes, add the same buffer solution to make exactly 50 mL, and filter through a 0.45- $\mu$ m pore-size membrane filter. Discard the first 1 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefaclor Reference Standard, and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 20 mL. Pipet 2.5 mL of this solution, add the same buffer solution to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas by the automatic integration method. Calculate the amount of each related substance by the following equation: the amount of each related sub-

stance is not more than 0.5%, and the total amount of the related substances is not more than 2.5%. If necessary, correct the fluctuation of the base line by performing the test in the same way with 20  $\mu$ L of 0.1 mol/L phosphate buffer solution, pH 4.5.

Amount (%) of each related substance  
 $= (W_S/W_T) \times (A_{Ti}/A_S) \times (W_M/C) \times (25/2)$

Total amount (%) of the related substances  
 $= (W_S/W_T) \times (\Sigma A_{Ti}/A_S) \times (W_M/C) \times (25/2)$

$W_S$ : Amount [mg (potency)] of Cefaclor Reference Standard

$W_T$ : Amount (mg) of the contents of Cefaclor Capsules

$W_M$ : Average mass (mg) of the contents in 1 capsule

$A_{Ti}$ : Area of each peak other than cefaclor and solvent from the sample solution

$A_S$ : Peak area of cefaclor from the standard solution

$C$ : Labeled potency [mg (potency)] of Cefaclor in 1 capsule

#### Operating conditions—

Proceed as directed in the operating conditions in the Purity (3) under Cefaclor.

#### System suitability—

Test for required detectability: Pipet 1 mL of the standard solution, and add 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 20 mL. Confirm that the peak area of cefaclor obtained with 20  $\mu$ L of this solution is equivalent to 3.5 to 6.5% of that of cefaclor obtained with 20  $\mu$ L of the standard solution.

System performance, and system repeatability: Proceed as directed in the system suitability in the Purity (3) under Cefaclor.

**Water** <2.48> Not more than 8.0% (0.2 g, volumetric titration, back titration).

**Uniformity of dosage units** <6.02> It meets the requirement of the Mass variation test.

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with one Cefaclor Capsules at 50 revolutions per minute according to the Paddle method using 900 mL of water as the dissolution medium. Withdraw not less than 20 mL of the dissolution medium 15 minutes after start of the test, and filter through a membrane filter with pore size of not more than 0.5  $\mu$ m. Discard the first 10 mL of the filtrate, pipet  $V$  mL of the subsequent filtrate, add water to make exactly  $V'$  mL so that each mL contains about 20  $\mu$ g (potency) of Cefaclor according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefaclor Reference Standard, and dissolve in water to make exactly 20 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , at 265 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>. The dissolution rate in 15 minutes is not less than 80%.

Dissolution rate (%) with respect to the labeled amount of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ )

$$= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 90$$

$W_S$ : Amount [mg (potency)] of Cefaclor Reference Stan-

ard

$C$ : Labeled amount [mg (potency)] of Cefaclor in 1 capsule

**Assay** Weigh accurately not less than 5 Cefaclor Capsules, open the capsules and carefully take out the contents, mix well, and powder, if necessary. Wash the empty capsules with a little amount of diethyl ether, if necessary, allow the capsules to stand at room temperature to vaporize adhering diethyl ether, and weigh accurately the capsules to calculate the mass of the contents. Weigh accurately a quantity of the contents, equivalent to about 0.1 g (potency) of Cefaclor according to the labeled amount, shake vigorously with 60 mL of 0.1 mol/L phosphate buffer solution, pH 4.5 for 10 minutes, add the same buffer solution to make exactly 100 mL, and centrifuge. Pipet 10 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg (potency) of Cefaclor Reference Standard, and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefaclor.

$$\text{Amount [mg (potency)] of cefaclor } (C_{15}H_{14}ClN_3O_4S) \\ = W_S \times (Q_T/Q_S) \times 2$$

$W_S$ : Amount [mg (potency)] of Cefaclor Reference Standard

**Internal standard solution**—A solution of 4-aminoacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

## Cefaclor Fine Granules

セファクロル細粒

Cefaclor Fine Granules contain not less than 90.0% and not more than 110.0% of the labeled amount of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ; 367.81).

**Method of preparation** Prepare fine granules as directed under Powders, with Cefaclor.

**Identification** Shake vigorously a quantity of Cefaclor Fine Granules, equivalent to 20 mg (potency) of Cefaclor according to the labeled amount, with 10 mL of water, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 20 mg (potency) of Cefaclor Reference Standard in 10 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of acetonitrile, water, ethyl acetate and formic acid (30:10:10:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot from the sample solution and the spot from the standard solution show the same  $R_f$  value.

**Purity** Related substances—Weigh accurately a quantity of Cefaclor Fine Granules after powdered if necessary, equivalent to about 0.1 g (potency) of Cefaclor according to the labeled amount, shake with 40 mL of 0.1 mol/L phosphate buffer solution, pH 4.5 for 10 minutes, add the same buffer solution to make exactly 50 mL, and filter through a 0.45- $\mu$ m pore-size membrane filter. Discard the first 1 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefaclor Reference Standard, and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 20 mL. Pipet 2 mL of this solution, add the same buffer solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas by the automatic integration method. Calculate the amount of each related substance by the following equation: the amount of each related substance is not more than 0.5%, and the total amount of the related substances is not more than 3.0%. If necessary, correct the fluctuation of the base line by performing the test in the same way with 50  $\mu$ L of 0.1 mol/L phosphate buffer solution, pH 4.5.

Amount (%) of each related substance  

$$= (W_S/W_T) \times (A_T/A_S) \times (1/C) \times 5$$

Total amount (%) of the related substances  

$$= (W_S/W_T) \times (\Sigma A_T/A_S) \times (1/C) \times 5$$

$W_S$ : Amount [mg (potency)] of Cefaclor Reference Standard

$W_T$ : Amount (g) of sample

$A_T$ : Area of the peak other than cefaclor and the solvent from the sample solution

$A_S$ : Peak area of cefaclor from the standard solution

C: Labeled potency [mg (potency)] of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ) per g of the sample

**Operating conditions—**

Proceed as directed in the operating conditions in the Purity (3) under Cefaclor.

**System suitability—**

Test for required detectability: Pipet 1 mL of the standard solution, and add 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 20 mL. Confirm that the peak area of cefaclor obtained with 50  $\mu$ L of this solution is equivalent to 3.5 to 6.5% of that of cefaclor obtained with 50  $\mu$ L of the standard solution.

System performance: When the procedure is run with 50  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefaclor are not less than 40,000 and between 0.8 and 1.3, respectively.

System repeatability: When the test is repeated 3 times with 50  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefaclor is not more than 2.0%.

**Water** <2.48> Not more than 1.5% (1 g, volumetric titration, back titration).

**Uniformity of dosage units** <6.02> The granules in single-unit container meet the requirement of the Mass variation

test.

**Dissolution** <6.10> Perform the test according to the following method: It meets requirement.

Perform the test with an accurately weighed quantity of Cefaclor Fine Granules, equivalent to about 0.25 g (potency) of Cefaclor according to the labeled amount, at 50 revolutions per minute according to the Paddle method using 900 mL of water as the dissolution medium. Withdraw not less than 20 mL of the dissolution medium 15 minutes after start of the test, and filter through a membrane filter with a pore size not exceeding 0.5  $\mu$ m. Discard the first 10 mL of the filtrate, pipet  $V$  mL of the subsequent filtrate, add water to make exactly  $V'$  mL so that each mL contains about 20  $\mu$ g (potency) of Cefaclor according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefaclor Reference Standard, and dissolve in water to make exactly 20 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , at 265 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>. The dissolution rate in 15 minutes is not less than 85%.

Dissolution rate (%) with respect to the labeled amount of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ )

$$= (W_S/W_T) \times (A_T/A_S) \times (V'/V) \times (1/C) \times 90$$

$W_S$ : Amount [mg (potency)] of Cefaclor Reference Standard

$W_T$ : Amount [mg (potency)] of sample

C: Labeled amount [mg (potency)] of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ) per g of Cefaclor Fine Granules

**Particle size** <6.03> It meets the requirement of fine granules of the Powders.

**Assay** Weigh accurately a quantity of Cefaclor Fine Granules after powdered if necessary, equivalent to about 0.1 g (potency) of Cefaclor according to the labeled amount, shake vigorously with 60 mL of 0.1 mol/L phosphate buffer solution, pH 4.5 for 10 minutes, add the same buffer solution to make exactly 100 mL, and centrifuge. Pipet 10 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg (potency) of Cefaclor Reference Standard, and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as standard solution. Proceed as directed in the Assay under Cefaclor.

$$\text{Amount [mg (potency)] of cefaclor } (C_{15}H_{14}ClN_3O_4S) \\ = W_S \times (Q_T/Q_S) \times 2$$

$W_S$ : Amount [mg (potency)] of Cefaclor Reference Standard

**Internal standard solution**—A solution of 4-aminoacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

## Cefaclor Compound Granules

セファクロル複合顆粒

Cefaclor Compound Granules contain gastric granules and enteric granules in one pack.

It contains cefaclor ( $C_{15}H_{14}ClN_3O_4S$ ; 367.81) equivalent to not less than 90.0% and not more than 110.0% of the labeled total potency and the labeled potency of gastric granule, respectively.

**Method of preparation** Prepare as directed under Granules, with Cefaclor, and divide into packs.

**Identification** Shake vigorously a quantity of Cefaclor Compound Granules, equivalent to 20 mg (potency) of Cefaclor according to the labeled total potency, with 10 mL of water, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 20 mg of Cefaclor Reference Standard in 10 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of acetonitrile, water, ethyl acetate and formic acid (30:10:10:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the principal spot from the sample solution and the spot from the standard solution show the same *R<sub>f</sub>* value.

**Purity** Related substances—Weigh accurately not less than 5 Cefaclor Compound Granules, transfer their total contents to a mortar, add a little amount of 0.1 mol/L phosphate buffer solution, pH 4.5, grind well, add the same buffer solution to make exactly *V* mL so that each mL contains about 2 mg (potency) of Cefaclor according to the labeled total potency, and filter through a 0.45- $\mu$ m pore-size membrane filter. Discard the first 1 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefaclor Reference Standard, and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 20 mL. Pipet 2 mL of this solution, add the same buffer solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of each related substance by the following equation: the amount of each related substance is not more than 0.6%, and the total amount of the related substances is not more than 2.8%. If necessary, correct the fluctuation of the base line by performing the test in the same way with 50  $\mu$ L of 0.1 mol/L phosphate buffer solution, pH 4.5.

Amount (%) of each related substance  

$$= W_s \times (A_{Ti}/A_s) \times \{V/(C \times T)\} \times 1/10$$

Total amount (%) of the related substances  

$$= W_s \times (\sum A_{Ti}/A_s) \times \{V/(C \times T)\} \times 1/10$$

*W<sub>s</sub>*: Amount [mg (potency)] of Cefaclor Reference Stan-

dard

*A<sub>Ti</sub>*: Area of each peak other than cefaclor, solvent and excipient from the sample solution

*A<sub>s</sub>*: Peak area of cefaclor from the standard solution

*C*: Labeled total potency [mg (potency)] of cefaclor in 1 pack

*T*: Number (pack) of sample

**Operating conditions**—

Proceed as directed in the operating conditions in the Purity (3) under Cefaclor.

**System suitability**—

Test for required detectability: Pipet 1 mL of standard solution, and add 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 20 mL. Confirm that the peak area of cefaclor obtained with 50  $\mu$ L of this solution is equivalent to 3.5 to 6.5% of that of cefaclor obtained with 50  $\mu$ L of the standard solution.

System performance: When the procedure is run with 50  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefaclor are not less than 40,000 and between 0.8 and 1.3, respectively.

System repeatability: When the test is repeated 3 times with 50  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefaclor is not more than 2.0%.

**Water** <2.48> Not more than 5.5% (0.3 g, volumetric titration, back titration).

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

(1) Total potency—Take out the total contents of 1 Cefaclor Compound Granules, add a little amount of 0.1 mol/L phosphate buffer solution, pH 4.5, grind well, add the same buffer solutions to make exactly *V* mL so that each mL contains about 3.8 mg (potency) of Cefaclor according to the labeled total potency after shaking vigorously for 10 minutes, and centrifuge. Pipet 3 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefaclor Reference Standard, equivalent to about 50 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefaclor.

Amount [mg (potency)] of cefaclor ( $C_{15}H_{14}ClN_3O_4S$ )  

$$= W_s \times (Q_T/Q_S) \times (V/15)$$

*W<sub>s</sub>*: Amount [mg (potency)] of Cefaclor Reference Standard

**Internal standard solution**—A solution of 4-aminoacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

(2) Potency of gastric granule—Stir gently the total contents of 1 Cefaclor Compound Granules with 60 mL of 0.1 mol/L phosphate buffer solution, pH 4.5 for 5 minutes, add the same buffer solution to make exactly *V* mL so that each mL contains about 1.5 mg (potency) of Cefaclor according to

the labeled potency of gastric granule, and centrifuge. Pipet 7 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefaclor Reference Standard, equivalent to about 50 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefaclor.

$$\begin{aligned} &\text{Amount [mg (potency)] of cefaclor (C}_{15}\text{H}_{14}\text{ClN}_3\text{O}_4\text{S)} \\ &= W_S \times (Q_T/Q_S) \times (V/35) \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefaclor Reference Standard

**Internal standard solution**—A solution of 4-aminoacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

**Dissolution <6.10>** Perform the test according to the following method: It meets the requirement.

Perform the test with 1 Cefaclor Compound Granules at 50 revolutions per minute according to the Paddle method using 900 mL of the 1st fluid for dissolution test as the dissolution medium. Withdraw not less than 20 mL of the dissolution medium 60 minutes after start of the test, and filter through a membrane filter with a pore size not exceeding 0.5  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet  $V$  mL of the subsequent filtrate, add the 1st fluid for dissolution test to make exactly  $V'$  mL so that each mL contains about 20  $\mu\text{g}$  (potency) of Cefaclor according to the labeled potency of gastric granule, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefaclor Reference Standard, equivalent to about 20 mg (potency), and dissolve in the 1st fluid for dissolution test to make exactly 20 mL. Pipet 2 mL of this solution, add the 1st fluid for dissolution test to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , at 265 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>. The dissolution rate in 60 minutes is between 35% and 45%.

Dissolution rate (%) of cefaclor (C<sub>15</sub>H<sub>14</sub>ClN<sub>3</sub>O<sub>4</sub>S) with respect to the labeled potency

$$= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 90$$

$W_S$ : Amount [mg (potency)] of Cefaclor Reference Standard

C: Labeled total potency [mg (potency)] of Cefaclor in 1 pack

Separately, perform the test with 1 Cefaclor Compound Granules at 50 revolutions per minute according to the Paddle method using 900 mL of 2nd fluid for dissolution method as the dissolution medium. Withdraw not less than 20 mL of the dissolution medium 60 minutes after start of the test, and filter through a membrane filter with pore size of not more than 0.5  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet  $V$  mL of the subsequent filtrate, add 0.01 mol/L hydrochloric acid TS to make exactly  $V'$  mL so that each mL contains about 20  $\mu\text{g}$  (potency) of Cefaclor according to the labeled total potency, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefaclor Refer-

ence Standard, equivalent to about 20 mg (potency), dissolve in 2nd fluid for dissolution test to make exactly 100 mL, and warm at 37°C for 60 minutes. Pipet 2 mL of this solution, add 0.01 mol/L hydrochloric acid TS to make exactly 20 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , at 265 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24> using 0.01 mol/L hydrochloric acid TS as the blank. The dissolution rate in 60 minutes is not less than 70%.

Dissolution rate (%) of cefaclor (C<sub>15</sub>H<sub>14</sub>ClN<sub>3</sub>O<sub>4</sub>S) with respect to the labeled potency

$$= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 90$$

$W_S$ : Amount [mg (potency)] of Cefaclor Reference Standard

C: Labeled total potency [mg (potency)] of Cefaclor in 1 pack

**Particle size <6.03>** It meets the requirement.

**Assay (1)** Total potency—Take out the total contents of not less than 5 Cefaclor Compound Granules, add a small amount of 0.1 mol/L phosphate buffer solution, pH 4.5, grind well, add the same buffer solution to make a solution containing about 5 mg (potency) of Cefaclor per mL according to the labeled total potency after shaking vigorously for 10 minutes, and centrifuge. Pipet 2 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefaclor Reference Standard, equivalent to about 50 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefaclor.

$$\begin{aligned} &\text{Amount [mg (potency)] of cefaclor (C}_{15}\text{H}_{14}\text{ClN}_3\text{O}_4\text{S)} \\ &= W_S \times (Q_T/Q_S) \times 2 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefaclor Reference Standard

**Internal standard solution**—A solution of 4-aminoacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

**(2)** Potency of gastric granule—Stir gently the total contents of not less than 5 Cefaclor Compound Granules with about 100 mL of 0.1 mol/L phosphate buffer solution, pH 4.5 for 5 minutes, the same buffer solution so that each mL containing about 2 mg (potency) of Cefaclor according to the labeled potency of gastric granule, and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefaclor Reference Standard, equivalent to about 50 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefaclor.

$$\text{Amount [mg (potency)] of cefaclor (C}_{15}\text{H}_{14}\text{ClN}_3\text{O}_4\text{S)}$$

$$= W_s \times (Q_T/Q_S) \times 2$$

$W_s$ : Amount [mg (potency)] of Cefaclor Reference Standard

**Internal standard solution**—A solution of 4-aminoacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Cefadroxil

セファドロキシル

$C_{16}H_{17}N_3O_5S$ : 363.39  
(6*R*,7*R*)-7-[(2*R*)-2-Amino-2-(4-hydroxyphenyl)acetyl-amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid  
[50370-12-2]

Cefadroxil contains not less than 950  $\mu$ g (potency) and not more than 1020  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefadroxil is expressed as mass (potency) of cefadroxil ( $C_{16}H_{17}N_3O_5S$ ).

**Description** Cefadroxil occurs as a white to light yellow-white powder.

It is sparingly soluble in water, slightly soluble in methanol, and very slightly soluble in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Cefadroxil (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefadroxil Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefadroxil as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefadroxil Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefadroxil in a mixture of heavy water for nuclear magnetic resonance spectroscopy and deuterated hydrochloric acid (3:1) (1 in 10), using sodium 3-(trimethylsilyl)propionate- $d_4$  for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ): it exhibits a single signal A at around  $\delta$  2.1 ppm, a double signal B at around  $\delta$  7.0 ppm, and a double signal C at around  $\delta$  7.5 ppm. The ratio of integrated intensity of each signal, A:B:C, is about 3:2:2.

**Optical rotation** <2.49>  $[\alpha]_D^{25}$ : +164 – +182° (0.6 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefadroxil in 200 mL of water: pH of the solution is between 4.0 and 6.0.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Cefadroxil according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.1 g of Cefadroxil in 4 mL of a mixture of ethanol (99.5), water and diluted hydrochloric acid (1 in 5) (75:22:3), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of ethanol (99.5), water and diluted hydrochloric acid (1 in 5) (75:22:3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop with a mixture of ethyl acetate, water, ethanol (99.5) and formic acid (14:5:5:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly ninhydrin-citric acid-acetic acid TS on the plate, and heat at 100°C for 10 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Water** <2.48> Not less than 4.2% and not more than 6.0% (0.5 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefadroxil and Cefadroxil Reference Standard equivalent to about 50 mg (potency), dissolve each in water to make exactly 500 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak areas,  $A_T$  and  $A_S$ , of cefadroxil of the solutions.

$$\text{Amount } [\mu\text{g (potency)}] \text{ of } C_{16}H_{17}N_3O_5S \\ = W_s \times (A_T/A_S) \times 1000$$

$W_s$ : amount [mg (potency)] of Cefadroxil Reference Standard

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 262 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** A mixture of a solution of potassium dihydrogenphosphate (17 in 12,500) and methanol (17:3).

**Flow rate:** Adjust the flow rate so that the retention time of cefadroxil is about 5 minutes.

**System suitability**—

**System performance:** Dissolve about 5 mg (potency) of cefadroxil and about 10 mg (potency) of propylene glycol cefatrizine in 50 mL of water. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, cefadroxil and cefatrizine are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability:** When the test is repeated 6 times with

10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefadroxil is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Cefalexin

セファレキシシ

$\text{C}_{16}\text{H}_{17}\text{N}_3\text{O}_4\text{S}$ : 347.39  
(6*R*,7*R*)-7-[(2*R*)-2-Amino-2-phenylacetyl-amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid [15686-71-2]

Cefalexin contains not less than 950  $\mu\text{g}$  (potency) and not more than 1030  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Cefalexin is expressed as mass (potency) of cefalexin ( $\text{C}_{16}\text{H}_{17}\text{N}_3\text{O}_4\text{S}$ ).

**Description** Cefalexin occurs as a white to light yellowish white, crystals or crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, and practically insoluble in ethanol (95) and in *N,N*-dimethylformamide.

It is hygroscopic.

**Identification (1)** Determine the absorption spectrum of a solution of Cefalexin (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefalexin as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefalexin in heavy water for nuclear magnetic resonance spectroscopy (1 in 200) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around  $\delta$  1.8 ppm, and a single or a sharp multiple signal B at around  $\delta$  7.5 ppm. The ratio of integrated intensity of these signals, A:B, is about 3:5.

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ : +144 – +158° (0.125 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Cefalexin according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefalexin by suspending in 10 mL of *N,N*-dimethylformamide, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve about 25 mg of Cefalexin in a solution of potassium dihydrogenphosphate (9 in 500) to make 5 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a solution of potassium dihydrogenphosphate (9 in 500) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the areas of each peak by the automatic integration method. If necessary, correct the change of the base-line due to the potassium dihydrogenphosphate solution by proceeding in the same manner with 20  $\mu\text{L}$  of a solution of potassium dihydrogenphosphate (9 in 500): each peak area other than cefalexin from the sample solution is not more than the peak area of cefalexin from the standard solution, and the total of the peak areas which are bigger than 1/50 of the peak area of cefalexin from the standard solution and those other than cefalexin from the sample solution is not more than 5 times of the peak area of cefalexin from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase A:** Dissolve 1.0 g of sodium 1-pentanesulfonate in 1000 mL of water, add 15 mL of triethylamine, and adjust to pH 2.5 with phosphoric acid.

**Mobile phase B:** Dissolve 1.0 g of sodium 1-pentanesulfonate in 300 mL of water, add 15 mL of triethylamine, and adjust to pH 2.5 with phosphoric acid. To this solution add 350 mL of acetonitrile and 350 mL of methanol.

**Flowing of the mobile phase:** Control the gradient by mixing the mobile A and B as directed in the following table.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 – 1	100	0
1 – 34.5	100→0	0→100
34.5 – 35.5	0	100

**Flow rate:** 1.0 mL per minute

**Time span of measurement:** About 2 times as long as the retention time of cefalexin beginning after the solvent peak.  
**System suitability—**

**Test for required detection:** Pipet 2 mL of the standard solution, add a solution of potassium dihydrogenphosphate (9 in 500) to make exactly 100 mL. Confirm that the peak area of cefalexin obtained from 20  $\mu\text{L}$  of this solution is equivalent to 1.8 to 2.2% of that of cefalexin obtained from 20  $\mu\text{L}$  of the standard solution.

**System performance:** When the procedure is run with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefalexin are not less than 150,000 steps and between 0.8 and 1.3, respectively.

**System repeatability:** When the test is repeated 3 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the retention time and the peak areas of cefalexin are not more than 2.0%, respectively.

**Water** <2.48> Not more than 8.0% (0.2 g, volumetric titration, back titration).

**Assay** Weigh accurately an amount of Cefalexin and Cefalexin Reference Standard, equivalent to about 0.1 g (potency), dissolve each in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 100 mL. Pipet 10 mL of these solutions, add exactly 5 mL of the internal standard solution, then add 0.1 mol/L phosphate buffer solution, pH 4.5 to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefalexin to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of } \text{C}_{16}\text{H}_{17}\text{N}_3\text{O}_4\text{S} \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : amount [mg (potency)] of Cefalexin Reference Standard

**Internal standard solution**—A solution of *m*-hydroxyacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 1500).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 6.8 g of potassium dihydrogenphosphate in 1000 mL of water, adjust to pH 3.0 with diluted phosphoric acid (3 in 500). To 800 mL of this solution add 200 mL of methanol.

**Flow rate:** Adjust the flow rate so that the retention time of cefalexin is about 7 minutes.

**System suitability**—

**System performance:** When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, cefalexin and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

**System repeatability:** When the test is repeated 5 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefalexin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Cefalotin Sodium

セファロチンナトリウム

$\text{C}_{16}\text{H}_{15}\text{N}_2\text{NaO}_6\text{S}_2$ : 418.42

Monosodium (6*R*,7*R*)-3-acetoxymethyl-8-oxo-7-[2-(thiophen-2-yl)acetyl-amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [58-71-9]

Cefalotin Sodium contains not less than 910  $\mu\text{g}$  (potency) and not more than 980  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Cefalotin Sodium is expressed as mass (potency) of cefalotin ( $\text{C}_{16}\text{H}_{16}\text{N}_2\text{O}_6\text{S}_2$ : 396.44).

**Description** Cefalotin Sodium occurs as white to light yellowish white, crystals or crystalline powder.

It is freely soluble in water, slightly soluble in methanol, very slightly soluble in ethanol (95), and practically insoluble in acetonitrile.

**Identification (1)** Determine the absorption spectrum of a solution of Cefalotin Sodium (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefalotin Sodium Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Cefalotin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefalotin Sodium Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** Determine the spectrum of a solution of Cefalotin Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around  $\delta 2.1$  ppm, a single or sharp multiple signal B at around  $\delta 3.9$  ppm, and a multiple signal C at around  $\delta 7.0$  ppm. The ratio of the integrated intensity of these signals, A:B:C, is about 3:2:2.

**(4)** Cefalotin Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{25}$ : +124 – +134° (5 g, water, 100 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 1.0 g of Cefalotin Sodium in 10 mL of water is between 4.5 and 7.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of

Cefalotin Sodium in 5 mL of water: the solution is clear and light yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cefalotin Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefalotin Sodium according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Pipet 1 mL of the standard solution obtained in the Assay, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution obtained in the Assay and the standard solution prepared here as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than cefalotin from the sample solution is not more than the peak area of cefalotin from the standard solution, and the total area of the peaks other than cefalotin from the sample solution is not more than 3 times the peak area of cefalotin from the standard solution.

*Operating conditions—*

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 4 times as long as the retention time of cefalotin.

*System suitability—*

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cefalotin obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that from 10  $\mu$ L of the standard solution.

System performance: Heat the standard solution in a water bath of 90°C for 10 minutes, and cool. Measure exactly 2.5 mL of this solution, and add the mobile phase to make exactly 100 mL. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, the resolution between the peak of cefalotin and the peak, having the relative retention time of about 0.5 with respect to cefalotin, is not less than 9, and the symmetry factor of the peak of cefalotin is not more than 1.8.

System repeatability: When the test is repeated 3 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefalotin is not more than 2.0%.

**Water** <2.48> Not more than 1.0% (0.5 g, volumetric titration, back titration).

**Assay** Weigh accurately an amount of Cefalotin Sodium and Cefalotin Sodium Reference Standard, equivalent to about 25 mg (potency), and dissolve each in the mobile phase to make exactly 25 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of cefalotin of the solutions.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of cefalotin } (\text{C}_{16}\text{H}_{16}\text{N}_2\text{O}_6\text{S}_2) \\ &= W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefalotin Sodium Refer-

ence Standard

*Operating conditions—*

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 17 g of sodium acetate trihydrate in 790 mL of water, and add 0.6 mL of acetic acid (100). If necessary adjust the pH to  $5.9 \pm 0.1$  with 0.1 mol/L sodium hydrochloride TS or acetic acid (100). To this solution add 150 mL of acetonitrile and 70 mL of ethanol (95).

Flow rate: Adjust the flow rate so that the retention time of cefalotin is about 12 minutes.

*System suitability—*

System performance: Heat the standard solution in a water bath of 90°C for 10 minutes, and cool. Measure exactly 2.5 mL of this solution, and add the mobile phase to make exactly 100 mL. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, the resolution between the peak of cefalotin and the peak, having the relative retention time of about 0.5 with respect to cefalotin is not less than 9, and the symmetry factor of the peak of cefalotin is not more than 1.8.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefalotin is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Cefapirin Sodium

セファピリンナトリウム

$\text{C}_{17}\text{H}_{16}\text{N}_3\text{NaO}_6\text{S}_2$ : 445.45  
 Monosodium (6*R*,7*R*)-3-acetoxymethyl-8-oxo-7-[2-(pyridin-4-ylsulfanyl)acetylamino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate  
 [24356-60-3]

Cefapirin Sodium contains not less than 865  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefapirin Sodium is expressed as mass (potency) of cefapirin ( $\text{C}_{17}\text{H}_{17}\text{N}_3\text{O}_6\text{S}_2$ : 423.46).

**Description** Cefapirin Sodium occurs as a white to yellowish white powder.

It is freely soluble in water, sparingly soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in acetone.

**Identification** (1) Determine the absorption spectrum of a solution of Cefapirin Sodium (3 in 200,000) as directed under

Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefapirin Sodium Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefapirin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefapirin Sodium Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefapirin Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10), using sodium 3-(trimethylsilyl)propionate- $d_4$  for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ): it exhibits a single signal A at around  $\delta$  2.2 ppm, and multiple signals, B and C, at around  $\delta$  7.3 ppm and at around  $\delta$  8.3 ppm, respectively. The ratio of integrated intensity of these signals, A:B:C, is about 3:2:2.

(4) Cefapirin Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{25}$ : +157 – +175° (2 g calculated as the anhydrous basis, water, 100 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefapirin Sodium in 10 mL of water: pH of the solution is between 6.5 and 8.5.

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Cefapirin Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefapirin Sodium according to Method 3, and perform the test (not more than 2 ppm). Use a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 25).

(3) Related substances—Dissolve 0.1 g of Cefapirin Sodium in 5 mL of a mixture of acetone and water (3:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of acetone and water (3:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop with a mixture of ethyl acetate, acetone, water and acetic acid (100) (5:2:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot and other than the spot at the original point from the sample solution are not more intense than the spot from the standard solution.

**Water** <2.48> Not more than 2.0% (0.7 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefapirin Sodium and Cefapirin Sodium Reference Standard equivalent to about 0.1 g (potency), dissolve each in phosphate buffer solution, pH 6.0 to make exactly 100 mL. Pipet 5 mL of each solution, add exactly 5 mL of the internal standard solution

and phosphate buffer solution, pH 6.0 to make 100 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefapirin to that of the internal standard.

$$\text{Amount } [\mu\text{g (potency)}] \text{ of cefapirin (C}_{17}\text{H}_{17}\text{N}_3\text{O}_6\text{S}_2) \\ = W_S \times (Q_T/Q_S) \times 1000$$

$W_S$ : Amount [mg (potency)] of Cefapirin Sodium Reference Standard

**Internal standard solution**—A solution of vanillin (1 in 1000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: A mixture of 0.05 mol/L sodium dihydrogenphosphate TS, pH 2.6 and acetonitrile (93:7).

**Flow rate**: Adjust the flow rate so that the retention time of cefapirin is about 7 minutes.

**System suitability**—

**System performance**: When the procedure is run with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, cefapirin and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

**System repeatability**: When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefapirin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

## Cefatrizine Propylene Glycolate

セファトリジンプロピレングリコール

$\text{C}_{18}\text{H}_{18}\text{N}_6\text{O}_5\text{S}_2 \cdot \text{C}_3\text{H}_8\text{O}_2$ : 538.60  
(6*R*, 7*R*)-7-[(2*R*)-2-Amino-2-(4-hydroxyphenyl)acetyl-amino]-8-oxo-3-[2-(1*H*-1,2,3-triazol-4-yl)sulfanylmethyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monopropylene-1,2-diolate (1/1)  
[51627-14-6, Cefatrizine]

Cefatrizine Propylene Glycolate contains not less than 785  $\mu\text{g}$  (potency) and not more than 876  $\mu\text{g}$

(potency) per mg, calculated on the anhydrous basis. The potency of Cefatrizine Propylene Glycolate is expressed as mass (potency) of cefatrizine ( $C_{18}H_{18}N_6O_5S_2$ ; 462.50).

**Description** Cefatrizine Propylene Glycolate occurs as a white to yellowish white powder.

It is sparingly soluble in water, and practically insoluble in methanol and in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Cefatrizine Propylene Glycolate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefatrizine Propylene Glycolate Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefatrizine Propylene Glycolate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefatrizine Propylene Glycolate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefatrizine Propylene Glycolate in a mixture of heavy water for nuclear magnetic resonance spectroscopy and deuterated hydrochloric acid for nuclear magnetic resonance spectroscopy (3:1) (1 in 10), using sodium 3-(trimethylsilyl)propionate- $d_4$  for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ): it exhibits a double signal A at around  $\delta$  1.2 ppm, a double signal B at around  $\delta$  7.0 ppm, a double signal C at around  $\delta$  7.5 ppm and a single signal D at around  $\delta$  8.3 ppm. The ratio of integrated intensity of these signals, A:B:C:D, is about 3:2:2:1.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +52 – +58° (2.5 g calculated on the anhydrous bases, 1 mol/L hydrochloric acid TS, 50 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Cefatrizine Propylene Glycolate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefatrizine Propylene Glycolate according to Method 3, and perform the test (not more than 2 ppm). Use a solution of magnesium nitrate hexahydrate in ethanol (1 in 25).

(3) Related substances—Dissolve 25 mg of Cefatrizine Propylene Glycolate in 5 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly ninhydrin-citric acid-acetic acid TS on the plate, and heat at 100°C for 10 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Water** <2.48> Not more than 2.0% (0.5 g, volumetric titra-

tion, direct titration).

**Assay** Weigh accurately an amount of Cefatrizine Propylene Glycolate and Cefatrizine Propylene Glycolate Reference Standard equivalent to about 0.1 g (potency), dissolve each in water to make exactly 500 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak areas,  $A_T$  and  $A_S$ , of cefatrizine of these solutions

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefatrizine } (C_{18}H_{18}N_6O_5S_2) \\ = W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefatrizine Propylene Glycolate Reference Standard

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 270 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** A mixture of a solution of potassium dihydrogenphosphate (17 in 12,500) and methanol (17:3).

**Flow rate:** Adjust the flow rate so that the retention time of cefatrizine is about 11 minutes.

**System suitability—**

**System performance:** Dissolve about 5 mg (potency) of Cefadroxil and about 10 mg (potency) of Cefatrizine Propylene Glycolate in 50 mL of water. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, cefadroxil and cefatrizine are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of peak areas of cefatrizine is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Cefazolin Sodium

セファゾリンナトリウム

$C_{14}H_{13}N_8NaO_4S_3$ ; 476.49  
Monosodium (6R,7R)-3-(5-methyl-1,3,4-thiadiazol-2-ylsulfanyl)-8-oxo-7-[2-(1H-tetrazol-1-yl)acetylamino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [27164-46-1]

Cefazolin Sodium contains not less than 900  $\mu$ g (potency) and not more than 975  $\mu$ g (potency) per mg,

calculated on the anhydrous basis. The potency of Cefazolin Sodium is expressed as mass (potency) of cefazolin ( $C_{14}H_{14}N_8O_4S_3$ ; 454.51).

**Description** Cefazolin Sodium occurs as a white to light yellow-white, crystals or crystalline powder.

It is freely soluble in water and in formamide, slightly soluble in methanol, and practically insoluble in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Cefazolin Sodium (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefazolin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefazolin Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10), using sodium 3-trimethylsilylpropionate- $d_4$  for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ): it exhibits single signals, A and B, at around  $\delta$  2.7 ppm and at around  $\delta$  9.3 ppm, respectively. The ratio of integrated intensity of these signals, A:B, is about 3:1.

(4) Cefazolin Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-19$  –  $-23^\circ$  (2.5 g calculated as the anhydrous basis, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefazolin Sodium in 10 mL of water: pH of the solution is between 4.8 and 6.3.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cefazolin Sodium in 10 mL of water: the solution is clear and colorless to pale yellow, and its absorbance at 400 nm determined as directed under Ultraviolet-visible Spectrophotometry <2.24> is not more than 0.35. The test should be performed within 10 minutes after preparing of the solution.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Cefazolin Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 2.0 g of Cefazolin Sodium according to Method 3, and perform the test. When prepare the test solution, add 1.5 mL of hydrogen peroxide (30) after addition of 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 50), and then ignite (not more than 1 ppm).

(4) Related substances—Dissolve 0.10 g of Cefazolin Sodium in 20 mL of 0.1 mol/L phosphate buffer solution, pH 7.0 and use this solution as the sample solution. Prepare the sample solution before use. Perform the test with 5  $\mu$ L of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and measure the areas of a peak appeared at the relative retention time of about 0.2 to the retention time of cefazolin and peaks other than cefazolin by the automatic integration method, and calculate the amounts of these peak areas by the area percent-

tage method: the amount of each peak area is not more than 1.5%, and the total area of the peaks other than cefazolin is not more than 2.5%. The area of the peak appeared at the relative retention time of about 0.2 to the retention time of cefazolin obtained here is used after multiplying by its sensitivity coefficient, 1.43.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of cefazolin beginning after the solvent peak.

**System suitability**—

Test for required detection: Dissolve about 80 mg of Cefazolin Reference Standard in 0.1 mol/L phosphate buffer solution, pH 7.0 to make 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution, and add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 20 mL. Confirm that the peak area of cefazolin obtained from 5  $\mu$ L of this solution is equivalent to 3 to 7% of that of cefazolin obtained from 5  $\mu$ L of the solution for system suitability test.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 5  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of cefazolin is not more than 1.0%.

**Water** <2.48> Not more than 2.5% (1.0 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

**Assay** Weigh accurately an amount of Cefazolin Sodium and Cefazolin Reference Standard, equivalent to about 0.1 g (potency), dissolve each in the internal standard solution to make exactly 100 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 5  $\mu$ L each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefazolin to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefazolin } (C_{14}H_{14}N_8O_4S_3) \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefazolin Reference Standard

**Internal standard solution**—A solution of *p*-acetoanisidide in 0.1 mol/L phosphate buffer solution, pH 7.0 (11 in 20,000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2.27 g of disodium hydrogen phosphate dodecahydrate and 0.47 g of citric acid monohydrate in water to make 935 mL, and add 65 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefazolin is about 8 minutes.

**System suitability—**

System performance: When the procedure is run with 5  $\mu$ L of the standard solution under the above operating conditions, cefazolin and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefazolin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Cefazolin Sodium Hydrate

セファゾリンナトリウム水和物

$C_{14}H_{13}N_8NaO_4S_3 \cdot 5H_2O$ ; 566.57

Monosodium (6*R*,7*R*)-3-(5-methyl-1,3,4-thiadiazol-2-ylsulfanylmethyl)-8-oxo-7-[2-(1*H*-tetrazol-1-yl)acetylamino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate pentahydrate [115850-11-8]

Cefazolin Sodium Hydrate contains not less than 920  $\mu$ g (potency) and not more than 975  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefazolin Sodium Hydrate is expressed as mass (potency) of cefazolin ( $C_{14}H_{14}N_8O_4S_3$ ; 454.51).

**Description** Cefazolin Sodium Hydrate occurs as white to pale yellowish white crystals.

It is freely soluble in water, sparingly soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

**Identification** (1) Determine the absorption spectrum of a solution of Cefazolin Sodium Hydrate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 270 nm and 274 nm.

(2) Determine the infrared absorption spectrum of Cefazolin Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave numbers of about 1761  $cm^{-1}$ , 1667  $cm^{-1}$ , 1599  $cm^{-1}$ , 1540  $cm^{-1}$  and 1389  $cm^{-1}$ .

(3) Determine the spectrum of a solution of Cefazolin Sodium Hydrate in heavy water for nuclear magnetic resonance spectroscopy (1 in 10), using sodium 3-trimethylsilylpropionate- $d_4$  for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ): it exhibits single signals, A and B, at around  $\delta$  2.7 ppm and at around  $\delta$  9.3 ppm. The ratio of integrated intensity of each signal, A:B, is about 3:1.

(4) Cefazolin Sodium Hydrate responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Absorbance** <2.24>  $E_{1\%}^{1\text{cm}}$  (272 nm): 272 – 292 (80 mg calculated on the anhydrous basis, water, 5000 mL).

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : –20 – –25° (2.5 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefazolin Sodium Hydrate in 10 mL of water: the pH of the solution is between 4.8 and 6.3.

**Purity** (1) Clarity and color of solution—Being specified separately.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Cefazolin Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic—Being specified separately.

(4) Related substances—Being specified separately.

(5) Residual solvents—Being specified separately.

**Water** <2.48> Not less than 13.7% and not more than 16.0% (0.1 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

**Bacterial endotoxins** <4.01> Less than 0.10 EU/mg (potency).

**Assay** Weigh accurately an amount of Cefazolin Sodium Hydrate and Cefazolin Reference Standard, equivalent to about 0.1 g (potency), dissolve in the internal standard solution to make exactly 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefazolin to that of the internal standard.

$$\text{Amount } [\mu\text{g (potency)}] \text{ of cefazolin } (C_{14}H_{14}N_8O_4S_3) \\ = W_S \times (Q_T/Q_S) \times 1000$$

$W_S$ : Amount [mg (potency)] of Cefazolin Reference Standard

**Internal standard solution**—A solution of *p*-acetoanisidine in 0.1 mol/L phosphate buffer solution, pH 7.0 (11 in 20,000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2.27 g of disodium hydrogen phosphate dodecahydrate and 0.47 g of citric acid monohydrate in water to make 935 mL. To this solution, add 65 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefazolin is about 8 minutes.

**System suitability**—

System performance: When the procedure is run with 5  $\mu$ L of the standard solution under the above operating conditions, cefazolin and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability:** When the test is repeated 5 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefazolin is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.  
Storage—Light-resistant.

## Cefbuperazone Sodium

セフブペラゾンナトリウム

$\text{C}_{22}\text{H}_{28}\text{N}_9\text{NaO}_9\text{S}_2$ : 649.63

Monosodium (6*R*,7*S*)-7-[(2*R*,3*S*)-2-[(4-ethyl-2,3-dioxopiperazine-1-carbonyl)amino]-3-hydroxybutanoylamino]-7-methoxy-3-(1-methyl-1*H*-tetrazol-5-ylsulfanylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate  
[76648-01-6]

Cefbuperazone Sodium contains not less than 870  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Cefbuperazone Sodium is expressed as mass (potency) of cefbuperazone ( $\text{C}_{22}\text{H}_{29}\text{N}_9\text{O}_9\text{S}_2$ : 627.65).

**Description** Cefbuperazone Sodium occurs as white to light yellowish white, powder or masses.

It is very soluble in water, freely soluble in methanol and in pyridine, sparingly soluble in ethanol (95), and very slightly soluble in acetonitrile.

**Identification (1)** Determine the absorption spectrum of a solution of Cefbuperazone Sodium (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 0.1 g of Cefbuperazone Sodium in 0.5 mL of deuterated pyridine for nuclear magnetic resonance spectroscopy and 1 drop of heavy water for nuclear magnetic resonance spectroscopy, and determine the spectrum of this solution as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a triplet signal A at around  $\delta$ 1.1 ppm, and two doublet signals, B and C, at around  $\delta$ 1.6 ppm and at around  $\delta$ 5.1 ppm, respectively. The ratio of the integrated intensity of each signal, A:B:C, is about 3:3:1.

(3) Cefbuperazone Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ : +48 – +56° (0.4 g calculated on the anhydrous basis, water, 20 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefbuperazone Sodium in 4 mL of water: the pH of the solution is between 4.0 and 6.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cefbuperazone Sodium in 4 mL of water: the solution is clear and light yellow.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Cefbuperazone Sodium according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefbuperazone Sodium according to Method 4, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.10 g of Cefbuperazone Sodium in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 25  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the percentages of each peak area of related substances from the sample solution against 50 times of the peak area of cefbuperazone from the standard solution; the amount of related substance I having the relative retention time of about 0.2 to cefbuperazone is not more than 2.0%, the amount of related substance II having the relative retention time of about 0.6 to cefbuperazone is not more than 4.5% and the amount of related substance III having the relative retention time of about 1.6 to cefbuperazone is not more than 1.0%, and the total amount of these related substances is not more than 6.0%. For these calculations, use the values of the peak areas of the related substances I and III obtained by the automatic integration method after multiplying by each sensitivity coefficient, 0.72 and 0.69, respectively.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of cefbuperazone.

**System suitability**—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cefbuperazone obtained from 25  $\mu\text{L}$  of this solution is equivalent to 7 to 13% of that from 25  $\mu\text{L}$  of the standard solution.

System performance: When the procedure is run with 25  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefbuperazone are not less than 5000 steps and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 25  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefbuperazone is not more than 2.0%.

**Water** <2.48> Not more than 1.0% (3 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefbuperazone Sodium and Cefbuperazone Reference Standard, equivalent to about 0.1 g (potency), and dissolve each in the mobile phase to make exactly 100 mL. Measure exactly 10 mL each of these solutions, add exactly 10 mL of the internal standard

solution and the mobile phase to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefbuperazone to that of the internal standard.

$$\text{Amount } [\mu\text{g (potency)}] \text{ of cefbuperazone (C}_{22}\text{H}_{29}\text{N}_9\text{O}_9\text{S}_2) \\ = W_S \times (Q_T/Q_S) \times 1000$$

$W_S$ : Amount [mg (potency)] of Cefbuperazone Reference Standard

**Internal standard solution**—A solution of acetonitrile in the mobile phase (1 in 4000).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 2.0 g of tetra-*n*-propylammonium bromide in 1000 mL of a mixture of water, acetonitrile and acetic acid-sodium acetate buffer solution, pH 5.0 (83:13:4).

**Flow rate:** Adjust the flow rate so that the retention time of cefbuperazone is about 16 minutes.

**System suitability**—

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the internal standard and cefbuperazone are eluted in this order with the resolution between these peaks being not less than 3.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefbuperazone to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

Storage—In a cold place.

## Cefcapene Pivoxil Hydrochloride Hydrate

セフカペン ピボキシル塩酸塩水和物

$\text{C}_{23}\text{H}_{29}\text{N}_5\text{O}_8\text{S}_2 \cdot \text{HCl} \cdot \text{H}_2\text{O}$ : 622.11

2,2-Dimethylpropanoyloxymethyl (6*R*,7*R*)-7-[(2*Z*)-2-(2-aminothiazol-4-yl)pent-2-enoylamino]-3-carbamoyloxymethyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate monohydrochloride monohydrate [147816-24-8]

Cefcapene Pivoxil Hydrochloride Hydrate contains not less than 722  $\mu$ g (potency) and not more than 764  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefcapene Pivoxil Hydrochloride Hydrate is expressed as mass (potency) of cefcapene ( $\text{C}_{17}\text{H}_{19}\text{N}_5\text{O}_6\text{S}_2$ ; 453.49).

**Description** Cefcapene Pivoxil Hydrochloride Hydrate occurs as a white to pale yellowish white, crystalline powder or mass. It has slightly a characteristic odor.

It is freely soluble in *N,N*-dimethylformamide and in methanol, soluble in ethanol (99.5), slightly soluble in water, and practically insoluble in diethyl ether.

**Identification (1)** Determine the infrared absorption spectra of Cefcapene Pivoxil Hydrochloride Hydrate and Cefcapene Pivoxil Hydrochloride Reference Standard as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(2)** Determine the spectrum of a solution of Cefcapene Pivoxil Hydrochloride Hydrate in deuterated methanol for nuclear magnetic resonance spectroscopy (1 in 50) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a triplet signal A at around  $\delta$  6.3 ppm, and a single signal B at around  $\delta$  6.7 ppm, and the ratio of integrated intensity of each signal, A:B, is about 1:1.

**(3)** Dissolve 10 mg of Cefcapene Pivoxil Hydrochloride Hydrate in 2 mL of a mixture of water and methanol (1:1), and add 1 drop of silver nitrate TS: a white precipitate is formed.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (265 nm): 255 – 285 (30 mg calculated on the anhydrous basis, a mixture of acetate buffer solution, pH 5.5 and methanol (1:1), 2000 mL).

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +51 – +54° (0.1 g calculated on the anhydrous basis, methanol, 10 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Cefcapene Pivoxil Hydrochloride Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(2)** Related substance I—Dissolve an amount of Cefcapene Pivoxil Hydrochloride Hydrate, equivalent to about 10 mg (potency), in 2 mL of methanol, add a mixture of water and methanol (1:1) to make 50 mL, and use this solution as the sample solution. Perform the test with 30  $\mu$ L of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. If necessary, compensate the base-line by performing in the same manner as the test with 30  $\mu$ L of a mixture of water and methanol (1:1). Measure the amount of the peak other than cefcapene pivoxil by the area percentage method: the amounts of the peaks, having the relative retention times of about 1.5 and about 1.7 with respect to cefcapene pivoxil, are not more than 0.2%, respectively. The amount of the peak other than the peaks mentioned above is not more than 0.1%, and the total of them is not more than 1.5%.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 20°C.

Mobile phase A: Dissolve 5.99 g of potassium dihydrogen phosphate in water to make 1100 mL. To this solution add a solution prepared by dissolving 1.89 g of tetra-*n*-pentylammonium bromide in methanol to make 1000 mL.

Mobile phase B: A mixture of methanol and water (22:3).

Flowing of the mobile phase: Control the gradient by mixing the mobile phase A and B as directed in the following table.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 - 20	98	2
20 - 40	98 → 50	2 → 50
40 - 50	50	50

Flow rate: 0.8 mL per minute.

Time span of measurement: About 2.5 times as long as the retention time of cefcapene pivoxil.

#### System suitability—

Test for required detectability: To exactly 1 mL of the sample solution add a mixture of water and methanol (1:1) to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add the mixture of water and methanol (1:1) to make exactly 10 mL. Confirm that the peak area of cefcapene pivoxil obtained from 30  $\mu\text{L}$  of this solution is equivalent to 7 to 13% of that of cefcapene pivoxil obtained from 30  $\mu\text{L}$  of the solution for system suitability test.

System performance: Dissolve 10 mg of Cefcapene Pivoxil Hydrochloride Hydrate and 10 mg of propyl parahydroxybenzoate in 25 mL of methanol, and add water to make 50 mL. To 5 mL of this solution add the mixture of water and methanol (1:1) to make 50 mL. When the procedure is run with 30  $\mu\text{L}$  of this solution under the above operating conditions, cefcapene pivoxil and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 3 times with 30  $\mu\text{L}$  of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of cefcapene pivoxil is not more than 4.0%.

(3) Related substance II—Dissolve an amount of Cefcapene Pivoxil Hydrochloride Hydrate, equivalent to about 2 mg (potency), in *N,N*-dimethylformamide for liquid chromatography to make 20 mL, and use this solution as the sample solution. Perform the test with 20  $\mu\text{L}$  of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks which appear earlier than cefcapene pivoxil is not more than 1.7% of the total area of the peaks other than the solvent.

#### Operating conditions—

Detector: An ultraviolet absorption photometer

(wavelength: 280 nm).

Column: A stainless steel column 7.8 mm in inside diameter and 30 cm in length, packed with styrene-divinylbenzene copolymer for liquid chromatography.

Column temperature: A constant temperature of about 25°C.

Mobile phase: A solution of lithium bromide in *N,N*-dimethylformamide for liquid chromatography (13 in 5000).

Flow rate: Adjust the flow rate so that the retention time of cefcapene pivoxil is about 22 minutes.

Time span of measurement: About 1.8 times as long as the retention time of cefcapene pivoxil.

#### System suitability—

Test for required detection: To exactly 1 mL of the sample solution add *N,N*-dimethylformamide for liquid chromatography to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 3 mL of the solution for system suitability test, and add *N,N*-dimethylformamide for liquid chromatography to make exactly 10 mL. Confirm that the peak area of cefcapene pivoxil obtained from 20  $\mu\text{L}$  of this solution is equivalent to 20 to 40% of that of cefcapene pivoxil obtained from 20  $\mu\text{L}$  of the solution for system suitability test.

System performance: When the procedure is run with 20  $\mu\text{L}$  of the sample solution under the above operating conditions, the number of theoretical plates of the peak of cefcapene pivoxil is not less than 12,000 steps.

System repeatability: When the test is repeated 6 times with 20  $\mu\text{L}$  of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of cefcapene pivoxil is not more than 4.0%.

**Water** <2.48> Not less than 2.8% and not more than 3.7% (0.5 g, volumetric titration, back titration).

**Assay** Weigh accurately an amount of Cefcapene Pivoxil Hydrochloride Hydrate and Cefcapene Pivoxil Hydrochloride Reference Standard, equivalent to about 20 mg (potency), and dissolve each in a mixture of water and methanol (1:1) to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 10 mL of the internal standard solution and the mixture of water and methanol (1:1) to them to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefcapene pivoxil to that of the internal standard of these solutions.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefcapene (C}_{17}\text{H}_{19}\text{N}_5\text{O}_6\text{S}_2) \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefcapene Pivoxil Hydrochloride Reference Standard

**Internal standard solution**—A solution of *p*-benzylphenol in a mixture of water and methanol (1:1) (7 in 4000).

#### Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column 3.0 mm in inside diameter and 7.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.56 g of sodium dihydrogenphosphate dihydrate and 1.22 g of sodium 1-decanesulfonate in water to make 1000 mL. To 700 mL of this solution add 300 mL of acetonitrile and 100 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefcapene pivoxil is about 5 minutes.

*System suitability*—

System performance: Dissolve 0.2 g of Cefcapene Pivoxil Hydrochloride Hydrate in 10 mL of methanol, and warm in a water bath at 60°C for 20 minutes. After cooling, pipet 1 mL of this solution, and add exactly 10 mL of the internal standard solution and the mixture of water and methanol (1:1) to make 50 mL. When the procedure is run with 10 µL of this solution under the above operating conditions, cefcapene pivoxil, *trans*-cefcapene pivoxil and the internal standard are eluted in this order, the ratios of the retention time of *trans*-cefcapene pivoxil and the internal standard to that of cefcapene pivoxil are about 1.7 and 2.0, respectively, and the resolution between the peaks of *trans*-cefcapene pivoxil and the internal standard is not less than 1.5.

System repeatability: When the test is repeated 5 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cefcapene pivoxil to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, at a temperature not exceeding 5°C.

## Cefcapene Pivoxil Hydrochloride Fine Granules

セフカペン ピボキシル塩酸塩細粒

Cefcapene Pivoxil Hydrochloride Fine Granules contains not less than 90.0% and not more than 110.0% of cefcapene (C<sub>17</sub>H<sub>19</sub>N<sub>5</sub>O<sub>6</sub>S<sub>2</sub>: 453.49).

**Method of preparation** Prepare to finely granulated form as directed under Powders, with Cefcapene Pivoxil Hydrochloride Hydrate.

**Identification** Powder Cefcapene Pivoxil Hydrochloride Fine Granules. To a portion of the powder, equivalent to 10 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate, add 40 mL of methanol, shake vigorously, and add methanol to make 50 mL. To 4 mL of this solution add methanol to make 50 mL, and filter through a membrane filter with a pore size of 0.45 µm. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 264 nm and 268 nm.

**Purity (1)** Related substances I—Powder Cefcapene Pivoxil Hydrochloride Fine Granules. To a portion of the powder, equivalent to 5 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate, add 1 mL of methanol, and shake. Add 25 mL of a mixture of water and methanol (1:1), shake vigorously for 5 minutes, and filter through a membrane filter with a pore size of 0.45 µm. Discard the first 3 mL of the

filtrate, and use the subsequent filtrate as the sample solution. Perform the test with 30 µL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method. If necessary, compensate the base-line by performing in the same manner as the test with 30 µL of a mixture of water and methanol (1:1). Calculate the amount of the peaks other than the peak of cefcapene pivoxil by the area percentage method: the amount of the substance, having the relative retention time of about 1.3 with respect to cefcapene pivoxil, is not more than 0.4%, the amount of the trans-isomer of cefcapene pivoxil, having the relative retention time of about 1.5, is not more than 1.1%, the amount of the substance other than that mentioned above is not more than 0.3%, and the total of these substances is not more than 2.8%.

*Operating conditions*—

Proceed as directed in the Purity (2) under Cefcapene Pivoxil Hydrochloride Hydrate.

*System suitability*—

Proceed as directed in the Purity (2) under Cefcapene Pivoxil Hydrochloride Hydrate.

(2) Related substances II—Powder Cefcapene Pivoxil Hydrochloride Fine Granules. To a portion of the powder, equivalent to 2 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate, add 20 mL of *N,N*-dimethylformamide for liquid chromatography, shake vigorously for 10 minutes, and filter through a membrane filter with a pore size of 0.45 µm. Discard the first 3 mL of the filtrate, and use the subsequent filtrate as the sample solution. Perform the test with 20 µL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks eluted before that of cefcapene pivoxil is not more than 4.0% of the total area of all peaks other than the solvent peak.

*Operating conditions*—

Proceed as directed in the Purity (3) under Cefcapene Pivoxil Hydrochloride Hydrate.

*System suitability*—

Proceed as directed in the Purity (3) under Cefcapene Pivoxil Hydrochloride Hydrate.

**Water** <2.48> Not more than 1.4% (0.5 g, volumetric titration, back titration). Perform the test without pulverizing the sample, and handling the sample under a relative humidity of less than 30%.

**Uniformity of dosage units** <6.02> The granules in single-unit container meet the requirement of the Mass variation test.

**Dissolution** Being specified separately.

**Particle size** <6.03> It meets the requirement of the fine granules of the Powders.

**Assay** Weigh accurately an amount of Cefcapene Pivoxil Hydrochloride Fine Granules, equivalent to about 0.2 g (potency) of and Cefcapene Pivoxil Hydrochloride Hydrate, add 100 mL of the mixture of water and methanol (1:1), shake vigorously for 10 minutes, add the mixture of water and methanol (1:1) to make exactly 200 mL, and centrifuge at 3000 rpm for 5 minutes. Filter the supernatant liquid through a membrane filter with a pore size of 0.45 µm, discard the first 1 mL of the filtrate, pipet the subsequent 2 mL of the filtrate,

add exactly 5 mL of the internal standard solution and the mixture of water and methanol (1:1) to make 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefcapene Pivoxil Hydrochloride Reference Standard, and dissolve in the mixture of water and methanol (1:1) to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the mixture of water and methanol (1:1) to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefcapene Pivoxil Hydrochloride Hydrate.

$$\begin{aligned} &\text{Amount [mg (potency)] of cefcapene (C}_{17}\text{H}_{19}\text{N}_5\text{O}_6\text{S}_2) \\ &= W_S \times (Q_T/Q_S) \times 10 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefcapene Pivoxil Hydrochloride Reference Standard

**Internal standard solution**—A solution of *p*-benzylphenol in the mixture of water and methanol (1:1) (7 in 4000).

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cefcapene Pivoxil Hydrochloride Tablets

セフカペン ピボキシル塩酸塩錠

Cefcapene Pivoxil Hydrochloride Tablets contain not less than 90.0% and not more than 105.0% of the labeled amount of cefcapene (C<sub>17</sub>H<sub>19</sub>N<sub>5</sub>O<sub>6</sub>S<sub>2</sub>; 453.49).

**Method of preparation** Prepare as directed under Tablets, with Cefcapene Pivoxil Hydrochloride Hydrate.

**Identification** To an amount of powdered Cefcapene Pivoxil Hydrochloride Tablets, equivalent to about 10 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate according to the labeled amount, add 40 mL of methanol, shake vigorously, and add methanol to make 50 mL. To 4 mL of this solution add methanol to make 50 mL, filter through a membrane filter with pore size of 0.45 μm, and use the filtrate as the sample solution. Determine the absorption spectrum of the sample solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 263 nm and 267 nm.

**Purity (1)** Related substances I—To an amount of powdered Cefcapene Pivoxil Hydrochloride Tablets, equivalent to about 5 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate according to the labeled amount, add 1 mL of methanol, and shake. Add 25 mL of a mixture of water and methanol (1:1), shake vigorously for 5 minutes, and filter through a membrane filter with pore size of 0.45 μm. Discard the first 3 mL of the filtrate, and use the subsequent filtrate as the sample solution. Perform the test with 30 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. If necessary, proceed with 30 μL of the mixture of water and methanol (1:1) in the same manner as the sample solution to compensate the base line. Calculate the amounts of the peaks other than cefcapene pivoxil by the area percentage method: the

peak, having the relative retention time of about 1.3 with respect to cefcapene pivoxil, is not more than 0.4%, the peak of cefcapene pivoxil trans-isomer, having the relative retention time of about 1.5, is not more than 0.5%, any other peaks are not more than 0.3%, respectively, and the total of these peaks is not more than 2.0%.

**Operating conditions**—

Proceed as directed in the Purity (2) under Cefcapene Pivoxil Hydrochloride Hydrate.

**System suitability**—

Proceed as directed in the Purity (2) under Cefcapene Pivoxil Hydrochloride Hydrate.

(2) Related substances II—To an amount of powdered Cefcapene Pivoxil Hydrochloride Tablets, equivalent to 2 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate according to the labeled amount, add 20 mL of *N,N*-dimethylformamide for liquid chromatography, shake vigorously for 10 minutes, and filter through a membrane filter with pore size of 0.45 μm. Discard the first 3 mL of the filtrate, and use the subsequent filtrate as the sample solution. Perform the test with 20 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks which are eluted before cefcapene pivoxil is not more than 3.3% of the total area of the peaks other than the solvent peak.

**Operating conditions**—

Proceed as directed in the Purity (3) under Cefcapene Pivoxil Hydrochloride Hydrate.

**System suitability**—

Proceed as directed in the Purity (3) under Cefcapene Pivoxil Hydrochloride Hydrate.

**Water <2.48>** Not more than 3.9% (0.5 g, volumetric titration, back titration). Powdering of the sample tablets and handling of the powder are performed under the relative humidity of not exceeding 30%.

**Uniformity of dosage units <6.02>** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Cefcapene Pivoxil Hydrochloride Tablets add 5 mL of water, and shake vigorously for 5 minutes to disintegrate. Add 20 mL of methanol, shake vigorously for 5 minutes, add a mixture of methanol and water (4:1) to make exactly 50 mL, and centrifuge at 3000 rpm for 5 minutes. Filter the supernatant liquid through a membrane filter with pore size of 0.45 μm, and discard the first 1 mL of the filtrate. Pipet *V* mL of the subsequent filtrate, equivalent to about 6 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate according to the labeled amount, add exactly 15 mL of the internal standard solution, add a mixture of water and methanol (1:1) to make 75 mL, and use this solution as the sample solution. Hereinafter, proceed as directed in the Assay.

$$\begin{aligned} &\text{Amount [mg (potency)] of cefcapene (C}_{17}\text{H}_{19}\text{N}_5\text{O}_6\text{S}_2) \\ &= W_S \times (Q_T/Q_S) \times (15/V) \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefcapene Pivoxil Hydrochloride Reference Standard

**Internal standard solution**—A solution of *p*-benzylphenol in a mixture of water and methanol (1:1) (7 in 4000).

**Dissolution** Being specified separately.

**Assay** To an amount of Cefcapene Pivoxil Hydrochloride Tablets, equivalent to about 0.6 g (potency) of Cefcapene Pivoxil Hydrochloride Hydrate according to the labeled amount, add 20 mL of water, and shake for 5 minutes to disintegrate. Add 80 mL of methanol, shake vigorously for 5 minutes, add a mixture of methanol and water (4:1) to make exactly 200 mL, and centrifuge at 3000 rpm for 5 minutes. Filter the supernatant liquid through a membrane filter with pore size of 0.45  $\mu\text{m}$ , and discard the first 1 mL of the filtrate. Pipet 2 mL of the subsequent filtrate, add exactly 15 mL of the internal standard solution, add the mixture of water and methanol (1:1) to make 75 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefcapene Pivoxil Hydrochloride Reference Standard, equivalent to about 20 mg (potency), and dissolve in the mixture of water and methanol (1:1) to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add the mixture of water and methanol (1:1) to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefcapene Pivoxil Hydrochloride Hydrate.

$$\begin{aligned} & \text{Amount [mg (potency)] of cefcapene (C}_{17}\text{H}_{19}\text{N}_5\text{O}_6\text{S}_2) \\ & = W_S \times (Q_T/Q_S) \times 30 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefcapene Pivoxil Hydrochloride Reference Standard

**Internal standard solution**—A solution of *p*-benzylphenol in the mixture of water and methanol (1:1) (7 in 4000).

**Containers and storage** Containers—Tight containers.

## Cefdinir

セフジニル

$\text{C}_{14}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2$ : 395.41  
(6*R*,7*R*)-7-[(*Z*)-2-(2-Aminothiazol-4-yl)-2-(hydroxyimino)acetyl-amino]-8-oxo-3-vinyl-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid  
[91832-40-5]

Cefdinir contains not less than 930  $\mu\text{g}$  (potency) and not more than 1020  $\mu\text{g}$  (potency) per mg. The potency of Cefdinir is expressed as mass (potency) of cefdinir ( $\text{C}_{14}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2$ ).

**Description** Cefdinir occurs as a white to light yellow crystalline powder.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It dissolves in 0.1 mol/L phosphate buffer solution, pH 7.0.

**Identification (1)** Determine the absorption spectra of solutions of Cefdinir and Cefdinir Reference Standard in 0.1 mol/L phosphate buffer solution, pH 7.0 (1 in 100,000) as

directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectra of Cefdinir and Cefdinir Reference Standard as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefdinir in a mixture of deuterated dimethyl sulfoxide and heavy water for nuclear magnetic resonance spectroscopy (4:1) (1 in 10), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ): it exhibits multiple signals, A at around  $\delta$  5.0 – 6.1 ppm and B at around  $\delta$  6.4 – 7.5 ppm. The ratio of integrated intensity of each signal, A:B is about 2:1.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (287 nm): 570 – 610 (50 mg, 0.1 mol/L phosphate buffer solution, pH 7.0, 5000 mL).

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-58$  –  $-66^\circ$  (0.25 g, 0.1 mol/L phosphate buffer solution, pH 7.0, 25 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Cefdinir according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve about 0.1 g of Cefdinir in 10 mL of 0.1 mol/L phosphate buffer solution, pH 7.0. Pipet 3 mL of this solution, add tetramethylammonium hydroxide TS, pH 5.5 to make exactly 20 mL, and use this solution as the sample solution. Perform the test with 10  $\mu\text{L}$  of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, determine the areas of each peak by the automatic integration method, and calculate the amounts of their peaks by the area percentage method: the amount of E-isomer having the relative retention time 1.5 to cefdinir is not more than 0.8%, and the amount of total peak areas other than cefdinir is not more than 3.0%.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase A:** To 1000 mL of tetramethylammonium hydroxide TS, pH 5.5, add 0.4 mL of 0.1 mol/L disodium dihydrogen ethylenediamine tetraacetate TS.

**Mobile phase B:** To 500 mL of tetramethylammonium hydroxide TS, pH 5.5 add 300 mL of acetonitrile for liquid chromatography and 200 mL of methanol, and add 0.4 mL of 0.1 mol/L disodium dihydrogen ethylenediamine tetraacetate TS.

**Flowing of the mobile phase:** Control the gradient by mixing the mobile A and B as directed in the following table.

Time after injection of the sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 – 2	95	5
2 – 22	95→75	5→25
22 – 32	75→50	25→50
32 – 37	50	50
37 – 38	50→95	50→5
38 – 58	95	5

Flow rate: 1.0 mL per minute. The retention time of cefdinir is about 22 minutes under this condition.

Time span of measurement: About 40 minutes after injection of the sample solution.

*System suitability—*

Test for required detection: Pipet 1 mL of the sample solution, add tetramethylammonium hydroxide TS, pH 5.5 to make exactly 100 mL, and use this solution as the test solution for system suitability. Pipet 1 mL of the test solution for system suitability, add tetramethylammonium hydroxide TS, pH 5.5 to make exactly 10 mL. Confirm that the peak area of cefdinir obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that obtained from 10  $\mu$ L of the test solution for system suitability.

System performance: Dissolve 0.03 g of Cefdinir Reference Standard and 2 mg of cefdinir lactam ring-cleavage lactones in 3 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, add tetramethylammonium hydroxide TS, pH 5.5, to make 20 mL. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, peak 1 and peak 2 of cefdinir lactam ring-cleavage lactones separated into 4 peaks, cefdinir, peak 3 and peak 4 of remaining cefdinir lactam ring-cleavage lactones are eluted in this order. Relative retention time of peak 3 of cefdinir lactam ring-cleavage lactone to the retention time of cefdinir is not less than 1.09. The number of theoretical plates and the symmetry factor of the peak of cefdinir are not less than 7000 steps and not more than 3.0, respectively.

System repeatability: When the test is repeated 3 times with 10  $\mu$ L of the test solution for system suitability under the above operating conditions, the relative standard deviation of the peak areas of cefdinir is not more than 2.0%.

**Water** <2.48> Not more than 2.0% (1 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

**Assay** Weigh accurately an amount of Cefdinir and Cefdinir Reference Standard equivalent to about 20 mg (potency), dissolve each in 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 5  $\mu$ L of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak areas,  $A_T$  and  $A_S$ , of cefdinir of the solutions.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of } \text{C}_{14}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2 \\ &= W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefdinir Reference Standard

*Operating conditions—*

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: To 1000 mL of tetramethylammonium hydroxide TS, pH 5.5, add 0.4 mL of 0.1 mol/L disodium dihydrogen ethylenediamine tetraacetate TS. To 900 mL of this solution add 60 mL of acetonitrile for liquid chromatography and 40 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefdinir is about 8 minutes.

*System suitability—*

System performance: Dissolve 2 mg of Cefdinir Reference Standard and 5 mg of cefdinir lactam ring-cleavage lactones in 10 mL of 0.1 mol/L phosphate buffer solution, pH 7.0. When the procedure is run with 5  $\mu$ L of this solution under the above operating conditions, peak 1 and peak 2 of cefdinir lactam ring-cleavage lactones separated into 4 peaks, cefdinir, peak 3 and peak 4 of remaining cefdinir lactam ring-cleavage lactones are eluted in this order. The resolution between the peak 2 of cefdinir lactam ring-cleavage lactone and that of cefdinir is not less than 1.2. The number of theoretical plates and the symmetry factor of the peak of cefdinir are not less than 2000 steps and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefdinir is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cefdinir Capsules

セフジニルカプセル

Cefdinir Capsules contain not less than 90.0% and not more than 110.0% of the labeled amount of cefdinir ( $\text{C}_{14}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2$ : 395.41).

**Method of preparation** Prepare as directed under Capsules, with Cefdinir.

**Identification** To an amount of the contents of Cefdinir Capsules, equivalent to 10 mg (potency) of Cefdinir according to the labeled amount, add 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, exposure to ultrasonic waves for 1 minute, and filter. To 2 mL of the filtrate add 0.1 mol/L phosphate buffer solution, pH 7.0 to make 20 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 221 nm and 225 nm and between 285 nm and 289 nm.

**Uniformity of dosage unit** <6.02> It meets the requirement of the Mass variation test.

**Dissolution** <6.10> Perform the test according to the follow-

ing method: it meets the requirement.

Perform the test with 1 capsule of Cefdinir Capsules at 50 revolutions per minute according to the Paddle method using a sinker, using 900 mL of 2nd fluid for dissolution test as the dissolution medium. Withdraw 20 mL or more of the dissolution medium 30 minutes after starting the test for a 50-mg capsule, or 45 minutes after for a 100-mg capsule, and filter through a membrane filter with pore size of not more than 0.5  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet  $V$  mL of the subsequent filtrate, add 2nd fluid for dissolution test to make exactly  $V'$  mL so that each mL contains about 56  $\mu\text{g}$  (potency) of Cefdinir according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg (potency) of Cefdinir Reference Standard, and dissolve in 2nd fluid for dissolution test to make exactly 100 mL. Pipet 4 mL of this solution, add 2nd fluid for dissolution test to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01>, and determine the peak areas,  $A_T$  and  $A_S$ , of cefdinir. The dissolution rate of a 50-mg capsule in 30 minutes is not less than 80% and that of a 100-mg capsule in 45 minutes is not less than 75%.

Dissolution rate (%) with respect to the labeled amount of cefdinir ( $\text{C}_{14}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2$ )

$$= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 180$$

$W_S$ : Amount [mg (potency)] of Cefdinir Reference Standard

$C$ : Labeled amount [mg (potency)] of cefdinir ( $\text{C}_{14}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2$ ) in 1 capsule

#### Operating conditions—

Proceed as directed in the Assay under Cefdinir.

#### System suitability—

System performance: When the procedure is run with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefdinir are not less than 2000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefdinir is not more than 1.0%.

**Assay** Weigh accurately not less than 5 Cefdinir Capsules, take out the contents, and powder. Wash the empty capsules with a little amount of diethyl ether, if necessary, allow to stand at a room temperature to vaporize the adhering diethyl ether, and weigh accurately the mass of the capsules to calculate the mass of the contents. Weigh accurately an amount of the contents, equivalent to about 0.1 g (potency) of Cefdinir according to the labeled amount, add 70 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, shake for 30 minutes, and add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL. Centrifuge this solution at 3000 revolutions per minute for 10 minutes, pipet 4 mL of the supernatant liquid, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefdinir Reference Standard, equivalent to about 20 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefdinir.

$$\text{Amount [mg (potency)] of cefdinir } (\text{C}_{14}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2) \\ = W_S \times (A_T/A_S) \times 5$$

$W_S$ : Amount [mg (potency)] of Cefdinir Reference Standard

**Containers and storage** Containers—Tight containers.

## Cefdinir Fine Granules

セフジニル細粒

Cefdinir Fine Granules contain not less than 93.0% and not more than 107.0% of the labeled amount of cefdinir ( $\text{C}_{14}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2$ ; 395.41).

**Method of preparation** Prepare to finely granulated form as directed under Powders, with Cefdinir.

**Identification** To an amount of Cefdinir Fine Granules, equivalent to 10 mg (potency) of Cefdinir according to the labeled amount, add 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, exposure to ultrasonic waves for 1 minute, and filter. To 2 mL of the filtrate add 0.1 mol/L phosphate buffer solution, pH 7.0 to make 20 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 221 nm and 225 nm and between 285 nm and 289 nm.

**Uniformity of dosage units** <6.02> The granules in single-unit container meet the requirement of the Mass variation test.

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with an accurate amount of Cefdinir Fine Granules, equivalent to about 0.1 g (potency) of Cefdinir according to the labeled amount, at 50 revolutions per minute according to the Paddle method using 900 mL of 2nd fluid for dissolution test as the dissolution medium. Withdraw 20 mL or more of the dissolution medium 30 minutes after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 28 mg (potency) of Cefdinir Reference Standard, and 2nd fluid for dissolution test to make exactly 50 mL. Pipet 4 mL of this solution, add 2nd fluid for dissolution test to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01>, and determine the peak areas,  $A_T$  and  $A_S$ , of cefdinir. The dissolution rate in 30 minutes is not less than 75%.

Dissolution rate (%) with respect to the labeled amount of cefdinir ( $\text{C}_{14}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2$ )

$$= (W_S/W_T) \times (A_T/A_S) \times (1/C) \times 360$$

$W_S$ : Amount [mg (potency)] of Cefdinir Reference Standard

$W_T$ : Amount (g) of sample

$C$ : Labeled amount [mg (potency)] of cefdinir ( $\text{C}_{14}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2$ ) in 1 g

**Operating conditions—**

Proceed as directed in the Assay under Cefdinir.

**System suitability—**

System performance: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefdinir are not less than 2000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefdinir is not more than 1.0%.

**Particle size** <6.03> It meets the requirement of fine granules of the Powders.

**Assay** Powder, if necessary, and weigh accurately an amount of Cefdinir Fine Granules, equivalent to about 0.1 g (potency) of Cefdinir according to the labeled amount, add 70 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, shake for 30 minutes, and add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL. Centrifuge at 3000 revolutions per minute for 10 minutes, pipet 4 mL of the supernatant liquid, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefdinir Reference Standard, equivalent to about 20 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefdinir.

$$\begin{aligned} \text{Amount [mg (potency)] of cefdinir (C}_{14}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2) \\ = W_S \times (A_T/A_S) \times 5 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefdinir Reference Standard

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Cefditoren Pivoxil

セフジトレン ピボキシル

$\text{C}_{25}\text{H}_{28}\text{N}_6\text{O}_7\text{S}_3$ : 620.72

2,2-Dimethylpropanoyloxymethyl (6*R*,7*R*)-7-[(*Z*)-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetyl-amino]-3-[(1*Z*)-2-(4-methylthiazol-5-yl)ethenyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [I17467-28-4]

Cefditoren Pivoxil contains not less than 770  $\mu$ g (potency) and not more than 820  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefditoren Pivoxil is expressed as mass (potency) of cefditoren ( $\text{C}_{19}\text{H}_{18}\text{N}_6\text{O}_5\text{S}_3$ : 506.58).

**Description** Cefditoren Pivoxil occurs as a light yellowish white to light yellow crystalline powder.

It is sparingly soluble in methanol, slightly soluble in acetonitrile and in ethanol (95), very slightly soluble in diethylether and practically insoluble in water.

It dissolves in dilute hydrochloric acid.

**Identification** (1) Dissolve 5 mg of Cefditoren Pivoxil in 3 mL of hydroxylammonium chloride-ethanol TS, allow to stand for 5 minutes, add 1 mL of acidic ammonium iron (III) sulfate TS and shake: a red-brown color develops.

(2) Dissolve 1 mg of Cefditoren Pivoxil in 1 mL of dilute hydrochloric acid and 4 mL of water, add 3 drops of sodium nitrite TS under ice-cooling, shake, and allow to stand for 2 minutes. Then add 1 mL of ammonium amidosulfate TS, shake well, and allow to stand for 1 minute, and add 1 mL of *N,N*-diethyl-*N'*-1-naphthylethylenediamine oxalate TS: a purple color develops.

(3) Determine the absorption spectrum of a solution of Cefditoren Pivoxil in methanol (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefditoren Pivoxil Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the spectrum of a solution of Cefditoren Pivoxil in deuterated chloroform for nuclear magnetic resonance spectroscopy (1 in 50), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ): it exhibits single signals A, B and C, at around  $\delta$  1.1 ppm, at around  $\delta$  2.4 ppm and at around  $\delta$  4.0 ppm, double signals D and E, at around  $\delta$  6.4 ppm and at around  $\delta$  6.7 ppm, and a single signal F at around  $\delta$  8.6 ppm. The ratio of integrated intensity of each signal A:B:C:D:E:F, is about 9:3:3:1:1:1.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (231 nm): 340 – 360 (50 mg, methanol, 2500 mL).

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : – 45 – – 52° (50 mg, methanol, 10 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Proceed with 2.0 g of Cefditoren Pivoxil according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Being specified separately.

(3) Residual solvents—Being specified separately.

**Water** <2.48> Not more than 1.5% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** Being specified separately.

**Assay** Conduct this procedure without exposure to daylight, using light-resistant vessels. Weigh accurately an amount of Cefditoren Pivoxil and Cefditoren Pivoxil Reference Standard, equivalent to about 40 mg (potency), dissolve in 40 mL of acetonitrile, add exactly 10 mL each of the internal standard solution, and add acetonitrile to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions,

and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefditoren pivoxil to that of the internal standard.

$$\begin{aligned} & \text{Amount } [\mu\text{g (potency)}] \text{ of cefditoren (C}_{19}\text{H}_{18}\text{N}_6\text{O}_5\text{S}_3) \\ & = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefditoren Pivoxil Reference Standard

**Internal standard solution**—A solution of propyl *p*-hydroxybenzoate in acetonitrile (1 in 200).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 230 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 1.58 g of ammonium formate in 900 mL of water, adjust to pH 6.0 with diluted formic acid (1 in 250), and add water to make 1000 mL. To 450 mL of this solution add 275 mL of acetonitrile and 275 mL of methanol.

**Flow rate:** Adjust the flow rate so that the retention time of cefditoren pivoxil is about 15 minutes.

**System suitability**—

**System performance:** When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the internal standard and cefditoren pivoxil are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 5 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefditoren pivoxil to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cefditoren Pivoxil Fine Granules

セフジトレン ピボキシル細粒

Cefditoren Pivoxil Fine Granules contain not less than 90.0% and not more than 110.0% of the labeled amount of cefditoren (C<sub>19</sub>H<sub>18</sub>N<sub>6</sub>O<sub>5</sub>S<sub>3</sub>; 506.58).

**Method of preparation** Prepare in the form of very fine granules as directed under Powders, with Cefditoren Pivoxil.

**Identification** To an amount of powdered Cefditoren Pivoxil Fine Granules, equivalent to 0.1 g (potency) of Cefditoren Pivoxil according to the labeled amount, add 10 mL of acetonitrile, shake vigorously, and filter. To 1 mL of the filtrate add acetonitrile to make 50 mL. To 1 mL of this solution add acetonitrile to make 20 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 230 nm and 234 nm.

**Purity** Related substances—Being specified separately.

**Loss on drying** <2.41> Not more than 4.5% (0.5 g, reduced

pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Uniformity of dosage units** <6.02> The granules in single-unit container meet the requirement of the Mass variation test.

**Dissolution** Being specified separately.

**Particle size** <6.03> It meets the requirement of fine granules of the Powders.

**Assay** Conduct this procedure without exposure to daylight, using light-resistant vessels. Weigh accurately an amount of powdered Cefditoren Pivoxil Fine Granules, equivalent to about 40 mg (potency) of Cefditoren Pivoxil according to the labeled amount, add 70 mL of diluted acetonitrile (3 in 4), and shake vigorously. To this solution add exactly 10 mL of the internal standard solution, then add acetonitrile to make 100 mL, filter, and use the filtrate as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefditoren Pivoxil Reference Standard, dissolve in 20 mL of acetonitrile, add exactly 5 mL of the internal standard solution, then add acetonitrile to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefditoren Pivoxil.

$$\begin{aligned} & \text{Amount [mg (potency)] of cefditoren (C}_{19}\text{H}_{18}\text{N}_6\text{O}_5\text{S}_3) \\ & = W_S \times (Q_T/Q_S) \times 2 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefditoren Pivoxil Reference Standard

**Internal standard solution**—A solution of propyl *p*-hydroxybenzoate in acetonitrile (1 in 200)

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cefditoren Pivoxil Tablets

セフジトレン ピボキシル錠

Cefditoren Pivoxil Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of cefditoren (C<sub>19</sub>H<sub>18</sub>N<sub>6</sub>O<sub>5</sub>S<sub>3</sub>; 506.58),

**Method of preparation** Prepare as directed under Tablets, with Cefditoren Pivoxil.

**Identification** To an amount of powdered Cefditoren Pivoxil Tablets, equivalent to 35 mg (potency) of Cefditoren Pivoxil according to the labeled amount, add 100 mL of methanol, shake, and filter. To 5 mL of the filtrate add methanol to make 100 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 229 nm and 233 nm.

**Purity** Related substances—Being specified separately.

**Loss on drying** <2.41> Not more than 4.0% (0.5 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Cefditoren Pivoxil Tablets add 12.5 mL of the 1st fluid for disintegration test, shake vigorously, add

about 25 mL of acetonitrile, shake again, and add acetonitrile to make exactly 50 mL. Pipet  $V$  mL of this solution, equivalent to about 20 mg (potency) of Cefditoren Pivoxil according to the labeled amount, add exactly 5 mL of the internal standard solution, then add diluted acetonitrile (3 in 4) to make 50 mL, filter, and use the filtrate as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefditoren Pivoxil Reference Standard, dissolve in 20 mL of acetonitrile, add exactly 5 mL of the internal standard solution, then add acetonitrile to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefditoren Pivoxil.

$$\begin{aligned} &\text{Amount [mg (potency)] of cefditoren (C}_{19}\text{H}_{18}\text{N}_6\text{O}_5\text{S}_3) \\ &= W_S \times (Q_T/Q_S) \times (50/V) \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefditoren Pivoxil Reference Standard

*Internal standard solution*—A solution of propyl parahydroxybenzoate in acetonitrile (1 in 200)

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Cefditoren Pivoxil Tablets at 50 revolutions per minute according to the Paddle method using 900 mL of the 1st fluid for dissolution test as the dissolution medium. Withdraw 20 mL or more of the dissolution medium 20 minutes after starting the test, and filter through a membrane filter with pore size of not more than 0.45  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet the subsequent  $V$  mL, add water to make exactly  $V'$  mL so that each mL contains about 11  $\mu\text{g}$  (potency) of Cefditoren Pivoxil according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 22 mg (potency) of Cefditoren Pivoxil Reference Standard, dissolve in 20 mL of diluted acetonitrile (3 in 4), then add the 1st fluid for dissolution test to make exactly 200 mL. Pipet 2 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , at 272 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24> using water as the control. The dissolution rate in 20 minutes is not less than 85%.

$$\begin{aligned} &\text{Dissolution rate (\%)} \text{ with respect to the labeled amount} \\ &= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 45 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefditoren Pivoxil Reference Standard

$C$ : Labeled amount [mg (potency)] of cefditoren pivoxil (C<sub>25</sub>H<sub>28</sub>N<sub>6</sub>O<sub>7</sub>S<sub>3</sub>) in 1 tablet

**Assay** Conduct this procedure without exposure to daylight, using light-resistant vessels. To an amount of Cefditoren Pivoxil Tablets, equivalent to 0.5 g (potency) of Cefditoren Pivoxil according to the labeled amount, add 63 mL of the 1st fluid for disintegration test, shake vigorously, add about 125 mL of acetonitrile, shake again, and add acetonitrile to make exactly 250 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, then add diluted acetonitrile (3 in 4) to make 50 mL, filter, and use the filtrate as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefditoren Pivoxil Reference Standard, dissolve in 20 mL of acetonitrile, add exactly 5 mL of the internal standard solution, then add acetonitrile to make

50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefditoren Pivoxil.

$$\begin{aligned} &\text{Amount [mg (potency)] of cefditoren (C}_{19}\text{H}_{18}\text{N}_6\text{O}_5\text{S}_3) \\ &= W_S \times (Q_T/Q_S) \times 25 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefditoren Pivoxil Reference Standard

*Internal standard solution*—A solution of propyl parahydroxybenzoate in acetonitrile (1 in 200)

**Containers and storage** Containers—Tight containers.

## Cefepime Dihydrochloride Hydrate

セフェピム塩酸塩水和物

C<sub>19</sub>H<sub>24</sub>N<sub>6</sub>O<sub>5</sub>S<sub>2</sub>·2HCl·H<sub>2</sub>O: 571.50

(6*R*,7*R*)-7-[(*Z*)-2-(2-Aminothiazol-4-yl)-2-(methoxyimino)acetylamino]-3-(1-methylpyrrolidinium-1-ylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate dihydrochloride monohydrate  
[123171-59-5]

Cefepime Dihydrochloride Hydrate contains not less than 835  $\mu\text{g}$  (potency) and not more than 886  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Cefepime Dihydrochloride Hydrate is expressed as mass (potency) of cefepime (C<sub>19</sub>H<sub>24</sub>N<sub>6</sub>O<sub>5</sub>S<sub>2</sub>: 480.56).

**Description** Cefepime Dihydrochloride Hydrate occurs as a white to yellowish white, crystals or crystalline powder.

It is freely soluble in water and in methanol, and slightly soluble in ethanol (95), and practically insoluble in diethylether.

**Identification** (1) Dissolve 0.02 g of Cefepime Dihydrochloride Hydrate in 2 mL of water, add 1 mL of a solution of hydroxylammonium chloride (1 in 10) and 2 mL of sodium hydroxide TS, allow to stand for 5 minutes, then add 3 mL of 1 mol/L hydrochloric acid TS and 3 drops of iron (III) chloride TS: a red-brown color develops.

(2) Determine the absorption spectra of solutions (1 in 20,000) of Cefepime Dihydrochloride Hydrate and Cefepime Dihydrochloride Reference Standard as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectra of Cefepime Dihydrochloride Hydrate and Cefepime Dihydrochloride Reference Standard as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Determine the spectrum of a solution of Cefepime Dihydrochloride Hydrate in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear

Magnetic Resonance Spectroscopy <2.21> (<sup>1</sup>H), using sodium 3-trimethylsilylpropionate-d<sub>4</sub> for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A and B, at around δ 3.1 ppm and at around δ 7.2 ppm, respectively, and the ratio of integrated intensity of each signal, A:B, is about 3:1.

(5) Dissolve 15 mg of Cefepime Dihydrochloride Hydrate in 5 mL of water, and add 2 drops of silver nitrate TS: a white turbidity is produced.

**Absorbance** <2.24>  $E_{1\text{ cm}}^{1\%}$  (259 nm): 310 – 340 (50 mg calculated on the anhydrous basis, water, 1000 mL).

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ : +39 – +47° (60 mg calculated on the anhydrous basis, water, 20 mL, 100 mm).

**pH** <2.54> Dissolve 0.1 g of Cefepime Dihydrochloride Hydrate in 10 mL of water: the pH of this solution is between 1.6 and 2.1.

**Purity (1)** Clarity and color of solution—Being specified separately.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cefepime Dihydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) *N*-Methylpyrrolidine—Weigh accurately an amount of Cefepime Dihydrochloride Hydrate equivalent to about 80 mg (potency), dissolve in diluted nitric acid (2 in 3125) to make exactly 10 mL, and use this solution as the sample solution. Separately, put 30 mL of water in a 100-mL volumetric flask, weigh accurately the mass of flask, then add about 0.125 g of *N*-methylpyrrolidine, weigh accurately the mass of the flask again, and add water to make exactly 100 mL. Pipet 4 mL of this solution, add diluted nitric acid (2 in 3125) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 100 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_{\text{T}}$  and  $A_{\text{S}}$ , of *N*-methylpyrrolidine by the automatic integration method. Calculate the amount of *N*-methylpyrrolidine per 1 mg (potency) of Cefepime Dihydrochloride Hydrate by the following equation: not more than 0.5%. The sample solution must be tested within 20 minutes after preparation.

$$\begin{aligned} &\text{Amount (\%)} \text{ of } N\text{-methylpyrrolidine} \\ &= \{(W_{\text{S}} \times f) / W_{\text{T}}\} \times (A_{\text{T}} / A_{\text{S}}) \times (1/250) \end{aligned}$$

$W_{\text{S}}$ : Amount (mg) of *N*-methylpyrrolidine

$W_{\text{T}}$ : Amount [mg (potency)] of sample

$f$ : Purity (%) of *N*-methylpyrrolidine

**Operating conditions—**

Detector: An electric conductivity detector

Column: A plastic tube 4.6 mm in inside diameter and 5 cm in length, packed with hydrophilic silica gel for liquid chromatography carrying sulfonic acid groups having the exchange capacity of about 0.3 meq per g (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: To 990 mL of diluted nitric acid (2 in 3125) add 10 mL of acetonitrile.

Flow rate: 1.0 mL per minute.

**System suitability—**

System performance: To 20 mL of a solution of sodium chloride (3 in 1000) add 0.125 g of *N*-methylpyrrolidine, and add water to make 100 mL. To 4 mL of this solution add diluted nitric acid (2 in 3125) to make 100 mL. When the procedure is run with 100 μL of this solution under the above operating conditions, sodium and *N*-methylpyrrolidine are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 5 times with 100 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of *N*-methylpyrrolidine is not more than 4.0%.

(4) Related substances—Dissolve about 0.1 g of Cefepime Dihydrochloride Hydrate in the mobile phase A to make 50 mL, and use this solution as the sample solution. Perform the test with 5 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the area of each peak by the automatic integration method. Calculate the total of the peak areas other than cefepime: not more than 0.5%.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: Dissolve 0.57 g of ammonium dihydrogenphosphate in 1000 mL of water.

Mobile phase B: Acetonitrile

Flowing of the mobile phase: Control the gradient by mixing the mobile phase A and B as directed in the following table.

Time after injection of the sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0–25	100→75	0→25

Flow rate: Adjust the flow rate so that the retention time of cefepime is about 9.5 minutes.

Time span of measurement: About 2.5 times as long as the retention time of cefepime.

**System suitability—**

Test for required detection: To 1 mL of the sample solution add the mobile phase A to make 10 mL, and use this solution as the solution for system suitability test. To 1 mL of the solution for system suitability test add the mobile phase A to make 10 mL, and use this solution as the solution for test for required detection. Pipet 1 mL of the solution for test for required detection, add the mobile phase A to make exactly 10 mL. Conform that the peak area of cefepime obtained from 5 μL of this solution is equivalent to 7 to 13% of that of cefepime obtained from 5 μL of the solution for test for required detection.

System performance: When the procedure is run with 5 μL of the solution for system suitability test under the above operating conditions, the number of theoretical plates of the peak of cefepime is not less than 6000 steps.

System repeatability: When the test is repeated 3 times with

5  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of cefepime is not more than 2.0%.

**Water** <2.48> Not less than 3.0% and not more than 4.5% (Weigh accurately about 50 mg, and add exactly 2 mL of methanol for water determination to dissolve. Use exactly 0.5 mL of this solution as the test solution; coulometric titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Bacterial endotoxins** <4.01> Less than 0.04 EU/mg (potency).

**Assay** Weigh accurately an amount of Cefepime Dihydrochloride Hydrate and Cefepime Dihydrochloride Reference Standard, equivalent to about 60 mg (potency), dissolve in the mobile phase to make exactly 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of cefepime of each solution.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of cefepime } (\text{C}_{19}\text{H}_{24}\text{N}_6\text{O}_5\text{S}_2) \\ &= W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefepime Dihydrochloride Reference Standard

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Adjust a solution of sodium 1-pentanesulfonate (261 in 100,000) to pH 3.4 with acetic acid (100), then adjust this solution to pH 4.0 with a solution of potassium hydroxide (13 in 20). To 950 mL of this solution add 50 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of cefepime is about 8 minutes.

**System suitability—**

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates of the peak of cefepime is not less than 1500 steps.

**System repeatability:** When the test is repeated 5 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefepime is not more than 2.0%.

**Containers and storage** Containers—Hermetic containers.

Storage—Light-resistant.

## Cefepime Dihydrochloride for Injection

注射用セフェピム塩酸塩

Cefepime Dihydrochloride for Injection is a preparation for injection, which is dissolved before use.

It contains not less than 95.0% and not more than 110.0% of the labeled amount of cefepime ( $\text{C}_{19}\text{H}_{24}\text{N}_6\text{O}_5\text{S}_2$ ; 480.56).

**Method of preparation** Prepare as directed under Injections, with Cefepime Dihydrochloride Hydrate.

**Description** Cefepime Dihydrochloride for Injection occurs as a white to pale yellow powder.

**Identification (1)** Dissolve 40 mg of Cefepime Dihydrochloride in 2 mL of water, add 1 mL of a solution of hydroxylammonium chloride (1 in 10) and 2 mL of sodium hydroxide TS, allow to stand for 5 minutes, then add 3 mL of 1 mol/L hydrochloric acid TS and 3 drops of iron (III) chloride TS: a red-brown color develops.

**(2)** Determine the absorption spectrum of a solution of Cefepime Dihydrochloride for Injection (1 in 12,500) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 233 nm and 237 nm and between 255 nm and 259 nm.

**pH** <2.54> The pH of a solution obtained by dissolving an amount of Cefepime Dihydrochloride for Injection, equivalent to 0.5 g (potency) of Cefepime Dihydrochloride Hydrate according to the labeled amount, in 5 mL of water is between 4.0 and 6.0.

**Purity (1)** Clarity and color of solution—Dissolve an amount of Cefepime Dihydrochloride for Injection, equivalent to 0.5 g (potency) of Cefepime Dihydrochloride Hydrate according to the labeled amount, in 5 mL of water: the solution is clear and colorless or light yellow. The color is not darker than Matching Fluid I.

**(2)** *N*-Methylpyrrolidine—Weigh accurately an amount of Cefepime Dihydrochloride for Injection, equivalent to about 0.2 g (potency) of Cefepime Dihydrochloride Hydrate according to the labeled amount, dissolve in diluted nitric acid (2 in 625) to make exactly 20 mL, and use this solution as the sample solution. Separately, transfer 30 mL of water into a 100-mL volumetric flask, weigh accurately the mass of the flask, add about 0.125 g of *N*-methylpyrrolidine, then weigh accurately the mass, and add water to make exactly 100 mL. Pipet 4 mL of this solution, add diluted nitric acid (2 in 3125) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 100  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas of *N*-methylpyrrolidine,  $A_T$  and  $A_S$ , by the automatic integration method within 20 minutes after the sample solution is prepared. Calculate the amount of *N*-methylpyrrolidine per mg (potency) of Cefepime Dihydrochloride for Injection by the following formula: not more than 1.0%.

Amount (%) of *N*-methylpyrrolidine

$$= \{(W_S \times f) / W_T\} \times (A_T / A_S) \times (1/125)$$

$W_S$ : Amount (mg) of *N*-methylpyrrolidine

$W_T$ : Amount [mg (potency)] of cefepime in the sample

$f$ : Purity (%) of *N*-methylpyrrolidine

#### Operating conditions—

Proceed as directed in the operating conditions in the Purity (3) under Cefepime Dihydrochloride Hydrate.

#### System suitability—

Proceed as directed in the system suitability in the Purity (3) under Cefepime Dihydrochloride Hydrate.

**Water** <2.48> Not more than 4.0% (Weigh accurately about 50 mg of Cefepime Dihydrochloride for Injection, dissolve in exactly 2 mL of methanol for Karl Fischer method, and perform the test with exactly 0.5 mL of this solution. Coulometric titration).

**Bacterial endotoxins** <4.01> Less than 0.06 EU/mg (potency).

**Uniformity of dosage units** <6.02> It meets the requirement of the Mass variation test.

**Foreign insoluble matter** <6.06> Perform the test according to the Method 2: it meets the requirement.

**Insoluble particulate matter** <6.07> Perform the test according to the Method 1: it meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Weigh accurately the mass of the contents of not less than 10 Cefepime Dihydrochloride for Injection. Weigh accurately an amount of the content, equivalent to about 60 mg (potency) of Cefepime Dihydrochloride Hydrate according to the labeled amount, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefepime Dihydrochloride Reference Standard, equivalent to about 60 mg (potency), dissolve in the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefepime Dihydrochloride Hydrate.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of cefepime } (\text{C}_{19}\text{H}_{24}\text{N}_6\text{O}_5\text{S}_2) \\ &= W_S \times (A_T / A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefepime Dihydrochloride Reference Standard

**Containers and storage** Containers—Hermetic containers.  
Storage—Light-resistant.

## Cefixime

セフィキシム

$\text{C}_{16}\text{H}_{15}\text{N}_5\text{O}_7\text{S}_2$ : 453.45

(6*R*,7*R*)-7-[(*Z*)-2-(2-Aminothiazol-4-yl)-2-(carboxymethoxyimino)acetyl-amino]-8-oxo-3-vinyl-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid  
[79350-37-1]

Cefixime contains not less than 930  $\mu\text{g}$  (potency) and not more than 1020  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Cefixime is expressed as mass (potency) of cefixime ( $\text{C}_{16}\text{H}_{15}\text{N}_5\text{O}_7\text{S}_2$ ).

**Description** Cefixime occurs as a white to light yellow crystalline powder.

It is freely soluble in methanol and in dimethylsulfoxide, sparingly soluble in ethanol (99.5), and practically insoluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Cefixime in 0.1 mol/L phosphate buffer solution, pH 7.0 (1 in 62,500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefixime Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefixime as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefixime Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 0.05 g of Cefixime in 0.5 mL of a mixture of deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy and heavy water for nuclear magnetic resonance spectroscopy (4:1). Determine the spectrum of this solution, using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ): it exhibits a single signal A at around  $\delta$  4.7 ppm, and a multiple signal B between  $\delta$  6.5 ppm and  $\delta$  7.4 ppm. The ratio of integrated intensity of these signals, A:B, is about 1:1.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-75$  –  $-88^\circ$  (0.45 g calculated on the anhydrous bases, a solution of sodium hydrogen carbonate (1 in 50), 50 mL, 100 mm).

**Purity** Dissolve 0.1 g of Cefixime in 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the sample solution. Perform the test with 10  $\mu\text{L}$  of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, measure the areas of the peaks by the automatic integration method, and calculate the amounts of these peak areas by the area percentage method: the amount of each peak area other than cefixime is not more than 1.0%, and the total area of the peaks other than cefixime is not more than 2.5%.

#### Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of cefixime beginning after the solvent peak.

#### System suitability—

Test for required detection: Pipet 1 mL of the sample solution, and add 0.1 mol/L phosphate buffer solution, pH 7.0 to

make exactly 100 mL. Confirm that the peak height of cefixime obtained from 10  $\mu$ L of this solution is equivalent to 20 to 60 mm.

**System performance:** Dissolve about 2 mg of Cefixime Reference Standard in 200 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the solution for system suitability test. When the procedure is run with 10  $\mu$ L of the solution according to the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefixime are not less than 4000 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of cefixime is not more than 2.0%.

**Water** <2.48> Not less than 9.0 and not more than 12.0% (0.1 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately an amount of Cefixime and Cefixime Reference Standard, equivalent to about 0.1 g (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL each. Pipet 10 mL each of these solutions, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 50 mL each, and use these solutions as the sample solution and standard solution, respectively. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak areas,  $A_T$  and  $A_S$ , of cefixime of these solutions.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of } C_{16}H_{15}N_5O_7S_2 \\ = W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefixime Reference Standard

#### Operating conditions—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4 mm in inside diameter and 125 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (4  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** To 25 mL of a solution of tetrabutylammonium hydroxide TS (10 in 13) add water to make 1000 mL, adjust to pH 6.5 with diluted phosphoric acid (1 in 10). To 300 mL of this solution add 100 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of cefixime is about 10 minutes.

#### System suitability—

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefixime are not less than 4000 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of peak areas of cefixime is not more than 2.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cefmenoxime Hydrochloride

セフメノキシム塩酸塩

$C_{16}H_{17}N_9O_5S_3 \cdot \frac{1}{2}HCl$ : 529.79

(6*R*,7*R*)-7-[(*Z*)-2-(2-Aminothiazol-4-yl)-2-(methoxyimino)acetylamino]-3-(1-methyl-1*H*-tetrazol-5-ylsulfanylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid hemihydrochloride [75738-58-8]

Cefmenoxime Hydrochloride contains not less than 890  $\mu$ g (potency) and not more than 975  $\mu$ g (potency) per mg, calculated on the dehydrated basis. The potency of Cefmenoxime Hydrochloride is expressed as mass (potency) of cefmenoxime ( $C_{16}H_{17}N_9O_5S_3$ : 511.56).

**Description** Cefmenoxime Hydrochloride occurs as white to light orange-yellow crystals or crystalline powder.

It is freely soluble in formamide and in dimethylsulfoxide, slightly soluble in methanol, very slightly soluble in water, and practically insoluble in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Cefmenoxime Hydrochloride in 0.1 mol/L phosphate buffer solution, pH 6.8 (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefmenoxime Hydrochloride Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Cefmenoxime Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefmenoxime Hydrochloride Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** Determine the spectrum of a solution of Cefmenoxime Hydrochloride in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits two single signals, A and B, at around  $\delta$ 3.9 ppm, and a single signal C at around  $\delta$ 6.8 ppm. The ratio of the integrated intensity of each signal, A:B:C, is about 3:3:1.

**(4)** Dissolve 10 mg of Cefmenoxime Hydrochloride in 1 mL of diluted sodium carbonate TS (1 in 20), add 5 mL of acetic acid (100) and 2 drops of silver nitrate TS: a white precipitate is formed.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-27 - -35^\circ$  (1 g, 0.1 mol/L phosphate buffer solution, pH 6.8, 100 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 0.10 g of Cefmenoxime Hydrochloride in 150 mL of water is between 2.8 and 3.3.

**Purity (1)** Clarity and color of solution—A solution obtained by dissolving 1.0 g of Cefmenoxime Hydrochloride in 10 mL of diluted sodium carbonate TS (1 in 4) is clear and colorless to light yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cefmenoxime Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefmenoxime Hydrochloride according to Method 4 and adding 10 mL of dilute hydrochloric acid to the residue after cooling, and perform the test (not more than 2 ppm).

(4) Related substances—Weigh accurately about 0.1 g of Cefmenoxime Hydrochloride, dissolve in 20 mL of 0.1 mol/L phosphate buffer solution, pH 6.8, and add the mobile phase to make exactly 100 mL. Pipet 4 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of 1-methyl-1*H*-tetrazol-5-thiol, and dissolve in the mobile phase to make exactly 100 mL. Pipet 4 mL of this solution, add the mobile phase to make exactly 250 mL, and use this solution as the standard solution (1). Weigh accurately about 0.1 g of Cefmenoxime Hydrochloride Reference Standard, dissolve in 20 mL of 0.1 mol/L phosphate buffer solution, pH 6.8, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 250 mL, and use this solution as the standard solution (2). Perform the test immediately after preparation of these solutions with exactly 10  $\mu$ L each of the sample solution and standard solutions (1) and (2) as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area obtained from the chromatograms of these solutions by the automatic integration method, and calculate the amounts of 1-methyl-1*H*-tetrazol-5-thiol and the total related substance by the following formula: the amount of 1-methyl-1*H*-tetrazol-5-thiol is not more than 1.0%, and the total related substance is not more than 3.0%.

$$\begin{aligned} \text{Amount (\%)} \text{ of 1-methyl-1H-tetrazol-5-thiol} \\ = (W_{\text{Sa}}/W_{\text{T}}) \times (A_{\text{Ta}}/A_{\text{Sa}}) \times 20 \end{aligned}$$

$$\begin{aligned} \text{Amount (\%)} \text{ of total related substances} \\ = \{(W_{\text{Sa}}/W_{\text{T}}) \times (A_{\text{Ta}}/A_{\text{Sa}}) \times 20\} \\ + \{(W_{\text{Sb}}/W_{\text{T}}) + (S_{\text{T}}/A_{\text{Sb}}) \times 5\} \end{aligned}$$

$W_{\text{Sa}}$ : Amount (g) of 1-methyl-1*H*-tetrazol-5-thiol

$W_{\text{Sb}}$ : Amount (g) of Cefmenoxime Hydrochloride Reference Standard

$W_{\text{T}}$ : Amount (g) of the sample

$A_{\text{Sa}}$ : Peak area of 1-methyl-1*H*-tetrazol-5-thiol from the standard solution (1)

$A_{\text{Sb}}$ : Peak area of cefmenoxime from the standard solution (2)

$A_{\text{Ta}}$ : Peak area of 1-methyl-1*H*-tetrazol-5-thiol from the sample solution

$S_{\text{T}}$ : Total area of the peaks other than 1-methyl-1*H*-tetrazol-5-thiol and other than cefmenoxime from the sample solution

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2.5 times as long as the retention time of cefmenoxime.

**System suitability**—

Test for required detectability: Measure exactly 5 mL of the standard solution (1), add the mobile phase to make exactly 100 mL. Confirm that the peak area of 1-methyl-1*H*-tetrazol-5-thiol obtained from 10  $\mu$ L of this solution is equivalent to 4.5 to 5.5% of that from the standard solution (1). Then, measure exactly 2 mL of the standard solution (2), add the mobile phase to make exactly 100 mL. Confirm that the peak area of cefmenoxime obtained from 10  $\mu$ L of this solution is equivalent to 1.5 to 2.5% of that from the standard solution (2).

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution (1) under the above operating conditions, the relative standard deviation of the peak area of 1-methyl-1*H*-tetrazol-5-thiol is not more than 1.0%.

**Water** <2.48> Not more than 1.5% (1 g, volumetric titration, direct titration. Use a mixture of formamide for Karl Fisher method and methanol for Karl Fisher method (2:1)).

**Assay** Weigh accurately an amount of Cefmenoxime Hydrochloride and Cefmenoxime Hydrochloride Reference Standard, equivalent to about 50 mg (potency), dissolve each in 10 mL of 0.1 mol/L phosphate buffer solution, pH 6.8, and add the mobile phase to make exactly 50 mL. Pipet 4 mL each of these solutions, add exactly 20 mL of the internal standard solution and the mobile phase to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_{\text{T}}$  and  $Q_{\text{S}}$ , of the peak area of cefmenoxime to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefmenoxime (C}_{16}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_3) \\ = W_{\text{S}} \times (Q_{\text{T}}/Q_{\text{S}}) \times 1000 \end{aligned}$$

$W_{\text{S}}$ : Amount [mg (potency)] of Cefmenoxime Hydrochloride Reference Standard

**Internal standard solution**—A solution of phthalimide in methanol (3 in 2000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water, acetonitrile and acetic acid (100) (50:10:1).

Flow rate: Adjust the flow rate so that the retention time of cefmenoxime is about 8 minutes.

**System suitability**—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, cefmenoxime and the internal standard are eluted

in this order with the resolution between these peaks being not less than 2.3.

System repeatability: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak areas of cefmenoxime to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

## Cefmetazole Sodium

セフメタゾールナトリウム

$\text{C}_{15}\text{H}_{16}\text{N}_7\text{NaO}_5\text{S}_3$ : 493.52

Monosodium (6*R*,7*R*)-7-

{[(cyanomethylsulfanyl)acetyl]amino}-7-methoxy-3-(1-methyl-1*H*-tetrazol-5-ylsulfanylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate  
[56796-20-4]

Cefmetazole Sodium contains not less than 860  $\mu\text{g}$  (potency) and not more than 965  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Cefmetazole Sodium is expressed as mass (potency) of cefmetazole ( $\text{C}_{15}\text{H}_{17}\text{N}_7\text{O}_5\text{S}_3$ : 471.53).

**Description** Cefmetazole Sodium occurs as a white to light yellowish white, powder or mass.

It is very soluble in water, freely soluble in methanol, slightly soluble in ethanol (95), and very slightly soluble in tetrahydrofuran.

**Identification (1)** Determine the absorption spectrum of a solution of Cefmetazole Sodium (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefmetazole Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefmetazole Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A, B and C, at around  $\delta$  3.6 ppm, at around  $\delta$  4.1 ppm and at around  $\delta$  5.2 ppm, respectively. The ratio of integrated intensity of each signal, A:B:C, is about 3:3:1.

(4) Cefmetazole Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ : +73 – +85° (0.25 g, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefmetazole Sodium in 10 mL of water: the pH of the solution is between 4.2 and 6.2.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cefmetazole Sodium in 10 mL of water: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cefmetazole Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefmetazole Sodium according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.10 g of Cefmetazole Sodium in 2 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 25 mL, and use this solution as the standard solution (1). Separately, dissolve 0.10 g of 1-methyl-1*H*-tetrazole-5-thiol in water to make exactly 100 mL, and use this solution as the standard solution (2). Immediately perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 1  $\mu\text{L}$  each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop with a mixture of 1-butanol, water and acetic acid (100) (4:1:1) to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand in iodine vapor: the spot obtained from the sample solution corresponding to the spot from the standard solution (2) is not more intense than the spot from the standard solution (2), and the spots other than this spot and other than the principal spot are not more intense than the spot from the standard solution (1).

**Water** <2.48> Not more than 1.0% (1 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefmetazole Sodium and Cefmetazole Reference Standard, equivalent to about 50 mg (potency), and dissolve each in the mobile phase to make exactly 25 mL. Pipet 1 mL each of these solutions, add exactly 10 mL of the internal standard solution, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10  $\mu\text{L}$  each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_{\text{T}}$  and  $Q_{\text{S}}$ , of the peak area of cefmetazole to that of the internal standard of each solution.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefmetazole } (\text{C}_{15}\text{H}_{17}\text{N}_7\text{O}_5\text{S}_3) \\ = W_{\text{S}} \times (Q_{\text{T}}/Q_{\text{S}}) \times 1000 \end{aligned}$$

$W_{\text{S}}$ : Amount [mg (potency)] of Cefmetazole Reference Standard

**Internal standard solution**—A solution of methyl parahydroxybenzoate in the mobile phase (1 in 10,000).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 214 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 5.75 g of ammonium dihydrogenphosphate in 700 mL of water, add 280 mL of methanol, 20 mL of tetrahydrofuran and 3.2 mL of 40% tetrabutylammonium hydroxide TS, and adjust to pH 4.5 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of cefmetazole is about 8 minutes.

*System suitability*—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, cefmetazole and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 5 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefmetazole to that of the internal standard is not more than 2.0%.

**Containers and storage** Containers—Hermetic containers.

## Cefminox Sodium Hydrate

セフミノクスナトリウム水和物

$C_{16}H_{20}N_7NaO_7S_3 \cdot 7H_2O$ : 667.66

Monosodium (6R,7S)-7-[2-[(2S)-2-amino-2-carboxyethylsulfanyl]acetylamino]-7-methoxy-3-(1-methyl-1H-tetrazol-5-ylsulfanylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate heptahydrate [75498-96-3]

Cefminox Sodium Hydrate contains not less than 900  $\mu$ g (potency) and not more than 970  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefminox Sodium Hydrate is expressed as mass (potency) of cefminox ( $C_{16}H_{21}N_7O_7S_3$ ; 519.58).

**Description** Cefminox Sodium Hydrate occurs as a white to light yellow crystalline powder.

It is freely soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol (99.5).

**Identification** (1) Determine the absorption spectrum of a solution of Cefminox Sodium Hydrate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefminox Sodium Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefminox Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the

spectrum of Cefminox Sodium Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefminox Sodium Hydrate in heavy water for nuclear magnetic resonance spectroscopy (1 in 30) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a multiple signal, A, at around  $\delta$  3.2 ppm, a single signal, B, at around  $\delta$  3.5 ppm, a single signal, C, at around  $\delta$  4.0 ppm, and a single signal, D, at around  $\delta$  5.1 ppm. The ratio of integrated intensity of each signal, A:B:C:D, is about 2:3:3:1.

(4) Cefminox Sodium Hydrate responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +62 – +72° (50 mg, water, 10 mL, 100 mm).

**pH** <2.54> Dissolve 0.70 g of Cefminox Sodium Hydrate in 10 mL of water: the pH of the solution is between 4.5 and 6.0.

**Purity** (1) Heavy metals <1.07>—Proceed with 2.0 g of Cefminox Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 2.0 g of Cefminox Sodium Hydrate according to Method 3, and perform the test (not more than 1 ppm).

**Water** <2.48> Not less than 18.0% and not more than 20.0% (0.1 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Escherichia coli* NIHJ

(ii) Culture medium—Use the medium iii in 3) under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 6.5 to 6.6 after sterilization.

(iii) Standard solution—Weigh accurately an amount of Cefminox Sodium Reference Standard, equivalent to about 40 mg (potency), dissolve in 0.05 mol/L phosphate buffer solution, pH 7.0 to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.05 mol/L phosphate buffer solution, pH 7.0 to make solutions so that each mL contains 40  $\mu$ g (potency) and 20  $\mu$ g (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solution—Weigh accurately an amount of Cefminox Sodium Hydrate equivalent to about 40 mg (potency), dissolve in 0.05 mol/L phosphate buffer solution, pH 7.0 to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.05 mol/L phosphate buffer solution, pH 7.0 to make solutions so that each mL contains 40  $\mu$ g (potency) and 20  $\mu$ g (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

(v) Procedure—Incubate between 32°C and 35°C.

**Containers and storage** Containers—Hermetic containers.

## Cefodizime Sodium

セフォジジムナトリウム

$C_{20}H_{18}N_6Na_2O_7S_4$ : 628.63

Disodium (6*R*,7*R*)-7-[(*Z*)-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetylamino]-3-[(5-carboxylatomethyl-4-methylthiazol-2-yl)sulfanylmethyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [86329-79-5]

Cefodizime Sodium contains not less than 890  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis and corrected by the ethanol amount. The potency of Cefodizime Sodium is expressed as mass (potency) of cefodizime ( $C_{20}H_{20}N_6O_7S_4$ : 584.67).

**Description** Cefodizime Sodium occurs as a white to light yellowish white crystalline powder.

It is very soluble in water, and practically insoluble in acetonitrile and in ethanol (99.5).

**Identification** (1) Determine the absorption spectrum of a solution of Cefodizime Sodium (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefodizime Sodium Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefodizime Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefodizime Sodium Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefodizime Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A, B and C, at around  $\delta 2.3$  ppm, at around  $\delta 4.0$  ppm, and at around  $\delta 7.0$  ppm. The ratio of the integrated intensity of these signals, A:B:C, is about 3:3:1.

(4) Cefodizime Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-56 - -62^\circ$  (0.2 g calculated on the anhydrous basis and corrected by the ethanol amount, water, 20 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefodizime Sodium in 10 mL of water: the pH of the solution is between 5.5 and 7.5.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of

Cefodizime Sodium in 10 mL of water: the solution is clear and pale yellow to light yellow.

(2) Heavy metals <1.07>—Weigh 1.0 g of Cefodizime Sodium in a crucible, cover loosely, and carbonize by gentle heating. After cooling, add 2 mL of sulfuric acid, heat gradually until the white fumes are no longer evolved, and ignite between  $500^\circ\text{C}$  and  $600^\circ\text{C}$ . Proceed according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefodizime Sodium according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 30 mg of Cefodizime Sodium in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than cefodizime from the sample solution is not more than the peak area of cefodizime from the standard solution, and the total area of the peaks other than cefodizime from the sample solution is not more than 3 times the peak area of cefodizime from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 4 times as long as the retention time of cefodizime beginning after the solvent peak.

**System suitability**—

Test for required detectability: Measure exactly 2 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of cefodizime obtained from 5  $\mu\text{L}$  of this solution is equivalent to 7 to 13% of that from 5  $\mu\text{L}$  of the standard solution.

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

(5) Ethanol—Weigh accurately about 1 g of Cefodizime Sodium, and dissolve in water to make exactly 10 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 2 g of ethanol for gas chromatography, and add water to make exactly 1000 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 10  $\mu\text{L}$  each of the sample solution and the standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of ethanol to that of the internal standard: the amount of ethanol is not more than 2.0%.

$$\text{Amount (\%)} \text{ of ethanol} = (W_S/W_T) \times (Q_T/Q_S)$$

$W_S$ : Amount (g) of ethanol for gas chromatography

$W_T$ : Amount (g) of the sample

**Internal standard solution**—A solution of 1-propanol (1 in 400).

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A glass column 3.2 mm in inside diameter and 3 m in length, packed with tetrafluoroethylene polymer for gas chromatography (180 – 250  $\mu\text{m}$  in particle diameter) coated in 15% with polyethylene glycol 20 M.

Column temperature: A constant temperature of about 100°C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of ethanol is about 3 minutes.

System suitability—

System performance: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, ethanol and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.5.

System repeatability: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ethanol to that of the internal standard is not more than 2.0%.

**Water** <2.48> Not more than 4.0% (0.5 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefodizime Sodium and Cefodizime Sodium Reference Standard, equivalent to about 50 mg (potency), add exactly 10 mL of the internal standard solution to dissolve, add water to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefodizime to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefodizime (C}_{20}\text{H}_{20}\text{N}_6\text{O}_7\text{S}_4) \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefodizime Sodium Reference Standard

**Internal standard solution**—A solution of anhydrous caffeine (3 in 400).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 0.80 g of potassium dihydrogen phosphate and 0.20 g of anhydrous disodium hydrogen phosphate in a suitable amount of water, and add 80 mL of acetonitrile and water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of cefodizime is about 5 minutes.

System suitability—

System performance: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, cefodizime and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with

10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefodizime to that of the internal standard is not more than 2.0%.

**Containers and storage** Containers—Tight containers.

## Cefoperazone Sodium

セフォペラゾンナトリウム

$\text{C}_{25}\text{H}_{26}\text{N}_9\text{NaO}_8\text{S}_2$ : 667.65

Monosodium (6*R*,7*R*)-7-[(2*R*)-2-[(4-ethyl-2,3-dioxopiperazine-1-carbonylamino]-2-(4-hydroxyphenyl)acetyl-amino]-3-(1-methyl-1*H*-tetrazol-5-ylsulfanylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [62893-20-3]

Cefoperazone Sodium contains not less than 871  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Cefoperazone Sodium is expressed as mass (potency) of cefoperazone ( $\text{C}_{25}\text{H}_{27}\text{N}_9\text{O}_8\text{S}_2$ : 645.67).

**Description** Cefoperazone Sodium occurs as a white to yellowish white crystalline powder.

It is very soluble in water, soluble in methanol, and slightly soluble in ethanol (99.5).

**Identification** (1) Determine the absorption spectrum of a solution of Cefoperazone Sodium (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the spectrum of a solution of Cefoperazone Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a triplet signal A at around  $\delta$  1.2 ppm, and double signals, B and C, at around  $\delta$  6.8 ppm and at around  $\delta$  7.3 ppm. The ratio of integrated intensity of these signals, A:B:C, is about 3:2:2.

(3) Cefoperazone Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-15 - -25^\circ$  (1 g, water, 100 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefoperazone Sodium in 4 mL of water: the pH of the solution is between 4.5 and 6.5.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Cefoperazone Sodium in 10 mL of water: the solution is clear and pale yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cefoper-

azone Sodium according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefoperazone Sodium according to Method 4, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.1 g of Cefoperazone Sodium in 100 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 25  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the areas of each peak by the automatic integration method. Calculate the percentages of each peak area from the sample solution to 50 times of the peak area of cefoperazone from the standard solution: the related substance I with the retention time of about 8 minutes is not more than 5.0%, the related substance II with that of about 17 minutes is not more than 1.5%, and the total of all related substances is not more than 7.0%. Use the peak areas of the related substances I and II after multiplying by their relative response factor, 0.90 and 0.75, respectively.

*Operating conditions*—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of cefoperazone beginning after the solvent peak.

*System suitability*—

Test for required detection: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of cefoperazone obtained from 25  $\mu$ L of this solution is equivalent to 3.5 to 6.5% of that of cefoperazone obtained from 25  $\mu$ L of the standard solution.

System performance: When the procedure is run with 25  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefoperazone are not less than 5000 steps and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 25  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefoperazone is not more than 2.0%.

**Water** <2.48> Not more than 1.0% (3 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefoperazone Sodium equivalent to about 0.1 g (potency), and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefoperazone Reference Standard equivalent to about 0.1 g (potency), dissolve in 5 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and add water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefoperazone to that of the internal standard.

Amount [ $\mu$ g (potency)] of cefoperazone ( $C_{25}H_{27}N_9O_8S_2$ )  
 $= W_S \times (Q_T/Q_S) \times 1000$

$W_S$ : Amount [mg (potency)] of Cefoperazone Reference Standard

*Internal standard solution*—A solution of acetanilide in a mixture of water and acetonitrile (43:7) (3 in 8000).

*Operating conditions*—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: To 57 mL of acetic acid (100) add 139 mL of triethylamine and water to make 1000 mL. To 20 mL of this solution add 835 mL of water, 140 mL of acetonitrile and 5 mL of dilute acetic acid.

Flow rate: Adjust the flow rate so that the retention time of cefoperazone is about 10 minutes.

*System suitability*—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the internal standard and cefoperazone are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefoperazone to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

Storage—In a cold place.

## Cefotaxime Sodium

セフトキシムナトリウム

$C_{16}H_{16}N_5NaO_7S_2$ : 477.45

Monosodium (6*R*,7*R*)-3-acetoxymethyl-7-[(*Z*)-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetylamin]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate  
 [64485-93-4]

Cefotaxime Sodium contains not less than 916  $\mu$ g (potency) per mg, calculated on the dried basis. The potency of Cefotaxime Sodium is expressed as mass (potency) of cefotaxime ( $C_{16}H_{17}N_5O_7S_2$ : 455.47).

**Description** Cefotaxime Sodium occurs as white to light yellowish white crystalline powder.

It is freely soluble in water, sparingly soluble in methanol, and very slightly soluble in ethanol (95).

**Identification (1)** Dissolve 2 mg of Cefotaxime Sodium in 0.01 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefotaxime Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefotaxime Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 125) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> (H), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits three single signals, A, B and C, at around  $\delta$ 2.1 ppm, at around  $\delta$ 4.0 ppm and at around  $\delta$ 7.0 ppm. The ratio of the integrated intensity of each signal, A:B:C, is about 3:3:1.

(4) Cefotaxime Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +58 – +64° (0.25 g calculated on the dried basis, water, 25 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 1.0 g of Cefotaxime Sodium in 10 mL of water is between 4.5 and 6.5.

**Purity (1)** Clarity and color of solution—A solution obtained by dissolving 1.0 g of Cefotaxime Sodium in 10 mL of water is clear and light yellow.

(2) Sulfate <1.14>—Dissolve 2.0 g of Cefotaxime Sodium in 40 mL of water, add 2 mL of dilute hydrochloric acid and water to make 50 mL, shake well, and filter. Discard first 10 mL of the filtrate, and to the subsequent 25 mL of the filtrate add water to make 50 mL. Perform the test with this solution as the test solution. Prepare the control solution as follows: To 1.0 mL of 0.005 mol/L sulfuric acid VS add 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.048%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Cefotaxime Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefotaxime Sodium according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Perform the test with 10  $\mu$ L of the sample solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area obtained from the chromatogram by the automatic integration method: the each peak area other than cefotaxime is not more than 1.0% and the total of these peak areas is not more than 3.0%.

**Operating conditions**—

Detector, column, column temperature, mobile phase A, mobile phase B, flowing of the mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3.5 times as long as the

retention time of cefotaxime beginning after the solvent peak.

**System suitability**—

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

Test for required detectability: Measure exactly 2 mL of the standard solution, and add the mobile phase A to make exactly 100 mL. Pipet 2 mL of this solution, and add the mobile phase A to make exactly 20 mL. Confirm that the peak area of cefotaxime obtained from 10  $\mu$ L of this solution is equivalent to 0.15 to 0.25% of that obtained from 10  $\mu$ L of the standard solution.

**Loss on drying** <2.41> Not more than 3.0% (1 g, 105°C, 3 hours).

**Assay** Weigh accurately an amount of Cefotaxime Sodium and Cefotaxime Reference Standard, equivalent to about 40 mg (potency), dissolve each in the mobile phase A to make exactly 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of cefotaxime of these solutions.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of cefotaxime } (\text{C}_{16}\text{H}_{17}\text{N}_5\text{O}_7\text{S}_2) \\ &= W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefotaxime Reference Standard

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 235 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase A: To 0.05 mol/L disodium hydrogen phosphate TS add phosphoric acid to adjust the pH to 6.25. To 860 mL of this solution add 140 mL of methanol.

Mobile phase B: To 0.05 mol/L disodium hydrogen phosphate TS add phosphoric acid to adjust the pH to 6.25. To 600 mL of this solution add 400 mL of methanol.

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 – 7	100	0
7 – 9	100 → 80	0 → 20
9 – 16	80	20
16 – 45	80 → 0	20 → 100
45 – 50	0	100

Flow rate: Adjust the flow rate so that the retention time of cefotaxime is about 14 minutes (about 1.3 mL/min).

**System suitability**—

System performance: To 1 mL of the standard solution add 7.0 mL of water and 2.0 mL of methanol, mix, then add

25 mg of sodium carbonate decahydrate, and shake. After allowing to stand for 10 minutes, add 3 drops of acetic acid (100) and 1 mL of the standard solution, and mix. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, desacetyl cefotaxime with the relative retention time being about 0.3 to cefotaxime and cefotaxime are eluted in this order with the resolution between these peaks being not less than 20, and the symmetry factor of the peak of cefotaxime is not more than 2.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefotaxime is not more than 2.0%.

**Containers and storage** Containers—Tight containers.

## Cefotetan

セフォテタン

$C_{17}H_{17}N_7O_8S_4$ : 575.62

(6*R*,7*R*)-7-[4-(Carbamoylcarboxymethylidene)-1,3-dithietane-2-carbonyl]amino}-7-methoxy-3-(1-methyl-1*H*-tetrazol-5-ylsulfanyl)methyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid [69712-56-7]

Cefotetan contains not less than 960  $\mu$ g (potency) and not more than 1010  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefotetan is expressed as mass (potency) of cefotetan ( $C_{17}H_{17}N_7O_8S_4$ ).

**Description** Cefotetan occurs as white to light yellowish white powder.

It is sparingly soluble in methanol, and slightly soluble in water and in ethanol (99.5).

**Identification (1)** Determine the absorption spectrum of a solution of Cefotetan in phosphate buffer solution for antibiotics, pH 6.5 (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefotetan Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefotetan as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefotetan Reference Standard: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Dissolve 50 mg of Cefotetan in 0.5 mL of a solution of sodium hydrogen carbonate in heavy water for nuclear magnetic resonance spectroscopy (1 in 25). Determine the spectrum of this solution as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ), using sodium

3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A, B, C and D, at around  $\delta$ 3.6 ppm, at around  $\delta$ 4.0 ppm, at around  $\delta$ 5.1 ppm and at around  $\delta$ 5.2 ppm, respectively. The ratio of the integrated intensity of each signal, A:B:C:D, is about 3:3:1:1.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +112 – +124° (0.5 g calculated on the anhydrous basis, a solution of sodium hydrogen carbonate (1 in 200), 50 mL, 100 mm).

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cefotetan in 10 mL of a solution of sodium hydrogen carbonate (1 in 30): the solution is clear, and colorless or light yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cefotetan according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Weigh accurately about 0.1 g of Cefotetan, dissolve in a suitable amount of methanol, add exactly 2 mL of the internal standard solution and methanol to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 3 mg of 1-methyl-1*H*-tetrazole-5-thiol for liquid chromatography, previously dried in a desiccator (in vacuum, silica gel) for 2 hours, and about 2 mg of Cefotetan Reference Standard, calculated on the anhydrous basis, dissolve in methanol to make exactly 20 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution and methanol to make 20 mL, and use this solution as the standard solution. Perform the test with 5  $\mu$ L of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_{Ta}$ ,  $Q_{Tb}$ ,  $Q_{Tc}$ ,  $Q_{Td}$ ,  $Q_{Te}$  and  $Q_{Tf}$ , of the peak areas of 1-methyl-1*H*-tetrazole-5-thiol, cefotetan lactone having the relative retention time of about 0.5 with respect to cefotetan,  $\Delta_2$ -cefotetan having the relative retention time of about 1.2 with respect to cefotetan, isothiazole substance having the relative retention time of about 1.3 with respect to cefotetan, each of other related substances and the total of other related substances, to the peak area of the internal standard, respectively, obtained from the sample solution, and the ratios,  $Q_{Sa}$  and  $Q_{Sb}$ , of the peak areas of 1-methyl-1*H*-tetrazole-5-thiol and cefotetan, to the peak area of the internal standard, respectively, obtained from the standard solution. Calculate the amount of 1-methyl-1*H*-tetrazole-5-thiol, cefotetan lactone,  $\Delta_2$ -cefotetan, isothiazole substance, each of other related substances and the total of other related substances from the following equations: the amount of 1-methyl-1*H*-tetrazole-5-thiol is not more than 0.3%, cefotetan lactone is not more than 0.3%,  $\Delta_2$ -cefotetan is not more than 0.5%, isothiazole substance is not more than 0.5%, each of other related substances is not more than 0.2% and the total of other related substances is not more than 0.4%.

$$\begin{aligned} & \text{1-Methyl-1H-tetrazole-5-thiol (\%)} \\ & = (W_{Sa}/W_T) \times (Q_{Ta}/Q_{Sa}) \times (1/100) \end{aligned}$$

$$\begin{aligned} & \text{Cefotetan lactone (\%)} \\ & = (W_{Sb}/W_T) \times (Q_{Tb}/Q_{Sb}) \times (1/100) \end{aligned}$$

$$\begin{aligned} & \Delta_2\text{-Cefotetan (\%)} \\ & = (W_{Sb}/W_T) \times (Q_{Tc}/Q_{Sb}) \times (1/100) \end{aligned}$$

$$\text{Isothiazole substance (\%)}$$

$$= (W_{\text{sb}}/W_{\text{T}}) \times (Q_{\text{Td}}/Q_{\text{Sb}}) \times (1/100)$$

Each of other related substances (%)

$$= (W_{\text{sb}}/W_{\text{T}}) \times (Q_{\text{Te}}/Q_{\text{Sb}}) \times (1/100)$$

Total of other related substances (%)

$$= (W_{\text{sb}}/W_{\text{T}}) \times (Q_{\text{Tf}}/Q_{\text{Sb}}) \times (1/100)$$

$W_{\text{sa}}$ : Amount (mg) of 1-methyl-1*H*-tetrazole-5-thiol

$W_{\text{sb}}$ : Amount (mg) of Cefotetan Reference Standard, calculated on the anhydrous basis

$W_{\text{T}}$ : Amount (g) of the sample

**Internal standard solution**—A solution of anhydrous caffeine in methanol (3 in 10,000).

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3.5 times as long as the retention time of cefotetan.

**System suitability**—

Test for required detectability: Measure exactly 15 mL of the standard solution, and add methanol to make exactly 100 mL. Confirm that the peak area of cefotetan obtained from 5  $\mu\text{L}$  of this solution is equivalent to 12 to 18% of that from 5  $\mu\text{L}$  of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cefotetan to that of the internal standard is not more than 2.0%.

**Water** <2.48> Not more than 2.5% (1 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Isomer ratio** Dissolve 10 mg of Cefotetan in 20 mL of methanol, and use this solution as the sample solution. Perform the test with 5  $\mu\text{L}$  of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of the adjacent two peaks appeared at around the retention time of 40 minutes, one having shorter retention time is *l*-substance and another having longer retention time is *d*-substance, by the area percentage method: the amount of *l*-substance is not less than 35% and not more than 45%.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of 0.1 mol/L phosphate buffer solution, pH 7.0, water and a solution of tetrabutylammonium hydrogensulfate in acetonitrile (1 in 150) (9:9:2).

Flow rate: Adjust the flow rate so that the retention time of *l*-substance is about 40 minutes.

**System suitability**—

System performance: When the procedure is run with 5  $\mu\text{L}$

of the sample solution under the above operating conditions, *l*-substance and *d*-substance are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: To exactly 1 mL of the sample solution add methanol to make exactly 10 mL. When the test is repeated 6 times with 5  $\mu\text{L}$  of this solution under the above operating conditions, the relative standard deviation of the peak area of *l*-substance is not more than 5.0%.

**Assay** Weigh accurately an amount of Cefotetan and Cefotetan Reference Standard, equivalent to about 50 mg (potency), and dissolve each in phosphate buffer solution for antibiotics, pH 6.5 to make exactly 50 mL. Pipet 15 mL each of these solutions, add exactly 10 mL of the internal standard solution and phosphate buffer solution for antibiotics, pH 6.5 to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 5  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_{\text{T}}$  and  $Q_{\text{S}}$ , of the peak area of cefotetan to that of the internal standard.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of } \text{C}_{17}\text{H}_{17}\text{N}_7\text{O}_8\text{S}_4 \\ &= W_{\text{S}} \times (Q_{\text{T}}/Q_{\text{S}}) \times 1000 \end{aligned}$$

$W_{\text{S}}$ : Amount [mg (potency)] of Cefotetan Reference Standard

**Internal standard solution**—A solution of anhydrous caffeine (1 in 1000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 11.53 g of phosphoric acid in 1000 mL of water. To 850 mL of this solution add 50 mL of acetonitrile, 50 mL of acetic acid (100) and 50 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefotetan is about 17 minutes.

**System suitability**—

System performance: When the procedure is run with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the internal standard and cefotetan are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 5 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cefotetan to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and at a temperature not exceeding 5°C.

## Cefotiam Hexetil Hydrochloride

セフォチアム ヘキセチル塩酸塩

$C_{27}H_{37}N_9O_7S_3 \cdot 2HCl$ : 768.76

(1*R*,2*S*)-1-Cyclohexyloxyethoxyethyl (6*R*,7*R*)-7-[2-(2-aminothiazol-4-yl)acetamino]-3-[1-(2-dimethylaminoethyl)-1*H*-tetrazol-5-ylsulfanyl]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate dihydrochloride [95789-30-3]

Cefotiam Hexetil Hydrochloride contains not less than 615  $\mu$ g (potency) and not more than 690  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefotiam Hexetil Hydrochloride is expressed as mass (potency) of cefotiam ( $C_{18}H_{23}N_9O_4S_3$ : 525.63).

**Description** Cefotiam Hexetil Hydrochloride occurs as a white to light yellow powder.

It is very soluble in water, in methanol and in ethanol (95), freely soluble in dimethylsulfoxide, and slightly soluble in acetonitrile.

It dissolves in 0.1 mol/L hydrochloric acid TS.

It is hygroscopic.

**Identification (1)** Determine the absorption spectrum of a solution of Cefotiam Hexetil Hydrochloride in 0.1 mol/L hydrochloric acid TS (3 in 125,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefotiam Hexetil Hydrochloride Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the spectrum of a solution of Cefotiam Hexetil Hydrochloride in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 20) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits two single signals, A and B, at around  $\delta$ 2.8 ppm and at around  $\delta$ 6.6 ppm, and a multiple signal, C, at around  $\delta$ 6.9 ppm. The ratio of the integrated intensity of each signal, A:B:C, is about 6:1:1.

(3) To a solution of Cefotiam Hexetil Hydrochloride (1 in 200) add 2 mL of dilute nitric acid and 1 mL of silver nitrate TS, and mix: a white precipitate is formed.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +52 – +60° (0.1 g calculated on the anhydrous basis, 0.1 mol/L hydrochloric acid TS, 10 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of

Cefotiam Hexetil Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 2.0 g of Cefotiam Hexetil Hydrochloride according to Method 3, and perform the test, using a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 5) (not more than 1 ppm).

(3) Related substance 1—Weigh accurately about 50 mg of Cefotiam Hexetil Hydrochloride, and dissolve in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 50 mL. Pipet 10 mL of this solution, add a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Cefotiam Hexetil Hydrochloride Reference Standard, and dissolve in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 50 mL. Pipet 1 mL of this solution, add a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of the related substances by the following equation: the amount of the related substance having the relative retention time of about 1.2 to one of the peaks of cefotiam hexetil, which has the larger retention time, is not more than 2.0%, and each amount of the other related substances is not more than 0.5%. For this calculation, use the value of the peak area obtained by the automatic integration method of the related substance having the relative retention time of about 1.2 to one of the peaks of cefotiam hexetil, which has the larger retention time, after multiplying by its relative response factor, 0.78.

$$\text{Amount (\%)} \text{ of each related substance} \\ = (W_S/W_T) \times (A_T/A_S) \times 5$$

$W_S$ : Amount (g) of Cefotiam Hexetil Hydrochloride Reference Standard

$W_T$ : Amount (g) of sample

$A_S$ : Total of two peak areas of cefotiam hexetil from the standard solution

$A_T$ : Each peak area of related substance from the sample solution

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: A mixture of diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 2), acetonitrile and acetic acid (100) (72:28:1).

Mobile phase B: A mixture of acetonitrile, diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 2) and acetic acid (100) (60:40:1).

Flowing of the mobile phase: Adjust so that the mixing rate of the mobile phase A and the mobile phase B is changed linearly from 1:0 to 0:1 for 30 minutes.

Flow rate: 0.7 mL per minute.

Time span of measurement: As long as about 3 times of the retention time of one of the cefotiam hexetil peaks, which appears first, beginning after the solvent peak.

*System suitability*—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 50 mL. Confirm that each area of the two peaks of cefotiam hexetil obtained from 10  $\mu$ L of this solution is equivalent to 1.6 to 2.4% of that from 10  $\mu$ L of the standard solution.

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the resolution between the two peaks of cefotiam hexetil is not less than 2.0.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the total of the two peak areas of cefotiam hexetil is not more than 2.0%.

(4) Related substance 2—Weigh accurately about 20 mg of Cefotiam Hexetil Hydrochloride, dissolve in exactly 2 mL of methanol, add a mixture of a solution of diammonium hydrogen phosphate (79 in 20,000) and acetic acid (100) (200:3) to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Cefotiam Hydrochloride Reference Standard, and dissolve in the mobile phase to make exactly 50 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of the related substances by the following equation: the amounts of the related substances having the relative retention time of about 0.1 and 0.9 to cefotiam are not more than 1.0%, respectively, and each amount of the related substances other than the related substances having the relative retention time of about 0.1 and 0.9 to cefotiam is not more than 0.5%. For this calculation, use the value of the peak area of the related substance having the relative retention time of about 0.9 to cefotiam after multiplying by its sensitivity coefficient, 0.76.

$$\begin{aligned} &\text{Amount (\%)} \text{ of each related substance} \\ &= (W_S/W_T) \times (A_T/A_S) \times 4 \end{aligned}$$

$W_S$ : Amount (g) of Cefotiam Hydrochloride Reference Standard

$W_T$ : Amount (g) of the sample

$A_S$ : Peak area of cefotiam from the standard solution

$A_T$ : Each peak area from the sample solution

*Operating conditions*—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of a solution of diammonium hydrogen phosphate (79 in 20,000), methanol and acetic acid (100) (200:10:3).

Flow rate: Adjust the flow rate so that the retention time of cefotiam is about 15 minutes.

Time span of measurement: As long as about 2 times of the retention time of cefotiam beginning after the solvent peak.

*System suitability*—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of cefotiam obtained from 10  $\mu$ L of this solution is equivalent to 1.6 to 2.4% of that from 10  $\mu$ L of the standard solution.

System performance: To 1 mL of a solution of acetaminophen in the mobile phase (1 in 50,000) add 3 mL of the standard solution, and mix well. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, acetaminophen and cefotiam are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefotiam is not more than 2.0%.

(5) Total amount of related substances—The total of the amount of related substances obtained in the Related substance 1 and the Related substance 2 is not more than 6.5%.

**Water** <2.48> Not more than 3.5% (0.1 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Isomer ratio** Proceed the test with 20  $\mu$ L of the sample solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the conditions directed in the Assay, and determine the areas of the two peaks,  $A_a$  for the faster peak and  $A_b$  for the later peak, closely appeared each other at the retention time of around 10 minutes:  $A_a/(A_a + A_b)$  is not less than 0.45 and not more than 0.55.

**Assay** Weigh accurately an amount of Cefotiam Hexetil Hydrochloride and Cefotiam Hexetil Hydrochloride Reference Standard, equivalent to about 30 mg (potency), and dissolve each in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 50 mL. Measure exactly 5 mL each of these solutions, add exactly 5 mL of the internal standard solution and a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefotiam hexetil to that of the internal standard. For this calculation, the total of the areas of the two peaks appeared closely each other at the retention time of around 10 minutes is used as the peak area of cefotiam hexetil.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of cefotiam (C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3) \\ &= W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefotiam Hexetil Hydrochloride Reference Standard

*Internal standard solution*—A solution of benzoic acid in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) (7 in 10,000).

*Operating conditions*—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 2), acetonitrile and acetic acid (100) (72:28:1).

Flow rate: Adjust the flow rate so that the retention time of the faster peak of cefotiam hexetil is about 9 minutes.

*System suitability*—

System performance: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, the internal standard and cefotiam hexetil are eluted in this order with the resolution between the two peaks of cefotiam hexetil being not less than 2.0.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefotiam hexetil to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Cefotiam Hydrochloride

セフォチアム塩酸塩

$C_{18}H_{23}N_9O_4S_3 \cdot 2HCl$ : 598.55

(6*R*,7*R*)-7-[2-(2-Aminothiazol-4-yl)acetamino]-3-[1-(2-dimethylaminoethyl)-1*H*-tetrazol-5-ylsulfanylmethyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid dihydrochloride [66309-69-1]

Cefotiam Hydrochloride contains not less than 810  $\mu$ g (potency) and not more than 890  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefotiam Hydrochloride is expressed as mass (potency) of cefotiam ( $C_{18}H_{23}N_9O_4S_3$ : 525.63).

**Description** Cefotiam Hydrochloride occurs as white to light yellow, crystals or crystalline powder.

It is freely soluble in water, in methanol and in formamide, slightly soluble in ethanol (95), and practically insoluble in acetonitrile.

**Identification (1)** Determine the absorption spectrum of a solution of Cefotiam Hydrochloride (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefotiam Hydrochloride Reference Standard prepared in the same manner as the sample solu-

tion: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefotiam Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefotiam Hydrochloride Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefotiam Hydrochloride in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> (<sup>1</sup>H), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals at around  $\delta$  3.1 ppm and at around  $\delta$  6.7 ppm, respectively. The ratio of integrated intensity of each signal is about 6:1.

(4) Dissolve 0.1 g of Cefotiam Hydrochloride in 5 mL of dilute nitric acid, and immediately add 1 mL of silver nitrate TS: a white precipitate is formed.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +60 – +72° (1 g calculated on the anhydrous bases, water, 100 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefotiam Hydrochloride in 10 mL of water: the pH of the solution is between 1.2 and 1.7.

**Purity (1)** Clarity of solution—Dissolve 1.0 g of Cefotiam Hydrochloride in 10 mL of water: the solution is clear, and colorless to yellow.

(2) Heavy metals <1.07>—To 1.0 g of Cefotiam Hydrochloride add 1 mL of sulfuric acid, and heat gently to carbonize. After cooling, add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10), fire the ethanol to burn, then heat gradually to incinerate. If a carbonized residue still retains, moisten the residue with a little amount of sulfuric acid, and ignite again to incinerate. After cooling, add 2 mL of hydrochloric acid to the residue, heat on a water bath to dissolve, then heat to dryness. Add 10 mL of water, and heat to dissolve. After cooling, add ammonia TS dropwise to adjust to pH 3 – 4, if necessary, filter, wash the residue on the filter with 10 mL of water, transfer the filtrate and washings into a Nessler tube, add water to make 50 mL, and use this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution in the same manner as for preparation of the test solution (not more than 20 ppm).

(3) Arsenic <1.11>—Incinerate 1.0 g of Cefotiam Hydrochloride according to Method 4. After cooling, add 10 mL of dilute hydrochloric acid to the residue, heat to dissolve on the water bath, and use this solution as the test solution. Perform the test (not more than 2 ppm).

**Water** <2.48> Not more than 7.0% (0.25 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

**Assay** Weigh accurately an amount of Cefotiam Hydrochloride and Cefotiam Hydrochloride Reference Standard, equivalent to about 0.1 g (potency), and dissolve each in the mobile phase to make exactly 100 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with exactly 10  $\mu$ L each of the sample

solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak areas,  $A_T$  and  $A_S$ , of cefotiam of these solutions.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of cefotiam (C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3) \\ &= W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefotiam Hydrochloride Reference Standard

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.0 mm in inside diameter and 125 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** To 800 mL of 0.05 mol/L disodium hydrogenphosphate TS add 0.05 mol/L potassium dihydrogenphosphate TS to adjust the pH to 7.7. To 440 mL of this solution add 60 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of cefotiam is about 14 minutes.

**System suitability—**

**System performance:** Dissolve 0.04 g of orcine in 10 mL of the standard solution. When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, orcine and cefotiam are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefotiam is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

## Cefotiam Hydrochloride for Injection

注射用セフトリアム塩酸塩

Cefotiam Hydrochloride for Injection is a preparation for injection which is dissolved before use.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of cefotiam (C<sub>18</sub>H<sub>23</sub>N<sub>9</sub>O<sub>4</sub>S<sub>3</sub>: 525.63).

**Method of Preparation** Prepare as directed under Injection, with Cefotiam Hydrochloride.

**Description** Cefotiam Hydrochloride for Injection occurs as a white to light yellow powder.

**Identification (1)** Determine the absorption spectrum of a solution of Cefotiam Hydrochloride for Injection (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 257 nm and 261 nm.

(2) Dissolve 50 mg of Cefotiam Hydrochloride for Injection in 0.5 mL of heavy water for nuclear magnetic resonance spectroscopy, and determine the spectrum of this solution as

directed under Nuclear Magnetic Resonance Spectroscopy <2.21> (<sup>1</sup>H): it exhibits a single signal A between  $\delta$  2.7 ppm and  $\delta$  3.0 ppm, and a single signal B at around  $\delta$  6.5 ppm. The ratio of the integrated intensity of each signal, A:B, is about 6:1.

**pH <2.54>** The pH of a solution prepared by dissolving an amount of Cefotiam Hydrochloride for Injection, equivalent to 0.5 g (potency) according to the labeled amount, in 5 mL of water is between 5.7 and 7.2.

**Purity** Clarity and color of solution—Dissolve an amount of Cefotiam Hydrochloride for Injection, equivalent to 1.0 g (potency) of Cefotiam Hydrochloride according to the labeled potency, in 10 mL of water: the solution is clear, and the absorbance of this solution, determined at 450 nm 10 minutes after dissolving as directed under Ultraviolet-visible Spectrophotometry <2.24>, is not more than 0.20.

**Loss on drying <2.41>** Not more than 6.0% (0.5 g, in vacuum, 60°C, 3 hours).

**Bacterial endotoxins <4.01>** Less than 0.125 EU/mg (potency).

**Uniformity of dosage units <6.02>** It meets the requirement of the Mass variation test.

**Foreign insoluble matter <6.06>** Perform the test according to Method 2: it meets the requirement.

**Insoluble particulate matter <6.07>** Perform the test according to Method 1: it meets the requirement.

**Sterility <4.06>** Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Weigh accurately the contents of not less than 10 Cefotiam Hydrochloride for Injection. Weigh accurately an amount of the content, equivalent to about 50 mg (potency) of Cefotiam Hydrochloride according to the labeled amount, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg (potency) of Cefotiam Hydrochloride Reference Standard, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefotiam Hydrochloride.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of cefotiam (C}_{18}\text{H}_{23}\text{N}_9\text{O}_4\text{S}_3) \\ &= W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefotiam Hydrochloride Reference Standard

**Operating conditions—**

Proceed as directed in the Assay under Cefotiam Hydrochloride.

**System Suitability—**

Proceed as directed in the Assay under Cefotiam Hydrochloride.

**Containers and storage** Containers—Hermetic containers. Polyethylene or polypropylene containers for aqueous injections may be used.

## Cefozopran Hydrochloride

セフォゾプラン塩酸塩

$C_{19}H_{17}N_9O_5S_2 \cdot HCl$ : 551.99

(6*R*,7*R*)-7-[(*Z*)-2-(5-Amino-1,2,4-thiadiazol-3-yl)-2-(methoxyimino)acetylamino]-3-(1*H*-imidazo[1,2-*b*]pyridazin-4-ium-1-ylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate monohydrochloride [113359-04-9, Cefozopran]

Cefozopran Hydrochloride contains not less than 860  $\mu$ g (potency) and not more than 960  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefozopran Hydrochloride is expressed as mass (potency) of cefozopran ( $C_{19}H_{17}N_9O_5S_2$ : 515.53).

**Description** Cefozopran Hydrochloride occurs as a white to pale yellow, crystals or crystalline powder.

It is freely soluble in dimethylsulfoxide and in formamide, slightly soluble in water, in methanol and in ethanol (95), and practically insoluble in acetonitrile and diethylene.

**Identification (1)** Dissolve 0.02 g of Cefozopran Hydrochloride in 10 mL of water, add 1 mL of a solution of hydroxylammonium chloride (1 in 10) and 2 mL of sodium hydroxide TS, allow to stand for 5 minutes, then add 3 mL of 1 mol/L hydrochloric acid TS and 3 drops of iron (III) chloride TS, and mix: a red-purple color develops.

(2) Determine the absorption spectra of solutions of Cefozopran Hydrochloride and Cefozopran Hydrochloride Reference Standard in a mixture of sodium chloride TS and methanol (3:2) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the spectrum of a solution of Cefozopran Hydrochloride in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 20) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around  $\delta$  3.9 ppm, a double signal B at around  $\delta$  5.2 ppm, and a quartet signal C at around  $\delta$  8.0 ppm, and the ratio of integrated intensity of each signal, A:B:C, is about 3:1:1.

(4) Dissolve 0.01 g of Cefozopran Hydrochloride in 1 mL of water and 2 mL of acetic acid (100), add 2 drops of silver nitrate TS, and mix: a white turbidity is formed.

**Absorbance** <2.24>  $E_{1\text{ cm}}^{1\%}$  (238 nm): 455 – 485 (50 mg calculated on the anhydrous basis, a mixture of sodium chloride TS and methanol (3:2), 5000 mL).

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-73$  –  $-78^\circ$  (0.1 g calculated on the anhydrous basis, a mixture of sodium chloride TS and

methanol (3:2), 10 mL, 100 mm).

**Purity (1)** Clarity and color of solution—Being specified separately.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Cefozopran Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic—Being specified separately.

(4) Related substances—Being specified separately.

**Water** <2.48> Not more than 2.5% (0.5 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

**Residue on ignition** Being specified separately.

**Bacterial endotoxins** <4.01> Less than 0.05 EU/mg (potency).

**Assay** Weigh accurately an amount of Cefozopran Hydrochloride and Cefozopran Hydrochloride Reference Standard, equivalent to about 50 mg (potency), and dissolve each in the mobile phase to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 10 mL of the internal standard solution and the mobile phase to make 25 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefozopran to that of the internal standard of these solutions.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefozopran } (C_{19}H_{17}N_9O_5S_2) \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefozopran Hydrochloride Reference Standard

**Internal standard solution**—A solution of 2,4-dihydroxybenzoic acid in the mobile phase (1 in 1250).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Mix 0.366 g of diethylamine with water to make 1000 mL, and add 60 mL of acetonitrile and 5 mL of acetic acid (100).

**Flow rate:** Adjust the flow rate so that the retention time of cefozopran is about 9 minutes.

**System suitability**—

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, cefozopran and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefozopran to that of the internal standard is not

more than 1.0%.

**Containers and storage** Containers—Hermetic containers.  
Storage—Light-resistant.

## Cefozopran Hydrochloride for Injection

注射用セフォゾプラン塩酸塩

Cefozopran Hydrochloride for Injection is a preparation for injection which is dissolved before use.

It contains not less than 90.0% and not more than 115.0% of the labeled potency of cefozopran ( $C_{19}H_{17}N_9O_5S_2$ ; 515.53).

**Method of Preparation** Prepare as directed under the Injections, with Cefozopran Hydrochloride.

**Description** Cefozopran Hydrochloride for Injection occurs as a white to light yellow, powder or masses.

**Identification (1)** Determine the absorption spectrum of a solution of Cefozopran Hydrochloride for Injection (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 236 nm and 241 nm.

(2) To 50 mg of Cefozopran Hydrochloride for Injection add 0.8 mL of deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy, and filter after shaking, and determine the spectrum of the filtrate as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around  $\delta$  3.9 ppm, a double signal B at around  $\delta$  5.0 ppm, and a quartet signal C at around  $\delta$  8.0 ppm. The ratio of the integrated intensity of each signal, A:B:C, is about 3:1:1.

**pH** <2.54> Dissolve an amount of Cefozopran Hydrochloride for Injection, equivalent to 0.5 g (potency) of Cefozopran Hydrochloride according to the labeled amount, in 5 mL of water: the pH of this solution is between 7.5 and 9.0.

**Purity (1)** Clarity and color of solution—Dissolve an amount of Cefozopran Hydrochloride for Injection, equivalent to 1 g (potency) of Cefozopran Hydrochloride according to the labeled amount, in 10 mL of water: the solution is clear and has no more color than Matching Fluid N.

(2) Related substances—Being specified separately.

**Water** <2.48> Not more than 2.5% (0.5 g, volumetric titration, direct titration. Use a mixture of formamide for Karl Fischer method and methanol for Karl Fischer method (2:1) instead of methanol for Karl Fischer method).

**Bacterial endotoxins** <4.01> Less than 0.05 EU/mg (potency).

**Uniformity of dosage units** <6.02> It meets the requirement of the Mass variation test.

**Foreign insoluble matter** <6.06> Perform the test according to Method 2: it meets the requirement.

**Insoluble particulate matter** <6.07> Perform the test accord-

ing to Method 1: it meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Weigh accurately the mass of the contents of not less than 10 Cefozopran Hydrochloride for Injection. Weigh accurately an amount of the contents, equivalent to about 0.5 g (potency) of Cefozopran Hydrochloride according to the labeled amount, and add water to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution, add the mobile phase to make 25 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefozopran Hydrochloride Reference Standard, equivalent to about 50 mg (potency), and dissolve in the mobile phase to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add the mobile phase to make 25 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefozopran Hydrochloride.

$$\text{Amount [mg (potency)] of cefozopran (C}_{19}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_2) \\ = W_S \times (Q_T/Q_S) \times 10$$

$W_S$ : Amount [mg (potency)] of Cefozopran Hydrochloride Reference Standard

**Internal standard solution**—A solution 2,4-dihydroxybenzoic acid in the mobile phase (1 in 1250).

**Containers and storage** Containers—Hermetic containers. Polyethylene or polypropylene containers for aqueous injections may be used.

Storage—Light-resistant.

## Cefpiramide Sodium

セフピラミドナトリウム

$C_{25}H_{23}N_8NaO_7S_2$ ; 634.62

Monosodium (6*R*,7*R*)-7-[(2*R*)-2-[(4-hydroxy-6-methylpyridine-3-carbonyl)amino]-2-(4-hydroxyphenyl)acetamino]-3-(1-methyl-1*H*-tetrazol-5-ylsulfanylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [74849-93-7]

Cefpiramide Sodium contains not less than 900  $\mu$ g (potency) and not more than 990  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefpiramide Sodium is expressed as mass (potency) of cefpiramide ( $C_{25}H_{24}N_8O_7S_2$ ; 612.64).

**Description** Cefpiramide Sodium occurs as white to yellowish white powder.

It is very soluble in dimethylsulfoxide, freely soluble in water, sparingly soluble in methanol, and slightly soluble in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a

solution of Cefpiramide Sodium in 0.05 mol/L phosphate buffer solution, pH 7.0 (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the spectrum of a solution of Cefpiramide Sodium in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> (<sup>1</sup>H), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A, B and C, at around δ2.3 ppm, at around δ3.9 ppm and at around δ8.2 ppm, respectively. The ratio of the integrated intensity of each signal, A:B:C, is about 3:3:1.

(3) Cefpiramide Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-33 - -40^\circ$  (0.2 g calculated on the anhydrous basis, 0.05 mol/L phosphate buffer solution, pH 7.0, 10 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 2.0 g of Cefpiramide Sodium in 20 mL of water is between 5.5 and 8.0.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Cefpiramide Sodium in 10 mL of 0.05 mol/L phosphate buffer solution, pH 7.0: the solution is clear, and colorless or light yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cefpiramide Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Weigh accurately about 25 mg of Cefpiramide Sodium, dissolve in 0.03 mol/L phosphate buffer solution, pH 7.5 to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of 1-methyl-1*H*-tetrazole-5-thiol for liquid chromatography, previously dried in a desiccator (in vacuum, silica gel) for 2 hours, and an amount of Cefpiramide Reference Standard, equivalent to about 75 mg (potency), dissolve them in 0.03 mol/L phosphate buffer solution, pH 7.5 to make exactly 100 mL. Pipet 2 mL of this solution, add 0.03 mol/L phosphate buffer solution, pH 7.5 to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of 1-methyl-1*H*-tetrazole-5-thiol, each of the other related substances and the total of the other related substances by the following equations: the amount of 1-methyl-1*H*-tetrazole-5-thiol, each of the other related substances and the total of the other related substances are not more than 1.0 %, not more than 1.5% and not more than 4.0%, respectively.

$$\begin{aligned} \text{Amount (\%)} \text{ of 1-methyl-1}H\text{-tetrazole-5-thiol (C}_2\text{H}_4\text{N}_4\text{S)} \\ = (W_{\text{Sa}}/W_{\text{T}}) \times (A_{\text{Ta}}/A_{\text{Sa}}) \end{aligned}$$

$$\begin{aligned} \text{Amount (\%)} \text{ of each of other related substances} \\ = (W_{\text{Sb}}/W_{\text{T}}) \times (A_{\text{Tc}}/A_{\text{Sb}}) \end{aligned}$$

$W_{\text{Sa}}$ : Amount (mg) of 1-methyl-1*H*-tetrazole-5-thiol

$W_{\text{Sb}}$ : Amount [mg (potency)] of Cefpiramide Reference Standard

$W_{\text{T}}$ : Amount (mg) of the sample

$A_{\text{Sa}}$ : Peak area of 1-methyl-1*H*-tetrazole-5-thiol from the standard solution

$A_{\text{Sb}}$ : Peak area of cefpiramide from the standard solution

$A_{\text{Ta}}$ : Peak area of 1-methyl-1*H*-tetrazole-5-thiol from the sample solution

$A_{\text{Tc}}$ : Area of each peak other than 1-methyl-1*H*-tetrazole-5-thiol and cefpiramide from the sample solution

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.03 mol/L phosphate buffer solution, pH 7.5 and methanol (3:1).

Flow rate: Adjust the flow rate so that the retention time of cefpiramide is about 11 minutes.

Time span of measurement: About 2 times as long as the retention time of cefpiramide.

**System suitability**—

Test for required detectability: Measure exactly 5 mL of the standard solution, and add 0.03 mol/L phosphate buffer solution, pH 7.5 to make exactly 50 mL. Confirm that the peak area of 1-methyl-1*H*-tetrazole-5-thiol obtained from 5 μL of this solution is equivalent to 8 to 12% of that from 5 μL of the standard solution.

System performance: Dissolve 25 mg of Cefpiramide Reference Standard and 7 mg of cinnamic acid in the mobile phase to make 50 mL. When the procedure is run with 5 μL of this solution under the above operating conditions, cinnamic acid and cefpiramide are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of 1-methyl-1*H*-tetrazole-5-thiol is not more than 2.0%.

**Water** <2.48> Not more than 7.0% (0.35 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefpiramide Sodium and Cefpiramide Reference Standard, equivalent to about 50 mg (potency), add exactly 5 mL of the internal standard solution to dissolve, then add the mobile phase to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_{\text{T}}$  and  $Q_{\text{S}}$ , of the peak area of cefpiramide to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefpiramide (C}_2\text{H}_4\text{N}_4\text{O}_7\text{S}_2) \\ = W_{\text{S}} \times (Q_{\text{T}}/Q_{\text{S}}) \times 1000 \end{aligned}$$

$W_{\text{S}}$ : Amount [mg (potency)] of Cefpiramide Reference Standard

**Internal standard solution**—A solution of 4-dimethylaminoantipyrine (1 in 100).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octylsilylated silica gel for liquid chromatography (10  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.01 mol/L phosphate buffer solution, pH 6.8, acetonitrile, methanol and tetrahydrofuran (22:1:1:1).

Flow rate: Adjust the flow rate so that the retention time of cefpiramide is about 7 minutes.

*System suitability*—

System performance: When the procedure is run with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, cefpiramide and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cefpiramide to that of the internal standard is not more than 2.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and at a temperature not exceeding 5°C.

## Cefpirome Sulfate

セフピロム硫酸塩

$\text{C}_{22}\text{H}_{22}\text{N}_6\text{O}_5\text{S}_2 \cdot \text{H}_2\text{SO}_4$ : 612.66

(6*R*,7*R*)-7-[(*Z*)-2-(2-Aminothiazol-4-yl)-2-(methoxyimino)acetylamino]-3-(6,7-dihydro-5*H*-cyclopenta[*b*]pyridinium-1-ylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate monosulfate [98753-19-6]

Cefpirome Sulfate contains not less than 760  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Cefpirome Sulfate is expressed as mass (potency) of cefpirome ( $\text{C}_{22}\text{H}_{22}\text{N}_6\text{O}_5\text{S}_2$ : 514.58).

**Description** Cefpirome Sulfate occurs as a white to pale yellowish white crystalline powder, and has a slight, characteristic odor.

It is soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

It is hygroscopic.

**Identification** (1) Dissolve 10 mg of Cefpirome Sulfate in 2 mL of water, add 3 mL of hydroxylammonium hydrochloride-ethanol TS, allow to stand for 5 minutes, add 1 mL of acidic ammonium iron (III) sulfate TS, and shake: a red-brown color develops.

(2) Dissolve 1 mg of Cefpirome Sulfate in 4 mL of water, add 1 mL of dilute hydrochloric acid while cooling in ice, add 1 mL of a freshly prepared solution of sodium nitrite (1 in

100), and allow to stand for 2 minutes. Add 1 mL of ammonium amidosulfuric acid TS while cooling in ice bath, allow to stand for 1 minute, and add 1 mL of a solution of *N*-1-naphthylethylene dihydrochloride (1 in 1000): a purple color develops.

(3) Take 5 mg of Cefpirome Sulfate, dissolve in 1 mL of ethanol (95) and 1 mL of water, add 100 mg of 1-chloro-2,4-dinitrobenzene, and heat on a water bath for 5 minutes. After cooling, add 2 or 3 drops of a solution of sodium hydroxide (1 in 10) and 3 mL of ethanol (95): a red-brown color develops.

(4) Determine the absorption spectra of solutions of Cefpirome Sulfate and Cefpirome Sulfate Reference Standard in 0.01 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectra: both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) Determine the spectrum of a solution of Cefpirome Sulfate in heavy water for nuclear magnetic resonance spectroscopy (1 in 25) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around  $\delta$  4.1 ppm, a double signal B at around  $\delta$  5.9 ppm, a single signal C at around  $\delta$  7.1 ppm, and a multiple signal D at around  $\delta$  7.8 ppm. The ratio of integrated intensity of each signal, A:B:C:D, is about 3:1:1:1.

(6) A solution of Cefpirome Sulfate (1 in 250) responds to the Qualitative Tests <1.09> (1) for sulfate salt.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (270 nm): 405 – 435 (50 mg calculated on the anhydrous basis, 0.01 mol/L hydrochloric acid TS, 2500 mL).

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ : –27 – –33° (50 mg calculated on the anhydrous basis, a solution prepared by addition of water to 25 mL of acetonitrile to make 50 mL, 20 mL, 100 mm).

**pH** <2.54> Dissolve 0.1 g of Cefpirome Sulfate in 10 mL of water: the pH of the solution is between 1.6 and 2.6.

**Purity** (1) Clarity and color of solution—Being specified separately.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cefpirome Sulfate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic—Being specified separately.

(4) Related substances—Being specified separately.

(5) Residual solvents—Being specified separately.

**Water** <2.48> Not more than 2.5% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** Being specified separately.

**Bacterial endotoxins** <4.01> Less than 0.10 EU/mg (potency).

**Assay** Weigh accurately an amount of Cefpirome Sulfate and Cefpirome Sulfate Reference Standard, equivalent to about 50 mg (potency), dissolve each in water to make exactly 100 mL. Pipet 5 mL of these solutions, add each in water to make exactly 20 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 20

$\mu\text{L}$  of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak areas,  $A_T$  and  $A_S$ , of cefpirome of each solution.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefpirome (C}_{22}\text{H}_{22}\text{N}_6\text{O}_5\text{S}_2) \\ = W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefpirome Sulfate Reference Standard

#### Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 3.45 g of ammonium dihydrogenphosphate in 1000 mL of water, and adjust the pH to 3.3 with phosphoric acid. To 800 mL of this solution add 100 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefpirome is about 7.5 minutes.

#### System suitability—

System performance: When the procedure is run with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates of the peak of cefpirome is not less than 3600.

System repeatability: When the test is repeated 5 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefpirome is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

Storage—At a temperature between 2 and 8°C.

## Cefpodoxime Proxetil

セフポドキシム プロキシセチル

$\text{C}_{21}\text{H}_{27}\text{N}_5\text{O}_9\text{S}_2$ ; 557.60

(1*RS*)-1-[(1-Methylethyl)carbonyloxy]ethyl  
(6*R*,7*R*)-7-[(*Z*)-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetylamino]-3-methoxymethyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate  
[87239-81-4]

Cefpodoxime Proxetil contains not less than 706  $\mu\text{g}$  (potency) and not more than 774  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Cefpodoxime Proxetil is expressed as mass (potency) of cefpodoxime ( $\text{C}_{15}\text{H}_{17}\text{N}_5\text{O}_6\text{S}_2$ ; 427.46).

**Description** Cefpodoxime Proxetil occurs as a white to light

brownish white powder.

It is very soluble in acetonitrile, in methanol and in chloroform, freely soluble in ethanol (99.5), and very slightly soluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Cefpodoxime Proxetil in acetonitrile (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefpodoxime Proxetil Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefpodoxime Proxetil as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefpodoxime Proxetil Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefpodoxime Proxetil in deuteriochloroform for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> (<sup>1</sup>H), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits double signals, A and B, at around  $\delta$ 1.3 ppm and at around  $\delta$ 1.6 ppm, and single signals, C and D, at around  $\delta$ 3.3 ppm and at around  $\delta$ 4.0 ppm. The ratio of the integrated intensity of these signals, A:B:C:D, is about 2:1:1:1.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +24.0 – +31.4° (0.1 g calculated on the anhydrous basis, acetonitrile, 20 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Cefpodoxime Proxetil according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Cefpodoxime Proxetil in 50 mL of a mixture of water, acetonitrile and acetic acid (100) (99:99:2), and use this solution as the sample solution. Perform the test with 20  $\mu\text{L}$  of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. If necessary, perform the test in the same manner with 20  $\mu\text{L}$  of the mixture of water, acetonitrile and acetic acid (100) (99:99:2) to compensate for the base line. Determine each peak area by the automatic integration method, and calculate the amounts of them by the area percentage method: the peak, having the relative retention time of about 0.8 with respect to the isomer B of cefpodoxime proxetil, is not more than 2.0%, the peak other than cefpodoxime proxetil is not more than 1.0%, and the sum of the peaks other than cefpodoxime proxetil is not more than 6.0%.

#### Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 22°C.

Mobile phase A: A mixture of water, methanol and a solu-

tion of formic acid (1 in 50) (11:8:1).

Mobile phase B: A mixture of methanol and a solution of formic acid (1 in 50) (19:1).

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 – 65	95	5
65 – 145	95 → 15	5 → 85
145 – 155	15	85

Flow rate: Adjust the flow rate so that the retention time of the isomer B of cefpodoxime proxetil is about 60 minutes.

Time span of measurement: About 2.5 times as long as the retention time of the isomer B of cefpodoxime proxetil beginning after the solvent peak.

*System suitability*—

Test for required detectability: Measure exactly 5 mL of the sample solution, add the mixture of water, acetonitrile and acetic acid (100) (99:99:2) to make exactly 200 mL, and use this solution as the solution for required detectability test. Pipet 2 mL of the solution for required detectability test, and add the mixture of water, acetonitrile and acetic acid (100) (99:99:2) to make exactly 100 mL. Confirm that the peak areas of the isomer A and the isomer B of cefpodoxime proxetil obtained from 20  $\mu$ L of this solution are equivalent to 1.4 to 2.6% of them from 20  $\mu$ L of the solution for required detectability test, respectively.

System performance: Dissolve 1 mg of Cefpodoxime Proxetil in 100 mL of the mixture of water, acetonitrile and acetic acid (100) (99:99:2). When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, the isomer A and the isomer B of cefpodoxime proxetil are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: Dissolve 1 mg of Cefpodoxime Proxetil in 100 mL of the mixture of water, acetonitrile and acetic acid (100) (99:99:2). When the test is repeated 5 times with 20  $\mu$ L of this solution under the above operating conditions, the relative standard deviations of the peak areas of the isomer A and the isomer B are not more than 2.0%, respectively.

**Water** <2.48> Not more than 2.5% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Isomer ratio** Perform the test with 5  $\mu$ L of the sample solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_a$  and  $A_b$ , of the two isomers of cefpodoxime proxetil, having the smaller and larger retention times, respectively, by the automatic integration method:  $A_b/(A_a + A_b)$  is between 0.50 and 0.60.

*Operating conditions*—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

*System suitability*—

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

**Assay** Weigh accurately an amount of Cefpodoxime Prox-

etil and Cefpodoxime Proxetil Reference Standard, equivalent to about 60 mg (potency), dissolve in 80 mL of acetonitrile, add exactly 4 mL of the internal standard solution, add acetonitrile to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_{T1}$ ,  $Q_{S1}$ ,  $Q_{T2}$  and  $Q_{S2}$ , of the areas of the two peaks of the isomers of cefpodoxime proxetil to the peak area of the internal standard.

$$\text{Amount } [\mu\text{g (potency)}] \text{ of cefpodoxime (C}_{15}\text{H}_{17}\text{N}_5\text{O}_6\text{S}_2) \\ = W_S \times \{(Q_{T1} + Q_{T2}) / (Q_{S1} + Q_{S2})\} \times 1000$$

$W_S$ : Amount [mg (potency)] of Cefpodoxime Proxetil Reference Standard

*Internal standard solution*—Dissolve 0.3 g of ethyl parahydroxybenzoate in a solution of citric acid in acetonitrile (1 in 2000) to make 100 mL.

*Operating conditions*—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of water and methanol (11:9).

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 11 minutes.

*System suitability*—

System performance: When the procedure is run with 5  $\mu$ L of the standard solution under the above operating conditions, the internal standard, the isomer A and the isomer B are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 5 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of the isomer B of cefpodoxime proxetil to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Cefroxadine Hydrate

セフロキサジン水和物

$\text{C}_{16}\text{H}_{19}\text{N}_5\text{O}_5\text{S} \cdot 2\text{H}_2\text{O}$ : 401.43

(6*R*,7*R*)-7-[(2*R*)-2-Amino-2-cyclohexa-1,4-dienylacetylamino]-3-methoxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid dihydrate [51762-05-1, anhydride]

Cefroxadine Hydrate contains not less than 930  $\mu$ g

(potency) and not more than 1020  $\mu\text{g}$  (potency) per mg, calculated on the dehydrated basis. The potency of Cefroxadine Hydrate is expressed as mass (potency) of cefroxadine ( $\text{C}_{16}\text{H}_{19}\text{N}_3\text{O}_5\text{S}$ : 365.40).

**Description** Cefroxadine Hydrate occurs as pale yellowish white to light yellow, crystalline particles or powder.

It is very soluble in formic acid, slightly soluble in water and in methanol, and very slightly soluble in acetonitrile and in ethanol (95).

It dissolves in 0.001 mol/L hydrochloric acid TS and in dilute acetic acid.

**Identification (1)** Determine the absorption spectrum of a solution of Cefroxadine Hydrate in 0.001 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefroxadine Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the spectrum of a solution of Cefroxadine Hydrate in deuterated formic acid for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits three sharp single signals, A, B and C, at around  $\delta 2.8$  ppm, at around  $\delta 4.1$  ppm and at around  $\delta 6.3$  ppm. The ratio of the integrated intensity of each signal, A:B:C, is about 4:3:1.

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ : +95 – +108° (0.1 g calculated on the dehydrated basis, diluted acetic acid (100) (3 in 25), 100 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Weigh 1.0 g of Cefroxadine Hydrate in a porcelain crucible, add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10), mix, burn the ethanol, and carbonize by gently heating. After cooling, add 2 mL of nitric acid, heat carefully, and incinerate by ignition at 500 – 600°C. If a carbonized substance is still remained, moisten it with a small amount of nitric acid, and incinerate again by ignition. After cooling, add 6 mL of hydrochloric acid, and evaporate on a water bath to dryness. Moisten the residue with 3 drops of hydrochloric acid, and add 10 mL of hot water to dissolve the residue by heating on a water bath. After cooling, adjust the pH between 3 and 4 with ammonia TS, add 2 mL of dilute acetic acid, filter if necessary, transfer to a Nessler tube, wash the crucible with 10 mL of water, and add the washing and water to the tube to make 50 mL. Perform the test with this solution. Prepare the control solution as follows: Put 2.0 mL of Standard Lead Solution and 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) in a porcelain crucible, and proceed as directed for the preparation of the test solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefroxadine Hydrate according to Method 4, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 10 mg of Cefroxadine Hydrate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 40  $\mu\text{L}$  each of the sample solution and standard solution

as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area obtained from the chromatograms of these solutions by the automatic integration method: the areas of the peaks appeared at the relative retention times of 0.07, 0.6 and 0.8 against the peak of cefroxadine from the sample solution are not more than 2 times, 4 times and 1 time of the peak area of cefroxadine from the standard solution, respectively, and any peak area other than cefroxadine and other than the peaks mentioned above from the sample solution is not more than 1/2 of the peak area of cefroxadine from the standard solution, and the total area of the peaks other than cefroxadine from the sample solution is not more than 6 times of the peak area of cefroxadine from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 1.4 g of sodium perchlorate in 1000 mL of a mixture of water and acetonitrile (489:11).

Flow rate: Adjust the flow rate so that the retention time of cefroxadine is about 20 minutes.

Time span of measurement: About 2 times as long as the retention time of cefroxadine.

**System suitability**—

Test for required detectability: Measure exactly 2 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of cefroxadine obtained from 40  $\mu\text{L}$  of this solution is equivalent to 7 to 13% of that obtained from 40  $\mu\text{L}$  of the standard solution.

System performance: Dissolve 3 mg of Cefroxadine Hydrate and 15 mg of orcin in 100 mL of the mobile phase. When the procedure is run with 40  $\mu\text{L}$  of this solution under the above operating conditions, orcin and cefroxadine are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 40  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefroxadine is not more than 2.0%.

**Water** <2.48> Not less than 8.5% and not more than 12.0% (0.1 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefroxadine Hydrate and Cefroxadine Reference Standard, equivalent to about 50 mg (potency), dissolve each in a suitable amount of a mixture of dilute acetic acid and phosphoric acid (500:1), add exactly 5 mL of the internal standard solution and a mixture of dilute acetic acid and phosphoric acid (500:1) to make 200 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_{\text{T}}$  and  $Q_{\text{S}}$ , of the peak area of cefroxadine to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefroxadine } (\text{C}_{16}\text{H}_{19}\text{N}_3\text{O}_5\text{S}) \\ = W_{\text{S}} \times (Q_{\text{T}}/Q_{\text{S}}) \times 1000 \end{aligned}$$

$W_s$ : Amount [mg (potency)] of Cefroxadine Reference Standard

**Internal standard solution**—Dissolve 1.6 g of vanillin in 5 mL of methanol, and add a mixture of dilute acetic acid and phosphoric acid (500:1) to make 100 mL.

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 25°C.

**Mobile phase**: A mixture of a solution of ammonium sulfate (1 in 50) and acetonitrile (97:3).

**Flow rate**: Adjust the flow rate so that the retention time of cefroxadine is about 10 minutes.

**System suitability**—

**System performance**: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, cefroxadine and the internal standard are eluted in this order with the resolution between these peaks being not less than 1.5.

**System repeatability**: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak areas of cefroxadine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Cefsulodin Sodium

セフスロジンナトリウム

$C_{22}H_{19}N_4NaO_8S_2$ : 554.53

Monosodium (6*R*,7*R*)-3-(4-carbamoylpyridinium-1-ylmethyl)-8-oxo-7-[(2*R*)-2-phenyl-2-sulfonatoacetyl-amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [52152-93-9]

Cefsulodin Sodium contains not less than 900  $\mu$ g (potency) and not more than 970  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefsulodin Sodium is expressed as mass (potency) of cefsulodin ( $C_{22}H_{20}N_4O_8S_2$ : 532.55).

**Description** Cefsulodin Sodium occurs as white to light yellow, crystals or crystalline powder.

It is freely soluble in water and in formamide, slightly soluble in methanol, and very slightly soluble in ethanol (95).

It is hygroscopic.

**Identification** (1) Determine the absorption spectrum of a solution of Cefsulodin Sodium (1 in 50,000) as directed under

Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefsulodin Sodium Reference Standard prepared in the same manner as sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefsulodin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefsulodin Sodium Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefsulodin Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a multiple signal A between  $\delta$  7.3 ppm and  $\delta$  7.7 ppm, and double signals, B and C, at around  $\delta$  8.4 ppm and at around  $\delta$  9.1 ppm, respectively. The ratio of integrated intensity of these signals, A:B:C, is about 5:2:2.

(4) Cefsulodin Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +16.5 – +20.0° (0.1 g calculated on the anhydrous basis, water, 10 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefsulodin Sodium in 10 mL of water: the pH of the solution is not less than 3.3 and not more than 4.8.

**Purity** (1) Clarity of solution—Dissolve 1.0 g of Cefsulodin Sodium in 10 mL of water: the solution is clear.

(2) Heavy metals <1.07>—To 1.0 g of Cefsulodin Sodium add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 5), mix, fire the ethanol to burn, then heat gradually to carbonize. After cooling, add 2 mL of nitric acid, heat carefully, then heat at 500 – 600°C to incinerate. If a carbonized residue still retains, add a little amount of nitric acid, and heat again to incinerate. After cooling, add 6 mL of hydrochloric acid to the residue, heat to dryness on a water bath, then moisten the residue with 3 drops of hydrochloric acid, add 10 mL of hot water, and heat on a water bath to dissolve. Add ammonia TS dropwise to adjust to pH 3 – 4, and add 2 mL of dilute acetic acid. If necessary, filter, wash the crucible and residue on the filter with 10 mL of water, transfer the filtrate and washings into a Nessler tube, add water to make 50 mL, and use this solution as the test solution. Prepare the control solution as follows: To 2.0 mL of Standard Lead Solution add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 5), fire the ethanol to burn. After cooling, add 2 mL of nitric acid, heat carefully, then heat at 500 – 600°C. After cooling, add 6 mL of hydrochloric acid, then proceed in the same manner as for the preparation of the test solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefsulodin Sodium according to Method 3, using a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 5) and 15 mL of dilute hydrochloric acid instead of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 50) and 3 mL of hydrochloric acid, and perform the test (not more than 2 ppm).

(4) Related substances—Weigh accurately about 0.10 g of Cefsulodin Sodium, dissolve in water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of isonicotinic acid amide and about 20 mg of Cefsulodin Sodium Reference Standard (separately determine the water <2.48> in the same manner as Cefsulodin Sodium), and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the areas of each peak by the automatic integration method. Calculate the amount of the related substances by the following formula: the amount of isonicotinic acid amide is not more than 1.0%, and the total of other related substances is not more than 1.2%.

$$\begin{aligned} \text{Amount (\%)} \text{ of isonicotinic acid amide} \\ = (A/B_1) \times (W_1/W_T) \times 5 \end{aligned}$$

$$\begin{aligned} \text{Total amount (\%)} \text{ of the other related substances} \\ = (B/B_S) \times (W_S/W_T) \times 5 \end{aligned}$$

*A*: Peak area of isonicotinic acid amide from the sample solution

*B*: Total peak area other than cefsulodin and other than isonicotinic acid amide from the sample solution

*B*<sub>1</sub>: Peak area of isonicotinic acid amide from the standard solution

*B*<sub>S</sub>: Peak area of cefsulodin from the standard solution

*W*<sub>T</sub>: Amount (g) of the sample

*W*<sub>S</sub>: Amount (g) of Cefsulodin Sodium Reference Standard

*W*<sub>1</sub>: Amount (g) of isonicotinic acid amide

*Operating conditions—*

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase A:** A mixture of a solution of ammonium sulfate (1 in 100) and acetonitrile (97:3).

**Mobile phase B:** A mixture of a solution of ammonium sulfate (1 in 100) and acetonitrile (92:8).

**Flowing of the mobile phase:** Change the mobile phase A to B at 14 minutes after the injection of sample.

**Flow rate:** Adjust the flow rate so that the retention time of cefsulodin is about 9 minutes.

**Time span of measurement:** About 4 times as long as the retention time of cefsulodin.

*System suitability—*

**Test for required detection:** Pipet 1 mL of the standard solution, add water to make exactly 10 mL. Confirm that the peak areas of isonicotinic acid amide and cefsulodin obtained from 10  $\mu$ L of this solution are equivalent to 7 to 13% of those of isonicotinic acid amide and cefsulodin obtained from 10  $\mu$ L of the standard solution.

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, isonicotinic acid amide and cefsulodin are eluted in this order with the resolution between these peaks being not less

than 5.

**System repeatability:** When the test is repeated 5 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefsulodin is not more than 1.0%.

**Water <2.48>** Not more than 5.0% (1 g, volumetric titration, direct titration, avoiding moisture absorption of the sample, using a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

**Assay** Weigh accurately an amount of Cefsulodin Sodium and Cefsulodin Sodium Reference Standard, equivalent to about 0.1 g (potency), dissolve each in water to make exactly 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak areas, *A*<sub>T</sub> and *A*<sub>S</sub>, of cefsulodin of each solution.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefsulodin (C}_{22}\text{H}_{20}\text{N}_4\text{O}_8\text{S}_2) \\ = W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

*W*<sub>S</sub>: Amount [mg (potency)] of Cefsulodin Sodium Reference Standard

*Operating conditions—*

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of a solution of ammonium sulfate (1 in 100) and acetonitrile (97:3).

**Flow rate:** Adjust the flow rate so that the retention time of cefsulodin is about 9 minutes.

*System suitability—*

**System performance:** Dissolve 40 mg of isonicotinic acid amide in 25 mL of the standard solution. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, isonicotinic acid amide and cefsulodin are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 5 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefsulodin is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

## Cefotaxime Hydrate

セフトアジジム水和物

$C_{22}H_{22}N_6O_7S_2 \cdot 5H_2O$ : 636.65

(6*R*,7*R*)-7-[(*Z*)-2-(2-Aminothiazol-4-yl)-2-(1-carboxy-1-methylethoxyimino)acetyl-amino]-3-(pyridinium-1-ylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate pentahydrate [78439-06-2]

Cefotaxime Hydrate contains not less than 950  $\mu$ g (potency) and not more than 1020  $\mu$ g (potency) per mg, calculated on the dried basis. The potency of Cefotaxime Hydrate is expressed as mass (potency) of cefotaxime ( $C_{22}H_{22}N_6O_7S_2$ : 546.58).

**Description** Cefotaxime Hydrate occurs as a white to light yellowish white crystalline powder.

It is slightly soluble in water, and very slightly soluble in acetonitrile and in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Cefotaxime Hydrate in phosphate buffer solution, pH 6.0 (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefotaxime Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefotaxime Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefotaxime Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 0.05 g of Cefotaxime Hydrate add 5 mg of dried sodium carbonate, and add 0.5 mL of heavy water for nuclear magnetic resonance spectroscopy to dissolve. Determine the spectrum of this solution as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A and B, at around  $\delta$  1.5 ppm and at around  $\delta$  6.9 ppm, and a multiple signal C between  $\delta$  7.9 ppm and  $\delta$  9.2 ppm. The ratio of integrated intensity of each signal, A:B:C, is about 6:1:5.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-28 - -34^\circ$  (0.5 g calculated on the dried bases, phosphate buffer solution, pH 6.0, 100 mL, 100 mm).

**pH** <2.54> Dissolve 0.5 g of Cefotaxime Hydrate in 100 mL of water: the pH of the solution is between 3.0 and 4.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of

Cefotaxime Hydrate in 10 mL of a solution obtained by dissolving 5 g of anhydrous disodium hydrogenphosphate and 1 g of potassium dihydrogenphosphate in water to make 100 mL: the solution is clear, and its absorbance <2.24> at 420 nm is not more than 0.20.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cefotaxime Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefotaxime Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances (i) Trityl-*t*-butyl substance and *t*-butyl substance—Dissolve 0.10 g of Cefotaxime Hydrate in 2 mL of diluted disodium hydrogenphosphate TS (1 in 3), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add diluted disodium hydrogenphosphate TS (1 in 3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop with a mixture of *n*-butyl acetate, acetic acid (100), acetate buffer solution, pH 4.5 and 1-butanol (16:16:13:3) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots which appear upper in position than the principal spot from the sample solution are not more intense than the spot from the standard solution.

(ii) Other related substances—Dissolve 20 mg of Cefotaxime Hydrate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the areas of each peak by the automatic integration method: each peak area other than cefotaxime from the sample solution is not more than that of cefotaxime from the standard solution, and the total of peak areas other than cefotaxime from the sample solution is not more than 5 times of the peak area of cefotaxime from the standard solution.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 5.0 g of ammonium dihydrogenphosphate in 750 mL of water, adjust to pH 3.5 with phosphoric acid, and add water to make 870 mL. To this solution add 130 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of cefotaxime is about 4 minutes.

**Time span of measurement:** About 3 times as long as the retention time of cefotaxime beginning after the solvent peak.

**System suitability**—

Test for required detection: Pipet 1 mL of the standard so-

lution, add the mobile phase to make exactly 5 mL, and confirm that the peak area of cefotaxime obtained from 5  $\mu$ L of this solution is equivalent to 15 to 25% of that of cefotaxime obtained from 5  $\mu$ L of the standard solution.

**System performance:** Dissolve about 0.01 g each of Cefotaxime Hydrate and acetanilide in 20 mL of the mobile phase. When the procedure is run with 5  $\mu$ L of this solution under the above operating conditions, cefotaxime and acetanilide are eluted in this order with the resolution between these peaks being not less than 10.

**System repeatability:** When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefotaxime is not more than 2.0%.

(5) **Free pyridine**—Weigh accurately about 50 mg of Cefotaxime Hydrate, dissolve in the mobile phase to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of pyridine, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak height,  $H_T$  and  $H_S$ , of pyridine of each solution: the amount of free pyridine is not more than 0.3%.

$$\begin{aligned} & \text{Amount (mg) of free pyridine} \\ & = W_S \times (H_T/H_S) \times (1/1000) \end{aligned}$$

$W_S$ : Amount (mg) of pyridine

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Dissolve 2.88 g of ammonium dihydrogenphosphate in 500 mL of water, add 300 mL of acetonitrile and water to make 1000 mL, and adjust to pH 7.0 with ammonia solution (28).

**Flow rate:** Adjust the flow rate so that the retention time of pyridine is about 4 minutes.

**System suitability**—

**Test for required detection:** Confirm that the peak height of pyridine obtained from 10  $\mu$ L of the standard solution is equivalent to 50% of the full scale.

**System performance:** Dissolve 5 mg of Cefotaxime Hydrate in 100 mL of a solution of pyridine in the mobile phase (1 in 20,000). When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, cefotaxime and pyridine are eluted in this order with the resolution between these peaks being not less than 9.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the heights of pyridine is not more than 5.0%.

**Loss on dryness** <2.41> Not less than 13.0% and not more than 15.0% (0.1 g, in vacuum not exceeding 0.67 kPa, 60°C, 3 hours).

**Assay** Weigh accurately an amount of Cefotaxime Hydrate and Cefotaxime Reference Standard, equivalent to about 0.1 g (potency), and dissolve each in 0.05 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL. Pipet 10 mL each of these solutions, add exactly 5 mL of the internal standard solution, then add 0.05 mol/L phosphate buffer solution, pH 7.0 to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 5  $\mu$ L each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefotaxime to that of the internal standard of each solution.

$$\begin{aligned} & \text{Amount } [\mu\text{g (potency)}] \text{ of cefotaxime (C}_{22}\text{H}_{22}\text{N}_6\text{O}_7\text{S}_2) \\ & = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefotaxime Reference Standard

**Internal standard solution**—A solution of dimedon in 0.05 mol/L phosphate buffer solution, pH 7.0 (11 in 10,000).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with hexasilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 4.26 g of anhydrous disodium hydrogenphosphate and 2.72 g of potassium dihydrogenphosphate in 980 mL of water, and add 20 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of cefotaxime is about 4 minutes.

**System suitability**—

**System performance:** When the procedure is run with 5  $\mu$ L of the standard solution under the above operating conditions, the internal standard and cefotaxime are eluted in this order with the resolution between these peaks being not less than 3.

**System repeatability:** When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefotaxime to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cefteram Pivoxil

セフテラム ピボキシル

$C_{22}H_{27}N_9O_7S_2$ : 593.64

2,2-Dimethylpropanoyloxymethyl (6*R*,7*R*)-7-[(*Z*)-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetyl-amino]-3-(5-methyl-2*H*-tetrazol-5-ylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate  
[82547-58-8, Cefteram]

Cefteram Pivoxil contains not less than 743  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Cefteram Pivoxil is expressed as mass (potency) of cefteram ( $C_{16}H_{17}N_9O_5S_2$ : 479.49).

**Description** Cefteram Pivoxil occurs as a white to pale yellowish white powder.

It is very soluble in acetonitrile, freely soluble in methanol, in ethanol (95) and in chloroform, and practically insoluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Cefteram Pivoxil in 0.05 mol/L hydrochloric acid-methanol TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the spectrum of a solution of Cefteram Pivoxil in deuterated chloroform for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals A, B and C, at around  $\delta$ 1.2 ppm, at around  $\delta$ 2.5 ppm and at around  $\delta$ 4.0 ppm, respectively. The ratio of the integrated intensity of these signals, A:B:C, is about 3:1:1.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +35 – +43° (0.4 g calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Cefteram Pivoxil according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefteram Pivoxil according to Method 4, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 50 mg of Cefteram Pivoxilin in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu\text{L}$  each of the sample solution and standard solution

as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak, having the relative retention time of about 0.9 with respect to cefteram pivoxil from the sample solution is not more than 1.25 times the peak area of cefteram pivoxil from the standard solution, the area of the peak, having the relative retention time of about 0.1 with respect to cefteram pivoxil from the sample solution is not more than 0.25 times the peak area of cefteram pivoxil from the standard solution, and the total area of the peaks other than cefteram pivoxil from the sample solution is not more than 2.75 times the peak area of cefteram pivoxil from the standard solution. For the above calculation, use the area of the peak, having the relative retention time of about 0.1, after multiplying by its relative response factor, 0.74.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of cefteram pivoxil.

**System suitability**—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cefteram pivoxil obtained from 10  $\mu\text{L}$  of this solution is equivalent to 7 to 13% of that from 10  $\mu\text{L}$  of the standard solution.

System performance: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefteram pivoxil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefteram pivoxil is not more than 3.0%.

**Water** <2.48> Not more than 3.0% (0.3 g, coulometric titration).

**Assay** Weigh accurately an amount of Cefteram Pivoxil and Cefteram Pivoxil Mesitylenesulfonate Reference Standard, equivalent to about 40 mg (potency), dissolve each in 20 mL of diluted acetonitrile (1 in 2), add exactly 5 mL of the internal standard solution and diluted acetonitrile (1 in 2) to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefteram pivoxil to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefteram } (C_{16}H_{17}N_9O_5S_2) \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefteram Pivoxil Mesitylenesulfonate Reference Standard

**Internal standard solution**—A solution of methyl parahydroxybenzoate in diluted acetonitrile (1 in 2) (1 in 1000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside di-

ameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To 100 mL of acetic acid-sodium acetate buffer solution, pH 5.0 add 375 mL of acetonitrile and water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of cefteram pivoxil is about 14 minutes.

*System suitability*—

System performance: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the internal standard and cefteram pivoxil are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefteram pivoxil to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—In a cold place.

## Cefteram Pivoxil Fine Granules

セフテラム ピボキシル細粒

Cefteram Pivoxil Fine Granules contain not less than 90.0% and not more than 110.0% of the labeled amount of cefteram ( $\text{C}_{16}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_2$ ; 479.49).

**Method of preparation** Prepare to finely granulated form as directed under Powders, with Cefteram Pivoxil.

**Identification** Powder Cefteram Pivoxil Fine Granules. To a portion of the powder, equivalent to 0.1 g (potency) of Cefteram Pivoxil according to the labeled amount, add 20 mL of methanol, shake well, and filter. To 1 mL of the filtrate add 0.05 mol/L hydrochloric acid-methanol TS to make 500 mL, and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 262 nm and 266 nm.

**Purity** Related substances—Powder Cefteram Pivoxil Fine Granules, if necessary. To a portion, equivalent to 0.1 g (potency) of Cefteram Pivoxil according to the labeled amount, add diluted acetonitrile (1 in 2) to make 100 mL, disperse the particle with the aid of ultrasonic waves, then filter, and use the filtrate as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak, having the relative retention time of about 0.9 with respect to cefteram pivoxil, is not larger than 1.75 times the peak area of cefteram pivoxil from the standard solution, the area of the peak, having the relative retention time of about 0.1, is not larger than 0.68 times the peak area of cefteram pivoxil from the standard solution, and the total

area of the peaks other than cefteram pivoxil is not larger than 3.7 times the peak area of cefteram pivoxil from the standard solution. For this calculation, use the peak area for the peak having the relative retention time of about 0.1 after multiplying by its relative response factor, 0.74.

*Operating conditions*—

Proceed as directed in the Purity (3) under Cefteram Pivoxil.

*System suitability*—

Proceed as directed in the Purity (3) under Cefteram Pivoxil.

**Water** <2.48> Not more than 0.3% (0.1 g (potency), coulometric titration).

**Uniformity of dosage units** <6.02> The Granules in single-unit container meet the requirement of the Mass variation test.

**Dissolution** Being specified separately.

**Particle size** <6.03> It meets the requirement of fine granules of the Powders.

**Assay** Powder Cefteram Pivoxil Fine Granules, if necessary, and use as the sample. Weigh accurately an amount of the sample, equivalent to about 0.3 g (potency) of Cefteram Pivoxil according to the labeled amount, add exactly 30 mL of the internal standard solution and diluted acetonitrile (1 in 2) to make 300 mL. Disperse the particle with the aid of ultrasonic waves, then filter, and use the filtrate as the sample solution. Separately, weigh accurately about 50 mg (potency) of Cefteram Pivoxil Mesitylenesulfonate Reference Standard, dissolve in 20 mL of diluted acetonitrile (1 in 2), add exactly 5 mL of the internal standard solution and diluted acetonitrile (1 in 2) to make 50 mL, and use this solution as the standard solution. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cefteram pivoxil to that of the internal standard.

$$\begin{aligned} &\text{Amount [mg (potency)] of cefteram (C}_{16}\text{H}_{17}\text{N}_9\text{O}_5\text{S}_2) \\ &= W_S \times (Q_T/Q_S) \times 6 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefteram Pivoxil Mesitylenesulfonate Reference Standard

*Internal standard solution*—A solution of methyl parahydroxybenzoate in diluted acetonitrile (1:2) (1 in 1000).

*Operating conditions*—

Proceed as directed in the Assay under Cefteram Pivoxil.

*System suitability*—

Proceed as directed in the Assay under Cefteram Pivoxil.

**Containers and storage** Containers—Tight containers.

## Ceftibuten Hydrate

セフチブテン水和物

$C_{15}H_{14}N_4O_6S_2 \cdot 2H_2O$ : 446.46  
(6*R*,7*R*)-7-[(2*Z*)-2-Aminothiazol-4-yl]-4-carboxybut-2-enoylamino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid dihydrate [118081-34-8]

Ceftibuten Hydrate contains not less than 900  $\mu\text{g}$  (potency) and not more than 1020  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Ceftibuten Hydrate is expressed as mass (potency) of ceftibuten ( $C_{15}H_{14}N_4O_6S_2$ : 410.42).

**Description** Ceftibuten Hydrate occurs as a white to pale yellowish white crystalline powder and has a slight, characteristic odor.

It is freely soluble in *N,N*-dimethylformamide and in dimethyl sulfoxide, and practically insoluble in water, in ethanol (95) and in diethyl ether.

**Identification (1)** Determine the absorption spectrum of a solution of Ceftibuten Hydrate in 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0 (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 261 nm and 265 nm.

(2) Determine the infrared absorption spectrum of Ceftibuten Hydrate as directed in the paste method under the Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave numbers of about 3249  $\text{cm}^{-1}$ , 1772  $\text{cm}^{-1}$ , 1700  $\text{cm}^{-1}$ , 1651  $\text{cm}^{-1}$  and 1544  $\text{cm}^{-1}$ .

(3) Determine the spectrum of a solution of Ceftibuten Hydrate in deuterated dimethyl sulfoxide for nuclear magnetic resonance spectroscopy (1 in 30), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> (<sup>1</sup>H): it exhibits double signals A and B, at around  $\delta$  3.2 ppm and at around  $\delta$  5.1 ppm, a quartet signal C, at around  $\delta$  5.8 ppm, and a single signal D, at around  $\delta$  6.3 ppm. The ratio of integrated intensity of each signal except the signal at around  $\delta$  3.2 ppm, B:C:D is about 1:1:1.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (263 nm): 320 – 345 (20 mg calculated on the anhydrous basis, 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0, 1000 mL).

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +135 – +155° (0.3 g calculated on the anhydrous basis, 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0, 50 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Ceftibuten Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Being specified separately.

**Water** <2.48> Not less than 8.0% and not more than 13.0% (0.2 g, volumetric titration, direct titration. Use a mixture of pyridine for water determination and ethylene glycol for water determination (5:1) instead of methanol for water determination).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately an amount of Ceftibuten Hydrate and Ceftibuten Hydrochloride Reference Standard, equivalent to about 10 mg (potency), dissolve each in 36 mL of 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0, add exactly 4 mL each of the internal standard solution, shake, and use these solutions as the sample solution and standard solution. Perform the test with 5  $\mu\text{L}$  of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of ceftibuten to that of the internal standard. Keep the sample solution and the standard solution at 5°C or below and use within 2 hours.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of ceftibuten } (C_{15}H_{14}N_4O_6S_2) \\ &= W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Ceftibuten Hydrochloride Reference Standard

**Internal standard solution**—A solution of methyl *p*-hydroxybenzoate in acetonitrile (3 in 4000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 263 nm).

Column: A stainless steel column 4 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.005 mol/L *n*-decyl trimethylammonium bromide TS and acetonitrile (4:1).

Flow rate: Adjust the flow rate so that the retention time of ceftibuten is about 10 minutes.

**System suitability**—

System performance: Dissolve 5 mg of Ceftibuten Hydrate in 1 mol/L Hydrochloric acid TS to make 50 mL, and allow to stand for 4 hours at room temperature. To 10 mL of this solution add 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0 to make 25 mL. When the procedure is run with 5  $\mu\text{L}$  of this solution under the above operating conditions, trans-isomer and ceftibuten are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ceftibuten to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and not exceeding 5°C.

## Cefprozime Sodium

セフチゾキシムナトリウム

$C_{13}H_{12}N_5NaO_5S_2$ : 405.38

Monosodium (6*R*,7*R*)-7-[(*Z*)-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetylamino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [68401-82-1]

Cefprozime Sodium contains not less than 925  $\mu$ g (potency) and not more than 965  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cefprozime Sodium is expressed as mass (potency) of cefprozime ( $C_{13}H_{13}N_5O_5S_2$ : 383.40).

**Description** Cefprozime Sodium occurs as a white to light yellow, crystals or crystalline powder.

It is very soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Cefprozime Sodium (1 in 63,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefprozime Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefprozime Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ), using sodium 3-trimethylsilylpropionate- $d_4$  for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around  $\delta$  4.0 ppm, a multiple signal B around  $\delta$  6.3 ppm, and a single signal C at around  $\delta$  7.0 ppm. The ratio of integrated intensity of each signal, A:B:C, is about 3:1:1.

(4) Cefprozime Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +125 – +145° (0.25 g calculated on the anhydrous bases, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefprozime Sodium in 10 mL of water: the pH of the solution is between 6.0 and 8.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cefprozime Sodium in 10 mL of water: the solution is clear, and colorless to light yellow.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Cefprozime Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard

Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 2.0 g of Cefprozime Sodium according to Method 3, and perform the test (not more than 1 ppm).

(4) Related substances—Dissolve 0.11 g of Cefprozime Sodium in 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the sample solution. Perform the test with 5  $\mu$ L of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the areas of each peak by the automatic integration method: each peak area other than cefprozime is not more than 0.5% of the peak area of cefprozime, and the total of peak areas other than cefprozime is not more than 1.0% of that of cefprozime.

**Operating conditions**—

Detector, column, and column temperature: Proceed as directed in the operating conditions in the Assay.

Mobile phase: Dissolve 2.31 g of disodium hydrogenphosphate dodecahydrate and 1.42 g of citric acid monohydrate in 1000 mL of water, adjust to pH 3.6 with diluted phosphoric acid (1 in 10) or dilute sodium hydroxide TS. To 200 mL of this solution add 10 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefprozime is about 12 minutes.

Time span of measurement: About 5 times as long as the retention time of cefprozime beginning after the solvent peak.

**System suitability**—

Test for required detection: Pipet 1 mL of the sample solution, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL, and use this solution as the solution for test for required detection. Pipet 1 mL of the solution, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 10 mL, and confirm that the peak area of cefprozime obtained from 5  $\mu$ L of this solution is equivalent to 7 to 13% of that of cefprozime obtained from 5  $\mu$ L of the solution for test for required detection.

System performance: Dissolve about 10 mg of Cefprozime Reference Standard in 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the solution for system suitability test. When the procedure is run with 5  $\mu$ L of this solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefprozime are not less than 4000 steps and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 5  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of cefprozime is not more than 2.0%.

**Water** <2.48> Not more than 8.5% (0.4 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefprozime Sodium and Cefprozime Reference Standard, equivalent to about 0.1 g (potency), and dissolve each in 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 20 mL. Pipet 2 mL each of these solutions, add exactly 10 mL of the internal standard solution, then add 0.1 mol/L phosphate buffer solution, pH 7.0 to make 20 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 5  $\mu$ L each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of

ceftizoxime to that of the internal standard of each solution.

$$\text{Amount } [\mu\text{g (potency)}] \text{ of ceftizoxime (C}_{13}\text{H}_{13}\text{N}_5\text{O}_5\text{S}_2) \\ = W_s \times (Q_T/Q_S) \times 1000$$

$W_s$ : Amount [mg (potency)] of Ceftriaxone Reference Standard

**Internal standard solution**—A solution of 3-hydroxybenzoic acid in 0.1 mol/L phosphate buffer solution, pH 7.0 (3 in 500).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 35°C.

**Mobile phase:** Dissolve 2.31 g of disodium hydrogenphosphate dodecahydrate and 1.42 g of citric acid monohydrate in 1000 mL of water, and adjust to pH 3.6 with diluted phosphoric acid (1 in 10) or dilute sodium hydroxide TS. To 450 mL of this solution add 50 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of ceftizoxime is about 4 minutes.

**System suitability**—

**System performance:** When the procedure is run with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, ceftizoxime and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.0 and the symmetry factor of each peak is not more than 2.

**System repeatability:** When the test is repeated 6 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ceftizoxime to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Ceftriaxone Sodium Hydrate

セフトリアキソンナトリウム水和物

$\text{C}_{18}\text{H}_{16}\text{N}_8\text{Na}_2\text{O}_7\text{S}_3 \cdot 3\frac{1}{2}\text{H}_2\text{O}$ : 661.60

Disodium (6*R*,7*R*)-7-[(*Z*)-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetyl-amino]-3-(6-hydroxy-2-methyl-5-oxo-2,5-dihydro-1,2,4-triazin-3-ylsulfanylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate hemiheptahydrate [104376-79-6]

Ceftriaxone Sodium Hydrate contains not less than 905  $\mu\text{g}$  (potency) and not more than 935  $\mu\text{g}$  (potency)

per mg, calculated on the anhydrous basis. The potency of Ceftriaxone Sodium Hydrate is expressed as mass (potency) of ceftriaxone ( $\text{C}_{18}\text{H}_{18}\text{N}_8\text{O}_7\text{S}_3$ : 554.58).

**Description** Ceftriaxone Sodium Hydrate occurs as a white to yellowish white crystalline powder.

It is freely soluble in water and in dimethylsulfoxide, sparingly soluble in methanol, very slightly soluble in ethanol (99.5), and practically insoluble in acetonitrile.

**Identification (1)** Determine the absorption spectrum of a solution of Ceftriaxone Sodium Hydrate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Ceftriaxone Sodium Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the spectrum of a solution of Ceftriaxone Sodium Hydrate in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 10), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ): it exhibits single signals, A, B, C and D, at around  $\delta$  3.5 ppm, at around  $\delta$  3.8 ppm, at around  $\delta$  6.7 ppm and at around  $\delta$  7.2 ppm, respectively. The ratio of integrated intensity of each signal, A: B: C: D, is about 3:3:1:2. When the signal at around  $\delta$  3.5 ppm overlaps with the signal of water, perform the measurement in the probe kept at about 50°C.

**(3)** Ceftriaxone Sodium Hydrate responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-153$  –  $-170^\circ$  (50 mg calculated on the anhydrous basis, water, 2.5 mL, 20 mm).

**pH** <2.54> Dissolve 0.6 g of Ceftriaxone Sodium Hydrate in 5 mL of water: the pH of the solution is between 6.0 and 8.0.

**Purity (1)** Clarity and color of solution—Dissolve 0.6 g of Ceftriaxone Sodium Hydrate in 5 mL of water: the solution is clear and light yellow.

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of Ceftriaxone Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Ceftriaxone Sodium Hydrate according to Method 3, and perform the test (not more than 2 ppm).

**(4)** Related substances 1—Dissolve 20 mg of Ceftriaxone Sodium Hydrate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of water and acetonitrile for liquid chromatography (11:9) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of the impurity 1 having the relative retention time of about 0.5 and the impurity 2 having the relative retention time of about 1.3 to ceftriaxone from the sample solution are not more than the peak area of ceftriaxone from the standard solution. In this case, these peak areas for the impurity 1 and the impurity 2 are used after multiplying by 0.9 and 1.2, respectively.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 5.796 g of anhydrous disodium hydrogen phosphate and 3.522 g of potassium dihydrogen phosphate in water to make exactly 1000 mL, and use this solution as the solution A. Separately, dissolve 20.256 g of citric acid monohydrate and 7.840 g of sodium hydroxide in water to make exactly 1000 mL, and use this solution as the solution B. Dissolve 4.00 g of tetra-*n*-heptylammonium bromide in 450 mL of acetonitrile for liquid chromatography, add 55 mL of the solution A, 5 mL of the solution B and 490 mL of water.

Flow rate: Adjust the flow rate so that the retention time of ceftriaxone is about 7 minutes.

Time span of measurement: About 2 times as long as the retention time of ceftriaxone.

**System suitability—**

Test for required detectability: Measure exactly 5 mL of the sample solution, add a mixture of water and acetonitrile for liquid chromatography (11:9) to make exactly 200 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add a mixture of water and acetonitrile for liquid chromatography (11:9) to make exactly 100 mL. Confirm that the peak area of ceftriaxone obtained from 10  $\mu$ L of this solution is equivalent to 0.9 to 1.1% of that from 10  $\mu$ L of the solution for system suitability test.

System performance: Dissolve 10 mg of Ceftriaxone Sodium Hydrate in a mixture of water and acetonitrile for liquid chromatography (11:9) to make 5 mL, add 5 mL of a solution of diethyl terephthalate in a mixture of water and acetonitrile for liquid chromatography (11:9) (9 in 5000), and add a mixture of water and acetonitrile for liquid chromatography (11:9) to make 200 mL. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, ceftriaxone and diethyl terephthalate are eluted in this order, with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of ceftriaxone is not more than 1.0%.

(5) Related substances 2—Dissolve 10 mg of Ceftriaxone Sodium Hydrate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of acetonitrile for liquid chromatography and water (23:11) to make exactly 100 mL, and use this solution as standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the each peak area of the impurities which appear after the peak of ceftriaxone from the sample solution is not more than the peak area of ceftriaxone from the standard solution, and the total peak area of these impurities is not more than 2.5 times

of the peak area from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 5.796 g of anhydrous disodium hydrogen phosphate and 3.522 g of potassium dihydrogen phosphate in water to make exactly 1000 mL, and use this solution as the solution A. Separately, dissolve 20.256 g of citric acid monohydrate and 7.840 g of sodium hydroxide in water to make exactly 1000 mL, and use this solution as the solution B. Dissolve 4.00 g of tetra-*n*-heptylammonium bromide in 450 mL of acetonitrile for liquid chromatography, and add 55 mL of the solution A, 5 mL of the solution B, 490 mL of water and 700 mL of acetonitrile for liquid chromatography.

Flow rate: Adjust the flow rate so that the retention time of ceftriaxone is about 3 minutes.

Time span of measurement: About 10 times as long as the retention time of ceftriaxone.

**System suitability—**

Test for required detectability: Measure exactly 5 mL of the sample solution, add a mixture of acetonitrile for liquid chromatography and water (23:11) to make exactly 100 mL, and use this solution as the solution for system suitability test. Measure exactly 1 mL of the solution for system suitability test, and add a mixture of acetonitrile for liquid chromatography and water (23:11) to make exactly 100 mL. Confirm that the peak area of ceftriaxone obtained from 10  $\mu$ L of this solution is equivalent to 0.9 to 1.1% of that from 10  $\mu$ L of the solution for system suitability test.

System performance: Dissolve 10 mg of Ceftriaxone Sodium Hydrate in a mixture of acetonitrile for liquid chromatography and water (23:11) to make 5 mL, add 5 mL of a solution of diethyl terephthalate in a mixture of water and acetonitrile for liquid chromatography (11:9) (9 in 5000), and add a mixture of acetonitrile for liquid chromatography and water (23:11) to make 200 mL. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, ceftriaxone and diethyl terephthalate are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of ceftriaxone is not more than 1.0%.

**Water** <2.48> Not less than 8.0% and not more than 11.0% (0.15 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Ceftriaxone Sodium Hydrate and Ceftriaxone Sodium Reference Standard, equivalent to about 0.1 g (potency), dissolve each in a mixture of water and acetonitrile for liquid chromatography (11:9) to make exactly 50 mL. Pipet 5 mL of each solution, add exactly 5 mL of the internal standard solution and a mixture of water and acetonitrile for liquid chromatography (11:9) to make 200 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with

10  $\mu\text{L}$  each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of ceftriaxone to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)] of ceftriaxone (C}_{18}\text{H}_{18}\text{N}_8\text{O}_7\text{S}_3) \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Ceftriaxone Sodium Reference Standard

**Internal standard solution**—A solution of diethyl terephthalate in a mixture of water and acetonitrile for liquid chromatography (11:9) (9 in 5000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu\text{m}$  in particle diameter).

**Column temperature**: A constant temperature of about 25°C.

**Mobile phase**: Dissolve 5.796 g of anhydrous disodium hydrogen phosphate and 3.522 g of potassium dihydrogen phosphate in water to make exactly 1000 mL, and use this solution as solution A. Dissolve 20.256 g of citric acid monohydrate and 7.840 g of sodium hydroxide in water to make exactly 1000 mL, and use this solution as solution B. Dissolve 4.00 g of tetra-*n*-heptylammonium bromide in 450 mL of acetonitrile for liquid chromatography, and add 490 mL of water, 55 mL of solution A, and 5 mL of solution B.

**Flow rate**: Adjust the flow rate so that the retention time of ceftriaxone is about 7 minutes.

**System suitability**—

**System performance**: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, ceftriaxone and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

**System repeatability**: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ceftriaxone to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cefuroxime Axetil

セフロキシム アキセチル

$\text{C}_{20}\text{H}_{22}\text{N}_4\text{O}_{10}\text{S}$ : 510.47

(1*R*,5*S*)-1-Acetoxyethyl (6*R*,7*R*)-3-carbamoyloxymethyl-7-(*Z*)-2-furan-2-yl-2-(methoxyimino)acetylamin]-8-oxo-5-

thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [64544-07-6]

Cefuroxime Axetil contains not less than 800  $\mu\text{g}$  (potency) and not more than 850  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis and corrected by the amount of acetone. The potency of Cefuroxime Axetil is expressed as mass (potency) of cefuroxime ( $\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$ : 424.39).

**Description** Cefuroxime Axetil occurs as white to yellowish white, non-crystalline powder.

It is freely soluble in dimethylsulfoxide, soluble in methanol, sparingly soluble in ethanol (95), and very slightly soluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Cefuroxime Axetil in methanol (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefuroxime Axetil Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefuroxime Axetil as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefuroxime Axetil Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the spectrum of a solution of Cefuroxime Axetil in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 20) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a double signal or a pair of double signals A at around  $\delta$ 1.5 ppm, a pair of single signals B at around  $\delta$ 2.1 ppm, and a single signal C at around  $\delta$ 3.9 ppm. The ratio of the integrated intensity of each signal, A:B:C, is about 1:1:1.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +41 – +47° (0.5 g, methanol, 50 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Cefuroxime Axetil according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11>—Put 1.0 g of Cefuroxime Axetil in a crucible, add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10), burn the ethanol, then heat gradually to incinerate. If a carbonized substance remains, moisten with a small amount of nitric acid, and ignite to incinerate. Cool, add 10 mL of dilute hydrochloric acid to the residue, dissolve by warming on a water bath, and perform the test using this solution as the test solution (not more than 2 ppm).

(3) Related substance—Dissolve 25 mg of Cefuroxime Axetil in 4 mL of methanol, add a solution of ammonium dihydrogen phosphate (23 in 1000) to make 10 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add 40 mL of methanol and a solution of ammonium dihydrogen phosphate (23 in 1000) to make exactly 100 mL, and use this solution as the standard solution. Perform the

test with exactly 2  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than cefuroxime axetil obtained from the sample solution is not more than 1.5 times the sum area of two peaks of cefuroxime axetil obtained from the standard solution, and the sum area of the peaks other than cefuroxime axetil from the sample solution is not more than 4 times the sum area of two peaks of cefuroxime axetil from the standard solution.

**Operating conditions—**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of the peak having the larger retention time of the two peaks of cefuroxime axetil beginning after the solvent peak.

**System suitability—**

Test for required detectability: Measure exactly 1 mL of the standard solution, and add 4 mL of methanol and a solution of ammonium dihydrogen phosphate (23 in 1000) to make exactly 10 mL. Confirm that the sum area of the two peaks of cefuroxime axetil obtained from 2  $\mu\text{L}$  of this solution is equivalent to 7 to 13% of that obtained from 2  $\mu\text{L}$  of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 2  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the sum area of the two peaks of cefuroxime axetil is not more than 2.0%.

(4) Acetone—Weigh accurately about 1 g of Cefuroxime Axetil, add exactly 0.2 mL of the internal standard solution and dimethylsulfoxide to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.5 g of acetone, and add dimethylsulfoxide to make exactly 100 mL. Pipet 0.2 mL of this solution, add exactly 0.2 mL of the internal standard solution and dimethylsulfoxide to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 1  $\mu\text{L}$  each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, determine each peak area by the automatic integration method, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of acetone to that of the internal standard: the amount of acetone is not more than 1.3%.

$$\text{Amount (\%)} \text{ of acetone} = (W_S/W_T) \times (Q_T/Q_S) \times 0.2$$

$W_S$ : Amount (g) of acetone

$W_T$ : Amount (g) of the sample

**Internal standard solution—**A solution of 1-propanol in dimethylsulfoxide (1 in 200).

**Operating conditions—**

Detector: A hydrogen flame-ionization detector.

Column: A glass column 3 mm in inside diameter and 2 m in length, packed with siliceous earth for gas chromatography coated with a mixture of polyethylene glycol 600 for gas chromatography and polyethylene glycol 1500 for gas chromatography (1:1) in the ratio of 20% (125–150  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 90°C.

Temperature of injection port: A constant temperature of about 115°C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 4 minutes.

**System suitability—**

System performance: When the procedure is run with 1  $\mu\text{L}$  of the standard solution under the above operating conditions, acetone and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 1  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of acetone to that of the internal standard is not more than 5.0%.

**Water <2.48>** Not more than 2.0% (0.4 g, volumetric titration, direct titration).

**Residue on ignition <2.44>** Not more than 0.2% (0.5 g).

**Isomer ratio** Perform the test with 10  $\mu\text{L}$  of the sample solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the area,  $A_a$ , of the peak having the smaller retention time and the area,  $A_b$ , of the peak having the bigger retention time of the two peaks of cefuroxime axetil:  $A_b/(A_a + A_b)$  is between 0.48 and 0.55.

**Operating conditions—**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

**System suitability—**

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

**Assay** Weigh accurately an amount of Cefuroxime Axetil and Cefuroxime Axetil Reference Standard, equivalent to about 50 mg (potency), and dissolve each in methanol to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 5 mL of the internal standard solution, 5 mL of methanol and a solution of ammonium dihydrogen phosphate (23 in 1000) to make 50 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the sum area of the two peaks of cefuroxime axetil to the peak area of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefuroxime (C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S)} \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefuroxime Axetil Reference Standard

**Internal standard solution—**A solution of acetanilide in methanol (27 in 5000).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 278 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 20 cm in length, packed with trimethylsilanized

silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of a solution of ammonium dihydrogen phosphate (23 in 1000) and methanol (5:3).

Flow rate: Adjust the flow rate so that the retention time of the peak having the smaller retention time of the two peaks of cefuroxime axetil is about 8 minutes.

*System suitability—*

System performance: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the internal standard and cefuroxime axetil are eluted in this order with the resolution between the two peaks of cefuroxime axetil being not less than 1.5.

System repeatability: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the sum area of the two peaks of cefuroxime axetil to the peak area of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cefuroxime Sodium

セフロキシムナトリウム

$\text{C}_{16}\text{H}_{15}\text{N}_4\text{NaO}_8\text{S}$ : 446.37

Monosodium (6*R*,7*R*)-3-carbamoyloxymethyl-7-[(*Z*)-2-furan-2-yl-2-(methoxyimino)acetylamino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [56238-63-2]

Cefuroxime Sodium contains not less than 875  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Cefuroxime Sodium is expressed as mass (potency) of cefuroxime ( $\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$ : 424.39).

**Description** Cefuroxime Sodium occurs as a white to light yellowish white, crystals or crystalline powder.

It is freely soluble in water, soluble in methanol, and very slightly soluble in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Cefuroxime Sodium (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefuroxime Sodium Reference Standard prepared in the same manner as sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefuroxime Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefuroxime Sodium Reference Standard: both spectra exhibit similar intensities of absorption at the same

wave numbers.

(3) Determine the spectrum of a solution of Cefuroxime Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1\text{H}$ ), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around  $\delta$  4.0 ppm, a quartet signal B at around  $\delta$  6.6 ppm, and double signals, C and D, at around  $\delta$  6.9 ppm and around  $\delta$  7.7 ppm, respectively. The ratio of integrated intensity of each signal, A:B:C:D, is about 3:1:1:1.

(4) Cefuroxime Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ : +59 – +66° (0.5 g calculated on the anhydrous bases, water, 100 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefuroxime Sodium in 10 mL of water: the pH of the solution is between 6.0 and 8.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cefuroxime Sodium in 10 mL of water: the solution is clear, and its absorbance <2.24> at 450 nm is not more than 0.25.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cefuroxime Sodium according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefuroxime Sodium according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 25 mg of Cefuroxime Sodium in 25 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the areas of each peak by the automatic integration method: each peak area other than cefuroxime from the sample solution is not more than the peak area of cefuroxime from the standard solution, and the total of the peak areas other than cefuroxime from the sample solution is not more than 3 times of the peak area of cefuroxime from the standard solution.

*Operating conditions—*

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 4 times as long as the retention time of cefuroxime beginning after the solvent peak.

*System suitability—*

Test for required detection: Pipet 1 mL of the standard solution, add water to make exactly 10 mL, and confirm that the peak area of cefuroxime obtained from 20  $\mu\text{L}$  of this solution is equivalent to 7 to 13% of that of cefuroxime obtained from 20  $\mu\text{L}$  of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefuroxime is not more than 2.0%.

**Water** <2.48> Not more than 4.0% (0.4 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefuroxime Sodium and Cefuroxime Sodium Reference Standard, equivalent to about 25 mg (potency), and dissolve each in water to make exactly 25 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with exactly 20  $\mu$ L each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the peak area,  $A_T$  and  $A_S$ , of cefuroxime of each solution.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of cefuroxime (C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S)} \\ = W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Cefuroxime Sodium Reference Standard

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 273 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 125 mm in length, packed with hexasilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 0.68 g of sodium acetate trihydrate in 900 mL of water, adjust to pH 3.4 with acetic acid (100), and add water to make 1000 mL. To 990 mL of this solution add 10 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of cefuroxime is about 8 minutes.

**System suitability**—

**System performance:** Allow the sample solution to stand at 60°C for 10 minutes. When the procedure is run with 20  $\mu$ L of this solution soon after cooling under the above operating conditions, the resolution between the peak of cefuroxime and the peak corresponding to the retention time of about 0.7 to the peak of cefuroxime is being not less than 2.0.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefuroxime is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Microcrystalline Cellulose

結晶セルロース

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbols (♦ ◆).

Microcrystalline Cellulose is purified, partially depolymerized  $\alpha$ -cellulose, obtained as a pulp from fibrous plant material, with mineral acids.

♦The label indicates the degree of polymerization, loss on drying, and bulk density values with the range.◆

♦**Description** Microcrystalline Cellulose occurs as a white crystalline powder having fluidity.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It swells with sodium hydroxide TS on heating.◆

**Identification** (1) Dissolve 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water, add 0.5 g of iodine, and shake for 15 minutes. Place about 10 mg of Microcrystalline Cellulose on a watch glass, and disperse in 2 mL of this solution: the substance develops a blue-violet color.

♦(2) Sieve 20 g of Microcrystalline Cellulose for 5 minutes on an air-jet sieve equipped with a screen (No.391, 200 mm in inside diameter) having 38- $\mu$ m openings. If more than 5% is retained on the screen, mix 30 g of Microcrystalline Cellulose with 270 mL of water; otherwise, mix 45 g with 255 mL of water. Perform the mixing for 5 minutes in a high-speed (18,000 revolutions per minute or more) power blender. Transfer 100 mL of the dispersion to a 100-mL graduated cylinder, and allow to stand for 3 hours: a white, opaque, bubble-free dispersion, which does not form a supernatant liquid at the surface, is obtained.◆

(3) Transfer 1.3 g of Microcrystalline Cellulose, accurately weighed, to a 125-mL conical flask, and add exactly 25 mL each of water and 1 mol/L cupriethylenediamine TS. Immediately purge the solution with nitrogen, insert the stopper, and shake on a suitable mechanical shaker to dissolve. Perform the test with a suitable amount of this solution, taken exactly, according to Method 1 under Viscosity Determination <2.53> using a capillary viscometer having the viscosity constant ( $K$ ) of approximately 0.03, at  $25 \pm 0.1^\circ\text{C}$ , and determine the kinematic viscosity,  $\nu$ . Separately, perform the test with a mixture of exactly 25 mL each of water and 1 mol/L cupriethylenediamine TS in the same manner as above, using a capillary viscometer having  $K$  of approximately 0.01, and determine the kinematic viscosity,  $\nu_0$ .

Calculate the relative viscosity,  $\eta_{\text{rel}}$ , of Microcrystalline Cellulose by the formula:

$$\eta_{\text{rel}} = \nu / \nu_0$$

Obtain the product,  $[\eta]C$ , of intrinsic viscosity  $[\eta]$ (mL/g) and concentration  $C$  (g/100 mL) from the value  $\eta_{\text{rel}}$  of the Table. When calculate the degree of polymerization,  $P$ , by the following formula,  $P$  is not more than 350 ♦and within the labeled range.◆

$$P = (95)[\eta]C / W_T$$

$W_T$ : Amount (g) of the sample, calculated on the dried basis

**pH** <2.54> Shake 5.0 g of Microcrystalline Cellulose with 40 mL of water for 20 minutes, and centrifuge: the pH of the supernatant liquid is between 5.0 and 7.5.

**Purity** ♦(1) Heavy metals <1.07>—Proceed with 2.0 g of Microcrystalline Cellulose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).◆

(2) Water-soluble substances—Shake 5.0 g of Microcrystalline Cellulose with 80 mL of water for 10 minutes, filter with the aid of vacuum through a filter paper for quantitative analysis (5C) into a vacuum flask. Evaporate the clear filtrate in a tared evaporating dish to dryness without charring, dry at 105°C for 1 hour, cool in a desiccator, and weigh: the difference between the mass of the residue

and the mass obtained from a blank determination does not exceed 12.5 mg.

(3) Diethyl ether-soluble substances—Place 10.0 g of Microcrystalline Cellulose in a column having an internal diameter of about 20 mm, and pass 50 mL of peroxide-free diethyl ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporation dish. Dry the residue at 105°C for 30 minutes, allow to cool in a desiccator, and weigh: the difference between the mass of the residue and the mass obtained from a blank determination does not exceed 5.0 mg.

ator, and weigh: the difference between the mass of the residue and the mass obtained from a blank determination does not exceed 5.0 mg.

**Conductivity <2.51>** Perform the test as directed in the Conductivity Measurement with the supernatant liquid obtained in the pH as the sample solution, and determine the conductivity ♦ at 25 ± 0.1°C. ♦ Determine in the same way the con-

Table for Conversion of Relative Viscosity ( $\eta_{rel}$ ) into the Product of Limiting Viscosity and Concentration ( $[\eta]C$ )

ductivity of water used for the preparation of the sample solution: the difference between these conductivities is not more than  $75 \mu\text{S}\cdot\text{cm}^{-1}$

**Loss on drying** <2.41> Not more than 7.0% ♦ and within a range as specified on the label ♦ (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% ♦ (2 g) ♦.

**Bulk density** (i) Apparatus—Use a volumeter shown in

the figure. Put a No.8.6 sieve (2000  $\mu\text{m}$ ) on the top of the volumeter. A funnel is mounted over a baffle box, having four glass baffle plates inside which the sample powder slides as it passes. At the bottom of the baffle box is a funnel that collect the powder, and allows it to pour into a sample receiving cup mounted directly below it.

(ii) Procedure—Weigh accurately the mass of a brass or stainless steel cup, which has a capacity of  $25.0 \pm 0.05 \text{ mL}$

and an inside diameter of  $30.0 \pm 2.0$  mm, and put the cup directly below the funnel of the volumeter. Slowly pour Microcrystalline Cellulose 5.1 cm height from the upper part of the powder funnel through the sieve, at a rate suitable to prevent clogging, until the cup overflows. If the clogging occurs, take out the sieve. Level the excess powder with the aid of a slide glass, weigh the filled cup, and weigh accurately the content of the cup, and then calculate the bulk density by the following expression: the bulk density is within the labeled specification.

$$\text{Bulk density (g/cm}^3\text{)} = A/25$$

A: Measured mass (g) of the content of the cup

◆**Microbial limit** <4.05> The total aerobic microbial count is not more than 1000 per g, the total count of fungi and yeast is not more than 100 per g, and yeast is not more than 100 per g, and *Escherichia coli*, *Salmonella species*, *Pseudomonas aeruginosa* and *Staphylococcus aureus* are not observed.◆

◆**Containers and storage** Containers—Tight containers.◆

## Powdered Cellulose

粉末セルロース

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols (◆ ◆).

Powdered Cellulose is a purified, mechanically disintegrated alpha cellulose ◆ obtained as a pulp, after partial hydrolysis as occasion demands◆, from fibrous plant materials.

The label indicates the mean degree of polymerization value with a range.

◆**Description** Powdered Cellulose occurs as a white powder.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.◆

**Identification** (1) Dissolve 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water, add 0.5 g of iodine, and shake for 15 minutes. Place about 10 mg of Powdered Cellulose on a watch glass, and disperse in 2 mL of this solution: the substance develops a blue-violet color.

◆(2) Mix 30 g of Powdered Cellulose with 270 mL of

water in a high-speed (18,000 revolutions per minute or more) blender for 5 minutes, transfer 100 mL of the dispersion to a 100-mL graduated cylinder, and allow to stand for 1 hour: a supernatant liquid appears above the layer of the cellulose.◆

(3) Transfer 0.25 g of Powdered Cellulose, accurately weighed, to a 125-mL conical flask, add exactly 25 mL each of water and 1 mol/L cupriethylenediamine TS, and proceed as directed in the Identification (3) under Microcrystalline Cellulose. The mean degree of polymerization, P, is not less than 440 and is within the labeled specification.

**pH** <2.54> Mix 10 g of Powdered Cellulose with 90 mL of water, and allow to stand for 1 hour with occasional stirring: the pH of the supernatant liquid is between 5.0 and 7.5.

**Purity** ◆(1) Heavy metals <1.07>—Proceed with 2.0 g of Powdered Cellulose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).◆

(2) Water-soluble substances—Shake 6.0 g of Powdered Cellulose with 90 mL of recently boiled and cooled water, and allow to stand for 10 minutes with occasional shaking. Filter, with the aid of vacuum through a filter paper, discard the first 10 mL of the filtrate, and pass the subsequent filtrate through the same filter, if necessary, to obtain a clear filtrate. Evaporate a 15.0-mL portion of the filtrate in a tared evaporating dish to dryness without charring, dry at 105°C for 1 hour, and weigh after allowing to cool in a desiccator: the difference between the mass of the residue and the mass obtained from a blank determination does not exceed 15.0 mg.

(3) Diethyl ether-soluble substances—Place 10.0 g of Powdered Cellulose in a column having an internal diameter of about 20 mm, and pass 50 mL of peroxide-free diethyl ether through the column. Evaporate the eluate to dryness in a previously dried and tared evaporation dish. Dry the residue at 105°C for 30 minutes, and weigh after allowing to cool in a desiccator: the difference between the mass of the residue and the mass obtained from a blank determination does not exceed 15.0 mg.

**Loss on drying** <2.41> Not more than 6.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.3% (1 g calculated on the dried basis).

◆**Microbial limit** <4.05> The total aerobic microbial count does not exceed 1000 per g, the total combined fungus and yeast count does not exceed 100 per g, and *Escherichia coli*, *Salmonella species*, *Pseudomonas aeruginosa* and *Staphylococcus aureus* are not observed.◆

◆**Containers and storage** Containers—Tight containers.◆

## Cellacefate

*Cellulose Acetate Phthalate*

セラセフェート

Cellulose acetate benzene-1,2-dicarboxylate  
[9004-38-0]

This monograph is harmonized with the European

Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbols (♦ ♦).

Cellacefate is a reaction product of phthalic anhydride and partially acetylated cellulose.

Cellacefate, calculated on the anhydrous and free acid-free basis, contains not less than 21.5% and not more than 26.0% of acetyl group (-COCH<sub>3</sub>: 43.04), and not less than 30.0% and not more than 36.0% of carboxybenzoyl group (-COC<sub>6</sub>H<sub>4</sub>COOH: 149.12).

♦**Description** Cellacefate occurs as a white powder or grain.

It is freely soluble in acetone, and practically insoluble in water, in methanol and in ethanol (99.5).♦

**Identification** Determine the infrared absorption spectrum of Cellacefate directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with ♦the Reference Spectrum or ♦ spectrum of Cellacefate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Viscosity** <2.53> Weigh accurately a quantity of Cellacefate, equivalent to 15 g calculated on the anhydrous basis, dissolve in 85 g of a mixture of acetone and water (249: 1 in mass), and perform the test with this solution at 25 ± 0.2°C as directed in Method 1 to obtain the kinematic viscosity  $\nu$ . Separately, determine the density,  $\rho$ , of Cellacefate as directed under Determination of Specific Gravity and Density <2.56>, and calculate the viscosity,  $\eta$ , as  $\eta = \rho\nu$ : not less than 45 mPa·s and not more than 90 mPa·s.

**Purity** (1) ♦Heavy metals <1.07>—Proceed with 2.0 g of Cellacefate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).♦

(2) Free acids—Weigh accurately about 3 g of Cellacefate, put in a glass-stoppered conical flask, add 100 mL of diluted methanol (1 in 2), stopper tightly, and filter after shaking for 2 hours. Wash both the flask and residue with two 10-mL portions each of diluted methanol (1 in 2), combine the washes to the filtrate, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform the blank determination with 120 mL of diluted methanol (1 in 2), and make any necessary correction.

$$\text{Amount (\%)} \text{ of free acids} = (0.8306 \times A) / W$$

*A*: amount (mL) of 0.1 mol/L sodium hydroxide consumed

*W*: amount (g) of the test sample, calculated on the anhydrous basis

The amount of free acids is not more than 3.0%, calculated as phthalic acid (C<sub>8</sub>H<sub>6</sub>O<sub>4</sub>: 166.13).

**Water** <2.48> Not more than 5.0% (1 g, volumetric titration, direct titration, using a mixture of ethanol (99.5) and dichloromethane (3:2) instead of methanol for Karl Fischer method).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** (1) Carboxybenzoyl group—Weigh accurately about 1 g of Cellacefate, dissolve in 50 mL of a mixture of ethanol (95) and acetone (3: 2), and titrate <2.50> with 0.1

mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination, and make any necessary correction.

Content (%) of carboxybenzoyl group (C<sub>8</sub>H<sub>5</sub>O<sub>3</sub>)

$$= \frac{\frac{1.491 \times A}{W} - (1.795 \times B)}{100 - B} \times 100$$

*A*: Amount (mL) of 0.1 mol/L sodium hydroxide consumed

*B*: Amount (%) of free acids obtained in the Purity (2) Free acids

*W*: Amount (g) of the test sample, calculated on the anhydrous basis

**Assay** (2) Acetyl group—Weigh accurately about 0.1 g of Cellacefate, put in a glass-stoppered conical flask, add exactly 25 mL of 0.1 mol/L sodium hydroxide VS, and boil for 30 minutes under a reflux condenser. After cooling, add 5 drops of phenolphthalein TS, and titrate <2.50> with 0.1 mol/L hydrochloric acid VS. Perform a blank determination.

Content (%) of free acids and bound acetyl group (C<sub>2</sub>H<sub>3</sub>O)

$$= 0.4305A / W$$

*A*: Amount (mL) of 0.1 mol/L sodium hydroxide consumed, corrected by the blank determination

*W*: Amount (g) of the test sample, calculated on the anhydrous basis

Content (%) of acetyl group (C<sub>2</sub>H<sub>3</sub>O)

$$= [\{100 \times (P - 0.5182B)\} / (100 - B)] - 0.5772C$$

*B*: Amount (%) of free acids obtained in the Purity (2) Free acids

*C*: Content (%) of carboxybenzoyl group

*P*: Content (%) of free acids and bound acetyl group (C<sub>2</sub>H<sub>3</sub>O)

**Containers and storage** Containers—Tight containers.

## Celmo-leukin (Genetical Recombination)

セルモロイキン(遺伝子組換え)

[94218-72-I]

The desired product of Celmo-leukin (Genetical Recombination) is a protein consisting of 133 amino

acid residues manufactured by *E. coli* through expression of human interleukin-2 cDNA.

It is a solution having a T-lymphocyte activating effect.

It contains not less than 0.5 and not more than 1.5 mg of protein per mL, and 1 mg of this protein contains potency not less than  $8.0 \times 10^6$  units.

**Description** Celmoleukin (Genetical Recombination) occurs as a colorless, clear liquid.

**Identification (1)** To 1 mL of Celmoleukin (Genetical Recombination) add 0.05 mL of diluted copper (II) sulfate TS (1 in 10), shake, add 0.9 g of potassium hydroxide, and shake. When 0.3 mL of ethanol (99.5) is added to this solution and shaken, the ethanol layer exhibits a violet color.

**(2)** Based on the results of the Assay (1), place an amount of Celmoleukin (Genetical Recombination) equivalent to about 50  $\mu$ g of protein in two hydrolysis tubes, and evaporate to dryness under vacuum. To one of the tubes add 100  $\mu$ L of a mixture of diluted hydrochloric acid (59→125), mercaptoacetic acid and phenol (100:10:1), and shake. Place this hydrolysis tube in a vial and humidify the inside of the vial with 200  $\mu$ L of the mixture of diluted hydrochloric acid (59→125), mercaptoacetic acid and phenol (100:10:1). Replace the vial interior with inert gas or reduce the pressure, and heat for 24 hours at about 115°C. After drying under vacuum, dissolve in 0.5 mL of 0.02 mol/L hydrochloric acid TS, and use this solution as the sample solution (1). To the other hydrolysis tube, add 100  $\mu$ L of ice cold performic acid, oxidize for 1.5 hours on ice, add 50  $\mu$ L of hydrobromic acid, and dry under vacuum. Add 200  $\mu$ L of water, repeat the dry under vacuum procedure two more times, place the hydrolysis tube in a vial, and humidify the inside of the vial with 200  $\mu$ L of diluted hydrochloric acid (59→125). Replace the vial interior with inert gas or reduce the pressure (vacuum), and heat for 24 hours at about 115°C. After drying under vacuum, dissolve in 0.5 mL of 0.02 mol/L hydrochloric acid TS, and use this solution as the sample solution (2). Separately, accurately weigh 60 mg of L-aspartic acid, 100 mg of L-glutamic acid, 17 mg of L-alanine, 23 mg of L-methionine, 21 mg of L-tyrosine, 24 mg of L-histidine hydrochloride monohydrate, 58 mg of L-threonine, 22 mg of L-proline, 14 mg of L-cystine, 45 mg of L-isoleucine, 37 mg of L-phenylalanine, 32 mg of L-arginine hydrochloride, 32 mg of L-serine, 6 mg of glycine, 18 mg of L-valine, 109 mg of L-leucine, 76 mg of L-lysine hydrochloride, and 8 mg of L-tryptophan, add 0.1 mol/L hydrochloric acid TS to dissolve to make 500 mL, add 40  $\mu$ L of this solution to two hydrolysis tubes, and evaporate to dryness under vacuum to make the standard solutions (1) and (2) processed in the same way for each respective sample solution. Perform the test with 250  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> and from the peak areas for each amino acid obtained from the sample solutions and standard solutions determine the molar number of the amino acids contained in 1 mL of the sample solutions. Furthermore, when calculating the number of amino acids assuming there are 22 leucine residues in one mole of Celmoleukin (Genetical Recombination), there are 17 or 18 glutamic acid (or glutamine), 11 to 13 threonine, 11 or 12 aspartic acid (or asparagine), 11 lysine, 7 or 8 isoleucine, 6 to 9 serine, 6 phenylalanine, 5 alanine, 5 or 6 proline, 4 arginine and 4 methionine, 3 or 4 cysteine, 3 or 4 valine, 3 tyrosine, 3 histi-

dine, 2 glycine, and 1 tryptophan.

**(3)** Molecular mass Based on the results of the Assay (1), add buffer for celmoleukin and dilute to prepare a sample solution so that there is about 0.5 mg of protein per mL. To vertical uncontinuous buffer SDS-polyacrylamide gel prepared from resolving gel for celmoleukin and stacking gel for celmoleukin add 20  $\mu$ L of the sample solution or 20  $\mu$ L of molecular weight marker for celmoleukin to each stacking gel well, and perform the electrophoresis. The molecular weight of the main electrophoretic band is between the range of 12500 and 13800 when the band is stained by immersion in Coomassie staining TS.

**(4)** Add 100  $\mu$ L of protein digestive enzyme TS to 100  $\mu$ L of Celmoleukin (Genetical Recombination), shake, leave standing for 18 to 24 hours at 37°C, and then add 2  $\mu$ L of 2-mercaptoethanol. Leave for a further 30 minutes at 37°C, and add 5  $\mu$ L of trifluoroacetic acid solution (1 in 10). This is the sample solution. Separately, process celmoleukin for liquid chromatography using the same method. This is the standard solution. Perform the test using 50  $\mu$ L of each both the sample and standard solutions as directed under Liquid Chromatography <2.01> according to the following conditions. When comparing the chromatograms obtained from the sample and standard solutions, the retention times for the sample and standard solutions are identical, and the peak heights are similar.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 215 nm)

**Column:** A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (particle size: 5  $\mu$ m).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase A:** A solution of trifluoroacetic acid (1 in 1000).

**Mobile phase B:** A solution of trifluoroacetic acid in a mixture of acetonitrile and water (17:3) (1 in 1000).

**Mobile phase flow:** The concentration gradient is controlled by changing the ratio of mobile phases A and B as shown in the table below.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 – 5	100	0
5 – 45	100→60	0→40
45 – 75	60→0	40→100
75 – 85	0	100

**Flow:** Adjust so that the retention time of celmoleukin is about 70 minutes.

**System suitability—**

**System performance:** Add 2  $\mu$ L of 2-mercaptoethanol to 100  $\mu$ L of celmoleukin for liquid chromatography, leave for 2 hours at 37°C, and then run this solution under the above conditions. Under these conditions, celmoleukin and its reduced form are eluted in this order with the resolution between these peaks being not less than 1.5.

**(5)** Accurately measure an appropriate amount of Celmoleukin (Genetical Recombination), dilute by adding culture medium for celmoleukin, and prepare a sample solution

containing 800 units per mL. Add 25  $\mu\text{L}$  of this sample solution to 2 holes (A and B) of a flat-bottomed microtest plate for tissue culture, and then add 25  $\mu\text{L}$  of reference anti-interleukin-2 antiserum solution diluted with culture medium for celmoleukin to hole A and 25  $\mu\text{L}$  of culture medium for celmoleukin to hole B. Add 50  $\mu\text{L}$  of culture medium for celmoleukin to another hole (hole C). After shaking the microtest plate, warm for 30 minutes to 2 hours at 37°C in air containing 5% carbon dioxide. Next, add to each hole 50  $\mu\text{L}$  of culture medium for celmoleukin containing the interleukin-2 dependent mouse natural killer cells NKC3 and culture for 16 to 24 hours at 37°C. Add 3-(4,5-dimethylthiazole-2-yl)-2,5-diphenyl-2*H*-tetrazolium bromide TS, culture for 4 to 6 hours at 37°C, and add sodium lauryl sulfate TS and leave for 24 to 48 hours. When the absorbance at 590 nm of the solution in each hole is measured as directed under Ultraviolet-visible Spectrophotometry <2.24>, the difference in absorbance between the solutions from holes A and C is not more than 3% of the difference in absorbance between the solutions from holes B and C.

**pH** <2.54> 4.5 – 5.5

**Purity** (1) Host cell-derived protein—Prepare a sample solution by the accurate two times stepwise dilution of Celmoleukin (Genetical Recombination) with phosphate buffer-sodium chloride TS (hereinafter referred to as PBS) containing bovine serum. Prepare a series of 5 standard solutions by accurately diluting *E. coli* protein (hereinafter referred to as ECP) over a range of 0.25 to 6 ng per mL with PBS containing bovine serum. Pipet 100  $\mu\text{L}$  of goat anti-ECP antibody TS into each hole of a flat-bottomed microtest plate, leave for 16 to 24 hours at 4°C, and then remove the liquid. Wash three times with PBS, add 200  $\mu\text{L}$  of PBS containing bovine serum albumin, leave for at least 3 hours at room temperature, and then wash three more times with PBS. Pipet 100  $\mu\text{L}$  of the sample solution and each standard solution into each hole, leave for 16 to 24 hours at 4°C, and then wash 5 times with PBS. Add 100  $\mu\text{L}$  of peroxidase-labeled rabbit anti-ECP antibody Fab' TS, leave for at least 4 hours at room temperature, and wash 5 times with PBS. Next, add 100  $\mu\text{L}$  of substrate buffer for celmoleukin, allow to react for 5 to 25 minutes at room temperature in a dark place, and then add 100  $\mu\text{L}$  of diluted sulfuric acid (3 in 25). Measure the absorbances of these flat-bottomed microtest plates by Ultraviolet-visible Spectrophotometry <2.24> at a wavelength of 492 nm. Separately, using 100  $\mu\text{L}$  of PBS containing bovine serum, perform a blank test using the same method and correct. Determine the absorbance of each standard solution, prepare a calibration curve, determine the amount of ECP per mL of the sample solution, and multiply by the sample solution dilution factor. When determining the concentration of ECP per unit of protein in the sample solution, there is not more than 0.02% (0.2  $\mu\text{g}/\text{mg}$  of protein).

(2) Polymers—Dilute (at least 4 steps) the sample solution prepared in the Identification (3) with buffer solution for celmoleukin so that the protein content is within the range of about 2 to 32  $\mu\text{g}$  per mL to prepare a series of standard solutions. Pipet 20  $\mu\text{L}$  of the sample solution or each of the standard solutions into the stacking gel well, and perform vertical uncoupled buffer SDS-polyacrylamide gel electrophoresis followed by immersion in Coomassie staining TS. Each electrophoretic band is stained blue. Next, determine the peak area of the electrophoretic bands obtained from each stan-

dard solution using a densitometer and calculate the protein content using the calibration curve mentioned above. When determining the polymer proteins derived from celmoleukin, other than celmoleukin monomer, the amount is not more than 2% in relation to the total protein.

(3) Related substances—Perform the test with 10  $\mu\text{L}$  each of Celmoleukin (Genetical Recombination) and 0.01 mol/L acetic acid buffer solution, pH 5.0, as directed under Liquid Chromatography <2.01> under the following conditions, and measure the area of each peak by an automatic integration method. When the amount of related substances other than celmoleukin is determined by the area percent method, the total amount is not more than 5%.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 215 nm)

**Column:** Stainless steel tube with an inside diameter of 4 mm and a length of 30 cm packed with octadecylsilanized silica gel for liquid chromatography (particle size: 5  $\mu\text{m}$ ).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase A:** A solution of trifluoroacetic acid in a mixture of acetic acid and water (3:2) (1 in 1000)

**Mobile phase B:** A solution of trifluoroacetic acid in a mixture of acetic acid and water (13:7) (1 in 1000)

**Mobile phase flow:** The concentration gradient is controlled by changing the ratio of mobile phases A and B as shown in the table below.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 ~ 60	70 → 10	30 → 90

**Flow:** Adjust so that the retention time of celmoleukin is about 50 minutes.

**Time span of measurement:** About 1.3 times as long as the retention time of celmoleukin beginning after the solvent peak.

**System suitability**—

**Test for required detectability:** Measure exactly 0.5 mL of Celmoleukin (Genetical Recombination), and add 0.01 mol/L acetic acid buffer solution, pH 5.0, to make exactly 50 mL. Confirm that the celmoleukin peak area obtained from 10  $\mu\text{L}$  of this solution is 0.9 to 1.1% of the peak area obtained from 10  $\mu\text{L}$  of Celmoleukin (Genetical Recombination).

**System performance:** Add 2  $\mu\text{L}$  of 2-mercaptoethanol to 100  $\mu\text{L}$  of Celmoleukin (Genetical Recombination), leave for 2 hours at 37°C, and then run this solution under the above conditions. Under these conditions, celmoleukin and its reduced form are eluted in this order with the resolution between these peaks being not less than 3.0.

**Ammonium acetate** Measure exactly 0.1 mL of Celmoleukin (Genetical Recombination), and add water to make exactly 10 mL. This is the sample solution. Separately, accurately weigh about 0.1 g of ammonium chloride, and add water to make exactly 100 mL. Measure exactly 5 mL of this solution, and add water to make exactly 100 mL. This is the standard stock solution. Measure exactly 3 mL of the standard stock solution, and add water to make exactly 50 mL.

This is the standard solution. Perform the test with exactly 25  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. When determining the area of the ammonium ion peak  $A_T$  and  $A_S$ , Celmo-leukin (Genetical Recombination) contains from 0.28 to 0.49 mg of ammonium acetate per mL.

Amount (mg) of ammonium acetate ( $\text{CH}_3\text{COONH}_4$ ) per mL  
 $= A_T/A_S \times W_S \times 0.003 \times 1.4410$

$W_S$ : Amount (mg) of ammonium chloride

0.003: Dilution correction coefficient

1.4410: Molecular weight conversion coefficient for converting ammonium chloride to ammonium acetate

#### Operating conditions—

Detector: Electronic conductivity detector

Column: Resin column with an inside diameter of 5 mm and a length of 25 cm packed with weakly acidic ion exchange resin for liquid chromatography (particle size: 5.5  $\mu\text{m}$ ). As a guard column, connect to a column with an inside diameter of 5 mm and a length of 5 cm packed with weakly acidic ion exchange resin for liquid chromatography.

Column temperature: A constant temperature of about 40°C.

Mobile phase: Diluted 0.1 mol/L methanesulfonic acid TS (3 in 10).

Flow: Adjust the flow so that the retention time of ammonium is about 8 minutes.

#### System suitability—

System performance: Measure exactly 1 mL of Standard Sodium Stock Solution and 0.2 mL of Standard Potassium Stock Solution, and then add water to make exactly 100 mL. Measure exactly 5 mL of this solution and 3 mL of the standard stock solution, and then add water to make exactly 5 mL. When 25  $\mu\text{L}$  of this solution is run under the above conditions, sodium, ammonium and potassium are eluted in this order with the resolution between the peaks of sodium and ammonium being not less than 3.0.

System repeatability: When the test is repeated 5 times with 25  $\mu\text{L}$  of the standard solution under the above conditions, the relative standard deviation of the ammonium peak area is not more than 10%.

**Bacterial endotoxins** <4.01> Less than 100 EU/mL

**Sterility** <4.06> Perform the test according to the Direct method: it meets the requirement. In the test, add 0.5 mL of Celmo-leukin (Genetical Recombination) to 8 test tubes and 1.0 mL of Celmo-leukin (Genetical Recombination) to 8 test tubes containing 15 mL of thioglycol acid I for sterility test, as well as 1.0 mL of Celmo-leukin (Genetical Recombination) to 8 test tubes containing 15 mL of soybean-casein digest medium.

**Assay** (1) Total protein content—Measure accurately 1 mL of Celmo-leukin (Genetical Recombination) and add water to make exactly 10 mL. This is the sample solution. Separately, weigh accurately about 50 mg of bovine serum albumin for assay in water to prepare standard dilution solutions of 50, 100, and 150  $\mu\text{g}/\text{mL}$ . Measure exactly 1 mL of the sample solution and each standard dilution solution, add exactly 2.5 mL of alkaline copper TS for protein content determination, shake, and leave for 15 minutes. Next, add exactly 2.5 mL of water and 0.5 mL of dilute Folin's TS, and

leave for 30 minutes at 37°C. Measure the absorbances of these solutions at 750 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using 1 mL of water processed in the same way as control. Using the calibration curve prepared from the absorbance of the standard dilution solution, determine the protein content of Celmo-leukin (Genetical Recombination).

(2) Specific activity—Measure exactly 0.1 mL of Celmo-leukin (Genetical Recombination) and add exactly 0.9 mL of culture medium for celmo-leukin to make the sample solution. Separately, take one Interleukin-2 Reference Standard and add exactly 1 mL of water to dissolve. This is the standard solution. Accurately serially dilute the sample and standard solutions in two-fold steps with culture medium for celmo-leukin, and add equal volumes of interleukin-2 dependent mouse natural killer NKC3 cells to the serially diluted solutions. The control solution is a mixture of equal volumes of NKC3 and culture medium for celmo-leukin. Incubate these solutions for 16 to 24 hours at 37°C. Following this, add a volume of 3-(4,5-dimethylthiazole-2-yl)-2,5-diphenyl-2H-tetrazolium bromide TS that is 1/5 that of the volume of culture medium for celmo-leukin, incubate for 4 to 6 hours at 37°C, add a volume of sodium lauryl sulfate TS equivalent to the volume of the culture medium for celmo-leukin, and leave for 24 to 48 hours. After eluting the blue-colored pigment generated, perform the test on these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, and measure the absorbance at 590 nm. Taking the absorbance obtained when 1000 to 2000 units of celmo-leukin per mL are added as 100% and the absorbance of the control solution as 0%, determine the dilution factor (A) of the Interleukin-2 Reference Standard that shows an absorbance of 50% and dilution factor of Celmo-leukin (Genetical Recombination) (B). Multiply the B/A value by the unit number of the Interleukin-2 Reference Standard to determine the biological activity of 1 mL of Celmo-leukin (Genetical Recombination). Calculate the ratio of biological activity in relation to protein content determined in the total protein content test.

**Containers and storage** Containers—Sterilized, tight containers.

Storage—Store at  $-20^\circ\text{C}$  or lower.

## Cetanol

セタノール

Cetanol is a mixture of solid alcohols, and consists chiefly of  $\text{C}_{16}\text{H}_{34}\text{O}$ : 242.44.

**Description** Cetanol occurs as unctuous, white flakes, granules, or masses. It has a faint, characteristic odor. It is tasteless.

It is very soluble in pyridine, freely soluble in ethanol (95), in ethanol (99.5) and in diethyl ether, very slightly soluble in acetic anhydride, and practically insoluble in water.

**Melting point** <1.13> 47 – 53°C Prepare the sample according to Method 2, then attach tightly a capillary tube to the bottom of the thermometer by means of a rubber band or by any suitable means, and make the bottom of the capillary tube equal in position to the lower end of the thermometer.

Insert this thermometer into a test tube 17 mm in inside diameter and about 170 mm in height, fasten the thermometer with cork stopper so that the lower end of the thermometer is about 25 mm distant from the bottom of the test tube. Suspend the test tube in a beaker containing water, and heat the beaker with constant stirring until the temperature rises to 5°C below the expected melting point. Then regulate the rate of increase to 1°C per minute. The temperature at which the sample is transparent and no turbidity is produced is taken as the melting point.

**Acid value** <1.13> Not more than 1.0.

**Ester value** <1.13> Not more than 2.0.

**Hydroxyl value** <1.13> 210 – 232

**Iodine value** <1.13> Not more than 2.0.

**Purity (1)** Clarity of solution—Dissolve 3.0 g of Cetanol in 25 mL of ethanol (99.5) by warming; the solution is clear.

**(2)** Alkalinity—To the solution obtained in (1) add 2 drops of phenolphthalein TS: no red color develops.

**Residue on ignition** <2.44> Not more than 0.05% (2 g).

**Containers and storage** Containers—Well-closed containers.

## Cetraxate Hydrochloride

セトラキサート塩酸塩

$C_{17}H_{23}NO_4 \cdot HCl$ : 341.83

3-{4-[*trans*-4-(Aminomethyl)cyclohexylcarbonyloxy]-phenyl}propanoic acid monohydrochloride [27724-96-5]

Cetraxate Hydrochloride, when dried, contains not less than 98.5% of  $C_{17}H_{23}NO_4 \cdot HCl$ .

**Description** Cetraxate Hydrochloride occurs as white crystals or crystalline powder.

It is soluble in methanol, sparingly soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 236°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Cetraxate Hydrochloride in methanol (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Dissolve 0.5 g of Cetraxate Hydrochloride in 5 mL of a mixture of water and 2-propanol (1:1) by warming, cool to below 25°C. Filter, dry the formed crystals in vacuum for 4 hours, and further dry at 105°C for 1 hour. Determine the infrared absorption spectrum of the dried matter as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Cetraxate Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> (2) for chloride.

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Cetraxate Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(2)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Cetraxate Hydrochloride according to Method 3, and perform the test with a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 5) (not more than 2 ppm).

**(3)** *cis* Isomer—Dissolve 0.10 g of Cetraxate Hydrochloride in 10 mL of water, and use this solution as the sample solution. To exactly 5 mL of the sample solution add water to make exactly 100 mL. To exactly 2 mL of this solution add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak which has a retention time 1.3 to 1.6 times that of cetraxate from the sample solution is not larger than the peak area of cetraxate from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 220 nm).

**Column:** A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Adjust the pH of a mixture of water, methanol and 0.5 mol/L ammonium acetate TS (15:10:4) to 6.0 with acetic acid (31).

**Flow rate:** Adjust the flow rate so that the retention time of cetraxate is about 10 minutes.

**System suitability—**

**System performance:** Dissolve 0.02 g of Cetraxate Hydrochloride and 0.01 g of phenol in 100 mL of water. To 2 mL of this solution add water to make 20 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, cetraxate and phenol are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cetraxate is not more than 2.0%.

**(4)** 3-(*p*-Hydroxyphenyl)propionic acid—To 0.10 g of Cetraxate Hydrochloride add exactly 2 mL of the internal standard solution and methanol to make 10 mL, and use this solution as the sample solution. Separately, dissolve 25 mg of 3-(*p*-hydroxyphenyl)propionic acid in methanol to make exactly 100 mL. To exactly 2 mL of this solution add exactly 2 mL of the internal standard solution and methanol to make 10 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of 3-(*p*-hydroxyphenyl)propionic acid to that of the internal standard:  $Q_T$  is not larger than  $Q_S$ .

**Internal standard solution**—A solution of caffeine in methanol (1 in 4000).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 230 nm).

**Column:** A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Adjust the pH of a mixture of water, methanol and 0.5 mol/L ammonium acetate TS (15:5:2) to 5.5 with acetic acid (31).

**Flow rate:** Adjust the flow rate so that the retention time of 3-(*p*-hydroxyphenyl)propionic acid is about 7 minutes.

**System suitability**—

**System performance:** When the procedure is run with 10 μL of the standard solution under the above operating conditions, 3-(*p*-hydroxyphenyl)propionic acid and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of 3-(*p*-hydroxyphenyl)propionic acid to that of the internal standard is not more than 1.0%.

(5) **Related substances**—Dissolve 0.10 g of Cetraxate Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and acetic acid (100) (20:4:3) to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin TS on the plate, and heat at 90°C for 10 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Cetraxate Hydrochloride, previously dried, dissolve in 100 mL of water, and adjust the pH of this solution to between 7.0 and 7.5 with dilute sodium hydroxide TS. To this solution add 10 mL of formaldehyde solution, stir for about 5 minutes, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS by taking over about 20 minutes (potentiometric titration). Perform a blank determination, and make any necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L sodium hydroxide VS} \\ = 34.18 \text{ mg of } C_{17}H_{23}NO_4 \cdot HCl \end{aligned}$$

**Containers and storage** Containers—Tight containers.

## Chenodeoxycholic Acid

ケノデオキシコール酸

$C_{24}H_{40}O_4$ : 392.57

3α,7α-Dihydroxy-5β-cholan-24-oic acid  
[474-25-9]

Chenodeoxycholic Acid, when dried, contains not less than 98.0% and not more than 101.0% of  $C_{24}H_{40}O_4$ .

**Description** Chenodeoxycholic Acid occurs as white, crystals, crystalline powder or powder.

It is freely soluble in methanol and in ethanol (99.5), soluble in acetone, and practically insoluble in water.

**Identification** Determine the infrared absorption spectrum of Chenodeoxycholic Acid, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +11.0 – +13.0° (after drying, 0.4 g, ethanol (99.5), 20 mL, 100 mm).

**Melting point** <2.60> 164 – 169°C

**Purity (1) Chloride** <1.03>—Dissolve 0.36 g of Chenodeoxycholic Acid in 30 mL of methanol, add 10 mL of dilute nitric acid and water to make 50 mL, and perform the test with this solution. Prepare the control solution as follows: To 1.0 mL of 0.01 mol/L hydrochloric acid VS add 30 mL of methanol, 10 mL of dilute nitric acid and water to make 50 mL (not more than 0.1%).

(2) **Heavy metals** <1.07>—Proceed with 1.0 g of Chenodeoxycholic Acid according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) **Barium**—To 2.0 g of Chenodeoxycholic Acid add 100 mL of water, and boil for 2 minutes. To this solution add 2 mL of hydrochloric acid, boil for 2 minutes, filter after cooling, and wash the filter with water until to get 100 mL of the filtrate. To 10 mL of the filtrate add 1 mL of dilute sulfuric acid: no turbidity is appeared.

(4) **Related substances**—Dissolve 0.20 g of Chenodeoxycholic Acid in a mixture of acetone and water (9:1) to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 10 mg of lithocholic acid for thin-layer chromatography in the mixture of acetone and water (9:1) to make exactly 10 mL. Pipet 2 mL of this solution, add the mixture of acetone and water (9:1) to make exactly 100 mL, and use this solution as the standard solution (1). Separately, dissolve 10 mg of ursodeoxycholic acid in the mixture of acetone and water (9:1) to make exactly 100 mL, and use this so-

lution as the standard solution (2). Separately, dissolve 10 mg of cholic acid for thin-layer chromatography in the mixture of acetone and water (9:1) to make exactly 100 mL, and use this solution as the standard solution (3). Pipet 1 mL of the sample solution, and add the mixture of acetone and water (9:1) to make exactly 20 mL. Pipet 0.5 mL, 1 mL, 2 mL, 3 mL and 5 mL of this solution, add the mixture of acetone and water (9:1) to each of them to make exactly 50 mL, and designate these solutions as standard solution A, standard solution B, standard solution C, standard solution D and standard solution E, respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution, standard solutions (1), (2), (3) and standard solutions A, B, C, D and E on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 4-methyl-2-pentanone, toluene and formic acid (16:6:1) to a distance of about 15 cm, air-dry the plate, and further dry at 120°C for 30 minutes. Immediately, spray evenly a solution of phosphomolybdic acid *n*-hydrate in ethanol (95) (1 in 5) on the plate, and heat at 120°C for 2 to 3 minutes: the spot corresponding to the spot with the standard solution (1) is not more intense than the spot with the standard solution (1), the spot corresponding to the spot with the standard solution (2) is not more intense than the spot with the standard solution (2), and the spot corresponding to the spot with the standard solution (3) is not more intense than the spot with the standard solution (3).

As compared to the spots with the standard solutions A, B, C, D and E, the spots other than the principal spot and other than the spots mentioned above are not more intense than the spot with the standard solution E, and the total amount of them is not more than 1.5%.

**Loss on drying** <2.41> Not more than 1.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Chenodeoxycholic Acid, previously dried, dissolve in 40 mL of ethanol (95) and 20 mL of water, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 39.26 mg of  $C_{24}H_{40}O_4$

**Containers and storage** Containers—Tight containers.

## Chloral Hydrate

抱水クロラール

$C_2H_3Cl_3O_2$ : 165.40  
2,2,2-Trichloroethane-1,1-diol [302-17-0]

Chloral Hydrate contains not less than 99.5% of  $C_2H_3Cl_3O_2$ .

**Description** Chloral Hydrate occurs as colorless crystals. It

has a pungent odor and an acrid, slightly bitter taste.

It is very soluble in water, and freely soluble in ethanol (95) and in diethyl ether.

It slowly volatilizes in air.

**Identification** (1) Dissolve 0.2 g of Chloral Hydrate in 2 mL of water, and add 2 mL of sodium hydroxide TS: the turbidity is produced, and it separates into two clear layers by warming.

(2) Heat 0.2 g of Chloral Hydrate with 3 drops of aniline and 3 drops of sodium hydroxide TS: the disagreeable odor of phenylisocyanide (poisonous) is perceptible.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Chloral Hydrate in 2 mL of water: the solution is clear and colorless.

(2) Acidity—Dissolve 0.20 g of Chloral Hydrate in 2 mL of water, and add 1 drop of methyl orange TS: a yellow color develops.

(3) Chloride <1.03>—Perform the test with 1.0 g of Chloral Hydrate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).

(4) Chloral alcoholate—Warm 1.0 g of Chloral Hydrate with 10 mL of sodium hydroxide TS, filter the upper layer, add iodine TS to the filtrate until a yellow color develops, and allow the solution to stand for 1 hour: no yellow precipitate is produced.

(5) Benzene—Warm the solution obtained in (1) with 3 mL of water: no odor of benzene is perceptible.

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 4 g of Chloral Hydrate in a glass-stoppered flask, add 10 mL of water and exactly 40 mL of 1 mol/L sodium hydroxide VS, and allow the mixture to stand for exactly 2 minutes. Titrate <2.50> the excess sodium hydroxide immediately with 0.5 mol/L sulfuric acid VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination, and make any necessary correction.

Each mL of 1 mol/L sodium hydroxide VS  
= 165.4 mg of  $C_2H_3Cl_3O_2$

**Containers and storage** Containers—Tight containers.

## Chloramphenicol

クロラムフェニコール

$C_{11}H_{12}Cl_2N_2O_5$ : 323.13  
2,2-Dichloro-*N*-[(1*R*,2*R*)-1,3-dihydroxy-1-(4-nitrophenyl)propan-2-yl]acetamide [56-75-7]

Chloramphenicol contains not less than 980  $\mu$ g (potency) and not more than 1020  $\mu$ g (potency) per mg, calculated on the dried basis. The potency of Chloramphenicol is expressed as mass (potency) of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ).

**Description** Chloramphenicol occurs as white to yellowish

white, crystals or crystalline powder.

It is freely soluble in methanol and in ethanol (99.5), and slightly soluble in water.

**Identification (1)** Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Chloramphenicol Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Chloramphenicol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Chloramphenicol Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +18.5 – +21.5° (1.25 g, ethanol (99.5), 25 mL, 100 mm).

**Melting point** <2.60> 150 – 155°C

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Chloramphenicol according to Method 2, and perform the test. Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 25 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 2.0 g of Chloramphenicol according to Method 4, and perform the test (not more than 1 ppm).

(3) Related substances—Dissolve 0.10 g of Chloramphenicol in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution (1). Pipet 10 mL of the standard solution (1), add methanol to make exactly 20 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of chloroform, methanol and acetic acid (100) (79:14:7) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot and the spot on the original obtained from the sample solution are not more intense than the spot from the standard solution (1), and the total amount of these spots is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately an amount of Chloramphenicol and Chloramphenicol Reference Standard, equivalent to about 0.1 g (potency), dissolve each in 20 mL of methanol, and add water to make exactly 100 mL. Pipet 20 mL each of these solutions, and add water to make exactly 100 mL. Pipet 10 mL each of these solutions, add water to make exactly 100 mL, and use these solutions as the sample solution and standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , at 278 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of } C_{11}H_{12}Cl_2N_2O_5 \\ &= W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Chloramphenicol Reference Standard

**Containers and storage** Containers—Tight containers.

## Chloramphenicol Palmitate

クロラムフェニコールパルミチン酸エステル

$C_{27}H_{42}Cl_2N_2O_6$ : 561.54

(2*R*,3*R*)-2-(Dichloroacetyl)amino-3-hydroxy-3-(4-nitrophenyl)propan-1-yl palmitate [530-43-8]

Chloramphenicol Palmitate contains not less than 558  $\mu$ g (potency) and not more than 587  $\mu$ g (potency) per mg, calculated on the dried basis. The potency of Chloramphenicol Palmitate is expressed as mass (potency) of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ : 323.13).

**Description** Chloramphenicol Palmitate occurs as a white to grayish white, crystalline powder.

It is freely soluble in acetone, sparingly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Chloramphenicol Palmitate in ethanol (99.5) (1 in 33,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Chloramphenicol Palmitate Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 5 mg each of Chloramphenicol Palmitate and Chloramphenicol Palmitate Reference Standard in 1 mL of acetone, and use these solutions as the sample solution and the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetone and cyclohexane (1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution has the same  $R_f$  value as the spot from the standard solution.

**Optical rotation** <2.49>  $[\alpha]_D^{25}$ : +21 – +25° (1 g calculated on the dried basis, ethanol (99.5), 20 mL, 100 mm).

**Melting point** <2.60> 91 – 96°C

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Chloramphenicol Palmitate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Chloramphenicol Palmitate according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 50 mg of Chloramphenicol Palmitate in 50 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. The test should be performed within 30 minutes after the sample solution and standard solution are prepared. Determine each peak area by the automatic integration method: the total area of the peaks other than the peak of chloramphenicol palmitate from the sample solution is not more than 3.5 times the peak area of chloramphenicol palmitate from the standard solution. For this calculation, use the peak areas for chloramphenicol, having the relative retention time of about 0.5 with respect to chloramphenicol palmitate, and for chloramphenicol dipalmitate, having the relative retention time of about 5.0 with respect to chloramphenicol palmitate, after multiplying by their relative response factors, 0.5 and 1.4, respectively.

*Operating conditions—*

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column 6.0 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 20°C.

Mobile phase: Methanol

Flow rate: Adjust the flow rate so that the retention time of chloramphenicol palmitate is about 5 minutes.

Time span of measurement: About 6 times as long as the retention time of chloramphenicol palmitate.

*System suitability—*

Test for required detectability: Dissolve 50 mg of Chloramphenicol Palmitate in 50 mL of methanol. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 5 mL of the solution for system suitability test, and add methanol to make exactly 50 mL. Confirm that the peak area of chloramphenicol palmitate obtained from 20  $\mu$ L of this solution is equivalent to 7 to 13% of that obtained from 20  $\mu$ L of the solution for system suitability test.

System performance: When the procedure is run with 20  $\mu$ L of the solution for system suitability test under the above operating conditions, the number of theoretical plates of the peak of chloramphenicol palmitate is not less than 5000.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of chloramphenicol palmitate is not more than 1.0%.

**Loss on drying** <2.41> Not more than 1.0% (1 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Assay** Weigh accurately an amount of Chloramphenicol Palmitate and Chloramphenicol Palmitate Reference Standard, equivalent to about 37 mg (potency), dissolve each in

40 mL of methanol and exactly 1 mL of acetic acid (100), and add methanol to make exactly 50 mL. Pipet 10 mL each of these solutions, add the mobile phase to make exactly 25 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ .

Amount [ $\mu$ g (potency)] of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ )  
 $= W_S \times (A_T/A_S) \times 1000$

$W_S$ : Amount [mg (potency)] of Chloramphenicol Palmitate Reference Standard

*Operating conditions—*

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of methanol, water and acetic acid (100) (172:27:1).

Flow rate: Adjust the flow rate so that the retention time of chloramphenicol palmitate is about 7 minutes.

*System suitability—*

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates of the peak of chloramphenicol palmitate is not less than 2400.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of chloramphenicol palmitate is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Chloramphenicol Sodium Succinate

クロラムフェニコールコハク酸エステルナトリウム

$C_{15}H_{15}Cl_2N_2NaO_8$ : 445.18

Monosodium (2*R*,3*R*)-2-(dichloroacetyl)amino-3-hydroxy-3-(4-nitrophenyl)propan-1-yl succinate [982-57-0]

Chloramphenicol Sodium Succinate contains not less than 711  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Chloramphenicol Sodium Succinate is expressed as mass (potency) of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ : 323.13).

**Description** Chloramphenicol Sodium Succinate occurs as white to yellowish white, crystals or crystalline powder.

It is very soluble in water, and freely soluble in methanol and in ethanol (99.5).

It is hygroscopic.

**Identification (1)** Determine the absorption spectrum of a solution of Chloramphenicol Sodium Succinate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Chloramphenicol Sodium Succinate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** Chloramphenicol Sodium Succinate responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{25}$ : +5 – +8° (1.25 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 1.4 g of Chloramphenicol Sodium Succinate in 5 mL of water is between 6.0 and 7.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Chloramphenicol Sodium Succinate in 10 mL of water: the solution is clear and colorless to yellowish.

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of Chloramphenicol Sodium Succinate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Chloramphenicol Sodium Succinate according to Method 1, and perform the test (not more than 2 ppm).

**Water** <2.48> Not more than 2.0% (1.0 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Chloramphenicol Sodium Succinate, equivalent to about 20 mg (potency), dissolve in water to make exactly 1000 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Chloramphenicol Succinate Reference Standard, equivalent to about 20 mg (potency), add about 50 mL of water to make a suspension, and add gradually about 7 mL of 0.01 mol/L sodium hydroxide TS while stirring to adjust the pH to 7.0. To this solution add water to make exactly 1000 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , at 276 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Amount [ $\mu$ g (potency)] of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ )  
 $= W_S \times (A_T/A_S) \times 1000$

$W_S$ : Amount [mg (potency)] of Chloramphenicol Succinate Reference Standard

**Containers and storage** Containers—Hermetic containers.

## Chlordiazepoxide

クロルジアゼポキシド

$C_{16}H_{14}ClN_3O$ : 299.75

7-Chloro-2-methylamino-5-phenyl-3H-1,4-benzodiazepin-4-oxide [58-25-3]

Chlordiazepoxide, when dried, contains not less than 98.5% of  $C_{16}H_{14}ClN_3O$ .

**Description** Chlordiazepoxide occurs as white to light yellow crystals or crystalline powder.

It is freely soluble in acetic acid (100), sparingly soluble in ethanol (95), very slightly soluble in diethyl ether, and practically insoluble in water.

It dissolves in dilute hydrochloric acid.

It is gradually affected by light.

Melting point: about 240°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Chlordiazepoxide in 0.1 mol/L hydrochloric acid TS (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Chlordiazepoxide Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectra of Chlordiazepoxide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Chlordiazepoxide Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** Proceed with Chlordiazepoxide as directed under Flame Coloration Test <1.04> (2), and perform the test: a green color develops.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Chlordiazepoxide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(2)** Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.20 g of Chlordiazepoxide in exactly 10 mL of a mixture of methanol and ammonia TS (97:3), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of methanol and ammonia TS (97:3) to make exactly 200 mL, and use this solution as the standard solution (1). Separately, dissolve 10 mg of 2-amino-5-chlorobenzophenone for thin-layer chromatography in methanol to make exactly 200 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 25  $\mu$ L of the

sample solution and 5  $\mu\text{L}$  each of the standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and ethanol (99.5) (19:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (1). Spray evenly a solution of sodium nitrite in 1 mol/L hydrochloric acid TS (1 in 100) on the plate, allow to stand for 1 minute, and spray evenly *N*-(1-naphthyl)-*N'*-diethylethylenediamine oxalate-acetone TS on the plate: the spots from the sample solution are not more intense than the spots from the standard solution (2).

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Chlordiazepoxide, previously dried, and dissolve in 50 mL of acetic acid (100). Titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the supernatant liquid changes from purple through blue-purple to blue (indicator: 3 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 29.98 mg of  $\text{C}_{16}\text{H}_{14}\text{ClN}_3\text{O}$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Chlordiazepoxide Powder

クロルジアゼポキシド散

Chlordiazepoxide Powder contains not less than 93% and not more than 107% of the labeled amount of chlordiazepoxide ( $\text{C}_{16}\text{H}_{14}\text{ClN}_3\text{O}$ : 299.75).

**Method of preparation** Prepare as directed under Powder, with Chlordiazepoxide.

**Identification (1)** Weigh a portion of Chlordiazepoxide Powder, equivalent to 0.01 g of Chlordiazepoxide according to the labeled amount, add 100 mL of 0.1 mol/L hydrochloric acid TS, shake, and filter. To 5 mL of the filtrate add 0.1 mol/L hydrochloric acid TS to make 100 mL, and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 244 nm and 248 nm and between 306 nm and 310 nm, and a minimum between 288 nm and 292 nm.

(2) Weigh a portion of Chlordiazepoxide Powder, equivalent to 0.02 g of Chlordiazepoxide according to the labeled amount, add 10 mL of methanol, shake for 5 minutes, then filter by suction through a glass filter (G4), evaporate the filtrate with the aid of a current of air to dryness, and dry the residue in vacuum at 60°C for 1 hour. Determine the infrared absorption spectrum of the residue as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave numbers of about 1625  $\text{cm}^{-1}$ , 1465  $\text{cm}^{-1}$ , 1265

$\text{cm}^{-1}$ , 850  $\text{cm}^{-1}$  and 765  $\text{cm}^{-1}$ .

**Purity** Conduct this procedure without exposure to daylight, using light-resistant vessels. To a portion of Chlordiazepoxide Powder, equivalent to 50 mg of Chlordiazepoxide according to the labeled amount, add exactly 5 mL of a mixture of methanol and ammonia TS (97:3), shake, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 50 mg of Chlordiazepoxide Reference Standard in a mixture of methanol and ammonia TS (97:3) to make exactly 50 mL, and use this solution as the standard solution (1). Dissolve 5.0 mg of 2-amino-5-chlorobenzophenone for thin-layer chromatography in methanol to make exactly 200 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 25  $\mu\text{L}$  of the sample solution and 10  $\mu\text{L}$  each of the standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Proceed as directed in the Purity (2) under Chlordiazepoxide.

**Assay** Conduct this procedure without exposure to daylight, using light-resistant vessels. Weigh accurately a quantity of Chlordiazepoxide Powder, equivalent to about 0.1 g of Chlordiazepoxide ( $\text{C}_{16}\text{H}_{14}\text{ClN}_3\text{O}$ ), transfer to a glass-stoppered flask, wet with exactly 10 mL of water, add exactly 90 mL of methanol, stopper, shake vigorously for 15 minutes, and centrifuge. Pipet 10 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of Chlordiazepoxide Reference Standard, previously dried in a desiccator (in vacuum, phosphorus (V) oxide, 60°C) for 4 hours, and dissolve in exactly 10 mL of water and 90 mL of methanol. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of chlordiazepoxide to that of the internal standard.

Amount (mg) of chlordiazepoxide ( $\text{C}_{16}\text{H}_{14}\text{ClN}_3\text{O}$ )  
=  $W_S \times (Q_T/Q_S)$

$W_S$ : Amount (mg) of Chlordiazepoxide Reference Standard

**Internal standard solution**—A solution of isobutyl salicylate in methanol (1 in 20).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol and 0.02 mol/L ammonium dihydrogen phosphate TS (7:3).

Flow rate: Adjust the flow rate so that the retention time of chlordiazepoxide is about 5 minutes.

**System suitability**—

System performance: When the procedure is run with

10  $\mu$ L of the standard solution under the above operating conditions, chlordiazepoxide and the internal standard are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of chlordiazepoxide to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Chlordiazepoxide Tablets

クロルジアゼポキシド錠

Chlordiazepoxide Tablets contain not less than 93% and not more than 107% of the labeled amount of chlordiazepoxide ( $C_{16}H_{14}ClN_3O$ ; 299.75).

**Method of preparation** Prepare as directed under Tablets, with Chlordiazepoxide.

**Identification (1)** Weigh a portion of powdered Chlordiazepoxide Tablets, equivalent to 0.01 g of Chlordiazepoxide according to the labeled amount, add 100 mL of 0.1 mol/L hydrochloric acid TS, shake, and filter. To 5 mL of the filtrate add 0.1 mol/L hydrochloric acid TS to make 100 mL, and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 244 nm and 248 nm and between 306 nm and 310 nm, and a minimum between 288 nm and 292 nm.

(2) Weigh a portion of powdered Chlordiazepoxide Tablets, equivalent to 0.01 g of Chlordiazepoxide according to the labeled amount, add 10 mL of diethyl ether, shake vigorously, and centrifuge. Evaporate 5 mL of the supernatant liquid by warming on a water bath to dryness. Determine the infrared absorption spectrum of the residue as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave numbers of about 1625  $cm^{-1}$ , 1465  $cm^{-1}$ , 1265  $cm^{-1}$ , 850  $cm^{-1}$  and 765  $cm^{-1}$ .

**Purity** Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. To a portion of powdered Chlordiazepoxide Tablets, equivalent to 50 mg of Chlordiazepoxide according to the labeled amount, add exactly 5 mL of a mixture of methanol and ammonia TS (97:3), shake, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 50 mg of Chlordiazepoxide Reference Standard in a mixture of methanol and ammonia TS (97:3) to make exactly 50 mL, and use this solution as the standard solution (1). Dissolve 5.0 mg of 2-amino-5-chlorobenzophenone for thin-layer chromatography in methanol to make exactly 200 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 25  $\mu$ L of the sample solution and 10  $\mu$ L each of the standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Proceed as directed in the Purity (2) under Chlordiazepoxide.

**Dissolution <6.10>** Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Chlordiazepoxide Tablets at 100 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the test solution. Take 30 mL or more of the dissolved solution 60 minutes after start of the test, and filter through a membrane filter with a pore size not exceeding 0.8  $\mu$ m. Discard the first 10 mL of the filtrate, pipet the subsequent  $V$  mL, add 2nd fluid for dissolution test to make exactly  $V'$  mL so that each mL contains about 3.7  $\mu$ g of chlordiazepoxide ( $C_{16}H_{14}ClN_3O$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 12 mg of chlordiazepoxide for assay, previously dried in a desiccator for 4 hours (in vacuum, phosphorus (V) oxide, 60°C), and dissolve in 2nd fluid for dissolution test to make exactly 200 mL. Pipet 3 mL of this solution, add 2nd fluid for dissolution test to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 260 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>. The dissolution rate of Chlordiazepoxide Tablets in 60 minutes is not less than 70%.

$$\begin{aligned} &\text{Dissolution rate (\%)} \text{ with respect to the labeled} \\ &\text{amount of chlordiazepoxide (} C_{16}H_{14}ClN_3O \text{)} \\ &= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 27 \end{aligned}$$

$W_S$ : Amount (mg) of chlordiazepoxide for assay.

$C$ : Labeled amount (mg) of chlordiazepoxide ( $C_{16}H_{14}ClN_3O$ ) in 1 tablet.

**Assay** Conduct this procedure without exposure to daylight, using light-resistant vessels. Weigh accurately a quantity of Chlordiazepoxide Tablets, equivalent to about 0.1 g of Chlordiazepoxide ( $C_{16}H_{14}ClN_3O$ ), transfer to a glass-stoppered flask, add 10 mL of water, and shake well to disintegrate. Add 60 mL of methanol, shake well, add methanol to make exactly 100 mL, and centrifuge. Pipet 10 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Chlordiazepoxide Reference Standard, previously dried in a desiccator (in vacuum, phosphorus (V) oxide, 60°C) for 4 hours, dissolve in 1 mL of water and a suitable amount of methanol, add exactly 5 mL of the internal standard solution, add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of chlordiazepoxide to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of chlordiazepoxide (} C_{16}H_{14}ClN_3O \text{)} \\ &= W_S \times (Q_T/Q_S) \times 10 \end{aligned}$$

$W_S$ : Amount (mg) of Chlordiazepoxide Reference Standard

**Internal standard solution**—A solution of isobutyl salicylate in methanol (1 in 20).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol and 0.02 mol/L ammonium dihydrogen phosphate TS (7:3).

Flow rate: Adjust the flow rate so that the retention time of chlordiazepoxide is about 5 minutes.

*System suitability*—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, chlordiazepoxide and the internal standard are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of chlordiazepoxide to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Chlorhexidine Gluconate Solution

クロルヘキシジングルコン酸塩液

Chlorhexidine Gluconate Solution is a solution of digluconate of chlorhexidine.

It contains not less than 19.0 w/v% and not more than 21.0 w/v% of chlorhexidine gluconate (C<sub>22</sub>H<sub>30</sub>Cl<sub>2</sub>N<sub>10</sub>·2C<sub>6</sub>H<sub>12</sub>O<sub>7</sub>: 897.76).

**Description** Chlorhexidine Gluconate Solution is a clear, colorless or pale yellow liquid. It is odorless, and has a bitter taste.

It is miscible with water and with acetic acid (100). 1 mL of Chlorhexidine Gluconate Solution is miscible with not more than 5 mL of ethanol (99.5) and with not more than 3 mL of acetone. By further addition of each of these solvents, a white turbidity is formed.

It is gradually colored by light.

Specific gravity  $d_{20}^{20}$ : 1.06 – 1.07

**Identification (1)** To 0.05 mL of Chlorhexidine Gluconate Solution add 5 mL of methanol, 1 mL of bromine TS and 1 mL of 8 mol/L sodium hydroxide TS: a deep red color is produced.

**(2)** To 0.5 mL of Chlorhexidine Gluconate Solution add 10 mL of water and 0.5 mL of copper (II) sulfate TS: a white precipitate is formed. Heat to boiling: the precipitate changes to light purple.

**(3)** To 10 mL of Chlorhexidine Gluconate Solution add 5 mL of water, cool on ice, and add 5 mL of sodium hydroxide TS dropwise with stirring: a white precipitate is formed. Collect the precipitate by filtration, wash with water, recrystallize from diluted ethanol (95) (7 in 10), and dry at 105°C for 30 minutes: the crystals thus obtained melt <2.60> between 130°C and 134°C.

**(4)** Neutralize the filtrate obtained in (3) with 5 mol/L hydrochloric acid TS. To 5 mL of this solution add 0.65 mL of acetic acid (100) and 1 mL of freshly distilled phenylhydra-

zine, and heat on a water bath for 30 minutes. After cooling, scratch the inner wall of the vessel with a glass rod to induce crystallization. Collect the crystals, dissolve in 10 mL of hot water, add a small amount of activated charcoal, and filter. Cool the filtrate, scratch the inner side of the vessel, collect the formed crystals, and dry: the crystals thus obtained melt <2.60> at about 195°C (with decomposition).

**pH** <2.54> To 5.0 mL of Chlorhexidine Gluconate Solution add water to make 100 mL: the pH of the solution is between 5.5 and 7.0.

**Purity** *p*-Chloroaniline—To 2.0 mL of Chlorhexidine Gluconate Solution add water to make exactly 100 mL. Pipet 5 mL of the solution, and add 20 mL of water and 5 mL of 1 mol/L hydrochloric acid TS. Add 0.3 mL of sodium nitrite TS, shake, and allow to stand for 2 minutes. Add 4 mL of ammonium amidosulfate TS, and then allow to stand for 1 minute. Add 5 mL of *N*-(1-naphthyl)-*N'*-diethylethylenediamine oxalate-acetone TS, allow to stand for 10 minutes, add 1 mL of ethanol (95), and then add water to make 50 mL: the color of the solution is not more intense than the following control solution.

Control solution: Dissolve 20 mg of 4-chloroaniline in 10 mL of 1 mol/L hydrochloric acid TS, and add water to make exactly 100 mL. Pipet 5 mL of the solution, and add water to make exactly 100 mL. Pipet 5 mL of the solution, add 20 mL of water and 5 mL of 1 mol/L hydrochloric acid TS, and proceed as directed for the preparation of the sample solution.

**Residue on ignition** <2.44> Not more than 0.1% (2 g, after evaporation).

**Assay** Pipet 2 mL of Chlorhexidine Gluconate Solution, evaporate to dryness on a water bath, dissolve the residue in 60 mL of acetic acid for nonaqueous titration, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 22.44 mg of C<sub>22</sub>H<sub>30</sub>Cl<sub>2</sub>N<sub>10</sub>·2C<sub>6</sub>H<sub>12</sub>O<sub>7</sub>

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Chlorhexidine Hydrochloride

クロルヘキシジン塩酸塩

C<sub>22</sub>H<sub>30</sub>Cl<sub>2</sub>N<sub>10</sub>·2HCl: 578.37

1,1'-Hexamethylenebis[5-(4-chlorophenyl)biguanide] dihydrochloride [3697-42-5]

Chlorhexidine Hydrochloride, when dried, contains not less than 98.0% of C<sub>22</sub>H<sub>30</sub>Cl<sub>2</sub>N<sub>10</sub>·2HCl.

**Description** Chlorhexidine Hydrochloride occurs as a white, crystalline powder. It is odorless, and has a bitter taste.

It is soluble in formic acid, slightly soluble in methanol and in warm methanol, and practically insoluble in water, in ethanol (95) and in diethyl ether.

It is gradually colored by light.

**Identification (1)** Dissolve 0.01 g of Chlorhexidine Hydrochloride in 5 mL of methanol by warming, and add 1 mL of bromine TS and 1 mL of 8 mol/L sodium hydroxide TS: a deep red color is produced.

**(2)** Dissolve 0.3 g of Chlorhexidine Hydrochloride in 10 mL of 6 mol/L hydrochloric acid TS, cool in ice, and add 10 mL of 8 mol/L sodium hydroxide TS dropwise with stirring: a white precipitate is produced. Collect the precipitate, wash with water, recrystallize from diluted ethanol (95) (7 in 10), and dry at 105°C for 30 minutes: the crystals so obtained melt <2.60> between 130°C and 134°C.

**(3)** Dissolve 0.1 g of Chlorhexidine Hydrochloride in 50 mL of dilute nitric acid: the solution responds to the Qualitative Tests <1.09> for chloride.

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Chlorhexidine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(2)** Arsenic <1.11>—To 1.0 g of Chlorhexidine Hydrochloride in a crucible add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10), fire the ethanol (95) to burn, and heat gradually to incinerate. If a carbonized substance remains, moisten with a small amount of nitric acid, and ignite to incinerate. Cool, add 10 mL of dilute hydrochloric acid to the residue, dissolve by warming on a water bath, use this solution as the test solution, and perform the test (not more than 2 ppm).

**(3)** *p*-Chloroaniline—Dissolve 0.10 g of Chlorhexidine Hydrochloride in 2 mL of formic acid, and add 15 mL of 1 mol/L hydrochloric acid TS and 20 mL of water immediately. Add 0.3 mL of sodium nitrite TS, shake, and allow to stand for 2 minutes. Add 4 mL of ammonium amidosulfate TS, and then allow to stand for 1 minute. Add 5 mL of *N*-(1-naphthyl)-*N'*-diethylethylenediamine oxalate-acetone TS, allow to stand for 10 minutes, and add 1 mL of ethanol (95) and water to make 50 mL: the solution has no more color than the following control solution.

Control solution: Dissolve 20 mg of 4-chloroaniline in 10 mL of 1 mol/L hydrochloric acid TS, and add water to make exactly 100 mL. Pipet 5 mL of the solution, and add water to make exactly 100 mL. To 2.0 mL of the solution add 2 mL of formic acid, 15 mL of 1 mol/L hydrochloric acid TS and 20 mL of water, and proceed in the same manner.

**Loss on drying** <2.41> Not more than 2.0% (1 g, 130°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Chlorhexidine Hydrochloride, previously dried, dissolve in 2.0 mL of formic acid, add 60 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 14.46 mg of C<sub>22</sub>H<sub>30</sub>Cl<sub>2</sub>N<sub>10</sub>·2HCl

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Chlorinated Lime

サラシ粉

Chlorinated Lime contains not less than 30.0% of available chlorine (Cl: 35.45).

**Description** Chlorinated Lime occurs as a white powder. It has a chlorine-like odor.

It dissolves partially in water. The solution changes red litmus paper to blue, then gradually decolorizes.

**Identification (1)** To Chlorinated Lime add dilute hydrochloric acid: a gas, which has the odor of chlorine, evolves, and the gas changes moistened starch-potassium iodide paper to blue.

**(2)** Shake 1 g of Chlorinated Lime with 10 mL of water, and filter: the filtrate responds to the Qualitative Tests <1.09> (2) and (3) for calcium salt.

**Assay** Weigh accurately about 5 g of Chlorinated Lime, transfer to a mortar, and triturate thoroughly with 50 mL of water. Transfer to a 500-mL volumetric flask with the aid of water, and add water to make 500 mL. Mix well, immediately take exactly 50 mL of the mixture in an iodine flask, add 10 mL of potassium iodide TS and 10 mL of dilute hydrochloric acid, and titrate <2.50> the liberated iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS  
= 3.545 mg of Cl

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and in a cold place.

## Chlormadinone Acetate

クロルマジノン酢酸エステル

C<sub>23</sub>H<sub>29</sub>ClO<sub>4</sub>: 404.93

6-Chloro-3,20-dioxopregna-4,6-dien-17-yl acetate  
[302-22-7]

Chlormadinone Acetate, when dried, contains not less than 98.0% of C<sub>23</sub>H<sub>29</sub>ClO<sub>4</sub>.

**Description** Chlormadinone Acetate occurs as white to light yellow crystals or crystalline powder. It is odorless.

It is freely soluble in chloroform, soluble in acetonitrile, slightly soluble in ethanol (95) and in diethyl ether, and practically insoluble in water.

**Identification (1)** Dissolve 2 mg of Chlormadinone Acetate in 1 mL of ethanol (95), and add 1 mL of 1,3-dinitrobenzene TS and 1 mL of a solution of potassium hydroxide (1 in 5): a red-purple color develops.

(2) To 0.05 g of Chlormadinone Acetate add 2 mL of potassium hydroxide-ethanol TS, and boil on a water bath for 5 minutes. After cooling, add 2 mL of diluted sulfuric acid (2 in 7), and boil gently for 1 minute: the odor of ethyl acetate is perceptible.

(3) Determine the infrared absorption spectrum of Chlormadinone Acetate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Chlormadinone Acetate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Perform the test with Chlormadinone Acetate as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-10.0 - -14.0^\circ$  (after drying, 0.2 g, acetonitrile, 10 mL, 100 mm).

**Melting point** <2.60> 211 – 215°C

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Chlormadinone Acetate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Chlormadinone Acetate according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 20 mg of Chlormadinone Acetate in 10 mL of acetonitrile, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of peaks other than the peak of chlormadinone acetate from the sample solution is not larger than the peak area of chlormadinone acetate from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 236 nm).

Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: A mixture of acetonitrile and water (13:7).

Flow rate: Adjust the flow rate so that the retention time of chlormadinone acetate is about 10 minutes.

Time span of measurement: About 1.5 times as long as the retention time of chlormadinone acetate beginning after the solvent peak.

**System suitability**—

Test for required detection: To exactly 5 mL of the standard solution add acetonitrile to make exactly 50 mL. Confirm that the peak area of chlormadinone acetate obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that of chlormadinone acetate obtained from 10  $\mu$ L of the stan-

dard solution.

System performance: Dissolve 8 mg of Chlormadinone Acetate and 2 mg of butyl parahydroxybenzoate in 100 mL of acetonitrile. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, butyl parahydroxybenzoate and chlormadinone acetate are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of chlormadinone acetate is not more than 1.0%.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 20 mg each of Chlormadinone Acetate and Chlormadinone Acetate Reference Standard, previously dried, and dissolve in ethanol (95) to make exactly 100 mL. Pipet 5 mL each of these solutions, to each add ethanol (95) to make exactly 100 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances,  $A_T$  and  $A_S$ , at 285 nm.

$$\begin{aligned} \text{Amount (mg) of } C_{23}H_{29}ClO_4 \\ = W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Chlormadinone Acetate Reference Standard

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Chlorobutanol

クロロブタノール

$C_4H_7Cl_3O$ : 177.46

1,1,1-Trichloro-2-methylpropan-2-ol [57-15-8]

Chlorobutanol contains not less than 98.0% of  $C_4H_7Cl_3O$ , calculated on the anhydrous basis.

**Description** Chlorobutanol occurs as colorless or white crystals. It has a camphoraceous odor.

It is very soluble in methanol, in ethanol (95) and in diethyl ether, and slightly soluble in water.

It slowly volatilizes in air.

Melting point: not lower than about 76°C.

**Identification (1)** To 5 mL of a solution of Chlorobutanol (1 in 200) add 1 mL of sodium hydroxide TS, then slowly add 3 mL of iodine TS: a yellow precipitate is produced and the odor of iodoform is perceptible.

(2) To 0.1 g of Chlorobutanol add 5 mL of sodium hydroxide TS, shake well the mixture, add 3 to 4 drops of aniline, and warm gently: the disagreeable odor of phenyl isocyanide (poisonous) is perceptible.

**Purity (1) Acidity**—Shake thoroughly 0.10 g of the powder of Chlorobutanol with 5 mL of water: the solution is neutral.

**(2) Chloride** <1.03>—Dissolve 0.5 g of Chlorobutanol in 25 mL of dilute ethanol, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS by adding 25 mL of dilute ethanol, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.071%).

**Water** <2.48> Not more than 6.0% (0.2 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Transfer about 0.1 g of Chlorobutanol, accurately weighed, to a 200-mL conical flask, and dissolve in 10 mL of ethanol (95). Add 10 mL of sodium hydroxide TS, boil under a reflux condenser for 10 minutes, cool, add 40 mL of dilute nitric acid and exactly 25 mL of 0.1 mol/L silver nitrate VS, and shake well. Add 3 mL of nitrobenzene, and shake vigorously until the precipitate is coagulated. Titrate <2.50> the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination.

Each mL of 0.1 mol/L silver nitrate VS  
= 5.915 mg of  $C_4H_7Cl_3O$

**Containers and storage** Containers—Tight containers.

## Chlorphenesin Carbamate

クロルフェネシンカルバミン酸エステル

$C_{10}H_{12}ClNO_4$ ; 245.66

(2*RS*)-3-(4-Chlorophenoxy)-2-hydroxypropyl carbamate  
[886-74-8]

Chlorphenesin Carbamate, when dried, contains not less than 98.0% and not more than 102.0% of  $C_{10}H_{12}ClNO_4$ .

**Description** Chlorphenesin Carbamate occurs as white crystals or crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in methanol, in ethanol (95) and in pyridine, soluble in 2-propanol, sparingly soluble in diethyl ether, slightly soluble in water, and practically insoluble in hexane.

A solution of Chlorphenesin Carbamate in ethanol (95) (1 in 20) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Chlorphenesin Carbamate in ethanol (95) (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Chlorphenesin Carbamate, previously dried, as directed in the

potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** Perform the test with Chlorphenesin Carbamate as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Melting point** <2.60> 88 – 91°C

**Purity (1) Heavy metals** <1.07>—Dissolve 2.0 g of Chlorphenesin Carbamate in 20 mL of ethanol (95), and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 20 mL of ethanol (95), 2 mL of dilute acetic acid and water to make 50 mL (not more than 10 ppm).

**(2) Arsenic** <1.11>—Prepare the test solution with 1.0 g of Chlorphenesin Carbamate according to Method 3, and perform the test (not more than 2 ppm).

**(3) Related substances**—(i) Chlorphenesin-2-carbamate: Dissolve 0.10 g of Chlorphenesin Carbamate in 20 mL of a mixture of hexane for liquid chromatography and 2-propanol (7:3), and use this solution as the sample solution. Perform the test with 10  $\mu$ L of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine the peak area,  $A_a$ , of chlorphenesin carbamate and the peak area,  $A_b$ , of chlorphenesin-2-carbamate by the automatic integration method: the ratio,  $A_b/(A_a + A_b)$ , is not larger than 0.007.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 280 nm).

**Column:** A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** A mixture of hexane for liquid chromatography, 2-propanol and acetic acid (100) (700:300:1).

**Flow rate:** Adjust the flow rate so that the retention time of chlorphenesin carbamate is about 9 minutes.

**System suitability**—

**Test for required detection:** Pipet 1 mL of the sample solution, add a mixture of hexane for liquid chromatography and 2-propanol (7:3) to make exactly 100 mL, and use this solution as the solution for system suitability test. To exactly 5 mL of the solution for system suitability test add a mixture of hexane for liquid chromatography and 2-propanol (7:3) to make exactly 10 mL. Confirm that the peak area of chlorphenesin carbamate obtained from 10  $\mu$ L of this solution is equivalent to 40 to 60% of that of chlorphenesin carbamate obtained from 10  $\mu$ L of the solution for system suitability test.

**System performance:** Dissolve 0.1 g of Chlorphenesin Carbamate in 50 mL of methanol. To 25 mL of this solution add 25 mL of dilute sodium hydroxide TS, and warm at 60°C for 20 minutes. To 20 mL of this solution add 5 mL of 1 mol/L hydrochloric acid TS, shake well with 20 mL of ethyl acetate, and allow to stand to separate the ethyl acetate layer. When the procedure is run with 10  $\mu$ L of this layer under the above operating conditions, chlorphenesin, chlorphenesin carbamate and chlorphenesin-2-carbamate are eluted in this order, with the ratios of the retention time of chlorphenesin and

chlorphenesin-2-carbamate with respect to chlorphenesin carbamate are about 0.7 and about 1.2, respectively, and with the resolution between the peaks of chlorphenesin and chlorphenesin carbamate being not less than 2.0.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of chlorphenesin carbamate is not more than 2.0%.

(ii) Other related substances: Dissolve 0.10 g of Chlorphenesin Carbamate in 10 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 20 mL. Pipet 2 mL of this solution, add ethanol (95) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 50  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and ammonia solution (28) (17:2:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 20 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.20% (1 g, in vacuum, silica gel, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Chlorphenesin Carbamate, previously dried, dissolve in 20 mL of pyridine, add exactly 50 mL of 0.1 mol/L potassium hydroxide-ethanol TS, and warm at 70°C for 40 minutes. After cooling, add 100 mL of ethanol (95), and titrate <2.50> the excess potassium hydroxide with 0.1 mol/L hydrochloric acid VS until the color of the solution changes from blue through blue-green to yellow (indicator: 1 mL of thymol blue TS). Perform a blank determination.

Each mL of 0.1 mol/L potassium hydroxide-ethanol TS  
= 24.57 mg of  $C_{10}H_{12}ClNO_4$

**Containers and storage** Containers—Tight containers.

## Chlorpheniramine and Calcium Powder

クロルフェニラミン・カルシウム散

Chlorpheniramine and Calcium Powder contains not less than 0.27% and not more than 0.33% of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ; 390.86).

### Method of preparation

Chlorpheniramine Maleate	3 g
Dibasic Calcium Phosphate Hydrate	800 g
Starch, Lactose Hydrate, or their mixture	a sufficient quantity
To make 1000 g	

Prepare as directed under Powders, with the above ingredients.

**Description** Chlorpheniramine and Calcium Powder occurs as a white powder.

**Identification** (1) Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 263 nm and 267 nm (chlorpheniramine maleate).

(2) To 0.5 g of Chlorpheniramine and Calcium Powder add 10 mL of dilute hydrochloric acid, shake well, and filter: the filtrate responds to the Qualitative Tests <1.09> (3) for calcium salt.

(3) To 0.5 g of Chlorpheniramine and Calcium Powder add 10 mL of dilute nitric acid, shake well, and filter: the filtrate responds to the Qualitative tests <1.09> (2) for phosphate.

(4) Shake 1 g of Chlorpheniramine and Calcium Powder with 5 mL of methanol, filter, and use the filtrate as the sample solution. Separately, dissolve 0.01 g of chlorpheniramine maleate in 17 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on the plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, acetone and ammonia solution (28) (73:15:10:2) to a distance of about 10 cm. Air-dry the plate, and examine under ultraviolet light (main wavelength: 254 nm): the spots from the sample solution and from the standard solution show the same *R<sub>f</sub>* value. Spray evenly Dragendorff's TS for spraying upon the plate: the spot from the standard solution and the corresponding spot from the sample solution reveal an orange color.

**Assay** Weigh accurately about 0.5 g of Chlorpheniramine and Calcium Powder, transfer to a 30-mL glass-stoppered centrifuge tube, add 20 mL of 0.05 mol/L sulfuric acid VS, shake for 5 minutes, centrifuge, and collect the supernatant liquid. Add 20 mL of 0.05 mol/L sulfuric acid VS to the residue, and proceed twice in the same manner mentioned above. Transfer all the supernatant liquid to a 200-mL separator, add 30 mL of diethyl ether, shake, and allow to stand for 5 minutes. Filter the water layer through dry filter paper into another separator. Extract the diethyl ether layer with two 10-mL portions of 0.05 mol/L sulfuric acid VS, filter the extracts into the preceding separator containing the water layer. Wash the filter paper with 5 mL of 0.05 mol/L sulfuric acid VS, combine the washings with the water layer in the preceding separator, and add 10 mL of ammonia TS. Extract with two 50-mL portions of diethyl ether, combine the diethyl ether layer, wash with 20 mL of water, and extract the diethyl ether layer with two 20-mL and 5-mL portions of 0.25 mol/L sulfuric acid VS. Combine all the extracts, add 0.25 mol/L sulfuric acid VS to make exactly 50 mL, and use this solution as the sample solution. Separately, dissolve about 75 mg of chlorpheniramine maleate for assay, previously dried at 105°C for 3 hours and accurately weighed, in 10 mL of 0.05 mol/L sulfuric acid VS, and add 0.05 mol/L sulfuric acid VS to make exactly 100 mL. Pipet 2 mL of the solution into a 200-mL separator, add 58 mL of 0.05 mol/L sulfuric acid VS and 30 mL of diethyl ether, and shake. Proceed in the same manner as the sample solution, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and

$A_S$ , of the sample solution and the standard solution at 265 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using 0.25 mol/L sulfuric acid VS as the blank.

$$\begin{aligned} &\text{Amount (mg) of chlorpheniramine maleate} \\ &(\text{C}_{16}\text{H}_{19}\text{ClN}_2 \cdot \text{C}_4\text{H}_4\text{O}_4) \\ &= W_S \times (A_T/A_S) \times (1/50) \end{aligned}$$

$W_S$ : Amount (mg) of chlorpheniramine maleate for assay

**Containers and storage** Containers—Well-closed containers.

## Chlorpheniramine Maleate

クロルフェニラミンマレイン酸塩

$\text{C}_{16}\text{H}_{19}\text{ClN}_2 \cdot \text{C}_4\text{H}_4\text{O}_4$ : 390.86  
(3*RS*)-3-(4-Chlorophenyl)-*N,N*-dimethyl-3-pyridin-2-ylpropylamine monomaleate [113-92-8]

Chlorpheniramine Maleate, when dried, contains not less than 98.0% and not more than 101.0% of *dl*-chlorpheniramine maleate ( $\text{C}_{16}\text{H}_{19}\text{ClN}_2 \cdot \text{C}_4\text{H}_4\text{O}_4$ ).

**Description** Chlorpheniramine Maleate occurs as white, fine crystals.

It is very soluble in acetic acid (100), freely soluble in water and in methanol, and soluble in ethanol (99.5).

It dissolves in dilute hydrochloric acid.

A solution of Chlorpheniramine Maleate (1 in 20) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Chlorpheniramine Maleate in 0.1 mol/L hydrochloric acid TS (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Chlorpheniramine Maleate Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Chlorpheniramine Maleate, previously dried, as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Chlorpheniramine Maleate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 0.10 g of Chlorpheniramine Maleate in 5 mL of methanol, and use this solution as the sample solution. Separately, dissolve 56 mg of maleic acid in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of diethyl ether, methanol, acetic acid (100) and water

(70:20:7:3) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): a spot among two of the spots obtained with the sample solution shows the same intense and *R<sub>f</sub>* value with the spot with the standard solution.

**pH** <2.54> Dissolve 1.0 g of Chlorpheniramine Maleate in 100 mL of freshly boiled and cooled water: the pH of this solution is between 4.0 and 5.5.

**Melting point** <2.60> 130 – 135°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Chlorpheniramine Maleate in 50 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Chlorpheniramine Maleate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.10 g of Chlorpheniramine Maleate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 3 mL of the sample solution, and add the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than maleic acid and chlorpheniramine is not larger than 2/3 times the peak area of chlorpheniramine obtained with the standard solution, and the total area of the peaks other than maleic acid and chlorpheniramine is not larger than the peak area of chlorpheniramine with the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 225 nm).

**Column:** A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 8.57 g of ammonium dihydrogen phosphate and 1 mL of phosphoric acid in water to make 1000 mL. To 800 mL of this solution add 200 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of chlorpheniramine is about 11 minutes.

**Time span of measurement:** About 4 times as long as the retention time of chlorpheniramine after the solvent peak.

**System suitability—**

**Test for required detectability:** To exactly 2.5 mL of the standard solution add the mobile phase to make exactly 25 mL. Confirm that the peak area of chlorpheniramine obtained with 20  $\mu\text{L}$  of this solution is equivalent to 7 to 13% of that with 20  $\mu\text{L}$  of the standard solution.

**System performance:** When the procedure is run with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of chlorpheniramine are not less than 4000 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with

20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of chlorpheniramine is not more than 4.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Dissolve about 0.4 g of Chlorpheniramine Maleate, previously dried and accurately weighed, in 20 mL of acetic acid (100). Titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue-green to green (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 19.54 mg of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Chlorpheniramine Maleate Injection

クロルフェニラミンマレイン酸塩注射液

Chlorpheniramine Maleate Injection is an aqueous solution for injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of *dl*-chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ : 390.86).

**Method of preparation** Prepare as directed under Injections, with Chlorpheniramine Maleate.

**Description** Chlorpheniramine Maleate Injection is a clear, colorless liquid.  
pH: 4.5 – 7.0

**Identification** Take a volume of Chlorpheniramine Maleate Injection, equivalent to 25 mg of Chlorpheniramine Maleate according to the labeled amount, add 5 mL of dilute sodium hydroxide TS, and extract with 20 mL of hexane. Wash the hexane layer with 10 mL of water, shake with 0.5 g of anhydrous sodium sulfate for several minutes, and filter. Evaporate the filtrate in a water bath at 50°C under a reduced pressure, and determine the infrared absorption spectrum of the residue as directed in the liquid film method under Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave numbers of about 2940  $cm^{-1}$ , 2810  $cm^{-1}$ , 2770  $cm^{-1}$ , 1589  $cm^{-1}$ , 1491  $cm^{-1}$ , 1470  $cm^{-1}$ , 1434  $cm^{-1}$ , 1091  $cm^{-1}$  and 1015  $cm^{-1}$ .

**Bacterial endotoxins** <4.01> Less than 8.8 EU/mg.

**Extractable volume** <6.05> It meets the requirement.

**Foreign insoluble matter** <6.06> Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> Perform the test according to Method 1: it meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Transfer an exactly measured volume of Chlorpheniramine Maleate Injection, equivalent to about 3 mg of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), to a 100-mL separator, add 20 mL of water and 2 mL of sodium hydroxide TS, and extract with two 50-mL portions of diethyl ether. Combine the diethyl ether extracts, wash with 20 mL of water, and then extract with 20-mL, 20-mL and 5-mL portions of 0.25 mol/L sulfuric acid TS successively. Combine all acid extracts, and add 0.25 mol/L sulfuric acid TS to make exactly 50 mL. Pipet 10 mL of this solution, add 0.25 mol/L sulfuric acid TS to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of Chlorpheniramine Maleate Reference Standard, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 200 mL. Pipet 20 mL of this solution, transfer to a 100-mL separator, add 2 mL of sodium hydroxide TS, and extract with two 50-mL portions of diethyl ether. Proceed in the same manner as for the preparation of the sample solution, and use the solution so obtained as the standard solution. Determine the absorbances  $A_T$  and  $A_S$  of the sample solution and standard solution at a wavelength of the maximum absorbance at about 265 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Amount (mg) of chlorpheniramine maleate  
( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ )  
=  $W_S \times (A_T/A_S) \times (1/10)$

$W_S$ : Amount (mg) of Chlorpheniramine Maleate Reference Standard

**Containers and storage** Containers—Hermetic containers.  
Storage—Light-resistant.

## Chlorpheniramine Maleate Powder

クロルフェニラミンマレイン酸塩散

Chlorpheniramine Maleate Powder contains not less than 93.0% and not more than 107.0% of the labeled amount of *dl*-chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ : 390.86).

**Method of preparation** Prepare as directed under Powders, with Chlorpheniramine Maleate.

**Identification** Weigh a portion of Chlorpheniramine Maleate Powder, equivalent to 50 mg of Chlorpheniramine Maleate according to the labeled amount, shake with 40 mL of 0.1 mol/L hydrochloric acid TS, and filter. Transfer the filtrate to a separator, and wash with 40 mL of hexane. Add 10 mL of sodium hydroxide TS, and extract with 20 mL of hexane. Wash the hexane layer with 5 mL of water. Centrifuge, if necessary, shake the hexane extract with 0.5 g of anhydrous sodium sulfate for several minutes, and filter. Evaporate the filtrate in a water bath under reduced pressure, and determine the spectrum of the residue as directed in the liquid film method under Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave number of about 2940  $cm^{-1}$ , 2810  $cm^{-1}$ , 2770  $cm^{-1}$ , 1589  $cm^{-1}$ , 1491  $cm^{-1}$ , 1470  $cm^{-1}$ , 1434  $cm^{-1}$ , 1091  $cm^{-1}$  and 1015  $cm^{-1}$ .

**Particle size** <6.03> It meets the requirement.

**Assay** Weigh accurately an amount of Chlorpheniramine

Maleate Powder, equivalent to about 4 mg of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), add 70 mL of the internal standard solution, shake for 15 minutes, then add the internal standard solution to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Chlorpheniramine Maleate Reference Standard, previously dried at 105°C for 3 hours, and add the internal standard to make exactly 100 mL. Pipet 20 mL of this solution, add the internal standard solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 30  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of chlorpheniramine to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of chlorpheniramine maleate} \\ & (C_{16}H_{19}ClN_2 \cdot C_4H_4O_4) \\ & = W_S \times (Q_T/Q_S) \times (1/5) \end{aligned}$$

$W_S$ : Amount (mg) of Chlorpheniramine Maleate Reference Standard

**Internal standard solution**—To 7 mL of a solution of methyl parahydroxybenzoate in methanol (1 in 1000) add water to make 1000 mL.

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 265 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: Dissolve 1 g of sodium 1-heptane sulfonate in 900 mL of water, add 10 mL of acetic acid (100) and water to make 1000 mL. To 650 mL of this solution add 350 mL of acetonitrile.

**Flow rate**: Adjust the flow rate so that the retention time of chlorpheniramine is about 8 minutes.

**System suitability**—

**System performance**: When the procedure is run with 30  $\mu$ L of the standard solution under the above operating conditions, chlorpheniramine and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.0.

**System repeatability**: When the test is repeated 6 times with 30  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of chlorpheniramine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Chlorpheniramine Maleate Tablets

クロルフェニラミンマレイン酸塩錠

Chlorpheniramine Maleate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of *dl*-chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ; 390.86).

**Method of preparation** Prepare as directed under Tablets, with Chlorpheniramine Maleate.

**Identification** Weigh a portion of powdered Chlorpheniramine Maleate Tablets, equivalent to 50 mg of Chlorpheniramine Maleate according to the labeled amount, shake with 40 mL of 0.1 mol/L hydrochloric acid TS, and filter. Transfer the filtrate to a separator, and wash with 40 mL of hexane. Add 10 mL of sodium hydroxide TS, and extract with 20 mL of hexane. Wash the hexane layer with 5 mL of water. Centrifuge, if necessary, shake the hexane extract with 0.5 g of anhydrous sodium sulfate for several minutes, and filter. Evaporate the filtrate in a water bath at about 50°C under a reduced pressure, and determine the infrared absorption spectrum of the residue as directed on the film method under Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave numbers of about 2940  $cm^{-1}$ , 2810  $cm^{-1}$ , 2770  $cm^{-1}$ , 1589  $cm^{-1}$ , 1491  $cm^{-1}$ , 1470  $cm^{-1}$ , 1434  $cm^{-1}$ , 1091  $cm^{-1}$  and 1015  $cm^{-1}$ .

**Uniformity of dosage unit** <6.02> Perform the test according to the following method: it meets the requirements of the Content uniformity test.

To 1 tablet of Chlorpheniramine Maleate Tablets add 10 mL of water, shake to disintegrate the tablet, then add water to make exactly  $V$  mL of a solution containing about 80  $\mu$ g of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) per mL, and filter through a membrane filter with pore size of not more than 0.5  $\mu$ m. Pipet 5 mL of the filtrate, add exactly 2.5 mL of the internal standard solution, add water to make 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Chlorpheniramine Maleate Reference Standard, previously dried at 105°C for 3 hours, and add water to make exactly 100 mL. Pipet 20 mL of this solution, add exactly 25 mL of the internal standard solution, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 30  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the conditions described in the Assay, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of chlorpheniramine to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of chlorpheniramine maleate} \\ & (C_{16}H_{19}ClN_2 \cdot C_4H_4O_4) \\ & = W_S \times (Q_T/Q_S) \times (V/250) \end{aligned}$$

$W_S$ : Amount (mg) of Chlorpheniramine Maleate Reference Standard

**Internal standard solution**—To 7 mL of a solution of methyl parahydroxybenzoate (1 in 250) add water to make 1000 mL.

**Assay** Weigh accurately the mass of not less than 20 Chlorpheniramine Maleate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 4 mg of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ), add 70 mL of the internal standard solution, shake for 15 minutes, then add the internal standard solution to make exactly 100 mL, filter through a membrane filter with pore size of not more than 0.5  $\mu$ m, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Chlorpheniramine Maleate Reference Standard, previously dried at 105°C for 3 hours, and add the internal standard to make exactly 100 mL. Pipet 20 mL of this solution, add the internal stan-

standard solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 30  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of chlorpheniramine to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of chlorpheniramine maleate} \\ & (\text{C}_{16}\text{H}_{19}\text{ClN}_2\cdot\text{C}_4\text{H}_4\text{O}_4) \\ & = W_S \times (A_T/A_S) \times (1/5) \end{aligned}$$

$W_S$ : Amount (mg) of Chlorpheniramine Maleate Reference Standard

**Internal standard solution**—To 7 mL of a solution of methyl parahydroxybenzoate in methanol (1 in 1000) add water to make 1000 mL.

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 265 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: Dissolve 1.0 g of sodium 1-heptane sulfonate in 900 mL of water, add 10 mL of acetic acid (100) and water to make 1000 mL. To 650 mL of this solution add 350 mL of acetonitrile.

**Flow rate**: Adjust the flow rate so that the retention time of chlorpheniramine is about 8 minutes.

**System repeatability**: When the test is repeated 6 times with 30  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of chlorpheniramine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## *d*-Chlorpheniramine Maleate

*d*-クロルフェニラミンマレイン酸塩

$\text{C}_{16}\text{H}_{19}\text{ClN}_2\cdot\text{C}_4\text{H}_4\text{O}_4$ : 390.86  
(3*S*)-3-(4-Chlorophenyl)-*N,N*-dimethyl-3-pyridin-2-ylpropylamine monomaleate [2438-32-6]

*d*-Chlorpheniramine Maleate, when dried, contains not less than 99.0% and not more than 101.0% of  $\text{C}_{16}\text{H}_{19}\text{ClN}_2\cdot\text{C}_4\text{H}_4\text{O}_4$ .

**Description** *d*-Chlorpheniramine Maleate occurs as a white, crystalline powder.

It is very soluble in water, in methanol and in acetic acid (100), and freely soluble in *N,N*-dimethylformamide and in ethanol (99.5).

It dissolves in dilute hydrochloric acid.

**Identification (1)** Determine the absorption spectrum of a solution of *d*-Chlorpheniramine Maleate in 0.1 mol/L hydrochloric acid TS (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of *d*-Chlorpheniramine Maleate, previously dried, as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** Dissolve 0.10 g of *d*-Chlorpheniramine Maleate in 5 mL of methanol, and use this solution as the sample solution. Separately, dissolve 56 mg of maleic acid in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of diethyl ether, methanol, acetic acid (100) and water (70:20:7:3) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): a spot among two of the spots obtained with the sample solution shows the same intense to the spot with the standard solution, and its *R<sub>f</sub>* value is about 0.4.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +39.5 – +43.0° (after drying, 0.5 g, *N,N*-dimethylformamide, 10 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of *d*-Chlorpheniramine Maleate in 100 mL of freshly boiled and cooled water: the pH of this solution is between 4.0 and 5.0.

**Melting point** <2.60> 111 – 115°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of *d*-Chlorpheniramine Maleate in 50 mL of water: the solution is clear and colorless.

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of *d*-Chlorpheniramine Maleate according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Related substances—Dissolve 0.10 g of *d*-Chlorpheniramine Maleate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than maleic acid and *d*-chlorpheniramine with the sample solution is not larger than 2/3 times the peak area of *d*-chlorpheniramine with the standard solution, and the total area of these peaks is not larger than the peak area of *d*-chlorpheniramine with the standard solu-

tion.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 225 nm).

**Column:** A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 8.57 g of ammonium dihydrogen phosphate and 1 mL of phosphoric acid in water to make 1000 mL. To 800 mL of this solution add 200 mL of acetic acid.

**Flow rate:** Adjust the flow rate so that the retention time of *d*-chlorpheniramine is about 11 minutes.

**Time span of measurement:** About 4 times as long as the retention time of *d*-chlorpheniramine beginning after the solvent peak.

**System suitability—**

**Test for required detectability:** To exactly 2.5 mL of the standard solution add the mobile phase to make exactly 25 mL. Confirm that the peak area of *d*-chlorpheniramine obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.

**System performance:** When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of *d*-chlorpheniramine are not less than 4000 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of *d*-chlorpheniramine is not more than 4.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 65°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of *d*-Chlorpheniramine Maleate, previously dried, and dissolve in 20 mL of acetic acid (100). Titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue-green to green (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 19.54 mg of C<sub>16</sub>H<sub>19</sub>ClN<sub>2</sub>·C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Chlorpromazine Hydrochloride

クロルプロマジン塩酸塩

C<sub>17</sub>H<sub>19</sub>ClN<sub>2</sub>S·HCl: 355.33

3-(2-Chloro-10*H*-phenothiazin-10-yl)-*N,N*-dimethylpropylamine monohydrochloride [69-09-0]

Chlorpromazine Hydrochloride, when dried, contains not less than 99.0% of C<sub>17</sub>H<sub>19</sub>ClN<sub>2</sub>S·HCl.

**Description** Chlorpromazine Hydrochloride occurs as a white to pale yellow, crystalline powder. It is odorless, or has a faint, characteristic odor.

It is very soluble in water, freely soluble in ethanol (95) and in acetic acid (100), sparingly soluble in acetic anhydride, and practically insoluble in diethyl ether.

It is gradually colored by light.

**Identification (1)** To 5 mL of a solution of Chlorpromazine Hydrochloride (1 in 1000) add 1 drop of iron (III) chloride TS: a red color develops.

**(2)** Dissolve 0.1 g of Chlorpromazine Hydrochloride in 20 mL of water and 3 drops of dilute hydrochloric acid, add 10 mL of 2,4,6-trinitrophenol TS, and allow to stand for 5 hours. Collect the resulting precipitate, wash with water, recrystallize from a small portion of acetone, and dry at 105°C for 1 hour: the crystals so obtained melt <2.60> between 175°C and 179°C.

**(3)** Dissolve 0.5 g of Chlorpromazine Hydrochloride in 5 mL of water, add 2 mL of ammonia TS, and heat on a water bath for 5 minutes. Cool, filter, and render the filtrate acidic with dilute nitric acid: the solution responds to the Qualitative Tests <1.09> (2) for chloride.

**Melting point** <2.60> 194 – 198°C

**pH** <2.54> Dissolve 1.0 g of Chlorpromazine Hydrochloride in 20 mL of freshly boiled and cooled water, and measure within 10 minutes: the pH of this solution is between 4.0 and 5.0.

**Purity (1)** Clarity and color of solution—A solution of 1.0 g of Chlorpromazine Hydrochloride in 20 mL of water, when observed within 10 minutes, is clear and colorless to pale yellow.

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of Chlorpromazine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.7 g of Chlorpromazine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 35.53 mg of C<sub>17</sub>H<sub>19</sub>ClN<sub>2</sub>S·HCl

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Chlorpromazine Hydrochloride Injection

クロルプロマジン塩酸塩注射液

Chlorpromazine Hydrochloride Injection is an aqueous solution for injection.

It contains not less than 95% and not more than 105% of the labeled amount of chlorpromazine hydrochloride ( $C_{17}H_{19}ClN_2S.HCl$ : 355.33).

**Method of preparation** Prepare as directed under Injections, with Chlorpromazine Hydrochloride.

**Description** Chlorpromazine Hydrochloride Injection is a clear, colorless or pale yellow liquid.

pH: 4.0 – 6.5

**Identification (1)** Proceed with a volume of Chlorpromazine Hydrochloride Injection, equivalent to 5 mg of Chlorpromazine Hydrochloride according to the labeled amount, as directed in the Identification (1) under Chlorpromazine Hydrochloride.

(2) Proceed with a volume of Chlorpromazine Hydrochloride Injection, equivalent to 0.1 g of Chlorpromazine Hydrochloride according to the labeled amount, as directed in the Identification (2) under Chlorpromazine Hydrochloride.

**Extractable volume** <6.05> It meets the requirement.

**Assay** Transfer an exactly measured volume of Chlorpromazine Hydrochloride Injection, equivalent to about 0.15 g of chlorpromazine hydrochloride ( $C_{17}H_{19}ClN_2S.HCl$ ) to a separator, add 30 mL of water and 10 mL of a solution of sodium hydroxide (1 in 5), and extract with two 30-mL portions and three 20-mL portions of diethyl ether. Wash the combined diethyl ether extracts with successive 10-mL portions of water until the last washing shows no red color upon the addition of phenolphthalein TS. Concentrate the diethyl ether extracts on a water bath to 20 mL, add 5 g of anhydrous sodium sulfate, allow to stand for 20 minutes, and filter through a pledget of absorbent cotton. Wash with diethyl ether, combine the washings with the filtrate, and evaporate the diethyl ether on a water bath. Dissolve the residue in 50 mL of acetone and 5 mL of acetic acid (100), and titrate <2.50> with 0.05 mol/L perchloric acid VS until the color of the solution changes from red-purple to blue-purple (indicator: 3 drops of bromocresol green-methylrosaniline chloride TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS  
= 17.77 mg of  $C_{17}H_{19}ClN_2S.HCl$

**Containers and storage** Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant.

## Chlorpromazine Hydrochloride Tablets

クロルプロマジン塩酸塩錠

Chlorpromazine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of chlorpromazine hydrochloride ( $C_{17}H_{19}ClN_2S.HCl$ : 355.33).

**Method of preparation** Prepare as directed under Tablets, with Chlorpromazine Hydrochloride.

**Identification (1)** Shake a quantity of powdered Chlorpromazine Hydrochloride Tablets, equivalent to 0.2 g of Chlorpromazine Hydrochloride according to the labeled amount, with 40 mL of 0.1 mol/L hydrochloric acid TS, and filter. To 1 mL of the filtrate add 4 mL of water and 1 drop of iron (III) chloride TS: a red color develops.

(2) To 20 mL of the filtrate obtained in (1) add 10 mL of 2,4,6-trinitrophenol TS dropwise, and proceed as directed in the Identification (2) under Chlorpromazine Hydrochloride.

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Chlorpromazine Hydrochloride Tablet at 75 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the test solution. Take 20 mL or more of the dissolved solution after 60 minutes from the start of the dissolution test, and filter through a membrane filter with a pore size not exceeding 0.8  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet the subsequent  $V$  mL, add 2nd fluid for dissolution test to make exactly  $V'$  mL so that each mL of the filtrate contains about 5.6  $\mu\text{g}$  of chlorpromazine hydrochloride ( $C_{17}H_{19}ClN_2S.HCl$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 0.09 g of chlorpromazine hydrochloride for assay, previously dried at 105°C for 2 hours, dissolve in 2nd fluid for dissolution test to make exactly 200 mL. Pipet 5 mL of this solution, add 2nd fluid for dissolution test to make exactly 100 mL, further pipet 5 mL of this solution, add 2nd fluid for dissolution test to make exactly 20 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 254 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

The dissolution rate of Chlorpromazine Hydrochloride Tablets in 60 minutes should be not less than 75%.

Dissolution rate (%) with respect to labeled amount of chlorpromazine hydrochloride ( $C_{17}H_{19}ClN_2S.HCl$ )  
=  $W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times (45/8)$

$W_S$ : Amount (mg) of chlorpromazine hydrochloride for assay.

$C$ : Labeled amount (mg) of chlorpromazine hydrochloride ( $C_{17}H_{19}ClN_2S.HCl$ ) in 1 tablet.

**Assay** Conduct this procedure without exposure to daylight, using light-resistant vessels. Weigh accurately, and powder not less than 20 Chlorpromazine Hydrochloride Tablets. Weigh accurately a portion of the powder, equivalent to

lent to about 50 mg of chlorpromazine hydrochloride ( $C_{17}H_{19}ClN_2S.HCl$ ), add 60 mL of a mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1), exposure to ultrasonic waves for 5 minutes, then shake vigorously for 20 minutes, and add the mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) to make exactly 100 mL. Filter the solution through a membrane filter with a pore size not exceeding  $0.45 \mu m$ , and discard the first 3 mL of the filtrate. To exactly 2.5 mL of the subsequent filtrate add exactly 5 mL of the internal standard solution, then add the mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) to make 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of chlorpromazine hydrochloride for assay, previously dried at  $105^\circ C$  for 2 hours, and dissolve in the mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution and the mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) to make 25 mL, and use this solution as the standard solution. Perform the test with  $10 \mu L$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of chlorpromazine to that of the internal standard.

$$\text{Amount (mg) of chlorpromazine hydrochloride} \\ (C_{17}H_{19}ClN_2S.HCl) = W_S \times (Q_T/Q_S) \times 2$$

$W_S$ : Amount (mg) of chlorpromazine hydrochloride for assay

**Internal standard solution**—A solution of ethyl parahydroxybenzoate in a mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) (1 in 4500).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 256 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography ( $5 \mu m$  in particle diameter).

**Column temperature**: A constant temperature of about  $25^\circ C$ .

**Mobile phase**: A mixture of diluted 0.05 mol/L sodium dihydrogen phosphate TS (1 in 2) and acetonitrile (27:13).

**Flow rate**: Adjust the flow rate so that the retention time of chlorpromazine is about 15 minutes.

**System suitability**—

**System performance**: When the procedure is run with  $10 \mu L$  of the standard solution under the above operating conditions, the internal standard and chlorpromazine are eluted in this order with the resolution between these peaks being not less than 10.

**System repeatability**: When the test is repeated 6 times with  $10 \mu L$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of chlorpromazine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Chlorpropamide

クロルプロパミド

$C_{10}H_{13}ClN_2O_3S$ : 276.74

4-Chloro-*N*-(propylcarbamoyl)benzenesulfonamide  
[94-20-2]

Chlorpropamide, when dried, contains not less than 98.0% of  $C_{10}H_{13}ClN_2O_3S$ .

**Description** Chlorpropamide occurs as white, crystals or crystalline powder.

It is freely soluble in methanol and in acetone, soluble in ethanol (95), and slightly soluble in diethyl ether, and practically insoluble in water.

**Identification (1)** Dissolve 0.08 g of Chlorpropamide in 50 mL of methanol. To 1 mL of the solution add 0.01 mol/L hydrochloric acid TS to make 200 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Chlorpropamide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** Perform the test with Chlorpropamide as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Melting point** <2.60>  $127 - 131^\circ C$

**Purity (1) Acidity**—To 3.0 g Chlorpropamide add 150 mL of water, and warm at  $70^\circ C$  for 5 minutes. Allow to stand in ice water for 1 hour, and filter. To 25 mL of the filtrate add 2 drops of methyl red TS and 0.30 mL of 0.1 mol/L sodium hydroxide VS: a yellow color develops.

**(2) Chloride** <1.03>—To 40 mL of the filtrate obtained in (1) add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).

**(3) Sulfate** <1.14>—To 40 mL of the filtrate obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.021%).

**(4) Heavy metals** <1.07>—Proceed with 2.0 g of Chlorpropamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(5) Related substances**—Dissolve 0.6 g of Chlorpropamide in acetone to make exactly 10 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 300 mL, and use this solu-

tion as the standard solution (1). Separately, dissolve 60 mg of 4-chlorobenzene sulfonamide in acetone to make exactly 300 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of cyclohexane, 3-methyl-1-butanol, methanol and ammonia solution (28) (15:10:5:1) to a distance of about 10 cm, and air-dry the plate. After drying the plate at 100°C for 1 hour, spray evenly sodium hypochlorite TS on the plate, and air-dry for 15 minutes. Then spray evenly potassium iodide-starch TS on the plate: the spot from the sample solution equivalent to the spot from the standard solution (2) is not more intense than the spot from the standard solution (2), and the spots other than the spot mentioned above and other than the principal spot from the sample solution is not more intense than the spot from the standard solution (1).

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.5 g of Chlorpropamide, previously dried, dissolve in 30 mL of neutralized ethanol, and add 20 mL of water. Titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS).

$$\begin{aligned} \text{Each mL of 0.1 mol/L sodium hydroxide VS} \\ = 27.67 \text{ mg of } C_{10}H_{13}ClN_2O_3S \end{aligned}$$

**Containers and storage** Containers—Well-closed containers.

## Chlorpropamide Tablets

クロルプロパミド錠

Chlorpropamide Tablets contain not less than 95% and not more than 105% of the labeled amount of chlorpropamide ( $C_{10}H_{13}ClN_2O_3S$ : 276.74).

**Method of preparation** Prepare as directed under Tablets, with Chlorpropamide.

**Identification** Take a quantity of powdered Chlorpropamide Tablets, equivalent to 0.08 g of Chlorpropamide according to the labeled amount, add 50 mL of methanol, shake, and filter. To 1 mL of the filtrate add 0.01 mol/L hydrochloric acid TS to make 200 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 231 nm and 235 nm.

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Chlorpropamide Tablets at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the test solution. Take 20 mL or more of the dissolved solution 45 minutes after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8  $\mu$ m. Discard the first 10 mL of the filtrate, pipet the subsequent  $V$  mL of the filtrate, add 2nd fluid for dissolution test to make exactly  $V'$

mL so that each mL contains about 10  $\mu$ g of chlorpropamide ( $C_{10}H_{13}ClN_2O_3S$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 0.05 g of chlorpropamide for assay, previously dried at 105°C for 3 hours, dissolve in 10 mL of methanol, and add water to make exactly 50 mL. Pipet 1 mL of this solution, add 2nd fluid for dissolution test to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 232 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>. The dissolution rate of Chlorpropamide Tablets in 45 minutes should be not less than 70 %.

$$\begin{aligned} \text{Dissolution rate (\%)} \text{ with respect to the} \\ \text{labeled amount of chlorpropamide } (C_{10}H_{13}ClN_2O_3S) \\ = W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 18 \end{aligned}$$

$W_S$ : Amount (mg) of chlorpropamide for assay.

$C$ : Labeled amount (mg) of chlorpropamide ( $C_{10}H_{13}ClN_2O_3S$ ) in 1 tablet.

**Assay** Weigh accurately and powder not less than 20 Chlorpropamide Tablets. Weigh accurately a quantity of the powder, equivalent to about 50 mg of chlorpropamide ( $C_{10}H_{13}ClN_2O_3S$ ), add 75 mL of the mobile phase, shake for 10 minutes, and add the mobile phase to make exactly 100 mL. Centrifuge this solution, pipet 10 mL of the supernatant liquid, add the mobile phase to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of chlorpropamide for assay, previously dried at 105°C for 3 hours, dissolve in the mobile phase to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following operating conditions. Determine the peak areas,  $A_T$  and  $A_S$ , of chlorpropamide of the sample solution and standard solution.

$$\begin{aligned} \text{Amount (mg) of chlorpropamide } (C_{10}H_{13}ClN_2O_3S) \\ = W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of chlorpropamide for assay

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 240 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of diluted acetic acid (100) (1 in 100) and acetonitrile (1:1).

**Flow rate:** Adjust the flow rate so that the retention time of chlorpropamide is about 5 minutes.

**System suitability**—

**System performance:** When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of chlorpropamide are not less than 1500 and not more than 1.5, respectively.

**System repeatability:** When the test is repeated 6 times with

20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of chlorpropamide is not more than 1.5%.

**Containers and storage** Containers—Well-closed containers.

## Cholera Vaccine

コレラワクチン

Cholera Vaccine is a liquid for injection containing inactivated *Vibrio cholerae* of the Ogawa and Inaba strains.

Monotypic products may be manufactured, if necessary.

It conforms to the requirements of Cholera Vaccine in the Minimum Requirements for Biological Products.

**Description** Cholera Vaccine is a white-turbid liquid.

## Cholecalciferol

Vitamin D<sub>3</sub>

コレカルシフェロール

$C_{27}H_{44}O$ : 384.64  
(3*S*,5*Z*,7*E*)-9,10-Secocholesta-5,7,10(19)-trien-3-ol  
[67-97-0]

Cholecalciferol contains not less than 97.0% and not more than 103.0% of  $C_{27}H_{44}O$ .

**Description** Cholecalciferol occurs as white crystals. It is odorless.

It is freely soluble in ethanol (95), in chloroform, in diethyl ether and in isooctane, and practically insoluble in water.

It is affected by air and by light.

Melting point: 84 – 88°C Transfer Cholecalciferol to a capillary tube, and dry for 3 hours in a desiccator (in vacuum at a pressure not exceeding 2.67 kPa). Immediately fireseal the capillary tube, put it in a bath fluid, previously heated to a temperature about 10°C below the expected melting point, and heat at a rate of rise of about 3°C per minute, and read the melting point.

**Identification (1)** Dissolve 0.5 mg of Cholecalciferol in 5 mL of chloroform, add 0.3 mL of acetic anhydride and 0.1 mL of sulfuric acid, and shake: a red color is produced, and rapidly changes through purple and blue to green.

(2) Determine the infrared absorption spectrum of Cholecalciferol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cholecalciferol Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (265 nm): 450 – 490 (10 mg, ethanol (95), 1000 mL).

**Optical rotation** <2.49>  $[\alpha]_D^{20}$  +103 – +112° (50 mg, ethanol (95), 10 mL, 100 mm). Prepare the solution without delay, using Cholecalciferol from a container opened not longer than 30 minutes, previously, and determine the rotation within 30 minutes after the solution has been prepared.

**Purity** 7-Dehydrocholesterol—Dissolve 10 mg of Cholecalciferol in 2.0 mL of diluted ethanol (95) (9 in 10), add a solution prepared by dissolving 20 mg of digitonin in 2.0 mL of diluted ethanol (95) (9 in 10), and allow the mixture to stand for 18 hours: no precipitate is formed.

**Assay** Proceed with the operation avoiding contact with air or other oxidizing agents and using light-resistant containers. Dissolve separately about 30 mg each of Cholecalciferol and Cholecalciferol Reference Standard, accurately weighed, in isooctane to make exactly 50 mL. Pipet 10 mL each of these solutions, add 3 mL each of the internal standard solution, then add the mobile phase to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu$ L each of the sample solution and the standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cholecalciferol to that of the internal standard.

$$\begin{aligned} \text{Amount (mg) of } C_{27}H_{44}O \\ = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Cholecalciferol Reference Standard

**Internal standard solution**—A solution of dimethyl phthalate in isooctane (1 in 100).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in inside diameter and 10 to 30 cm in length, packed with silica gel for liquid chromatography (5 to 10  $\mu$ m in particle diameter).

Column temperature: Ordinary temperature.

Mobile phase: A mixture of hexane and *n*-amylalcohol (997:3).

Flow rate: Adjust the flow rate so that the retention time of cholecalciferol is about 25 minutes.

Selection of column: Dissolve 15 mg of Cholecalciferol Reference Standard in 25 mL of isooctane. Transfer this solution to a flask, heat under a reflux condenser in an oil bath for 2 hours, and cool to room temperature rapidly. Transfer this solution to a quartz test tube, and irradiate under a short-wave lamp (main wavelength: 254 nm) and a long-wave lamp (main wavelength: 365 nm) for 3 hours. To this solution add the mobile phase to make 50 mL. Proceed with 10  $\mu$ L of this solution under the above operating conditions. Use a column with the ratios of the retention time of previtamin D<sub>3</sub>, transvitamin D<sub>3</sub> and tachysterol<sub>3</sub> to that of cholecalciferol being

about 0.5, about 0.6 and about 1.1, respectively, and with resolution between previtamin D<sub>3</sub> and trans-vitamin D<sub>3</sub>, and that between cholecalciferol and tachysterol<sub>3</sub> being not less than 1.0.

**Containers and storage** Containers—Hermetic containers.

Storage—Light-resistant, under nitrogen atmosphere, and in a cold place.

## Cholesterol

コレステロール

C<sub>27</sub>H<sub>46</sub>O: 386.65

Cholest-5-en-3β-ol [57-88-5]

**Description** Cholesterol occurs as white to pale yellow crystals or granules. It is odorless, or has a slight odor. It is tasteless.

It is freely soluble in chloroform and in diethyl ether, soluble in 1,4-dioxane, sparingly soluble in ethanol (99.5), and practically insoluble in water.

It gradually changes to a yellow to light yellow-brown color by light.

**Identification (1)** Dissolve 0.01 g of Cholesterol in 1 mL of chloroform, add 1 mL of sulfuric acid, and shake: a red color develops in the chloroform layer, and the sulfuric acid layer shows a green fluorescence.

**(2)** Dissolve 5 mg of Cholesterol in 2 mL of chloroform, add 1 mL of acetic anhydride and 1 drop of sulfuric acid, and shake: a red color is produced, and it changes to green through blue.

**Optical rotation** <2.49> [α]<sub>D</sub><sup>25</sup>: -34 - -38° (after drying, 0.2 g, 1,4-dioxane, 10 mL, 100 mm).

**Melting point** <2.60> 147 - 150°C

**Purity (1)** Clarity of solution—Place 0.5 g of Cholesterol in a glass-stoppered flask, dissolve in 50 mL of warm ethanol (95), and allow to stand at room temperature for 2 hours: no turbidity or deposit is produced.

**(2)** Acidity—Place 1.0 g of Cholesterol in a flask, dissolve in 10 mL of diethyl ether, add 10.0 mL of 0.1 mol/L sodium hydroxide VS, and shake for 1 minute. Expel the diethyl ether, and boil for 5 minutes. Cool, add 10 mL of water, and titrate <2.50> with 0.05 mol/L sulfuric acid VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination.

The volume of 0.1 mol/L sodium hydroxide VS consumed is not more than 0.30 mL.

**Loss on drying** <2.41> Not more than 0.30% (1 g, in vacuum, 60°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Ciclacillin

シクラシリン

C<sub>15</sub>H<sub>23</sub>N<sub>3</sub>O<sub>4</sub>S: 341.43

(2*S*,5*R*,6*R*)-6-[(1-Aminocyclohexanecarbonyl)amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid [3485-14-1]

Ciclacillin contains not less than 920 μg (potency) and not more than 1010 μg (potency) per mg, calculated on the dehydrated basis. The potency of Ciclacillin is expressed as mass (potency) of ciclacillin (C<sub>15</sub>H<sub>23</sub>N<sub>3</sub>O<sub>4</sub>S).

**Description** Ciclacillin occurs as white to light yellowish white crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, and practically insoluble in acetonitrile and in ethanol (99.5).

**Identification** Determine the infrared absorption spectrum of Ciclacillin as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ciclacillin Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> [α]<sub>D</sub><sup>20</sup>: +300 - +315° (2 g, water, 100 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Ciclacillin according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(2)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Ciclacillin according to Method 3, and perform the test (not more than 2 ppm).

**Water** <2.48> Not more than 2.0% (1 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Ciclacillin and Ciclacillin Reference Standard, equivalent to about 50 mg (potency), dissolve each in a suitable amount of the mobile phase, add exactly 5 mL of the internal standard solution and the mobile phase to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios, *Q*<sub>T</sub> and *Q*<sub>S</sub>, of the peak area of ciclacillin to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of } \text{C}_{15}\text{H}_{23}\text{N}_3\text{O}_4\text{S} \\ = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

*W*<sub>S</sub>: Amount [mg (potency)] of Ciclacillin Reference

## Standard

**Internal standard solution**—A solution of orcin in the mobile phase (1 in 500).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 0.771 g of ammonium acetate in about 900 mL of water, adjust the pH to 4.0 with acetic acid (100), and add water to make 1000 mL. To 850 mL of this solution add 150 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of ciclacillin is about 4 minutes.

**System suitability**—

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, ciclacillin and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak areas of ciclacillin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Ciclosporin

### Ciclosporin A

シクロスポリン

Abu = (2S)-2-Aminobutyric acid

MeGly = N-Methylglycine

MeLeu = N-Methylleucine

MeVal = N-Methylvaline

$C_{62}H_{111}N_{11}O_{12}$ : 1202.61

*cyclo*{-[(2S,3R,4R,6E)-3-Hydroxy-4-methyl-2-methylamino-oct-6-enoyl]-L-2-aminobutanoyl-N-methylglycyl-N-methyl-L-leucyl-L-valyl-N-methyl-L-leucyl-L-alanyl-D-alanyl-N-methyl-L-leucyl-N-methyl-L-leucyl-N-methyl-L-valyl-} [59865-13-3]

Ciclosporin contains not less than 98.5% and not more than 101.5% of  $C_{62}H_{111}N_{11}O_{12}$ , calculated on the dried basis.

**Description** Ciclosporin occurs as a white powder.

It is very soluble in acetonitrile, in methanol and in ethanol (95), freely soluble in diethyl ether, and practically insoluble in water.

**Identification** Determine the infrared absorption spectrum of Ciclosporin as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : -185 - -193° (0.1 g calculated on the dried basis, methanol, 20 mL, 100 mm).

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Ciclosporin in 10 mL of ethanol (95); the solution is clear, and has no more color than the following control solutions (1), (2) or (3).

**Control solution (1):** To exactly 3.0 mL of Ferric Chloride Stock CS and exactly 0.8 mL of Cobaltous Chloride Stock CS add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

**Control solution (2):** To exactly 3.0 mL of Ferric Chloride Stock CS, exactly 1.3 mL of Cobaltous Chloride Stock CS and exactly 0.5 mL of Cupric Sulfate Stock CS add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

**Control solution (3):** To exactly 0.5 mL of Iron (III) chloride Stock CS and exactly 1.0 mL of Cobaltous Chloride Stock CS add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

**(2) Heavy metals** <1.07>—Proceed with 1.0 g of Ciclosporin according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3) Related substances**—Use the sample solution obtained in the Assay as the sample solution. Pipet 2 mL of the sample solution, add a mixture of water and acetonitrile (1:1) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak other than the ciclosporin is not more than 0.7 times of the peak area of ciclosporin from the standard solution, and the total area of all peaks other than the ciclosporin is not more than 1.5 times of the peak area of ciclosporin from the standard solution.

**Operating conditions**—

**Detector, column, column temperature, mobile phase, and flow rate:** Proceed as directed in the operating conditions in the Assay.

**Time span of measurement:** About 2 times as long as the retention time of ciclosporin beginning after the solvent peak.

**System suitability**—

**Test for required detection:** To exactly 2 mL of the standard solution add a mixture of water and acetonitrile (1:1) to make exactly 20 mL. Confirm that the peak area of ciclosporin obtained from 20  $\mu$ L of this solution is equivalent to 7 to 13% of that of ciclosporin obtained from 20  $\mu$ L of the standard solution.

**System performance:** Proceed as directed in the system suitability in the Assay.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of

ciclosporin is not more than 3.0%.

**Loss on drying** <2.41> Not more than 2.0% (1 g, in vacuum at a pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 30 mg each of Ciclosporin and Ciclosporin Reference Standard (previously determine the loss on drying <2.41> in the same manner as Ciclosporin), and dissolve each in a mixture of water and acetonitrile (1:1) to make exactly 25 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of ciclosporin.

$$\begin{aligned} \text{Amount (mg) of } C_{62}H_{111}N_{11}O_{12} \\ = W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Ciclosporin Reference Standard, calculated on the dried basis

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 210 nm).

**Column:** A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter). Connect the sample injection port and the column with a stainless steel tube 0.3 mm in inside diameter and 1 m in length.

**Column temperature:** A constant temperature of about 80°C (including the sample injection port and the connecting tube).

**Mobile phase:** A mixture of water, acetonitrile, tert-butyl methyl ether and phosphoric acid (520:430:50:1).

**Flow rate:** Adjust the flow rate so that the retention time of ciclosporin is about 27 minutes.

**System suitability**—

**System performance:** Dissolve 3 mg of Ciclosporin U in 2.5 mL of a mixture of water and acetonitrile (1:1), and add 2.5 mL of the standard solution. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, ciclosporin U and ciclosporin are eluted in this order with the resolution between these peaks being not less than 1.2.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ciclosporin is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cilastatin Sodium

シラスタチンナトリウム

$C_{16}H_{25}N_2NaO_5S$ : 380.43

Monosodium (2Z)-7-[[{(2R)-2-amino-2-carboxyethyl]sulfanyl]-2-({[(1S)-2,2-dimethylcyclopropyl]carbonyl} amino)hept-2-enoate [81129-83-1]

Cilastatin Sodium contains not less than 98.0% and not more than 101.0% of  $C_{16}H_{25}N_2NaO_5S$ , calculated on the anhydrous basis and corrected on the amount of the residual solvent.

**Description** Cilastatin Sodium occurs as a white to pale yellowish white powder.

It is very soluble in water, freely soluble in methanol, and slightly soluble in ethanol (99.5).

It is hygroscopic.

**Identification (1)** Determine the infrared absorption spectrum of Cilastatin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(2)** A solution of Cilastatin Sodium (1 in 10) responds to the Qualitative Tests <1.09> for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +41.5 – +44.5° (0.1 g, calculated on the anhydrous basis and corrected on the amount of the residual solvent, a solution of hydrochloric acid in methanol (9 in 1000), 10 mL, 100 mL).

**pH** <2.54> The pH of a solution prepared by dissolving 1.0 g of Cilastatin Sodium in 100 mL of water is between 6.5 and 7.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cilastatin Sodium in 100 mL of water: the solution is clear and the solution has no more color than the following control solution.

**Control solution:** To a mixture of 2.4 mL of Iron (III) Chloride Colorimetric Stock Solution and 0.6 mL of Cobalt (II) Chloride Colorimetric Stock Solution add water to make 10 mL, pipet 5 mL of this solution, and add water to make exactly 100 mL.

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of Cilastatin Sodium according to Method 2, and perform the test. After carbonization, add 0.5 mL of sulfuric acid instead of nitric acid. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Arsenic <1.11>—To 2.0 g of Cilastatin Sodium add 5 mL of nitric acid and 1 mL of sulfuric acid, and heat carefully until white fumes are evolved. After cooling, heat with two 2-mL portions of nitric acid, then heat with several 2-mL portions of hydrogen peroxide (30) until a colorless or pale yellow

low solution is obtained. After cooling, heat again until white fumes are evolved. After cooling, add water to make 5 mL, and perform the test with this solution as the test solution: it shows no more color than the following color standard.

Color standard: Prepare a solution according to the above procedure without using Cilastatin Sodium, add exactly 2 mL of Standard Arsenic Solution, and perform the test in the same manner as the test solution (not more than 1 ppm).

(4) Related substances—Dissolve about 40 mg of Cilastatin Sodium in 25 mL of water, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than cilastatin is not larger than 1/6 times the peak area of cilastatin from the standard solution, and the total area of the peaks other than the peak of cilastatin is not larger than the peak area of cilastatin from the standard solution.

*Operating conditions—*

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4.5 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase A: A mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (7:3).

Mobile phase B: Diluted phosphoric acid (1 in 1000).

Flowing of the mobile phase: Control the gradient by mixing the mobile phase A and B as directed in the following table.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 – 30	15 → 100	85 → 0
30 – 40	100	0

Flow rate: 2.0 mL per minute.

Time span of measurement: 40 minutes.

*System suitability—*

Test for required detectability: Pipet 1 mL of the standard solution, and add water to make exactly 30 mL. Confirm that the peak area of cilastatin obtained with 20  $\mu$ L of this solution is equivalent to 2.3 to 4.5% of that obtained with 20  $\mu$ L of the standard solution.

System performance: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, the retention time of cilastatin is about 20 minutes, and the number of theoretical plates and the symmetry factor of the peak of cilastatin are not less than 10,000 and not more than 2.5, respectively.

System repeatability: When the test is repeated 3 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cilastatin is not more than 2.0%.

(5) Residual solvents <2.46>—Weigh accurately about 0.2

g of Cilastatin Sodium, add exactly 2 mL of the internal standard solution, dissolve in water to make 10 mL, and use this solution as the sample solution. Separately, measure exactly 2 mL of acetone, 0.5 mL of methanol and 0.5 mL of mesityl oxide, and add water to make exactly 1000 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, add water to make 10 mL, and use this solution as the standard solution. Perform the test with 2  $\mu$ L each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions. Determine the ratios of the peak areas of acetone, methanol and mesityl oxide and to the peak area of the internal standard,  $Q_{Ta}$  and  $Q_{Sa}$ ,  $Q_{Tb}$  and  $Q_{Sb}$ ,  $Q_{Tc}$  and  $Q_{Sc}$ , and calculate the amounts of acetone, methanol and mesityl oxide by the following equation: they are not more than 1.0%, not more 0.5% and not more than 0.4%, respectively.

$$\begin{aligned} \text{Amount (\%)} \text{ of acetone (CH}_3\text{COCH}_3) \\ = (1/W_T) \times (Q_{Ta}/Q_{Sa}) \times 400 \times 0.79 \end{aligned}$$

$$\begin{aligned} \text{Amount (\%)} \text{ of methanol (CH}_3\text{OH)} \\ = (1/W_T) \times (Q_{Tb}/Q_{Sb}) \times 100 \times 0.79 \end{aligned}$$

$$\begin{aligned} \text{Amount (\%)} \text{ of mesityl oxide (CH}_3\text{COCH=C(CH}_3)_2) \\ = (1/W_T) \times (Q_{Tc}/Q_{Sc}) \times 100 \times 0.86 \end{aligned}$$

$W_T$ : Amount (mg) of sample

0.79: Density (g/mL) of acetone and methanol

0.86: Density (g/mL) of mesityl oxide

*Internal standard solution—*To 0.5 mL of 1-propanol add water to make 1000 mL.

*Operating conditions—*

Detector: A hydrogen flame-ionization detector.

Column: A glass column 3.2 mm in inside diameter and 2.1 m in length, packed with teflon for gas chromatography (250 – 420  $\mu$ m) coated with polyethylene glycol 20 M for gas chromatography at the ratio of 10%.

Column temperature: A constant temperature of about 70°C.

Carrier gas: Helium

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 5 minutes.

Time span of measurement: About 3 times as long as the retention time of the internal standard.

*System suitability—*

System performance: When the procedure is run with the standard solution under the above operating conditions, acetone, methanol, 1-propanol and mesityl oxide are eluted in this order, and these peaks completely separate each other.

System repeatability: When the test is repeated 6 times with 2  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviations of the ratio of the peak area of acetone, methanol and mesityl oxide to that of the internal standard are not more than 4.0%, respectively.

**Water** <2.48> Not more than 2.0% (0.5 g, volumetric titration, direct titration).

**Assay** Weigh accurately about 0.3 g of Cilastatin Sodium, dissolve in 30 mL of methanol, add 5 mL of water, and adjust to pH 3.0 with 0.1 mol/L hydrochloric acid TS. Titrate <2.50> with 0.1 mol/L sodium hydroxide VS from the first equivalence point to the third equivalence point (potentiometric titration).

Each mL of 0.1 mol/L sodium hydroxide VS

= 19.02 mg of  $C_{16}H_{25}N_2NaO_5S$

**Containers and storage** Containers—Tight containers.

Storage—In a cold place.

## Cilostazol

シロスタゾール

$C_{20}H_{27}N_5O_2$ : 369.46

6-[4-(1-Cyclohexyl-1H-tetrazol-5-yl)butyloxy]-  
3,4-dihydroquinolin-2(1H)-one  
[73963-72-1]

Cilostazol, when dried, contains not less than 98.5% and not more than 101.5% of  $C_{20}H_{27}N_5O_2$ .

**Description** Cilostazol occurs as white to pale yellowish white, crystals or crystalline powder.

It is slightly soluble in methanol, in ethanol (99.5) and in acetonitrile, and practically insoluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Cilostazol in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cilostazol Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cilostazol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cilostazol Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 158 – 162°C

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Cilostazol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 25 mg of Cilostazol in 25 mL of acetonitrile, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add acetonitrile to make exactly 100 mL. Pipet 10 mL of this solution, add acetonitrile to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than cilostazol obtained with the sample solution is not larger than 0.7 times the peak area of cilostazol with the standard solution, and the total area of the peaks other than the peak of cilostazol with the sample solution is not larger than 1.2 times

the peak area of cilostazol with the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of hexane, ethyl acetate and methanol (10:9:1).

Flow rate: Adjust the flow rate so that the retention time of cilostazol is about 7 minutes.

Time span of measurement: About 3 times as long as the retention time of cilostazol beginning after the solvent peak.

**System suitability**—

Test for required detectability: Pipet 1 mL of the standard solution, and add acetonitrile to make exactly 10 mL. Confirm that the peak area of cilostazol obtained with 10  $\mu$ L of this solution is equivalent to 7 to 13% of that with 10  $\mu$ L of the standard solution.

System performance: Pipet 1 mL of the sample solution, add 1 mL of a solution prepared by dissolving 5 mg of 3,4-dihydro-6-hydroxy-2(1H)-quinolinone in 10 mL of acetonitrile and acetonitrile to make exactly 100 mL. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, 3,4-dihydro-6-hydroxy-2(1H)-quinolinone and cilostazol are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cilostazol is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.1% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 50 mg each of Cilostazol and Cilostazol Reference Standard, previously dried, dissolve each in a suitable amount of methanol, add exactly 5 mL of the internal standard solution and methanol to make 50 mL. To 1 mL each of these solutions add methanol to make 10 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cilostazol to that of the internal standard.

$$\text{Amount (mg) of } C_{20}H_{27}N_5O_2 = W_S \times (Q_T / Q_S)$$

$W_S$ : Amount (mg) of Cilostazol Reference Standard

**Internal standard solution**—A solution of benzophenone in methanol (1 in 250).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water, acetonitrile and methanol (10:7:3).

Flow rate: Adjust the flow rate so that the retention time of cilostazol is about 9 minutes.

*System suitability*—

System performance: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, cilostazol and the internal standard are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 5 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cilostazol to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

## Cilostazol Tablets

シロスタゾール錠

Cilostazol Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of cilostazol ( $\text{C}_{20}\text{H}_{27}\text{N}_5\text{O}_2$ ; 369.46).

**Method of preparation** Prepare as directed under Tablets, with Cilostazol.

**Identification** Mix well an amount of powdered Cilostazol Tablets, equivalent to 50 mg of Cilostazol according to the labeled amount, with 10 mL of acetone, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 25 mg of Cilostazol Reference Standard in 5 mL of acetone, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 6  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography, develop the plate with a mixture of ethyl acetate, acetonitrile, methanol and formic acid (75:25:5:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly Dragendorff's TS for spraying on the plate: the principal spot with the sample solution and the spot with the standard solution are orange in color and have the same  $R_f$  value.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Cilostazol Tablets add 2 mL of water to disintegrate the tablet, add the internal standard solution exactly 5 mL for a 50-mg tablet and exactly 10 mL for a 100-mg tablet, and add methanol to make 50 mL. Shake for 10 minutes for the 50-mg tablet and for 20 minutes for the 100-mg tablet. To 1 mL of the solution add methanol to make 10 mL for the 50-mg tablet and 20 mL for the 100-mg tablet, filter through a membrane filter with pore size of not more than 0.5  $\mu\text{m}$ , and use the filtrate as the sample solution. Proceed as directed in the Assay.

$$\begin{aligned} & \text{Amount (mg) of cilostazol } (\text{C}_{20}\text{H}_{27}\text{N}_5\text{O}_2) \\ & = W_S \times (Q_T/Q_S) \times (C/50) \end{aligned}$$

$W_S$ : Amount (mg) of Cilostazol Reference Standard

$C$ : Labeled amount (mg) of cilostazol ( $\text{C}_{20}\text{H}_{27}\text{N}_5\text{O}_2$ ) in 1 tablet

*Internal standard solution*—A solution of benzophenone in methanol (1 in 250).

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Cilostazol Tablets at 50 revolutions per minute according to the Paddle method, using 900 mL of a solution of sodium lauryl sulfate (3 in 1000) as the dissolution medium. Withdraw 20 mL or more of the dissolution medium 45 minutes after starting the test for a 50-mg tablet and 60 minutes after starting the test for a 100-mg tablet, and filter through a membrane filter with a pore size not exceeding 0.45  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet the subsequent  $V$  mL, add the solution of sodium lauryl sulfate (3 in 1000) to make exactly  $V'$  mL so that each mL contains about 5.6  $\mu\text{g}$  of cilostazol ( $\text{C}_{20}\text{H}_{27}\text{N}_5\text{O}_2$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of Cilostazol Reference Standard, previously dried at 105°C for 2 hours, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, add the solution of sodium lauryl sulfate (3 in 1000) to make exactly 200 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 257 nm as directed under Ultraviolet-visible Spectrophotometry using the solution of sodium lauryl sulfate (3 in 1000) as the control: the dissolution rates of a 50-mg tablet in 45 minutes and a 100-mg tablet in 60 minutes are not less than 75% and not less than 70%, respectively.

Dissolution rate (%) with respect to the labeled amount of cilostazol ( $\text{C}_{20}\text{H}_{27}\text{N}_5\text{O}_2$ )

$$= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 18$$

$W_S$ : Amount (mg) of Cilostazol Reference Standard

$C$ : Labeled amount (mg) of cilostazol ( $\text{C}_{20}\text{H}_{27}\text{N}_5\text{O}_2$ ) in 1 tablet

**Assay** Weigh accurately, and powder not less than 20 Cilostazol Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of cilostazol ( $\text{C}_{20}\text{H}_{27}\text{N}_5\text{O}_2$ ), add exactly 5 mL of the internal standard solution and methanol to make 50 mL, and shake well for 10 minutes. To 1 mL of this solution add methanol to make 10 mL, filter through a membrane filter with a pore size of not more than 0.5  $\mu\text{m}$ , and use the filtrate as the sample solution. Separately, weigh accurately about 50 mg of Cilostazol Reference Standard, dissolve in a suitable amount of methanol, and add exactly 5 mL of the internal standard solution and methanol to make 50 mL. To 1 mL of this solution add methanol to make 10 mL, and use this solution as the standard solution. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cilostazol to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of cilostazol } (\text{C}_{20}\text{H}_{27}\text{N}_5\text{O}_2) \\ & = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Cilostazol Reference Standard

*Internal standard solution*—A solution of benzophenone in methanol (1 in 250).

**Operating conditions—**

Proceed as directed in the operating conditions in the Assay under Cilostazol.

**System suitability—**

System performance: Proceed as directed in the system suitability in the Assay under Cilostazol.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cilostazol to that of the internal standard is not more than 1.5%.

**Containers and storage** Containers—Well-closed containers.

## Cimetidine

シメチジン

$C_{10}H_{16}N_6S$ : 252.34

2-Cyano-1-methyl-3-[(5-methyl-1*H*-imidazol-4-yl)methylsulfanyl]ethylguanidine [51481-61-9]

Cimetidine, when dried, contains not less than 99.0% of  $C_{10}H_{16}N_6S$ .

**Description** Cimetidine occurs as a white crystalline powder. It is odorless, and has a bitter taste.

It is freely soluble in methanol and in acetic acid (100), sparingly soluble in ethanol (95), slightly soluble in water, and practically insoluble in diethyl ether.

It dissolves in dilute hydrochloric acid.

It is gradually colored by light.

**Identification (1)** To 0.1 mL of a solution of Cimetidine in ethanol (95) (1 in 100) add 5 mL of citric acid-acetic anhydride TS, and heat in a water bath for 15 minutes: a red-purple color develops.

(2) Determine the infrared absorption spectrum of Cimetidine, previously dried, as directed in the potassium bromide disk method under the Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**pH** <2.54> Dissolve 0.5 g of Cimetidine in 50 mL of freshly boiled and cooled water, shake for 5 minutes and filter: the pH of the filtrate is between 9.0 and 10.5.

**Melting point** <2.60> 140 – 144°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cimetidine in 10 mL of methanol: the solution is clear and colorless to pale yellow in color.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Cimetidine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Dissolve 1.0 g of Cimetidine in 5 mL of dilute hydrochloric acid, and perform the test with this so-

lution (not more than 2 ppm).

(4) Related substances—Dissolve 0.5 g of Cimetidine in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 4  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and ammonia solution (28) (21:2:2) to a distance of about 15 cm, air-dry the plate, and then dry at 80°C for 30 minutes. Allow the plate to stand in iodine vapor for 45 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.24 g of Cimetidine, previously dried, dissolve in 75 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 25.23 mg of  $C_{10}H_{16}N_6S$

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Cisplatin

シスプラチン

$Cl_2H_6N_2Pt$ : 300.05

(SP-4-2)-Diamminedichloroplatinum [15663-27-1]

Cisplatin, when dried, contains not less than 98.0% and not more than 102.0% of  $Cl_2H_6N_2Pt$ .

**Description** Cisplatin occurs as a yellow crystalline powder.

It is sparingly soluble in *N,N*-dimethylformamide, slightly soluble in water, and practically insoluble in ethanol (99.5).

**Identification (1)** To 5 mL of a solution of Cisplatin (1 in 2000) add 2 to 3 drops of a solution of tin (II) chloride dihydrate (1 in 100): a brown precipitate is formed.

(2) Determine the absorption spectrum of a solution of Cisplatin in a solution of sodium chloride in 0.01 mol/L hydrochloric acid TS (9 in 1000) (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cisplatin Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Cisplatin as directed in the potassium bromide disk method

under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cisplatin Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Cisplatin (1 in 2000) responds to the Qualitative Test <1.09> (1) for chloride.

**Purity** Ammonium aminotrichloroplatinate—Conduct this procedure using light-resistant vessels. Dissolve 50 mg of Cisplatin in a solution of sodium chloride (9 in 1000) to make exactly 100 mL, and use this solution as the sample solution. Separately, dissolve 10 mg of ammonium aminotrichloroplatinate for liquid chromatography, previously dried at 80°C for 3 hours, in the solution of sodium chloride (9 in 1000) to make exactly 200 mL. Pipet 2 mL of this solution, add the solution of sodium chloride (9 in 1000) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 40  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak area of ammonium aminotrichloroplatinate by the automatic integration method: the peak area from the sample solution is not more than that from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 209 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with silica gel for liquid chromatography having quaternary ammonium groups (10  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A solution of ammonium sulfate (1 in 800).

**Flow rate:** Adjust the flow rate so that the retention time of ammonium aminotrichloroplatinate is about 8 minutes.

**System suitability—**

**System performance:** When the procedure is run with 40  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ammonium aminotrichloroplatinate are not less than 1500 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 40  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ammonium aminotrichloroplatinate is not more than 3.0%.

**Loss on drying** <2.41> Not more than 0.1% (1 g, 105°C, 4 hours).

**Assay** Conduct this procedure using light-resistant vessels. Weigh accurately about 25 mg each of Cisplatin and Cisplatin Reference Standard, previously dried, dissolve in *N,N*-dimethylformamide to make exactly 25 mL, and use these solutions as the sample solution and the standard solution. Perform the test with exactly 40  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of cisplatin by the automatic integration method.

$$\text{Amount (mg) of Cl}_2\text{H}_6\text{N}_2\text{Pt} = W_S \times (A_T/A_S)$$

$W_S$ : Amount (mg) of Cisplatin Reference Standard

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 310 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with aminopropyl-silanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of ethyl acetate, methanol, water and *N,N*-dimethylformamide (25:16:5:5).

**Flow rate:** Adjust the flow rate so that the retention time of cisplatin is about 4 minutes.

**System suitability—**

**System performance:** When the procedure is run with 40  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cisplatin are not less than 3000 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 40  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cisplatin is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Anhydrous Citric Acid

無水クエン酸

$C_6H_8O_7$ : 192.12

2-Hydroxypropane-1,2,3-tricarboxylic acid [77-92-9]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbol (♦ ♦).

Anhydrous Citric Acid contains not less than 99.5% and not more than 100.5% of  $C_6H_8O_7$ , calculated on the anhydrous basis.

♦**Description** Anhydrous Citric Acid occurs as colorless crystals, white granules or crystalline powder.

It is very soluble in water, and freely soluble in ethanol (95).♦

♦**Identification** Determine the infrared absorption spectrum of Anhydrous Citric Acid, previously dried at 105°C for 2 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.♦

**Purity** (1) Clarity and color of solution—Dissolve 2.0 g of Anhydrous Citric Acid in water to make 10 mL: the solution is clear and has no more color than the following control solutions (1), (2) or (3).

Control solution (1): To 1.5 mL of Cobalt (II) Chloride Colorimetric Stock Solution and 6.0 mL of Iron (III) Chloride Colorimetric Stock Solution add water to make

1000 mL.

Control solution (2): To 0.15 mL of Cobalt (II) Chloride Colorimetric Stock Solution, 7.2 mL of Iron (III) Chloride Colorimetric Stock Solution and 0.15 mL of Copper (II) Sulfate Colorimetric Stock Solution add water to make 1000 mL.

Control solution (3): To 2.5 mL of Cobalt (II) Chloride Colorimetric Stock Solution, 6.0 mL of Iron (III) Chloride Colorimetric Stock Solution and 1.0 mL of Copper (II) Sulfate Colorimetric Stock Solution add water to make 1000 mL.

(2) Sulfates <1.14>—Dissolve 2.0 g of Anhydrous Citric Acid in water to make 30 mL, and use this solution as the sample solution. Separately, dissolve 0.181 g of potassium sulfate in diluted ethanol (99.5) (3 in 10) to make exactly 500 mL. Pipet 5 mL of this solution, and add diluted ethanol (99.5) (3 in 10) to make exactly 100 mL. To 4.5 mL of this solution add 3 mL of a solution of barium chloride dihydrate (1 in 4), shake, and allow to stand for 1 minute. To 2.5 mL of this solution add 15 mL of the sample solution and 0.5 mL of acetic acid (31), and allow to stand for 5 minutes: the solution has no more turbidity than the following control solution.

Control solution: Dissolve 0.181 g of potassium sulfate in water to make exactly 500 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and proceed in the same manner as above using this solution instead of the sample solution.

(3) Oxalic acid—Dissolve 0.80 g of Anhydrous Citric Acid in 4 mL of water, add 3 mL of hydrochloric acid and 1 g of zinc, and boil for 1 minute. After allowing to stand for 2 minutes, take the supernatant liquid, add 0.25 mL of a solution of phenylhydrazinium hydrochloride (1 in 100), heat to boil, and then cool quickly. To this solution add the equal volume of hydrochloric acid and 0.25 mL of a solution of potassium hexacyanoferrate (III) (1 in 20), mix, and allow to stand for 30 minutes: the solution has no more color than the following control solution prepared at the same time.

Control solution: To 4 mL of a solution of oxalic acid dihydrate (1 in 10,000) add 3 mL of hydrochloric acid and 1 g of zinc, and proceed in the same manner as the test solution.

♦(4) Heavy metals <1.07>—Proceed with 2.0 g of Anhydrous Citric Acid according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).♦

(5) Readily carbonizable substances <1.15>—Perform the test with 0.5 g of Anhydrous Citric Acid, provided that the solution is heated at 90°C for 1 hour and then cool quickly: the solution has no more color than Matching Fluid K.

**Water** <2.48> Not more than 1.0% (2 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.55 g of Anhydrous Citric Acid, dissolve in 50 mL of water, and titrate with 1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS).

Each mL of 1 mol/L sodium hydroxide VS  
= 64.04 mg of C<sub>6</sub>H<sub>8</sub>O<sub>7</sub>

♦**Containers and storage** Containers—Tight containers.♦

## Citric Acid Hydrate

クエン酸水和物

C<sub>6</sub>H<sub>8</sub>O<sub>7</sub>·H<sub>2</sub>O: 210.14

2-Hydroxypropane-1,2,3-tricarboxylic acid monohydrate  
[5949-29-1]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbol (♦ ♦).

Citric Acid Hydrate contains not less than 99.5% and not more than 100.5% of anhydrous citric acid (C<sub>6</sub>H<sub>8</sub>O<sub>7</sub>: 192.12), calculated on the anhydrous basis.

♦**Description** Citric Acid Hydrate occurs as colorless crystals, white granules or crystalline powder.

It is very soluble in water, and freely soluble in ethanol (95).

It is efflorescent in dry air.♦

♦**Identification** Determine the infrared absorption spectrum of Citric Acid Hydrate, previously dried at 105°C for 2 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.♦

**Purity** (1) Clarity and color of solution—Dissolve 2.0 g of Citric Acid Hydrate in water to make 10 mL: the solution is clear and has no more color than the following control solutions (1), (2) or (3).

Control solution (1): To 1.5 mL of Cobalt (II) Chloride Colorimetric Stock Solution and 6.0 mL of Iron (III) Chloride Colorimetric Stock Solution add water to make 1000 mL.

Control solution (2): To 0.15 mL of Cobalt (II) Chloride Colorimetric Stock Solution, 7.2 mL of Iron (III) Chloride Colorimetric Stock Solution and 0.15 mL of Copper (II) Sulfate Colorimetric Stock Solution add water to make 1000 mL.

Control solution (3): To 2.5 mL of Cobalt (II) Chloride Colorimetric Stock Solution, 6.0 mL of Iron (III) Chloride Colorimetric Stock Solution and 1.0 mL of Copper (II) Sulfate Colorimetric Stock Solution add water to make 1000 mL.

(2) Sulfates <1.14>—Dissolve 2.0 g of Citric Acid Hydrate in water to make 30 mL, and use this solution as the sample solution. Separately, dissolve 0.181 g of potassium sulfate in diluted ethanol (99.5) (3 in 10) to make exactly 500 mL. Pipet 5 mL of this solution, and add diluted ethanol (99.5) (3 in 10) to make exactly 100 mL. To 4.5 mL of this solution add 3 mL of a solution of barium chloride dihydrate (1 in 4), shake, and allow to stand for 1 minute. To 2.5 mL of this solution add 15 mL of the sample solution and 0.5 mL of acetic acid (31), and allow to stand for 5 minutes: the solution has no more turbidity than the following control solution.

Control solution: Dissolve 0.181 g of potassium sulfate in water to make exactly 500 mL. Pipet 5 mL of this solution,

add water to make exactly 100 mL, and proceed in the same manner as above using this solution instead of the sample solution.

(3) Oxalic acid—Dissolve 0.80 g of Citric Acid Hydrate in 4 mL of water, add 3 mL of hydrochloric acid and 1 g of zinc, and boil for 1 minute. After allowing to stand for 2 minutes, take the supernatant liquid, add 0.25 mL of a solution of phenylhydrazinium hydrochloride (1 in 100), heat to boil, and then cool quickly. To this solution add the equal volume of hydrochloric acid and 0.25 mL of a solution of potassium hexacyanoferrate (III) (1 in 20), mix, and allow to stand for 30 minutes: the solution has no more color than the following control solution prepared at the same time.

Control solution: To 4 mL of a solution of oxalic acid dihydrate (1 in 10,000) add 3 mL of hydrochloric acid and 1 g of zinc, and proceed in the same manner as the test solution.

♦(4) Heavy metals <1.07>—Proceed with 2.0 g of Citric Acid Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).♦

## Clarithromycin

クラリスロマイシン

C<sub>38</sub>H<sub>69</sub>NO<sub>13</sub>: 747.95  
(2*R*,3*S*,4*S*,5*R*,6*R*,8*R*,10*R*,11*R*,12*S*,13*R*)-5-(3,4,6-Trideoxy-3-dimethylamino-β-D-xylo-hexopyranosyloxy)-3-(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl-α-L-ribo-hexopyranosyloxy)-11,12-dihydroxy-6-methoxy-2,4,6,8,10,12-hexamethyl-9-oxopentadecan-13-olide [81103-11-9]

Clarithromycin is a derivative of erythromycin.

It contains not less than 950 μg (potency) and not more than 1050 μg (potency) per mg, calculated on the anhydrous basis. The potency of Clarithromycin is expressed as mass (potency) of clarithromycin (C<sub>38</sub>H<sub>69</sub>NO<sub>13</sub>).

**Description** Clarithromycin occurs as a white crystalline powder and has a bitter taste.

It is soluble in acetone and in chloroform, slightly soluble in methanol and in ethanol (95), and practically insoluble in water.

**Identification** (1) To 5 mg of Clarithromycin add 2 mL of sulfuric acid, and shake gently: a red-brown color develops.

(2) Dissolve 3 mg of Clarithromycin in 2 mL of acetone, and add 2 mL of hydrochloric acid: an orange color develops and changes immediately to red to deep purple.

(3) Determine the infrared absorption spectra of Clarithromycin and Clarithromycin Reference Standard as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Dissolve 10 mg each of Clarithromycin and Clarithromycin Reference Standard in 4 mL of chloroform, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop with a mixture of chloroform, methanol and ammonia water (28) (100:5:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly sulfuric acid on the plate, and heat at 105°C for 10 minutes: the principal spot from the sample solution and the spot from the standard solution show a dark purple color and have the same R<sub>f</sub> value.

**Optical rotation** <2.49> [α]<sub>D</sub><sup>20</sup>: -87 - -97° (0.25 g calculated on the anhydrous basis, chloroform, 25 mL, 100 mm).

**Melting point** <2.60> 220 - 227°C

**Purity** (1) Heavy metals <1.07>—Proceed with 2.0 g of Clarithromycin according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic—Prepare the test solution with 1.0 g of Clarithromycin according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Weigh accurately about 0.1 g of Clarithromycin, dissolve in the mobile phase to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Clarithromycin Reference Standard, dissolve in the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the each peak area by the automatic integration method: the amount of each related substance calculated on the anhydrous basis is not more than 2.0%, and the total of them is not more than 5.0%. Exclude any peak with an area of less than 0.05%.

Amount (%) of each related substance calculated on the anhydrous basis

$$= (W_S/W_T) \times (A_T/A_S) \times 100$$

Total amount (%) of the related substances calculated on the anhydrous basis

$$= (W_S/W_T) \times (\Sigma A_T/A_S) \times 100$$

$W_S$ : Amount (mg) of Clarithromycin Reference Standard

$W_T$ : Amount (mg) of the sample, calculated on the anhydrous basis

$A_S$ : Peak area of clarithromycin obtained with the standard solution

$A_T$ : Peak area of each related substance obtained with the sample solution

$\Sigma A_T$ : Total area of the peaks other than clarithromycin obtained with the sample solution

#### Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 5 times as long as the retention time of the main peak after 2 minutes of sample injection.

#### System suitability—

Test for required detection: To exactly 2 mL of the standard solution add the mobile phase to make exactly 10 mL, and use this solution as the solution for system suitability test. Confirm that when the procedure is run with 10  $\mu$ L of the solution for system suitability test, the peak area of clarithromycin is equivalent to 14–26% of that obtained from the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of clarithromycin is not more than 3.0%.

**Water** <2.48> Not more than 2.0% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (2 g).

**Assay** Weigh accurately an amount of Clarithromycin and Clarithromycin Reference Standard, equivalent to about 0.1 g (potency), and dissolve in the mobile phase to make exactly 20 mL. Pipet 2 mL each of these solutions, add exactly 2 mL of the internal standard solution, add the mobile phase to make 20 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of clarithromycin to that of the internal standard.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of } C_{38}H_{69}NO_{13} \\ &= W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Clarithromycin Reference Standard

**Internal standard solution**—A solution of butyl parahydroxybenzoate in the mobile phase (1 in 20,000).

#### Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4 mm in inside diameter

and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: A mixture of diluted 0.2 mol/L potassium dihydrogenphosphate TS (1 in 3) and acetonitrile (13:7).

Flow rate: Adjust the flow rate so that the retention time of clarithromycin is about 8 minutes.

#### System suitability—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, clarithromycin and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of clarithromycin to that of the internal standard is not more than 2.0%.

**Containers and storage** Containers—Well-closed containers.

## Clarithromycin Tablets

クラリスロマイシン錠

Clarithromycin Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of clarithromycin ( $C_{38}H_{69}NO_{13}$ : 747.95).

**Method of preparation** Prepare as directed under Tablets, with Clarithromycin.

**Identification** Shake a quantity of pulverized Clarithromycin Tablets, equivalent to 60 mg (potency) of Clarithromycin according to the labeled amount, with 40 mL of acetone for 10 minutes, and centrifuge at 4000 rpm for 5 minutes. Evaporate 30 mL of the supernatant liquid, and determine the infrared absorption spectrum of the residue so obtained as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave numbers of about 2980  $\text{cm}^{-1}$ , 2940  $\text{cm}^{-1}$ , 1734  $\text{cm}^{-1}$ , 1693  $\text{cm}^{-1}$ , 1459  $\text{cm}^{-1}$ , 1379  $\text{cm}^{-1}$  and 1171  $\text{cm}^{-1}$ .

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Clarithromycin Tablets add exactly  $V/20$  mL of the internal standard solution (1), then add the mobile phase so that each mL contains about 5 mg (potency) of clarithromycin ( $C_{38}H_{69}NO_{13}$ ) to make  $V$  mL, and disperse to fine particles with the aid of ultrasonic waves for 20 minutes while occasional vigorous shaking. Centrifuge this solution at 4000 rpm for 15 minutes, and filter the supernatant liquid through a membrane filter with a pore size of not more than 0.45  $\mu$ m. Then, proceed as directed in the Assay.

$$\begin{aligned} &\text{Amount [mg (potency)] of clarithromycin } (C_{38}H_{69}NO_{13}) \\ &= W_S \times (Q_T/Q_S) \times (V/10) \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Clarithromycin Reference Standard

**Internal standard solution (1)**—A solution of butyl para-

hydroxybenzoate in the mobile phase (1 in 1000).

**Internal standard solution (2)**—To exactly 1 mL of the internal standard solution (1) add the mobile phase to make exactly 20 mL.

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Clarithromycin Tablets at 50 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L disodium hydrogen phosphate-citric acid buffer solution, pH 6.0 as the dissolution medium. Withdraw 20 mL or more of the dissolution medium 30 minutes after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet the subsequent  $V$  mL, add the mobile phase to make exactly  $V'$  mL so that each mL contains about 28  $\mu\text{g}$  (potency) of clarithromycin ( $\text{C}_{38}\text{H}_{69}\text{NO}_{13}$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg (potency) of Clarithromycin Reference Standard, and dissolve in acetonitrile for liquid chromatography to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 100  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of clarithromycin. The dissolution rates in 30 minutes of a 50-mg tablet and a 200-mg tablet are not less than 80% and not less than 75%, respectively.

Dissolution rate (%) with respect to the labeled amount of clarithromycin ( $\text{C}_{38}\text{H}_{69}\text{NO}_{13}$ )

$$= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 90$$

$W_S$ : Amount [mg (potency)] of Clarithromycin Reference Standard

$C$ : Labeled amount [mg (potency)] of clarithromycin ( $\text{C}_{38}\text{H}_{69}\text{NO}_{13}$ ) in 1 tablet

**Operating conditions**—

Proceed as directed in the operating conditions in the Assay.

**System suitability**—

**System performance**: When the procedure is run with 100  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clarithromycin are not less than 3000 and not more than 2.0, respectively.

**System repeatability**: When the test is repeated 6 times with 100  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clarithromycin is not more than 2.0%.

**Assay** To not less than 5 Clarithromycin Tablets add diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 3) so that each mL contains about 8 mg (potency) of clarithromycin ( $\text{C}_{38}\text{H}_{69}\text{NO}_{13}$ ), disperse to fine particles with the aid of ultrasonic waves, add exactly 1 mL of the internal standard solution (1) per 100 mg (potency) of clarithromycin according to the labeled amount, then add acetonitrile for liquid chromatography so that each mL contains about 5 mg (potency) of clarithromycin ( $\text{C}_{38}\text{H}_{69}\text{NO}_{13}$ ), and disperse to fine particles with the aid of ultrasonic waves for 10 minutes while occasional vigorous shaking. Centrifuge of this solu-

tion at 4000 rpm for 15 minutes, and filter the supernatant liquid through a membrane filter with a pore size of not more than 0.45  $\mu\text{m}$ . Discard the first 3 mL of the filtrate, to 2 mL of the subsequent filtrate add the mobile phase to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg (potency) of Clarithromycin Reference Standard, and dissolve in the mobile phase to make exactly 10 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution (2) and the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of clarithromycin to that of the internal standard.

$$\begin{aligned} &\text{Amount [mg (potency)] of clarithromycin } (\text{C}_{38}\text{H}_{69}\text{NO}_{13}) \\ &= W_S \times (Q_T/Q_S) \times (1/5) \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Clarithromycin Reference Standard

**Internal standard solution (1)**—A solution of butyl parahydroxybenzoate in the mobile phase (1 in 1000).

**Internal standard solution (2)**—To exactly 1 mL of the internal standard solution (1) add the mobile phase to make exactly 20 mL.

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 210 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature**: A constant temperature of about 50°C.

**Mobile phase**: A mixture of diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 3) and acetonitrile for liquid chromatography (13:7).

**Flow rate**: Adjust the flow rate so that the retention time of clarithromycin is about 8 minutes.

**System suitability**—

**System performance**: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, clarithromycin and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

**System repeatability**: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of clarithromycin to that of the internal standard is not more than 2.0%.

**Containers and storage** Containers—Well-closed containers.

## Clemastine Fumarate

クレマスチンフマル酸塩

$C_{21}H_{26}ClNO \cdot C_4H_4O_4$ : 459.96

(2*R*)-2-{2-[(1*R*)-1-(4-chlorophenyl)-1-phenylethoxy]ethyl}-1-methylpyrrolidine monofumarate  
[14976-57-9]

Clemastine Fumarate, when dried, contains not less than 98.5% of  $C_{21}H_{26}ClNO \cdot C_4H_4O_4$ .

**Description** Clemastine Fumarate occurs as a white, crystalline powder. It is odorless.

It is sparingly soluble in methanol and in acetic acid (100), slightly soluble in ethanol (95), very slightly soluble in diethyl ether, and practically insoluble in water.

**Identification (1)** To 5 mg of Clemastine Fumarate add 5 mL of sulfuric acid, and shake to dissolve: a yellow color develops. Slowly drop this solution into 10 mL of water: the yellow color immediately disappears.

**(2)** To 0.01 g of Clemastine Fumarate add 1 mL of fuming nitric acid, and evaporate on a water bath to dryness. Then add 2 mL of diluted hydrochloric acid (1 in 2) and 0.2 g of zinc powder, heat for 10 minutes on a water bath, cool, and filter. Add 20 mL of water to the filtrate. The solution responds to the Qualitative Tests <1.09> for primary aromatic amines.

**(3)** To 5 mL of a solution of Clemastine Fumarate (1 in 50,000), add 5 mL of 4-dimethylaminobenzaldehyde TS, and warm for 10 minutes: a red-purple color develops.

**(4)** Perform the test with Clemastine Fumarate as directed under Flame Coloration Test <1.04> (2): a green color appears.

**(5)** Dissolve 0.04 g of Clemastine Fumarate and 0.01 g of fumaric acid for thin-layer chromatography in 2 mL each of a mixture of ethanol (95) and water (4:1) by gentle warming, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of isopropyl ether, formic acid and water (90:7:3) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm): the spot with larger *R<sub>f</sub>* value from the sample solution has the same *R<sub>f</sub>* value as the spot from the standard solution.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +16 – +18° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

**Melting point** <2.60> 176 – 180°C (with decomposition).

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Clemastine Fumarate in 10 mL of methanol by warming: the

solution is clear and colorless.

**(2)** Heavy metals <1.07>—Perform the test with 1.0 g of Clemastine Fumarate according to Method 2. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Arsenic <1.11>—Take 1.0 g of Clemastine Fumarate, prepare the test solution according to Method 3, and perform the test (not more than 2 ppm).

**(4)** Related Substances—Dissolve 0.10 g of Clemastine Fumarate in 5 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 250 mL, and use this solution as the standard solution (1). Pipet 5 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia solution (28) (90:10:1) to a distance of about 10 cm, and air-dry the plate. After spraying evenly Dragendorff's TS on the plate, immediately spray evenly hydrogen peroxide TS: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (1), and not more than 2 spots from the sample solution are more intense than the spot from the standard solution (2).

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.4 g of Clemastine Fumarate, previously dried, dissolved in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 46.00 mg of  $C_{21}H_{26}ClNO \cdot C_4H_4O_4$

**Containers and storage** Containers—Tight containers.

## Clindamycin Hydrochloride

クリンダマイシン塩酸塩

$C_{18}H_{33}ClN_2O_5S \cdot HCl$ : 461.44

Methyl 7-chloro-6,7,8-trideoxy-6-[(2*S*,4*R*)-1-methyl-4-propylpyrrolidine-2-carboxamido]-1-thio-*L*-*threo*- $\alpha$ -*D*-galacto-octopyranoside monohydrochloride [21462-39-5]

Clindamycin Hydrochloride is the hydrochloride of a derivative of lincomycin.

It contains not less than 759  $\mu$ g (potency) and not more than 902  $\mu$ g (potency) per mg. The potency of

Clindamycin Hydrochloride is expressed as mass (potency) of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ : 424.98).

**Description** Clindamycin Hydrochloride occurs as white to grayish white, crystals or crystalline powder.

It is freely soluble in water and in methanol, and slightly soluble in ethanol (95).

**Identification** Dissolve 0.1 g of Clindamycin Hydrochloride in 5 mL of water, add 2 mL of sodium hydroxide TS, and mix: a white turbidity is produced. To this solution add 0.3 mL of sodium pentacyanonitrosylferrate (III) TS, mix, allow to stand at 60 to 65°C for 10 minutes, and add 2 mL of dilute hydrochloric acid: a blue-green color develops.

**Optical rotation** <2.49>  $[\alpha]_D^{25}$ : +135 – +150° (0.5 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

**Water** <2.48> Not more than 6.0% (0.3 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Micrococcus luteus* ATCC 9341

(ii) Culture medium—Use the medium i in 3) Medium for other organisms under (1) Agar media for seed and base layer.

(iii) Standard solutions—Weigh accurately an amount of Clindamycin Hydrochloride Reference Standard, equivalent to about 25 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 250 mL, and use this solution as the standard stock solution. Keep the standard stock solution at a temperature not exceeding 15°C and use within 14 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make solutions so that each mL contains 2 µg (potency) and 1 µg (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Clindamycin Hydrochloride, equivalent to about 25 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 250 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make solutions so that each mL contains 2 µg (potency) and 1 µg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Clindamycin Hydrochloride Capsules

クリンダマイシン塩酸塩カプセル

Clindamycin Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labeled amount of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ : 424.98).

**Method of preparation** Prepare as directed under Capsules, with Clindamycin Hydrochloride.

**Identification** To an amount of the contents of Clindamycin Hydrochloride Capsules, equivalent to 10 mg (potency) of Clindamycin Hydrochloride, add 2 mL of methanol, shake well, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 10 mg of Clindamycin Hydrochloride Reference Standard in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, toluene and ammonia solution (28) (140:60:3) to a distance of about 12 cm, and air-dry the plate. Spray evenly a mixture of 500 mL of a solution of L-tartaric acid (1 in 5) and 50 mL of bismuth subnitrate TS on the plate: the  $R_f$  values of the principal spot with the sample solution and the spot with the standard solution are not different each other.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 capsule of Clindamycin Hydrochloride Capsules add a suitable amount of the mobile phase, shake for 30 minutes, and add the mobile phase to make exactly  $V$  mL so that each mL contains 0.75 mg (potency) of Clindamycin Hydrochloride according to the labeled amount. Centrifuge for 10 minutes, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 75 mg (potency) of Clindamycin Hydrochloride Reference Standard, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of clindamycin.

$$\begin{aligned} &\text{Amount [mg (potency)] of clindamycin } (C_{18}H_{33}ClN_2O_5S) \\ &= W_S \times (A_T/A_S) \times (V/100) \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Clindamycin Hydrochloride Reference Standard

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 210 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: Adjust the pH of 0.05 mol/L potassium dihydrogen phosphate TS to 7.5 with 8 mol/L potassium hydroxide TS. To 550 mL of this solution add 450 mL of acetonitrile for liquid chromatography.

**Flow rate**: Adjust the flow rate so that the retention time of clindamycin is about 7 minutes.

**System suitability**—

**System performance**: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clindamycin are not less than 3000 and not more than 2.0, respectively.

**System repeatability**: When the test is repeated 6 times with

20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clindamycin is not more than 1.0%.

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Clindamycin Hydrochloride Capsules at 50 revolutions per minute according to the Paddle method, using the sinker, using 900 mL of water as the dissolution medium. Withdraw not less than 20 mL of the dissolution medium 15 minutes after starting the test for a 75-mg capsule or 30 minutes after starting the test for a 150-mg capsule, and filter through a membrane filter with a pore size not exceeding 0.45  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet  $V$  mL of the subsequent filtrate, add water to make exactly  $V'$  so that each mL contains about 83  $\mu\text{g}$  (potency) of clindamycin hydrochloride, and use this solution as the sample solution. Separately, weigh accurately about 17 mg (potency) of Clindamycin Hydrochloride Reference Standard, dissolve in water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01>, and determine the peak areas,  $A_T$  and  $A_S$ , of clindamycin. The dissolution rate of a 75-mg capsule in 15 minutes and that of a 150-mg capsule in 30 minutes are not less than 80%, respectively.

Dissolution rate (%) with respect to the labeled amount of clindamycin hydrochloride

$$= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 450$$

$W_S$ : Amount [mg (potency)] of Clindamycin Hydrochloride Reference Standard

$C$ : Labeled amount [mg (potency)] of clindamycin ( $\text{C}_{18}\text{H}_{33}\text{ClN}_2\text{O}_5\text{S}$ ) in 1 tablet

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 210 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: Adjust the pH of 0.05 mol/L potassium dihydrogen phosphate TS to 7.5 with 8 mol/L potassium hydroxide TS. To 550 mL of this solution add 450 mL of acetonitrile.

**Flow rate**: Adjust the flow rate so that the retention time of clindamycin is about 7 minutes.

**System suitability**—

**System performance**: When the procedure is run with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clindamycin are not less than 3000 and not more than 2.0, respectively.

**System repeatability**: When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clindamycin is not more than 2.0%.

**Assay** Perform the test according to the Cylinder–plate method as directed under Microbial Assay for Antibiotics

<4.02> according to the following conditions.

(i) Test organism, culture medium, and standard solutions—Proceed as directed in the Assay under Clindamycin Hydrochloride.

(ii) Sample solutions—Weigh accurately the mass of not less than 20 Clindamycin Hydrochloride Capsules, cut the capsules and take out the contents, mix well, and powder, if necessary. If necessary, wash the empty capsules with a small amount of diethyl ether, allow to stand at room temperature to dry the capsules, weigh their mass accurately, and calculate the mass of the contents. Weigh accurately an amount of the contents, equivalent to about 25 mg (potency) according to the labeled amount, add a suitable amount of 0.1 mol/L phosphate buffer solution, pH 7.0, shake vigorously, then add 0.1 mol/L phosphate buffer solution to make a solution so that each mL contains about 100  $\mu\text{g}$  (potency), and filter, if necessary. To exactly an amount of this solution add 0.1 mol/L phosphate buffer solution, pH 7.0 to make solutions so that each mL contains 2  $\mu\text{g}$  (potency) and 1  $\mu\text{g}$  (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Clindamycin Phosphate

クリンダマイシンリン酸エステル

$\text{C}_{18}\text{H}_{34}\text{ClN}_2\text{O}_8\text{PS}$ : 504.96

Methyl 7-chloro-6,7,8-trideoxy-6-[(2*S*,4*R*)-1-methyl-4-propylpyrrolidine-2-carboxamido]-1-thio-L-threo- $\alpha$ -D-galacto-octopyranoside 2-dihydrogenphosphate [24729-96-2]

Clindamycin Phosphate is a derivative of clindamycin.

It contains not less than 800  $\mu\text{g}$  (potency) and not more than 846  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Clindamycin Phosphate is expressed as mass (potency) of clindamycin ( $\text{C}_{18}\text{H}_{33}\text{ClN}_2\text{O}_5\text{S}$ : 424.98).

**Description** Clindamycin Phosphate occurs as a white to pale yellowish white crystalline powder.

It is freely soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol (95).

**Identification** Determine the infrared absorption spectrum of Clindamycin Phosphate, previously dried at 100°C for 2 hours, as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Clindamycin Phosphate Reference Standard previously dried at 100°C for 2 hours: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +115 – +130° (0.25 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 0.10 g of Clindamycin Phosphate in 10 mL of water. The pH of the solution is between 3.5 and 4.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Clindamycin Phosphate in 10 mL of freshly boiled and cooled water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Clindamycin Phosphate according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 5 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Clindamycin Phosphate according to Method 4, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.1 g of Clindamycin Phosphate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of clindamycin, having the relative retention time of about 1.8 with respect to clindamycin phosphate, obtained from the sample solution is not more than 1/2 of the peak area of clindamycin phosphate from the standard solution, and the total area of the peaks other than clindamycin phosphate from the sample solution is not more than 4 times the peak area of clindamycin phosphate from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of clindamycin phosphate beginning after the solvent peak.

**System suitability**—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of clindamycin phosphate obtained from 20  $\mu$ L of this solution is equivalent to 7 to 13% of that from 20  $\mu$ L of the standard solution.

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

**Water** <2.48> Not more than 6.0% (0.5 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Clindamycin Phosphate and Clindamycin Phosphate Reference Standard, equivalent to about 20 mg (potency), add exactly 25 mL of the internal standard solution and the mobile phase to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of clindamycin phosphate to that of the internal standard.

$$\text{Amount } [\mu\text{g (potency)}] \text{ of clindamycin (C}_{18}\text{H}_{33}\text{ClN}_2\text{O}_5\text{S)} \\ = W_S \times (Q_T/Q_S) \times 1000$$

$W_S$ : Amount [mg (potency)] of Clindamycin Phosphate

#### Reference Standard

**Internal standard solution**—A solution of methyl parahydroxybenzoate in the mobile phase (3 in 50,000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 10.54 g of potassium dihydrogen phosphate in 775 mL of water, adjust the pH to 2.5 with phosphoric acid, and add 225 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of clindamycin phosphate is about 8 minutes.

**System suitability**—

System performance: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, clindamycin phosphate and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of clindamycin phosphate to that of the internal standard is not more than 2.5%.

**Containers and storage** Containers—Tight containers.

## Clinofibrate

クリノフィブラート

$\text{C}_{28}\text{H}_{36}\text{O}_6$ : 468.58

2,2'-(4,4'-Cyclohexylidenediphenoxy)-2,2'-dimethyldibutanoic acid [30299-08-2]

Clinofibrate, when dried, contains not less than 98.5% of  $\text{C}_{28}\text{H}_{36}\text{O}_6$ .

**Description** Clinofibrate occurs as a white to yellowish white powder.

It is odorless and has no taste.

It is freely soluble in methanol, in ethanol (99.5), in acetone and in diethyl ether, and practically insoluble in water.

A solution of Clinofibrate in methanol (1 in 20) shows no optical rotation.

Melting point: about 146°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Clinofibrate in ethanol (99.5) (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clinofibrate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Clinofibrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Clinofibrate according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.10 g of Clinofibrate in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add acetone to make exactly 50 mL. Pipet 5 mL of this solution, add acetone to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 50  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, cyclohexane and acetic acid (100) (12:5:3) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Isomer ratio** To 50 mg of Clinofibrate add 0.4 mL of thionyl chloride, stopper tightly, heat on a water bath of 60°C for 5 minutes with occasional shaking, and evaporate the excess thionyl chloride at a temperature not exceeding 60°C under reduced pressure. Dissolve the residue in 2 mL of toluene previously dried with synthetic zeolite for drying, add 2 mL of a solution of D-(+)- $\alpha$ -methylbenzylamine in toluene previously dried with synthetic zeolite for drying (3 in 100), mix gently, allow to stand for 10 minutes, and evaporate the toluene at a temperature not exceeding 60°C under reduced pressure. Dissolve the residue in 5 mL of chloroform, and use this solution as the sample solution. Perform the test with 5  $\mu$ L of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area,  $A_a$ ,  $A_b$  and  $A_c$ , of three peaks appear in order near the retention time of 40 minutes: a value,  $\{A_b/(A_a + A_b + A_c)\} \times 100$ , is between 40 and 70.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column about 4 mm in inside diameter and about 30 cm in length, packed with silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 20°C.

**Mobile phase:** A mixture of hexane and 2-propanol (500:3).

**Flow rate:** Adjust the flow rate so that the retention time of the peak appearing first is about 35 minutes.

**Selection of column:** Proceed with 5  $\mu$ L of the sample solu-

tion under the above operating conditions. Use a column giving a complete separation of the three peaks.

**Assay** Weigh accurately about 0.45 g of Clinofibrate, previously dried, dissolve in 40 mL of ethanol (99.5), add 30 mL of water, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 23.43 mg of  $C_{28}H_{36}O_6$

**Containers and storage** Containers—Tight containers.

## Clozapramine Hydrochloride Hydrate

クロカプラミン塩酸塩水和物

$C_{28}H_{37}ClN_4O \cdot 2HCl \cdot H_2O$ : 572.01

1'-[3-(3-Chloro-10,11-dihydro-5H-dibenz[*b,f*]azepin-5-yl)propyl]-1,4'-bipiperidine-4'-carboxamide dihydrochloride monohydrate [60789-62-0]

Clozapramine Hydrochloride Hydrate, when dried, contains not less than 98.0% of clozapramine hydrochloride ( $C_{28}H_{37}ClN_4O \cdot 2HCl$ : 553.99).

**Description** Clozapramine Hydrochloride Hydrate occurs as white crystals or crystalline powder. It is odorless, and has a bitter taste.

It is freely soluble in acetic acid (100), sparingly soluble in water and in methanol, slightly soluble in ethanol (95), in chloroform and in isopropylamine, and practically insoluble in acetic anhydride and in diethyl ether.

It is gradually colored by light.

Melting point: about 260°C (with decomposition, after drying).

**Identification (1)** To 5 mL of a solution of Clozapramine Hydrochloride Hydrate (1 in 2500) add 1 mL of nitric acid: a blue color develops at first, and rapidly changes to deep blue, and then changes to green to yellow-green.

(2) Determine the absorption spectrum of a solution of Clozapramine Hydrochloride Hydrate in methanol (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>., and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Clozapramine Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the

Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Dissolve 0.1 g of Clozapramine Hydrochloride Hydrate in 10 mL of water by warming, and after cooling, add 2 mL of ammonia TS, and filter. Acidify the filtrate with dilute nitric acid: the solution responds to the Qualitative Tests <1.09> (2) for chloride.

**Purity (1)** Sulfate <1.14>—Dissolve 0.5 g of Clozapramine Hydrochloride Hydrate in 40 mL of water by warming, after cooling, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Clozapramine Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.10 g of Clozapramine Hydrochloride Hydrate in 10 mL of a mixture of chloroform and isopropylamine (99:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and isopropylamine (99:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of diethyl ether, ethyl acetate, methanol and ammonia solution (28) (100:70:40:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> 2.0 – 3.5% (0.5 g, in vacuum at a pressure not exceeding 0.67 kPa, phosphorus (V) oxide, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Clozapramine Hydrochloride Hydrate, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100) (6:1), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 27.70 mg of  $C_{28}H_{37}ClN_4O \cdot 2HCl$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Clofedanol Hydrochloride

クロフェダノール塩酸塩

$C_{17}H_{20}ClNO \cdot HCl$ : 326.26  
(1*S*)-1-(2-Chlorophenyl)-3-dimethylamino-1-phenylpropan-1-ol monohydrochloride [511-13-7]

Clofedanol Hydrochloride, when dried, contains not less than 98.5% of  $C_{17}H_{20}ClNO \cdot HCl$ .

**Description** Clofedanol Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in methanol, in ethanol (95) and in acetic acid (100), sparingly soluble in water, and practically insoluble in diethyl ether.

A solution of Clofedanol Hydrochloride in methanol (1 in 20) does not show optical rotation.

Melting point: about 190°C (after drying, with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Clofedanol Hydrochloride in 0.01 mol/L hydrochloric acid TS (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clofedanol Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Clofedanol Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> for chloride.

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Clofedanol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 0.05 g of Clofedanol Hydrochloride in 25 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 3  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of all peaks other than clofedanol from the sample solution is not larger than the peak area of clofedanol from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 4 mm in inside di-

ameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.34 g of potassium methanesulfonate in diluted phosphoric acid (1 in 1000) to make 1000 mL, and to 650 mL of this solution add 350 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of clofedanol is about 9 minutes.

Selection of column: Dissolve 0.01 g each of Clofedanol Hydrochloride and ethyl parahydroxybenzoate in methanol to make 100 mL. Proceed with 3  $\mu\text{L}$  of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of clofedanol and ethyl parahydroxybenzoate in this order with the resolution of these peaks being not less than 4.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of clofedanol obtained from 3  $\mu\text{L}$  of the standard solution composes between 20% and 50% of the full scale.

Time span of measurement: About three times as long as the retention time of clofedanol beginning after the solvent peak.

**Loss on drying** <2.41> Not more than 2.0% (1 g, in vacuum, silica gel, 80°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Clofedanol Hydrochloride, previously dried, dissolve in 15 mL of acetic acid (100), add 35 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 32.63 mg of  $\text{C}_{17}\text{H}_{20}\text{ClNO}_2\text{HCl}$

**Containers and storage** Containers—Tight containers.

## Clofibrate

クロフィブラート

$\text{C}_{12}\text{H}_{15}\text{ClO}_3$ : 242.70

Ethyl 2-(4-chlorophenoxy)-2-methylpropanoate  
[637-07-0]

Clofibrate, calculated on the anhydrous basis, contains not less than 98.0% of  $\text{C}_{12}\text{H}_{15}\text{ClO}_3$ .

**Description** Clofibrate occurs as a colorless or light yellow, clear, oily liquid. It has a characteristic odor and taste, which is bitter at first, and subsequently sweet.

It is miscible with methanol, with ethanol (95), with ethanol (99.5), with diethyl ether and with hexane, and practically insoluble in water.

It is gradually decomposed by light.

**Identification (1)** Determine the absorption spectrum of a solution of Clofibrate in ethanol (99.5) (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1 or the spectrum of a solution of Clofibrate Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Clofibrate in ethanol (99.5) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 2 or the spectrum of a solution of Clofibrate Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clofibrate as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Clofibrate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Refractive index** <2.45>  $n_D^{20}$ : 1.500 – 1.505

**Specific gravity** <2.56>  $d_{20}^{20}$ : 1.137 – 1.144

**Purity (1) Acidity**—Dissolve 2.0 g of Clofibrate in 100 mL of neutralized ethanol, and add 1 drop of phenolphthalein TS and 0.20 mL of 0.1 mol/L sodium hydroxide VS: the solution is red in color.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Clofibrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—To 5.0 g of Clofibrate add 20 mL of nitric acid and 5 mL of sulfuric acid, and heat until white fumes are evolved. After cooling, if necessary, add further 5 mL of nitric acid, heat until white fumes are evolved, and repeat this procedure until the solution is colorless to light yellow. After cooling, add 15 mL of saturated ammonium oxalate solution, and heat again until white fumes are evolved. Cool, add water to make 25 mL, use 5 mL of this solution as the test solution, and perform the test.

Color standard: Prepare a solution according to the above procedure without using Clofibrate as the blank. Transfer 5 mL of the solution to a generator bottle, add 2.0 mL of Standard Arsenic Solution, and then proceed as directed in the test solution (not more than 20 ppm).

(4) *p*-Chlorophenol—To 1.0 g of Clofibrate add exactly 1 mL of the internal standard solution, then add the mobile phase to make 5 mL, and use this solution as the sample solution. Separately, dissolve 0.010 g of 4-chlorophenol in a mixture of hexane and 2-propanol (9:1) to make exactly 100 mL. Pipet 10 mL of this solution, and add a mixture of hexane and 2-propanol (9:1) to make exactly 50 mL. Pipet 6 mL of this solution, add exactly 4 mL of the internal standard solution, then add the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of 4-chlorophenol to that of the internal standard:  $Q_T$  is not greater than  $Q_S$ .

**Internal standard solution**—A solution of 4-ethoxyphenol in

the mobile phase (1 in 30,000).

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 275 nm).

**Column:** A stainless steel column about 4 mm in inside diameter and about 30 cm in length, packed with cyanopropyl-silanized silica gel for liquid chromatography (5 to 10  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of hexane, 2-propanol and acetic acid (100) (1970:30:1).

**Flow rate:** Adjust the flow rate so that the retention time of clofibrate is about 2 minutes.

**Selection of column:** Dissolve 10.0 g of clofibrate, 6 mg of 4-chlorophenol and 6 mg of 4-ethoxyphenol in 1000 mL of hexane. Proceed with 20  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of clofibrate, 4-chlorophenol and 4-ethoxyphenol in this order, with the resolution between the peaks of clofibrate and 4-chlorophenol is not less than 5, and with the resolution between the peaks of 4-chlorophenol and 4-ethoxyphenol is not less than 2.0.

**Water** <2.48> Not more than 0.2% (1 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Clofibrate, add exactly 50 mL of 0.1 mol/L potassium hydroxide-ethanol VS, and heat in a water bath under a reflux condenser with a carbon dioxide absorbing tube (soda-lime) for 2 hours with frequent shaking. Cool, and titrate <2.50> immediately the excess potassium hydroxide with 0.1 mol/L hydrochloric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS  
= 24.27 mg of C<sub>12</sub>H<sub>15</sub>ClO<sub>3</sub>

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Clofibrate Capsules

クロフィブラートカプセル

Clofibrate Capsules contain not less than 93% and not more than 107% of the labeled amount of clofibrate (C<sub>12</sub>H<sub>15</sub>ClO<sub>3</sub>: 242.70).

**Method of preparation** Prepare as directed under Capsules, with Clofibrate.

**Identification** Cut and open Clofibrate Capsules, and use the contents as the sample. Determine the absorption spectrum of a solution of the sample in ethanol (99.5) (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 278 nm and 282 nm, and it exhibits a maximum between 224 nm and 228 nm after diluting this solution 10 times with ethanol (99.5)

**Purity** *p*-Chlorophenol—Cut and open not less than 20 Clofibrate Capsules, and proceed with 1.0 g of the well-mixed contents as directed in the Purity (4) under Clofibrate.

**Assay** Weigh accurately not less than 20 Clofibrate Capsules, cut and open the capsules, rinse the inside of the capsules with a small amount of diethyl ether after taking out the contents, evaporate the diethyl ether by allowing the capsules to stand at room temperature, and weigh the capsules accurately. Weigh accurately an amount of the contents, equivalent to about 0.1 g of clofibrate (C<sub>12</sub>H<sub>15</sub>ClO<sub>3</sub>), dissolve in acetonitrile to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of Clofibrate Reference Standard, proceed in the same manner as directed for the sample solution, and use the solution so obtained as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of clofibrate to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of clofibrate (C}_{12}\text{H}_{15}\text{ClO}_3) \\ &= W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Clofibrate Reference Standard, calculated on the anhydrous basis

**Internal standard solution—**A solution of ibuprofen in the mobile phase (1 in 100).

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 275 nm).

**Column:** A stainless steel column about 4 mm in inside diameter and about 30 cm in length, packed with octadecyl-silanized silica gel for liquid chromatography (5 to 10  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of acetonitrile and diluted phosphoric acid (1 in 1000) (3:2).

**Flow rate:** Adjust the flow rate so that the retention time of clofibrate is about 10 minutes.

**Selection of column:** Dissolve 0.05 g of clofibrate and 0.3 g of ibuprofen in 50 mL of acetonitrile. Proceed with 10  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of ibuprofen and clofibrate in this order with the resolution between these peaks being not less than 6.

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Clomifene Citrate

クロミフェンクエン酸塩

C<sub>26</sub>H<sub>28</sub>ClNO<sub>7</sub>: 598.08

2-[4-(2-Chloro-1,2-diphenylvinyl)phenoxy]-*N,N*-

diethylethylamine monocitrate [50-41-9]

Clomifene Citrate, when dried, contains not less than 98.0% of  $C_{26}H_{28}ClNO \cdot C_6H_8O_7$ .

**Description** Clomifene Citrate occurs as a white to pale yellowish white powder. It is odorless.

It is freely soluble in methanol and in acetic acid (100), sparingly soluble in ethanol (95), and practically insoluble in diethyl ether.

It gradually changes in color by light.

Melting point: about 115°C

**Identification (1)** To 2 mL of a solution of Clomifene Citrate in methanol (1 in 200) add 2 mL of Reinecke salt TS: a light red precipitate is produced.

**(2)** Determine the absorption spectrum of a solution of Clomifene Citrate in 0.1 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Clomifene Citrate Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(3)** A solution of Clomifene Citrate in methanol (1 in 200) responds to the Qualitative Tests <1.09> (1) and (2) for citrate salt.

**Purity (1)** Clarity and color of solution—A solution of 1.0 g of Clomifene Citrate in 30 mL of methanol is clear and colorless.

**(2)** Heavy metals <1.07>—Proceed with 2.0 g of Clomifene Citrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Loss on drying <2.41>** Not more than 1.0% (1 g, in vacuum, phosphorus (V) oxide, 3 hours).

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Isomer ratio** To 0.10 g of Clomifene Citrate add 10 mL of water and 1 mL of sodium hydroxide TS, and extract with three 15-mL portions of diethyl ether. Wash the combined diethyl ether extracts with 20 mL of water, add 10 g of anhydrous sodium sulfate to the combined diethyl ether extracts, shake for 1 minute, filter, and evaporate the diethyl ether of the filtrate. Dissolve the residue in 10 mL of chloroform, and use this solution as the sample solution. Perform the test with 2  $\mu$ L of the sample solution as directed under Gas Chromatography <2.02> according to the following conditions. Determine the areas of two adjacent peaks,  $A_a$  and  $A_b$ , having retention times of about 20 minutes, where  $A_a$  is the peak area of shorter retention time and  $A_b$  is the peak area of longer retention time:  $A_b/(A_a + A_b)$  is between 0.3 and 0.5.

**Operating conditions—**

Detector: A hydrogen flame-ionization detector.

Column: A column 3 mm in inside diameter and 1 m in length, having methylsilicone polymer coated at the ratio of 1% on siliceous earth for gas chromatography (125 to 150  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 195°C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of the first peak of clomifene citrate is about 20 minutes.

**System suitability—**

System performance: When the procedure is run with 2  $\mu$ L of the sample solution under the above operating conditions, the resolution between the two peaks is not less than 1.3.

System repeatability: When the test is repeated 5 times with 2  $\mu$ L of the sample solution under the above operating conditions, the relative standard deviation of  $A_b/(A_a + A_b)$  is not more than 5.0%.

**Assay** Weigh accurately about 1 g of Clomifene Citrate, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

= 59.81 mg of  $C_{26}H_{28}ClNO \cdot C_6H_8O_7$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Clomifene Citrate Tablets

クロミフェンクエン酸塩錠

Clomifene Citrate Tablets contain not less than 93% and not more than 107% of the labeled amount of the clomifene citrate ( $C_{26}H_{28}ClNO \cdot C_6H_8O_7$ ; 598.08).

**Method of preparation** Prepare as directed under Tablets, with Clomifene Citrate.

**Identification (1)** Weigh a portion of powdered Clomifene Citrate Tablets, equivalent to 1 g of Clomifene Citrate according to the labeled amount, shake vigorously with 100 mL of chloroform, and filter. Concentrate the filtrate on a water bath, allow to stand at room temperature, collect the crystals formed by filtration, and wash with a small quantity of chloroform. Proceed with the crystals as directed in the Identification (1) and (3) under Clomifene Citrate.

**(2)** Determine the absorption spectrum of a solution of the crystals obtained in (1) in 0.1 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 233 nm and 237 nm, and between 290 nm and 294 nm.

**Assay** Weigh accurately, and powder not less than 20 Clomifene Citrate Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of clomifene citrate ( $C_{26}H_{28}ClNO \cdot C_6H_8O_7$ ), add 50 mL of methanol, shake for 10 minutes, and add methanol to make exactly 100 mL. Centrifuge a portion of this solution, pipet 4 mL of the supernatant liquid, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Clomifene Citrate Reference Standard, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 3 hours, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, and dilute with methanol to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and the standard solution, respectively, at 295 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Amount (mg) of clomifene citrate ( $C_{26}H_{28}ClNO \cdot C_6H_8O_7$ )

$$= W_S \times (A_T/A_S)$$

$W_S$ : Amount (mg) of Clomifene Citrate Reference Standard

**Containers and storage** Containers—Tight containers.

## Clomipramine Hydrochloride

クロミプラミン塩酸塩

$C_{19}H_{23}ClN_2 \cdot HCl$ : 351.31

3-(3-Chloro-10,11-dihydro-5*H*-dibenz[*b,f*]azepin-5-yl)-*N,N*-dimethylpropylamine monohydrochloride [17321-77-6]

Clomipramine Hydrochloride, when dried, contains not less than 98.5% of  $C_{19}H_{23}ClN_2 \cdot HCl$ .

**Description** Clomipramine Hydrochloride occurs as a white to pale yellow, crystalline powder. It is odorless.

It is very soluble in acetic acid (100), freely soluble in water, in methanol and in chloroform, soluble in ethanol (95), sparingly soluble in acetic anhydride, slightly soluble in acetone, and practically insoluble in ethyl acetate and in diethyl ether.

**Identification (1)** Dissolve 3 mg of Clomipramine Hydrochloride in 1 mL of nitric acid: a deep blue color develops.

(2) Determine the absorption spectrum of a solution of Clomipramine Hydrochloride in 0.1 mol/L hydrochloric acid TS (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Take 1 g of Clomipramine Hydrochloride in a separator, dissolve in 10 mL of water, add 5 mL of sodium hydroxide TS, and extract with two 30-mL portions of diethyl ether [the water layer is used for Identification (4)]. Combine the diethyl ether extracts, add 20 mL of water, and shake. Take diethyl ether layer, dry with a small portion of anhydrous sodium sulfate, and filter. Evaporate the combined extracts by warming on a water bath, and proceed the test with the residue as directed under Flame Coloration Test <1.04> (2): a green color appears.

(4) The solution neutralized by adding dilute nitric acid to the water layer obtained in (3) responds to the Qualitative Tests <1.09> for chloride.

**pH** <2.54> Dissolve 1.0 g of Clomipramine Hydrochloride in 10 mL of water: the pH of this solution is between 3.5 and 5.0.

**Melting point** <2.60> 192 – 196°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of

Clomipramine Hydrochloride in 10 mL of water: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Clomipramine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Clomipramine Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.20 g of Clomipramine Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Separately, weigh 20 mg of Imipramine Hydrochloride, dissolve in methanol to make exactly 100 mL, and use this solution as the standard solution (1). Then pipet 1 mL of the sample solution, and add methanol to make exactly 50 mL. Pipet 5 mL of the solution, add methanol to make exactly 50 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetone and ammonia solution (28) (15:5:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly potassium dichromate-sulfuric acid TS on the plate: the spot from the sample solution, corresponding to that from the standard solution (1), is not more intense than the spot from the standard solution (1). Each of the spots other than the principal spot and the above spot from the sample solution is not more intense than the spot from the standard solution (2).

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Clomipramine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 35.13 mg of  $C_{19}H_{23}ClN_2 \cdot HCl$

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Clonazepam

クロナゼパム

$C_{15}H_{10}ClN_3O_3$ : 315.71

5-(2-Chlorophenyl)-7-nitro-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one [1622-61-3]

Clonazepam, when dried, contains not less than 99.0% of  $C_{15}H_{10}ClN_3O_3$ .

**Description** Clonazepam occurs as white to light yellow, crystals or crystalline powder.

It is sparingly soluble in acetic anhydride and in acetone, slightly soluble in methanol and in ethanol (95), very slightly soluble in diethyl ether, and practically insoluble in water.

It is gradually colored by light.

Melting point: about 240°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Clonazepam in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clonazepam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Clonazepam as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Purity (1)** Chloride <1.03>—To 1.0 g of Clonazepam add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. Discard the first 20 mL portion of the filtrate, take the subsequent 20 mL portion of the filtrate, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution, and perform the test. Prepare the control solution as follows: to 0.25 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.022%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Clonazepam according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.25 g of Clonazepam in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 100 mL, then pipet 1 mL of this solution, add acetone to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of nitromethane and acetone (10:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.30% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Clonazepam, previously dried, dissolve in 70 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 31.57 mg of  $C_{15}H_{10}ClN_3O_3$

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Clonidine Hydrochloride

クロニジン塩酸塩

$C_9H_9Cl_2N_3 \cdot HCl$ : 266.55

2-(2,6-Dichlorophenylimino)imidazolidine  
monohydrochloride [4205-91-8]

Clonidine Hydrochloride, when dried, contains not less than 99.0% of  $C_9H_9Cl_2N_3 \cdot HCl$ .

**Description** Clonidine Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in methanol, soluble in water and in ethanol (95), slightly soluble in acetic acid (100), and practically insoluble in acetic anhydride and in diethyl ether.

**Identification (1)** To 5 mL of a solution of Clonidine Hydrochloride (1 in 1000) add 6 drops of Dragendorff's TS: an orange precipitate is formed.

(2) Determine the absorption spectrum of a solution of Clonidine Hydrochloride in 0.01 mol/L hydrochloric acid TS (3 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Clonidine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Clonidine Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**pH** <2.54> Dissolve 1.0 g of Clonidine Hydrochloride in 20 mL of water: the pH of this solution is between 4.0 and 5.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Clonidine Hydrochloride in 20 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Clonidine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 0.5 g of Clonidine Hydrochloride according to Method 3, and perform the test (not more than 4 ppm).

(4) Related substances—Dissolve 0.20 g of Clonidine Hydrochloride in 2 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 1 mL and 2 mL

of this solution, to each add methanol to make exactly 20 mL, and use these solutions as the standard solution (1) and the standard solution (2), respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, 1,4-dioxane, ethanol (99.5) and ammonia solution (28) (10:8:2:1) to a distance of about 12 cm, air-dry the plate, and then dry at 100°C for 1 hour. Spray evenly sodium hypochlorite TS on the plate, air-dry the plate for 15 minutes, and then spray evenly potassium iodide starch TS on the plate: the spots other than the principal spot and the spot of the starting point from the sample solution are not more intense than the spot from the standard solution (2), and the numbers of spots other than the principal spot and the spot of the starting point, which are more intense than the spot from the standard solution (1), are not more than 3.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Cloperastine Hydrochloride, previously dried, and dissolve in 30 mL of acetic acid (100) by warming. After cooling, add 70 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 26.66 mg of  $C_9H_9Cl_2N_3.HCl$

**Containers and storage** Containers—Tight containers.

## Cloperastine Hydrochloride

クロペラスチン塩酸塩

$C_{20}H_{24}ClNO.HCl$ : 366.32  
1-{2-[(*RS*)-(4-Chlorophenyl)phenylmethoxy]ethyl}piperidine monohydrochloride [14984-68-0]

Cloperastine Hydrochloride, when dried, contains not less than 98.5% of  $C_{20}H_{24}ClNO.HCl$ .

**Description** Cloperastine Hydrochloride occurs as white, crystals or crystalline powder.

It is very soluble in water, in methanol, in ethanol (95) and in acetic acid (100), and soluble in acetic anhydride.

A solution of Cloperastine Hydrochloride (1 in 10) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Cloperastine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths.

Separately, determine the absorption spectrum of a solution of Cloperastine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 62,500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cloperastine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Shake 10 mL of a solution of Cloperastine Hydrochloride (1 in 100) with 2 mL of ammonia TS and 20 mL of diethyl ether, separate the water layer, wash the water layer with 20 mL of diethyl ether, and filter. Acidify the filtrate with dilute nitric acid: the solution responds to the Qualitative Tests <1.09> for chloride.

**Melting point** <2.60> 148 – 152°C

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Cloperastine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 40 mg of Cloperastine Hydrochloride in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area of both solutions by the automatic integration method: The areas of two peaks corresponding to the relative retention times about 0.8 and 3.0 to the retention time of cloperastine obtained from the sample solution are not larger than the peak area from the standard solution, respectively, and the area of the peak corresponding to the relative retention time about 2.0 to cloperastine is not larger than 5/3 of the peak area from the standard solution, and the areas of the peaks other than cloperastine and other than the peaks mentioned above are all not larger than 3/5 of the peak area from the standard solution. The total area of these peaks is not larger than 2 times of the peak area from the standard solution.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 222 nm).

**Column:** A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of methanol, 0.1 mol/L monobasic potassium phosphate TS and perchloric acid (500:250:1).

**Flow rate:** Adjust the flow rate so that the retention time of cloperastine is about 7 minutes.

**Selection of column:** Dissolve 0.03 g of Cloperastine

Hydrochloride and 0.04 g of benzophenone in 100 mL of the mobile phase. To 2.0 mL of this solution add the mobile phase to make 50 mL. Perform the test with 20  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of cloperastine and benzophenone in this order with the resolution between these peaks being not less than 6.

**Detection sensitivity:** Adjust the detection sensitivity so that the peak height of cloperastine obtained from 20  $\mu$ L of the standard solution is about 30% of the full scale.

**Time span of measurement:** About 4 times as long as the retention time of cloperastine, beginning after the solvent peak.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Cloperastine Hydrochloride, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L perchloric acid VS} \\ = 36.63 \text{ mg of } C_{20}H_{24}ClNO.HCl \end{aligned}$$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Clotiazepam

クロチアゼパム

$C_{16}H_{15}ClN_2OS$ : 318.82

5-(2-Chlorophenyl)-7-ethyl-1-methyl-1,3-dihydro-2H-thieno[2,3-e][1,4]-diazepin-2-one [33671-46-4]

Clotiazepam, when dried, contains not less than 98.5% of  $C_{16}H_{15}ClN_2OS$ .

**Description** Clotiazepam occurs as white to light yellowish white crystals or crystalline powder. It is odorless, and has a slightly bitter taste.

It is very soluble in chloroform, freely soluble in methanol, in ethanol (95), in acetone, in acetic acid (100) and in ethyl acetate, soluble in diethyl ether, and practically insoluble in water.

It dissolves in 0.1 mol/L hydrochloric acid TS.

It is gradually colored by light.

**Identification** (1) Dissolve 0.01 g of Clotiazepam in 3 mL of sulfuric acid: the solution shows a light yellow fluorescence under ultraviolet light (main wavelength: 365 nm).

(2) Determine the absorption spectrum of a solution of Clotiazepam in 0.1 mol/L hydrochloric acid TS (1 in

100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Prepare the test solution with 0.01 g of Clotiazepam as directed under Oxygen Flask Combustion Method <1.06>, using 10 mL of diluted hydrogen peroxide (30) (1 in 5) as the absorbing liquid. Apply a small amount of water to the upper part of the Apparatus A, pull out C carefully, wash C, B and the inner side of A with 15 mL of methanol, and use the obtained solution as the test solution. Add 0.5 mL of dilute nitric acid to 15 mL of the test solution: this solution responds to the Qualitative Tests <1.09> (2) for chloride. The remaining test solution responds to the Qualitative Tests <1.09> (1) for sulfate.

**Melting point** <2.60> 106 – 109°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Clotiazepam in 10 mL of ethanol (95): the solution is clear and is not more colored than the following control solution.

Control solution: To 5 mL of Matching Fluid C add 0.01 mol/L hydrochloric acid TS to make 10 mL.

(2) Chloride <1.03>—To 1.0 g of Clotiazepam add 50 mL of water, shake for 30 minutes, and filter. To 30 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.015%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Clotiazepam according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Clotiazepam, according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.25 g of Clotiazepam in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 20 mL, pipet 2 mL of this solution, add acetone to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and acetone (5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 80°C, 3 hours).

**Residue on ignition** <2.44> not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Clotiazepam, previously dried, dissolve in 80 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid (potentiometric titration). Perform a blank determination in, and make any necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L perchloric acid VS} \\ = 31.88 \text{ mg of } C_{16}H_{15}ClN_2OS \end{aligned}$$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Clotrimazole

クロトリマゾール

$C_{22}H_{17}ClN_2$ : 344.84  
1-[(2-Chlorophenyl)(diphenyl)methyl]-1H-imidazole  
[23593-75-1]

Clotrimazole, when dried, contains not less than 98.0% of  $C_{22}H_{17}ClN_2$ .

**Description** Clotrimazole occurs as a white, crystalline powder. It is odorless and tasteless.

It is freely soluble in dichloromethane and in acetic acid (100), soluble in *N,N*-dimethylformamide, in methanol and in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water.

**Identification** (1) To 0.1 g of Clotrimazole add 10 mL of 5 mol/L hydrochloric acid TS, dissolve by heating, and cool. To this solution add 3 drops of Reinecke salt TS: a light red precipitate is produced.

(2) Determine the absorption spectrum of a solution of Clotrimazole in methanol (1 in 5000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Clotrimazole, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Perform the test with Clotrimazole as directed under Flame Coloration Test (2) <1.04>: a green color appears.

**Melting point** <2.60> 142 – 145°C

**Purity** (1) Clarity and color of solution—Dissolve 0.5 g of Clotrimazole in 10 mL of dichloromethane: the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 1.0 g of Clotrimazole in 40 mL of *N,N*-dimethylformamide, add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.60 mL of 0.01 mol/L hydrochloric acid VS, 40 mL of *N,N*-dimethylformamide, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.021%).

(3) Sulfate <1.14>—Dissolve 0.5 g of Clotrimazole in 10 mL of methanol, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.05 mL of 0.005 mol/L sulfuric acid VS, 10 mL of

methanol, 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.048%).

(4) Heavy metals <1.07>—Proceed with 2.0 g of Clotrimazole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Arsenic <1.11>—Prepare the test solution with 1.0 g of Clotrimazole according to Method 3, and perform the test (not more than 2 ppm).

(6) Imidazole—Dissolve 0.10 g of Clotrimazole in exactly 10 mL of dichloromethane, and use this solution as the sample solution. Separately, dissolve 25 mg of imidazole for thin-layer chromatography in dichloromethane to make exactly 50 mL. Pipet 5 mL of this solution, add dichloromethane to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and chloroform (3:2) to a distance of about 10 cm, and air-dry the plate. Spray evenly sodium hydrochloride TS on the plate, and air-dry the plate for 15 minutes, then spray evenly potassium iodide-starch TS on the plate: the spot from the sample solution, corresponding to that from the standard solution, is not more intense than that from the standard solution.

(7) (2-Chlorophenyl)-diphenylmethanol—Dissolve 0.20 g of Clotrimazole in exactly 10 mL of dichloromethane, and use this solution as the sample solution. Separately, dissolve 0.010 g of (2-chlorophenyl)-diphenylmethanol for thin-layer chromatography in dichloromethane to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and ammonia solution (28) (50:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot from the sample solution, corresponding to that from the standard solution, is not more intense than that from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.35 g of Clotrimazole, previously dried, and dissolve in 80 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 34.48 mg of  $C_{22}H_{17}ClN_2$

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Cloxacillin Sodium Hydrate

クロキサシリンナトリウム水和物

$C_{19}H_{17}ClN_3NaO_5S \cdot H_2O$ : 475.88

Monosodium (2*S*,5*R*,6*R*)-6-[[3-(2-chlorophenyl)-5-methylisoxazole-4-carbonyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrate [7081-44-9]

Cloxacillin Sodium Hydrate contains not less than 900  $\mu$ g (potency) and not more than 960  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Cloxacillin Sodium Hydrate is expressed as mass (potency) of cloxacillin ( $C_{19}H_{18}ClN_3O_5S$ : 435.88).

**Description** Cloxacillin Sodium Hydrate occurs as white to light yellowish white, crystals or crystalline powder.

It is freely soluble in water, in *N,N*-dimethylformamide and in methanol, and sparingly soluble in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Cloxacillin Sodium Hydrate in methanol (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cloxacillin Sodium Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelength.

**(2)** Determine the infrared absorption spectrum of Cloxacillin Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cloxacillin Sodium Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** Cloxacillin Sodium Hydrate responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +163 – +171° (1 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cloxacillin Sodium Hydrate in 10 mL of water: the pH of the solution is between 5.5 and 7.5.

**Purity (1)** Clarity and color of solution—A solution obtained by dissolving 1.0 g of Cloxacillin Sodium Hydrate in 10 mL of water is clear and colorless to light yellow.

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of Cloxacillin Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Cloxacillin Sodium Hydrate according to Method 5, and perform the test (not more than 2 ppm).

**(4)** Related substances—Dissolve 50 mg of Cloxacillin

Sodium Hydrate in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than cloxacillin obtained from the sample solution is not more than the peak area of cloxacillin obtained from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 230 nm).

**Column:** A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 4.953 g of diammonium hydrogen phosphate in 700 mL of water, and add 250 mL of acetonitrile. Adjust the pH to 4.0 with phosphoric acid, and add water to make exactly 1000 mL.

**Flow rate:** Adjust the flow rate so that the retention time of cloxacillin is about 24 minutes.

**Time span of measurement:** About 3 times as long as the retention time of cloxacillin.

**System suitability—**

**Test for required detectability:** Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cloxacillin obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that obtained from the standard solution.

**System performance:** Weigh accurately about 50 mg of Cloxacillin Sodium Reference Standard, dissolve in a suitable amount of the mobile phase, add 5 mL of a solution of guaifenesin in the mobile phase (1 in 200), then add the mobile phase to make exactly 50 mL, and use this solution as the solution for system suitability test. When the procedure is run with 10  $\mu$ L of the solution for system suitability test under the above operating conditions, guaifenesin and cloxacillin are eluted in this order with the resolution between these peaks being not less than 25.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the ratios of the peak area of cloxacillin to that of guaifenesin is not more than 1.0%.

**Water** <2.48> 3.0 – 4.5% (0.2 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) Medium for test organism [5] under (1) Agar media for seed and base layer.

(iii) Standard solutions—Weigh accurately an amount of Cloxacillin Sodium Reference Standard equivalent to about 20 mg (potency), and dissolve in 0.05 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL. Take exactly a suitable amount of this solution, add 0.05 mol/L phos-

phate buffer solution, pH 7.0 to make solutions so that each mL contains 20  $\mu\text{g}$  (potency) and 5  $\mu\text{g}$  (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Cloxacillin Sodium Hydrate equivalent to about 20 mg (potency), and dissolve in 0.05 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL. Take exactly a suitable amount of the solution, add 0.05 mol/L phosphate buffer solution, pH 7.0 to make solutions so that each mL contains 20  $\mu\text{g}$  (potency) and 5  $\mu\text{g}$  (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Cloxazolam

クロキサゾラム

$\text{C}_{17}\text{H}_{14}\text{Cl}_2\text{N}_2\text{O}_2$ : 349.21  
(11*bRS*)-10-Chloro-11*b*-(2-chlorophenyl)-2,3,7,11*b*-tetrahydro[1,3]oxazolo[3,2-*d*][1,4]benzodiazepin-6(5*H*)-one [24166-13-0]

Cloxazolam, when dried, contains not less than 99.0% of  $\text{C}_{17}\text{H}_{14}\text{Cl}_2\text{N}_2\text{O}_2$ .

**Description** Cloxazolam occurs as white crystals or crystalline powder.

It is odorless and tasteless.

It is freely soluble in acetic acid (100), sparingly soluble in dichloromethane, slightly soluble in ethanol (99.5) and in diethyl ether, very slightly soluble in ethanol (95), and practically insoluble in water.

It dissolves in dilute hydrochloric acid.

It is gradually colored by light.

Melting point: about 200°C (with decomposition).

**Identification** (1) Dissolve 0.01 g of Cloxazolam in 10 mL of ethanol (99.5) by heating, and add 1 drop of hydrochloric acid: the solution shows a light yellow color and a yellow-green fluorescence under ultraviolet light (main wavelength: 365 nm). Add 1 mL of sodium hydroxide TS to this solution: the color and fluorescence of this solution disappear immediately.

(2) Dissolve 0.01 g of Cloxazolam in 5 mL of dilute hydrochloric acid by heating in a water bath for 10 minutes. After cooling, 1 mL of this solution responds to the Qualitative Tests <1.09> for primary aromatic amines.

(3) Place 2 g of Cloxazolam in a 200-mL flask, add 50 mL of ethanol (95) and 25 mL of sodium hydroxide TS, and boil under a reflux condenser for 4 hours. After cooling, neutralize with dilute hydrochloric acid, and extract with 30 mL of dichloromethane. Dehydrate with 3 g of anhydrous sodium sulfate, filter, and evaporate the dichloromethane of the filtrate. Dissolve the residue in 5 mL of methanol by heating

on a water bath, and cool immediately in an ice bath. Collect the crystals, and dry the crystals in vacuum at 60°C for 1 hour: it melts <2.60> between 87°C and 91°C.

(4) Determine the absorption spectrum of a solution of Cloxazolam in ethanol (99.5) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) Proceed with Cloxazolam as directed under Flame Coloration Test <1.04> (2), and perform the test: a green color appears.

**Absorbance** <2.24>  $E_{1\text{ cm}}^{1\%}$  (244 nm): 390 – 410 (after drying, 1 mg, ethanol (99.5), 100 mL).

**Purity** (1) Chloride <1.03>—To 1.0 g of Cloxazolam add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. To 25 mL of this filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cloxazolam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Place 1.0 g of Cloxazolam in a Kjeldahl flask, add 5 mL of sulfuric acid and 5 mL of nitric acid, and heat gently. Repeat the addition of 2 to 3 mL of nitric acid at times, and continue heating until a colorless to light yellow solution is obtained. After cooling, add 15 mL of saturated ammonium oxalate solution, and heat the solution until dense white fumes are evolved, and evaporate to a volume of 2 to 3 mL. After cooling, dilute with water to 10 mL, and perform the test with this solution as the test solution (not more than 2 ppm).

(4) Related substances—Dissolve 0.05 g of Cloxazolam in 10 mL of dichloromethane, and use this solution as the sample solution. Pipet 1 mL of this solution, add dichloromethane to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Immediately after air-drying, develop the plate with a mixture of toluene and acetone (5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than that from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Cloxazolam, previously dried, and dissolve in 50 mL of acetic acid (100). Titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue to blue-green (indicator: 2 drops of crystal violet TS). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS  
= 34.92 mg of  $\text{C}_{17}\text{H}_{14}\text{Cl}_2\text{N}_2\text{O}_2$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Cocaine Hydrochloride

コカイン塩酸塩

$C_{17}H_{21}NO_4 \cdot HCl$ : 339.81  
(1*R*,2*R*,3*S*,5*S*)-2-Methoxycarbonyl-8-methyl-8-azabicyclo[3.2.1]oct-3-yl benzoate monohydrochloride  
[53-21-4]

Cocaine Hydrochloride, when dried, contains not less than 98.0% of  $C_{17}H_{21}NO_4 \cdot HCl$ .

**Description** Cocaine Hydrochloride occurs as colorless crystals or a white crystalline powder.

It is very soluble in water, freely soluble in ethanol (95) and in acetic acid (100), slightly soluble in acetic anhydride, and practically insoluble in diethyl ether.

**Identification** (1) Determine the absorption spectrum of a solution of Cocaine Hydrochloride in 0.01 mol/L hydrochloric acid TS (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Cocaine Hydrochloride in 0.01 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cocaine Hydrochloride, previously dried, as directed in the potassium bromide disk method under the Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Cocaine Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> (2) for chloride.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-70 - -73^\circ$  (after drying, 0.5 g, water, 20 mL, 100 mm).

**Purity** (1) Acidity—Dissolve 0.5 g of Cocaine Hydrochloride in 10 mL of water, add 1 drop of methyl red TS, and neutralize with 0.01 mol/L sodium hydroxide VS: the consumed volume is not more than 1.0 mL.

(2) Cinnamyl cocaine—Dissolve 0.10 g of Cocaine Hydrochloride in 5 mL of water, and add 0.3 mL of diluted sulfuric acid (1 in 20) and 0.10 mL of 0.02 mol/L potassium permanganate VS: the red color does not disappear within 30 minutes.

(3) Isoatropyl cocaine—Dissolve 0.10 g of Cocaine Hydrochloride in 30 mL of water in a beaker. Transfer 5 mL of this solution to a test tube, add 1 drop of ammonia TS,

and mix. After the precipitate is coagulated, add 10 mL of water, and transfer the mixture to the former beaker, to which 30 mL of water has been added previously. Wash the test tube with 10 mL of water, combine the washings with the mixture in the beaker, add 3 drops of ammonia TS to the combined mixture, and mix gently: a crystalline precipitate is produced. Allow to stand for 1 hour: the supernatant liquid is clear.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 0.5 g of Cocaine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 33.98 mg of  $C_{17}H_{21}NO_4 \cdot HCl$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Coconut Oil

*Oleum Cocois*

ヤシ油

Coconut oil is the fixed oil obtained from the seeds of *Cocos nucifera* Linné (*Palmae*).

**Description** Coconut Oil is a white to light yellow mass or a colorless or light yellow, clear oil. It has a slight, characteristic odor and a mild taste.

It is freely soluble in diethyl ether and in petroleum ether. It is practically insoluble in water.

At a temperature below 15°C, it congeals to a hard and brittle solid.

Melting point: 20 – 28°C

**Acid value** <1.13> Not more than 0.2.

**Saponification value** <1.13> 246 – 264

**Unsaponifiable matter** <1.13> Not more than 1.0%.

**Iodine value** <1.13> 7 – 11

**Containers and storage** Containers—Tight containers.

## Codeine Phosphate Hydrate

コデインリン酸塩水和物

$C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ : 406.37  
(5*R*,6*S*)-4,5-Epoxy-3-methoxy-17-methyl-7,8-didehydromorphinan-6-ol monophosphate hemihydrate  
[41444-62-6]

Codeine Phosphate Hydrate contains not less than 98.0% of codeine phosphate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4$ : 397.36), calculated on the anhydrous basis.

**Description** Codeine Phosphate Hydrate occurs as white to yellowish white crystals or crystalline powder.

It is freely soluble in water and in acetic acid (100), slightly soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution of Codeine Phosphate Hydrate (1 in 10) is between 3.0 and 5.0.

It is affected by light.

**Identification (1)** Determine the absorption spectrum of a solution of Codeine Phosphate Hydrate (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Codeine Phosphate Hydrate, previously dried at 105°C for 4 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Codeine Phosphate Hydrate (1 in 20) responds to the Qualitative Tests <1.09> (1) for phosphate.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-98 - -102^\circ$  (0.4 g calculated on the anhydrous basis, water, 20 mL, 100 mm).

**Purity (1) Chloride** <1.03>—Perform the test with 0.5 g of Codeine Phosphate Hydrate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(2) **Sulfate** <1.14>—Perform the test with 0.20 g of Codeine Phosphate Hydrate. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.240%).

(3) **Related substances**—Dissolve 0.20 g of Codeine Phosphate Hydrate in 10 mL of a mixture of 0.01 mol/L hydrochloric acid TS and ethanol (99.5) (4:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of 0.01 mol/L hydrochloric acid TS and ethanol (99.5) (4:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography

<2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethanol (99.5), toluene, acetone and ammonia solution (28) (14:14:7:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Water** <2.48> 1.5 – 3.0% (0.5 g, direct titration).

**Assay** Dissolve about 0.5 g of Codeine Phosphate Hydrate, accurately weighed, in 70 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue to greenish blue (indicator: 3 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 39.74 mg of  $C_{18}H_{21}NO_3 \cdot H_3PO_4$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## 1% Codeine Phosphate Powder

コデインリン酸塩散 1%

10% Codeine Phosphate Powder contains not less than 0.90% and not more than 1.10% of codeine phosphate hydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ : 406.37).

### Method of preparation

Codeine Phosphate Hydrate	10 g
Lactose Hydrate	a sufficient quantity
To make 1000 g	

Prepare as directed under Powders, with the above ingredients.

**Identification** Determine the absorption spectrum of a solution of 1% Codeine Phosphate Powder (1 in 100) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 283 nm and 287 nm.

**Assay** Weigh accurately about 5 g of 1% Codeine Phosphate Powder, dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of codeine phosphate for assay (previously determine the water <2.48> in the same manner as Codeine Phosphate Hydrate), dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of codeine to that of the internal standard.

Amount (mg) of codeine phosphate Hydrate  
( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ )

$$= W_s \times (Q_T/Q_S) \times 1.0227$$

$W_s$ : Amount (mg) of codeine phosphate for assay, calculated on the anhydrous basis

**Internal standard solution**—A solution of etilefrine hydrochloride (3 in 10,000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 280 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran, and mix.

**Flow rate**: Adjust the flow rate so that the retention time of codeine is about 10 minutes.

**System suitability**—

**System performance**: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, codeine and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability**: When the test is repeated 5 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of codeine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## 10% Codeine Phosphate Powder

コデインリン酸塩散 10%

10% Codeine Phosphate Powder contains not less than 9.3% and not more than 10.7% of codeine phosphate Hydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ; 406.37).

**Method of preparation**

Codeine Phosphate Hydrate	100 g
Lactose Hydrate	a sufficient quantity
To make 1000 g	

Prepare as directed under Powders, with the above ingredients.

**Identification** Determine the absorption spectrum of a solution of 10% Codeine Phosphate Powder (1 in 1000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 283 nm and 287 nm.

**Assay** Weigh accurately about 2.5 g of 10% Codeine Phosphate Powder, dissolve in water to make exactly 100 mL, then pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution and water to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of codeine phosphate for assay (previ-

ously determine the water <2.48> in the same manner as Codeine Phosphate Hydrate), dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of codeine to that of the internal standard:

$$\begin{aligned} &\text{Amount (mg) of codeine phosphate Hydrate} \\ &(C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O) \\ &= W_s \times (Q_T/Q_S) \times 5 \times 1.0227 \end{aligned}$$

$W_s$ : Amount (mg) of codeine phosphate for assay, calculated on the anhydrous basis

**Internal standard solution**—A solution of etilefrine hydrochloride (3 in 10,000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 280 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran, and mix.

**Flow rate**: Adjust the flow rate so that the retention time of codeine is about 10 minutes.

**System suitability**—

**System performance**: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, codeine and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability**: When the test is repeated 5 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of codeine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Codeine Phosphate Tablets

コデインリン酸塩錠

Codeine Phosphate Tablets contain not less than 93% and not more than 107% of the labeled amount of codeine phosphate hydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ; 406.37)

**Method of preparation** Prepare as directed under Tablets, with Codeine Phosphate Hydrate.

**Identification** To a quantity of powdered Codeine Phosphate Tablets, equivalent to 0.1 g of Codeine Phosphate Hydrate according to the labeled amount, add 20 mL of water, shake, and filter. To 2 mL of the filtrate add water to make

100 mL, and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 283 nm and 287 nm.

**Assay** Weigh accurately and powder not less than 20 Codeine Phosphate Tablets. Weigh accurately a portion of the powder, equivalent to about 0.1 g of codeine phosphate hydrate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ), add 30 mL of water, shake, add 20 mL of diluted dilute sulfuric acid (1 in 20), treat the mixture with ultrasonic waves for 10 minutes, and add water to make exactly 100 mL. Filter the solution, then pipet 5 mL of the filtrate, add exactly 10 mL of the internal standard solution and water to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of codeine phosphate for assay (previously determine the water <2.48> in the same manner as Codeine Phosphate Hydrate), dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of codeine to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of codeine phosphate hydrate} \\ & (C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O) \\ & = W_S \times (Q_T/Q_S) \times 2 \times 1.0227 \end{aligned}$$

$W_S$ : Amount (mg) of codeine phosphate for assay, calculated on the anhydrous basis

**Internal standard solution**—A solution of etilefrine hydrochloride (3 in 10,000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 280 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran, and mix.

**Flow rate**: Adjust the flow rate so that the retention time of codeine is about 10 minutes.

**System suitability**—

**System performance**: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, codeine and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability**: When the test is repeated 5 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of codeine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Cod Liver Oil

肝油

Cod Liver Oil is the fatty oils obtained from fresh livers and pyloric appendages of *Gadus macrocephalus* Tilesius or *Theragra chalcogramma* Pallas (*Gadidae*).

Cod Liver Oil contains not less than 2000 Vitamin A Units and not more than 5000 Vitamin A Units per g.

**Description** Cod Liver Oil is a yellow to orange oily liquid. It has a characteristic, slightly fishy odor and a mild taste.

It is miscible with chloroform.

It is slightly soluble in ethanol (95), and practically insoluble in water.

It is decomposed by air or by light.

**Identification** Dissolve 0.1 g of Cod Liver Oil in 10 mL of chloroform, and to 1 mL of this solution add 3 mL of antimony (III) chloride TS: a blue color develops immediately, but the color fades rapidly.

**Specific gravity** <1.13>  $d_{20}^{20}$ : 0.918 – 0.928

**Acid value** <1.13> Not more than 1.7.

**Saponification value** <1.13> 180 – 192

**Unsaponifiable matter** <1.13> Not more than 3.0%.

**Iodine value** <1.13> 130 – 170

**Purity** Rancidity—No unpleasant odor of rancid oil is perceptible on warming Cod Liver Oil.

**Assay** Proceed with about 0.5 g of Cod Liver Oil, accurately weighed, as directed in Method 2 under the Vitamin A Determination <2.55>, and perform the test.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and almost well-filled, or under nitrogen atmosphere.

## Colchicine

コルヒチン

$C_{22}H_{25}NO_6$ : 399.44

*N*-[(7*S*)-(1,2,3,10-Tetramethoxy-9-oxo-5,6,7,9-tetrahydrobenzo[*a*]heptalen-7-yl)]acetamide [64-86-8]

Colchicine contains not less than 97.0% and not more than 102.0% of  $C_{22}H_{25}NO_6$ , calculated on the anhydrous basis and corrected by the amount of ethyl acetate.

**Description** Colchicine occurs as a yellowish white powder.

It is very soluble in methanol, freely soluble in *N,N*-dimethylformamide, in ethanol (95) and in acetic anhydride, and sparingly soluble in water.

It is colored by light.

**Identification (1)** Determine the absorption spectrum of a solution of Colchicine in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) To 1 g of potassium bromide for infrared absorption spectrum add 0.5 mL of a solution of Colchicine in methanol (1 in 50), grind thoroughly, and dry in vacuum at 80°C for 1 hour. Determine the infrared absorption spectrum of this powder as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-235$  –  $-250^\circ$  (0.1 g calculated on the anhydrous basis and corrected by the amount of ethyl acetate, ethanol (95), 10 mL, 100 mm).

**Purity (1)** Colchicine—Dissolve 0.10 g of Colchicine in 10 mL of water, and to 5 mL of this solution add 2 drops of iron (III) chloride TS: no definite green color develops.

(2) Chloroform and ethyl acetate—Weigh accurately about 0.6 g of Colchicine, dissolve in exactly 2 mL of the internal standard solution, add *N,N*-dimethylformamide to make 10 mL, and use this solution as the sample solution. Separately, weigh 0.30 g of chloroform using a 100-mL volumetric flask containing about 20 mL of *N,N*-dimethylformamide, and add *N,N*-dimethylformamide to make exactly 100 mL. Pipet 2 mL of this solution, add *N,N*-dimethylformamide to make exactly 200 mL, and use this solution as the standard solution (1). Separately, weigh accurately about 1.8 g of ethyl acetate using a 100-mL volumetric flask containing about 20 mL of *N,N*-dimethylformamide, and add *N,N*-dimethylformamide to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution and *N,N*-dimethylformamide to make 10 mL, and use this solution as the standard solution (2). Perform the test with 2  $\mu$ L each of the sample solution and standard solutions (1) and (2) as directed under Gas Chromatography <2.02> according to the following conditions: the peak area of chloroform is not more than that from the standard solution (1). Determine the ratios of the peak area of ethyl acetate to that of the internal standard,  $Q_T$  and  $Q_S$ , of the sample solution and standard solution (2), and calculate the amount of ethyl acetate by the following formula: the amount of ethyl acetate is not more than 6.0%.

$$\begin{aligned} \text{Amount (\%)} & \text{ of ethyl acetate (C}_4\text{H}_8\text{O}_2) \\ & = (W_S/W_T) \times (Q_T/Q_S) \times 2 \end{aligned}$$

$W_S$ : Amount (g) of ethyl acetate

$W_T$ : Amount (g) of the sample

**Internal standard solution**—A solution of 1-propanol in *N,N*-dimethylformamide (3 in 200)

**Operating conditions**—

Detector: A hydrogen flame-ionization detector

Column: A fused silica column 0.53 mm in inside diameter and 30 m in length, coated inside surface with polyethylene glycol 20 M for gas chromatography 1.0  $\mu$ m in thickness.

Column temperature: 60°C for 7 minutes, then up to 100°C at a rate of 40°C per minute if necessary, and hold at 100°C for 10 minutes.

Injection port temperature: A constant temperature of about 130°C

Detector temperature: A constant temperature of about 200°C

Carrier gas: Helium

Flow rate: Adjust the flow rate so that the retention time of ethyl acetate is about 3 minutes.

Split ratio: 1:20

**System suitability**—

Test for required detectability: Pipet 2 mL of the standard solution (2), and add *N,N*-dimethylformamide to make exactly 25 mL. Pipet 1 mL of this solution, and add *N,N*-dimethylformamide to make exactly 50 mL. Confirm that the peak area of ethyl acetate obtained from 2  $\mu$ L of this solution is equivalent to 0.11 to 0.21% of that obtained from 2  $\mu$ L of the standard solution (2).

System performance: To 1 mL of chloroform add *N,N*-dimethylformamide to make 10 mL. To 1 mL of this solution add 2 mL of ethyl acetate and *N,N*-dimethylformamide to make 100 mL. To 2 mL of this solution add 2 mL of the internal standard solution and *N,N*-dimethylformamide to make 10 mL. When the procedure is run with 2  $\mu$ L of this solution under the above operating conditions, ethyl acetate, chloroform and the internal standard are eluted in this order with the resolution between the peaks of chloroform and the internal standard being not less than 2.0.

System repeatability: When the test is repeated 3 times with 2  $\mu$ L of the standard solution (2) under the above operating conditions, the relative standard deviation of the ratio of the peak area of ethyl acetate to that of the internal standard is not more than 3.0%.

(3) Related substances Dissolve 60 mg of Colchicine in 100 mL of diluted methanol (1 in 2). Pipet 1 mL of this solution, add diluted methanol (1 in 2) to make exactly 100 mL, and use this solution as the sample solution. Perform the test with 20  $\mu$ L of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the total amount of the peaks other than colchicine by the area percentage method: not more than 5.0%.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To 450 mL of 0.05 mol/L potassium dihydrogen phosphate TS add methanol to make 1000 mL. Adjust the pH to 5.5 with diluted phosphoric acid (7 in 200).

Flow rate: Adjust the flow rate so that the retention time of colchicine is about 7 minutes.

Time span of measurement: About 2 times as long as the retention time of colchicine beginning after the solvent peak.

**System suitability**—

Test for required detectability: Pipet 1 mL of the sample solution, and add diluted methanol (1 in 2) to make exactly 50 mL. Confirm that the peak area of colchicine obtained

from 20  $\mu\text{L}$  of this solution is equivalent to 1.4 to 2.6% of that obtained from 20  $\mu\text{L}$  of the sample solution.

**System performance:** When the procedure is run with 20  $\mu\text{L}$  of the sample solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of colchicine are not less than 6000 and not more than 1.5, respectively.

**System repeatability:** When the test is repeated 6 times with 20  $\mu\text{L}$  of the sample solution under the above operating conditions, the relative standard deviation of the peak area of colchicine is not more than 2.0%.

**Water** <2.48> Not more than 2.0% (0.5 g, volumetric titration, back titration).

**Assay** Weigh accurately about 0.4 g of Colchicine, dissolve in 25 mL of acetic anhydride, and titrate <2.50> with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS  
= 19.97 mg of  $\text{C}_{22}\text{H}_{25}\text{NO}_6$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Colistin Sodium Methanesulfonate

コリスチンメタンスルホン酸ナトリウム

Colistin A Sodium Methanesulfonate : R = 6-Methyloctanoic acid  
Dbu = L- $\alpha, \gamma$ -Diaminobutyric acid  
R' =  $\text{SO}_3\text{Na}$

Colistin B Sodium Methanesulfonate : R = 6-Methylheptanoic acid  
Dbu = L- $\alpha, \gamma$ -Diaminobutyric acid  
R' =  $\text{SO}_3\text{Na}$

[8068-28-8, Colistin Sodium Methanesulfonate]

Colistin Sodium Methanesulfonate is the sodium salt of colistin derivatives, and is a mixture of colistin A sodium methanesulfonate and colistin B sodium methanesulfonate. It, when dried, contains not less than 11,500 Units per mg. The unit of Colistin Sodium Methanesulfonate is expressed as mass of colistin A (R = 6-methyloctanoic acid, R' = H;  $\text{C}_{53}\text{H}_{100}\text{N}_{16}\text{O}_{13}$ : 1169.46).

**Description** Colistin Sodium Methanesulfonate occurs as a white to light yellowish white powder.

It is freely soluble in water, and practically insoluble in ethanol (95).

**Identification** (1) Dissolve 20 mg of Colistin Sodium Methanesulfonate in 2 mL of water, add 0.5 mL of sodium hydroxide TS, and add 5 drops of copper (II) sulfate TS while shaking: a blue-purple color develops.

(2) Dissolve 40 mg of Colistin Sodium Methanesulfonate in 1 mL of 1 mol/L hydrochloric acid TS, and add 0.5 mL of dilute iodine TS: the color of iodine disappears.

(3) Determine the infrared absorption spectrum of

Colistin Sodium Methanesulfonate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Colistin Sodium Methanesulfonate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Colistin Sodium Methanesulfonate responds to the Qualitative Tests <1.09> (1) for sodium salt.

**pH** <2.54> Dissolve 0.1 g of Colistin Sodium Methanesulfonate in 10 mL of water, and allow to stand for 30 minutes: the pH of the solution is between 6.5 and 8.5.

**Purity** (1) Clarity and color of solution—Dissolve 0.16 g of Colistin Sodium Methanesulfonate in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Colistin Sodium Methanesulfonate according to Method 4, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Colistin Sodium Methanesulfonate according to Method 4, and perform the test (not more than 2 ppm).

(4) Free colistin—Dissolve 80 mg of Colistin Sodium Methanesulfonate in 3 mL of water, add 0.05 mL of a solution of silicotungstic acid 26-water (1 in 10), and immediately compare the solution with the reference suspension described under Test Methods for Plastic Containers <7.02>: the turbidity is not greater than that of the reference suspension (not more than 0.25%).

**Loss on drying** <2.41> Not more than 3.0% (0.1 g, reduced pressure, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Escherichia coli* NIHJ

(ii) Culture medium—To 10.0 g of peptone, 30.0 g of sodium chloride, 3.0 g of meat extract and 20.0 g of agar add 1000 mL of water, then add a suitable amount of sodium hydroxide TS so that the pH of the medium is being 6.5 to 6.6 after sterilization, sterile, and use this as the seeded agar medium and the agar medium for base layer.

(iii) Standard solutions—Weigh accurately an amount of Colistin Sodium Methanesulfonate Reference Standard, previously dried, dissolve in phosphate buffer solution, pH 6.0 to make a solution containing 100,000 Units per mL, and use this solution as the standard stock solution. Keep the standard stock solution at 10°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, and add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10,000 Units and 2500 Units, and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Colistin Sodium Methanesulfonate, previously dried, dissolve in phosphate buffer solution, pH 6.0 to make a solution containing about 100,000 Units per mL, and use this solution as the sample stock solution. Take exactly a suitable amount of the sample stock solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10,000 Units and 2500 Units, and use these solutions as the high con-

centration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Colistin Sulfate

コリスチン硫酸塩

Colistin A Sulfate C<sub>53</sub>H<sub>100</sub>N<sub>16</sub>O<sub>13</sub>·2½H<sub>2</sub>SO<sub>4</sub>: 1414.66

Colistin B Sulfate C<sub>52</sub>H<sub>98</sub>N<sub>16</sub>O<sub>13</sub>·2½H<sub>2</sub>SO<sub>4</sub>: 1400.63

[1264-72-8]

Colistin Sulfate is the sulfate of a mixture of peptide substances having antibacterial activity produced by the growth of *Bacillus polymyxa* var. *colistinus*.

It, when dried, contains not less than 16,000 units per mg. The potency of Colistin Sulfate is expressed as unit calculated from the amount of colistin A (C<sub>53</sub>H<sub>100</sub>N<sub>16</sub>O<sub>13</sub>; 1169.46). One unit of Colistin Sulfate is equivalent to 0.04 μg of colistin A (C<sub>53</sub>H<sub>100</sub>N<sub>16</sub>O<sub>13</sub>).

**Description** Colistin Sulfate occurs as a white to light yellowish white powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

It is hygroscopic.

**Identification (1)** Dissolve 20 mg of Colistin Sulfate in 2 mL of water, add 0.5 mL of sodium hydroxide TS, then add 5 drops of copper (II) sulfate TS while shaking: a purple color develops.

(2) Dissolve 50 mg of Colistin Sulfate in 10 mL of diluted hydrochloric acid (1 in 2). Transfer 1 mL of this solution in a tube for hydrolysis, seal, and heat at 135°C for 5 hours. After cooling, open the tube, and evaporate the content to dryness until the odor of hydrochloric acid is no more perceptible. Dissolve the residue in 0.5 mL of water, and use this solution as the sample solution. Separately, dissolve 20 mg each of L-leucine, L-threonine, phenylalanine and L-serine in 10 mL of water, and use these solutions as the standard solution (1), the standard solution (2), the standard solution (3) and the standard solution (4). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 1 μL each of the sample solution and standard solutions on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, acetic acid (100), water, pyridine and ethanol (99.5) (60:15:10:6:5) to a distance of about 10 cm, and dry the plate at 105°C for 10 minutes. Spray evenly ninhydrin TS on the plate, and heat at 110°C for 5 minutes: three principal spots are obtained from the sample solution, the R<sub>f</sub> values of two spots of them are the same with those of the corresponding

spots obtained from the standard solution (1) and the standard solution (2), and the R<sub>f</sub> value of the rest principal spot is about 0.1. No spot is observed at the position corresponding to the spots obtained from the standard solution (3) and the standard solution (4).

(3) A solution of Colistin Sulfate (1 in 20) responds to the Qualitative Tests <1.09> (1) for sulfate.

**Optical rotation** <2.49> [α]<sub>D</sub><sup>20</sup>: -63 - -73° (1.25 g, after drying, water, 25 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 0.10 g of Colistin Sulfate in 10 mL of water is between 4.0 and 6.0.

**Purity (1)** Sulfuric acid—Weigh accurately about 0.25 g of previously dried Colistin Sulfate, dissolve in a suitable amount of water, adjust the pH to 11 with ammonia solution (28), and add water to make 100 mL. To this solution add exactly 10 mL of 0.1 mol/L barium chloride VS and 50 mL of ethanol (99.5), and titrate with <2.50> 0.1 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the blue-purple color of the solution disappears (indicator: 0.5 mg of phthalein purple): the amount of sulfuric acid (SO<sub>4</sub>) is 16.0 to 18.0%.

Each mL of 0.1 mol/L barium chloride VS  
= 9.606 mg of SO<sub>4</sub>

(2) Related substances—Dissolve 50 mg of Colistin Sulfate in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 1 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of pyridine, 1-butanol, water and acetic acid (100) (6:5:4:1) to a distance of about 10 cm, and dry the plate at 100°C for 30 minutes. Spray evenly ninhydrin-butanol TS on the plate, and heat at 100°C for about 20 minutes: the spot other than the principal spot from the sample solution is not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 6.0% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 1.0% (1 g).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Escherichia coli* NIHJ

(ii) Culture medium—Dissolve 10.0 g of peptone, 30.0 g of sodium chloride, 3.0 g of meat extract and 15.0 g of agar in 1000 mL of water, adjust the pH with sodium hydroxide TS so that the solution will be 6.5 to 6.6 after sterilization, and use as the agar media for seed layer and for base layer.

(iii) Standard solutions—Weigh accurately an amount of Colistin Sulfate Reference Standard, previously dried, equivalent to about 1,000,000 units, dissolve in phosphate buffer solution, pH 6.0 to make exactly 10 mL, and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 10°C, and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10,000 units and 2500 units, and use these solutions as the high concentration stan-

standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Colistin Sulfate, previously dried, equivalent to about 1,000,000 units, and dissolve in phosphate buffer solution, pH 6.0 to make exactly 10 mL. Take exactly a suitable amount of this solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10,000 units and 2500 units, and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Corn Oil

### *Oleum Maydis*

トウモロコシ油

Corn Oil is the fixed oil obtained from the embryo of *Zea mays* Linné (*Gramineae*).

**Description** Corn Oil is a clear, light yellow oil. It is odorless or has a slight odor, and a mild taste.

It is miscible with diethyl ether and with petroleum ether.

It is slightly soluble in ethanol (95), and practically insoluble in water.

At  $-7^{\circ}\text{C}$ , it congeals to an unguentary mass.

Specific gravity  $d_{25}^{25}$ : 0.915 – 0.921

**Acid value** <1.13> Not more than 0.2.

**Saponification value** <1.13> 187 – 195

**Unsaponifiable matter** <1.13> Not more than 1.5%.

**Iodine value** <1.13> 103 – 130

**Containers and storage** Containers—Tight containers.

## Corn Starch

### *Amylum Maydis*

トウモロコシデンプン

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols (♦ ♦).

Corn Starch consists of starch granules derived from the ripen seeds of *Zea mays* Linné (*Gramineae*).

♦**Description** Corn Starch occurs as white to pale yellowish white masses or powder.

It is practically insoluble in water and in ethanol (99.5).♦

**Identification** (1) Under a microscope, Corn Starch, preserved in a mixture of water and glycerin (1:1), appears as irregularly polygonal simple grains about 2 – 23  $\mu\text{m}$  in diameter, or irregularly orbicular or spherical simple grains about 25 – 35  $\mu\text{m}$  in diameter; hilum appears as distinct cave or 2 – 5 radial clefts; concentric striation absent; a black cross, its intersection point on hilum, is observed when grains

The figures are in mm.

are put between two nicol prisms fixed at right angle to each other.

(2) To 1 g of Corn Starch add 50 mL of water, boil for 1 minute, and allow to cool: a subtle white-turbid, pasty liquid is formed.

(3) To 1 mL of the pasty liquid obtained in (2) add 0.05 mL of diluted iodine TS (1 in 10): an orange-red to deep blue color is formed and the color disappears by heating.

**pH** <2.54> Put 5.0 g of Corn Starch in a non-metal vessel, add 25.0 mL of freshly boiled and cooled water, mix gently for 1 minute, and allow to stand for 15 minutes: the pH of the solution is between 4.0 and 7.0.

**Purity** (1) Iron—To 1.5 g of Corn Starch add 15 mL of 2 mol/L hydrochloric acid TS, mix, filter, and use the filtrate as the test solution. To 2.0 mL of Standard Iron Solution add water to make 20 mL, and use as the control solution. Put 10 mL each of the test solution and the control solution in test tubes, add 2 mL of a solution of citric acid (1 in 5) and 0.1 mL of mercapto acetic acid, and mix. Alkalinize with ammonia solution (28) to litmus paper, add water to make 20 mL, and mix. Transfer 10 mL each of these solutions into test tubes, allow to stand for 5 minutes, and compare the color of these solutions against a white background: the color of the test solution is not more intense than that of the control solution (not more than 10 ppm).

(2) Oxidizing substances—To 4.0 g of Corn Starch add 50.0 mL of water, shake for 5 minutes, and centrifuge. To 30.0 mL of the supernatant liquid add 1 mL of acetic acid (100) and 0.5 to 1.0 g of potassium iodide, shake, and allow to stand for 25 to 30 minutes at a dark place. Add 1 mL of starch TS, and titrate <2.50> with 0.002 mol/L sodium thiosulfate VS until the color of the solution disappears. Perform a blank determination and make any necessary correction: the volume of 0.002 mol/L sodium thiosulfate VS consumed is not more than 1.4 mL (not more than 20 ppm, calculated as hydrogen peroxide).

(3) Sulfur dioxide—

(i) Apparatus Use as shown in the following figure.

(ii) Procedure Introduce 150 mL of water into the boiling flask, close the tap of the funnel, and pass carbon dioxide through the whole system at a rate of  $100 \pm 5$  mL per minute. Pass cooling water through the condenser, and place

10 mL of hydrogen peroxide-sodium hydroxide TS in the test-tube. After 15 minutes, remove the funnel without interrupting the stream of carbon dioxide, and introduce through the opening into the flask about 25 g of Corn Starch, accurately weighed, with the aid of 100 mL of water. Apply tap grease to the outside of the connection part of the funnel, and load the funnel. Close the tap of the funnel, pour 80 mL of 2 mol/L hydrochloric acid TS into the funnel, open the tap to introduce the hydrochloric acid into the flask, and close the tap while several mL of the hydrochloric acid remains, in order to avoid losing sulfur dioxide. Place the flask in a water bath, and heat the mixture for 1 hour. Transfer the contents of the test-tube with the aid of a little water to a wide-necked conical flask. Heat in a water bath for 15 minutes, and cool. Add 0.1 mL of bromophenol blue TS, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS until the color changes from yellow to violet-blue lasting for at least 20 seconds. Perform a blank determination and make any necessary correction. Calculate the amount of sulfur dioxide by applying the following formula: it is not more than 50 ppm.

$$\text{Amount (ppm) of sulfur dioxide} = (V/W) \times 1000 \times 3.203$$

*W*: Amount (g) of the sample

*V*: Amount (mL) of 0.1 mol/L sodium hydroxide VS consumed

**Loss on drying** <2.41> Not more than 15.0% (1 g, 130°C, 90 minutes).

**Residue on ignition** <2.44> Not more than 0.6% (1 g).

♦**Containers and storage** Containers—Well-closed containers. ♦

## Cortisone Acetate

コルチゾン酢酸エステル

$C_{23}H_{30}O_6$ : 402.48

17,21-Dihydroxypregn-4-ene-3,11,20-trione 21-acetate  
[50-04-4]

Cortisone Acetate, when dried, contains not less than 97.0% and not more than 102.0% of  $C_{23}H_{30}O_6$ .

**Description** Cortisone Acetate occurs as white crystals or crystalline powder.

It is sparingly soluble in methanol, slightly soluble in ethanol (99.5), and practically insoluble in water.

Melting point: about 240°C (with decomposition).

**Identification** (1) To 2 mg of Cortisone Acetate add 2 mL of sulfuric acid, and allow to stand for a while: a yellowish green color is produced, and it gradually changes to yellow-orange. Examine the solution under ultraviolet light: the solution shows a light green fluorescence. Add carefully 10 mL of water to this solution: the color of the solution is dis-

charged, and the solution remains clear.

(2) Determine the absorption spectrum of a solution of Cortisone Acetate in methanol (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cortisone Acetate Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Cortisone Acetate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Cortisone Acetate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Cortisone Acetate and Cortisone Acetate Reference Standard in acetone, respectively, then evaporate the acetone to dryness, and repeat the test on the residues.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +207 – +216° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

**Purity** Related substances—Dissolve 25 mg of Cortisone Acetate in 10 mL of a mixture of acetonitrile, water and acetic acid (100) (70:30:1), and use this solution as the sample solution. Pipet 1 mL of this solution add the mixture of acetonitrile, water and acetic acid (100) (70:30:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than cortisone acetate is not larger than 1/2 times the peak area of cortisone acetate obtained with the standard solution, and the total area of the peak other than cortisone acetate is not larger than 1.5 times the peak area of cortisone acetate with the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: A mixture of water and acetonitrile (7:3).

Mobile phase B: A mixture of acetonitrile and water (7:3).

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)
0 – 5	90	10
5 – 25	90 → 10	10 → 90
25 – 30	10	90

Flow rate: About 1 mL per minute.

Time span of measurement: About 3 times as long as the retention time of cortisone acetate beginning after the solvent peak.

*System suitability—*

Test for required detectability: To exactly 1 mL of the standard solution add a mixture of acetonitrile, water and acetic acid (100) (70:30:1) to make exactly 10 mL. Confirm that the peak area of cortisone acetate obtained with 15  $\mu$ L of this solution is equivalent to 8 to 12% of that with 15  $\mu$ L of the standard solution.

System performance: When the procedure is run with 15  $\mu$ L of the sample solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cortisone acetate are not less than 10,000 and not more than 1.3, respectively.

System repeatability: When the test is repeated 3 times with 15  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cortisone acetate is not more than 5.0%.

**Loss on drying** <2.41> Not more than 1.0% (0.5 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Dissolve about 10 mg each of Cortisone Acetate and Cortisone Acetate Reference Standard, previously dried and accurately weighed, in 50 mL of methanol, add exactly 5 mL each of the internal standard solution, then add methanol to make 100 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cortisone acetate to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of } C_{23}H_{30}O_6 \\ &= W_s \times (Q_T/Q_S) \end{aligned}$$

$W_s$ : Amount (mg) of Cortisone Acetate Reference Standard

**Internal standard solution**—A solution of butyl parahydroxybenzoate in methanol (3 in 5000).

*Operating conditions—*

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and acetonitrile (13:7).

Flow rate: Adjust the flow rate so that the retention time of cortisone acetate is about 12 minutes.

*System suitability—*

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, cortisone acetate and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cortisone acetate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Creosote

クレオソート

Creosote is a mixture of phenols obtained from wood tar.

**Description** Creosote is a colorless or pale yellow, clear liquid. It has a characteristic odor, and a burning taste.

It is miscible with ethanol (95) and with diethyl ether.

It is slightly soluble in water.

Its saturated solution is neutral.

It is highly refractive.

It gradually changes in color by light or by air.

**Identification** To 10 mL of a saturated solution of Creosote add 1 drop of iron (III) chloride TS: a purple color develops, and the solution becomes rapidly turbid, and changes through blue and muddy green to brown.

**Specific gravity** <2.56>  $d_{20}^{20}$ : not less than 1.076.

**Purity (1)** Bases and hydrocarbons—Shake 1.0 mL of Creosote with 9 mL of sodium hydroxide TS: the solution is clear and does not darken. On further addition of 50 mL of water, the solution is practically clear.

(2) Phenol or coal-tar creosote—Shake Creosote with an equal volume of collodion: no coagulum is produced.

(3) Other impurities—To 1.0 mL of Creosote add 2 mL of petroleum benzene and 2 mL of barium hydroxide TS, shake, and allow to stand: no blue or muddy brown color develops in the upper layer of the mixture, and no red color develops in the lower layer.

**Distilling range** <2.57> 200 – 220°C, not less than 85 vol%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cresol

クレゾール

$C_7H_8O$ : 108.14

Cresol is a mixture of isomeric cresols.

**Description** Cresol is a clear, colorless or yellow to yellow-brown liquid. It has a phenol-like odor.

It is miscible with ethanol (95) and with diethyl ether.

It is sparingly soluble in water.

It dissolves in sodium hydroxide TS.

A saturated solution of Cresol is neutral to bromocresol purple TS.

It is a highly refractive liquid.

It becomes dark brown by light or on aging.

**Identification** To 5 mL of a saturated solution of Cresol add 1 to 2 drops of dilute iron (III) chloride TS: a blue-purple color develops.

**Specific gravity** <2.56>  $d_{20}^{20}$ : 1.032 – 1.041

**Purity (1) Hydrocarbons**—Dissolve 1.0 mL of Cresol in 60 mL of water: the solution shows no more turbidity than that produced in the following control solution.

Control solution: To 54 mL of water add 6.0 mL of 0.005 mol/L sulfuric acid and 1.0 mL of barium chloride TS, and after thorough shaking, allow to stand for 5 minutes.

**(2) Sulfur compounds**—Transfer 20 mL of Cresol in a 100-mL conical flask, place a piece of moistened lead (II) acetate paper on the mouth of the flask, and warm for 5 minutes on a water bath: the lead (II) acetate paper may develop a yellow color, but neither a brown nor a dark tint.

**Distilling range** <2.57> 196 – 206°C, not less than 90 vol%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Cresol Solution

クレゾール水

Cresol Solution contains not less than 1.25 vol% and not more than 1.60 vol% of cresol.

### Method of preparation

Saponated Cresol Solution	30 mL
Water or Purified Water	a sufficient quantity
To make 1000 mL	

Prepare by mixing the above ingredients.

**Description** Cresol Solution is a clear or slightly turbid, yellow solution. It has the odor of cresol.

**Identification** Shake 0.5 mL of the oily layer obtained in the Assay with 30 mL of water, filter, and perform the following tests using this filtrate as the sample solution:

**(1)** To 5 mL of the sample solution add 1 to 2 drops of iron (III) chloride TS: a blue-purple color develops.

**(2)** To 5 mL of the sample solution add 1 to 2 drops of bromine TS: a light yellow, flocculent precipitate is produced.

**Assay** Transfer 200 mL of Cresol Solution, exactly measured, to a 500-mL distilling flask. Add 40 g of sodium chloride and 3 mL of dilute sulfuric acid, and connect the distilling apparatus with the distilling flask, and distil into a cassia flask which contains 30 g of powdered sodium chloride and 3 mL of kerosene, exactly measured, until the distillate measures 90 mL. Draw off the water from the condenser, and continue the distillation until water vapor begins to come out of the tip of the condenser. Shake often the cassia flask in warm water to dissolve the sodium chloride, and allow to stand for 15 minutes. After cooling to 15°C, add a saturated solution of sodium chloride, and allow to stand for more than 3 hours with occasional shaking. Allow to stand for 1 to 2 minutes with gentle shaking to combine the separated oil drops with the oil layer. The difference between the number of mL of the oil layer measured and 3 mL represents the amount (mL) of cresol.

**Containers and storage** Containers—Tight containers.

## Saponated Cresol Solution

クレゾール石ケン液

Saponated Cresol Solution contains not less than 42 vol% and not more than 52 vol% of cresol.

### Method of preparation

Cresol	500 mL
Fixed Oil	300 mL
Potassium Hydroxide	a suitable quantity
Water or Purified Water	a sufficient quantity
To make 1000 mL	

Dissolve Potassium Hydroxide, in required quantity for saponification, in a sufficient quantity of Water or Purified Water, add this solution to fixed oil, previously warmed, add a sufficient quantity of Ethanol, if necessary, heat in a water bath by thorough stirring, and continue the saponification. After complete saponification, add Cresol, stir thoroughly until the mixture becomes clear, and add sufficient Water or Purified Water to make 1000 mL. A corresponding amount of Sodium Hydroxide may be used in place of Potassium Hydroxide.

**Description** Saponated Cresol Solution is a yellow-brown to red-brown, viscous liquid. It has the odor of cresol.

It is miscible with water, with ethanol (95) and with glycerin.

It is alkaline.

**Identification** Proceed as directed in the Identification under Cresol, using the distillate in the Purity (3).

**Purity (1) Alkalinity**—Mix well 0.50 mL of Saponated Cresol Solution with 10 mL of neutralized ethanol, add 2 to 3 drops of phenolphthalein TS and 0.10 mL of 1 mol/L hydrochloric acid VS: no red color develops.

**(2) Unsaponified matter**—To 1.0 mL of Saponated Cresol Solution add 5 mL of water, and shake: the solution is clear.

**(3) Cresol fraction**—Transfer 180 mL of Saponated Cresol Solution to a 2000-mL distilling flask, add 300 mL of water and 100 mL of dilute sulfuric acid, and distil with steam until the distillate becomes clear. Draw off the water from the condenser, and continue the distillation until water vapor begins to come out of the tip of the condenser. Cool the condenser again, and continue distillation for 5 minutes. Dissolve 20 g of sodium chloride per 100 mL of the distillate, allow to stand, and collect the separated clear oil layer. After adding about 15 g of powdered calcium chloride for drying in small portions with frequent shaking, allow to stand for 4 hours. Filter, and distil exactly 50 mL of the filtrate: the distillate is not less than 43 mL between 196°C and 206°C.

**Assay** Transfer 5 mL of Saponated Cresol Solution, exactly measured, to a 500-mL distilling flask, holding the pipet vertically for 15 minutes to draw off the solution into the flask. Add 200 mL of water, 40 g of sodium chloride and 3 mL of dilute sulfuric acid, connect the distilling apparatus with the distilling flask, and distil into a cassia flask which contains 30 g of powdered sodium chloride and exactly 3 mL of kerosene, until the distillate reaches 90 mL. Draw off the water from the

condenser, and continue the distillation until water vapor begins to come out of the tip of the condenser. Allow the cassia flask to stand in warm water for 15 minutes to dissolve the sodium chloride with frequent shaking. Cool to 15°C, add a saturated solution of sodium chloride, and allow to stand for more than 3 hours with occasional shaking. Allow to stand for 1 to 2 minutes with gentle shaking, and combine the separated oil drops with the oil layer. The volume (mL) subtracted 3 (mL) from the oil layer measured represents the amount (mL) of cresol.

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Croconazole Hydrochloride

クロコナゾール塩酸塩

$C_{18}H_{15}ClN_2O \cdot HCl$ : 347.24  
1-[1-[2-(3-Chlorobenzoyloxy)phenyl]vinyl]-1*H*-imidazole  
monohydrochloride [77174-66-4]

Croconazole Hydrochloride, when dried, contains not less than 98.5% of  $C_{18}H_{15}ClN_2O \cdot HCl$ .

**Description** Croconazole Hydrochloride occurs as white to pale yellowish white crystals or crystalline powder.

It is very soluble in water, freely soluble in methanol, in ethanol (95) and in acetic acid (100), and practically insoluble in diethyl ether.

**Identification (1)** Determine the absorption spectrum of a solution of Croconazole Hydrochloride in methanol (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Croconazole Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 0.05 g of Croconazole Hydrochloride in 10 mL of water, add 2 mL of sodium hydroxide TS and 20 mL of diethyl ether, and shake. Wash the separated aqueous layer with two 10-mL portions of diethyl ether, and acidify the solution with 2 mL of dilute nitric acid: the solution responds to the Qualitative Tests <1.09> for chloride.

**Melting point** <2.60> 148 – 153°C

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Croconazole Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of

Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Croconazole Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, hexane, methanol and ammonia solution (28) (30:15:5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot and other than the spot of the starting point from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 60°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Croconazole Hydrochloride, previously dried, dissolve in 10 mL of acetic acid (100), add 40 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS [indicator: 1 to 2 drops of a solution of malachite green oxalate in acetic acid (100) (1 in 100)] until the color of the solution changes from blue-green through green to yellow-green. Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 34.72 mg of  $C_{18}H_{15}ClN_2O \cdot HCl$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Croscarmellose Sodium

クロスカルメロースナトリウム

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbol (♦ ◆).

Croscarmellose Sodium is the sodium salt of a cross-linked poly carboxymethylether of cellulose.

♦**Description** Croscarmellose Sodium occurs as a white to yellowish white powder.

It is practically insoluble in ethanol (99.5) and in diethyl ether.

It swells with water and becomes a suspension.

It is hygroscopic. ◆

**Identification (1)** To 1 g of Croscarmellose Sodium add 100 mL of a solution of methylene blue (1 in 250,000), stir well, and allow to stand: blue cotton-like precipitates appear.

(2) To 1 g of Croscarmellose Sodium add 50 mL of water, and stir well to make a suspension. To 1 mL of this suspension add 1 mL of water and 5 drops of freshly prepared solution of 1-naphthol in methanol (1 in 25), and gently add 2 mL of sulfuric acid along a wall of the vessel: a red-purple color appears at the zone of contact.

(3) The suspension obtained in (2) responds to the

Qualitative Tests <1.09> (1) for sodium salt.

**pH** <2.54> To 1.0 g of Croscarmellose Sodium add 100 mL of water, and stir for 5 minutes: the pH of the supernatant liquid is between 5.0 and 7.0.

**Purity** ♦(1) Heavy metals <1.07>—Proceed with 2.0 g of Croscarmellose Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm). ♦

♦(2) Sodium chloride and sodium glycolate—The total amount of sodium chloride and sodium glycolate is not more than 0.5%.

(i) Sodium chloride: Weigh accurately about 5 g of Croscarmellose Sodium, add 50 mL of water and 5 mL of hydrogen peroxide (30), and heat on a water bath for 20 minutes with occasional stirring. After cooling, add 100 mL of water and 10 mL of nitric acid, and titrate <2.50> with 0.1 mol/L silver nitrate VS (potentiometric titration). Perform a blank determination in the same manner and make any necessary correction.

Each mL of 0.1 mol/L silver nitrate VS = 5.844 mg of NaCl

(ii) Sodium glycolate: Weigh accurately about 0.5 g of Croscarmellose Sodium, add 2 mL of acetic acid (100) and 5 mL of water, and stir for 15 minutes. Add gradually 50 mL of acetone with stirring, then add 1 g of sodium chloride, stir for 3 minutes, and filter through a filter paper moistened with acetone. Wash the residue thoroughly with 30 mL of acetone, combine the filtrate and washings, add acetone to make exactly 100 mL, and use this solution as the sample stock solution. Separately, dissolve 0.100 g of glycolic acid in water to make 200 mL. Pipet 0.5 mL, 1 mL, 2 mL, 3 mL and 4 mL of this solution, add water to make them exactly 5 mL, then add 5 mL of acetic acid (100) and acetone to make exactly 100 mL, and designate them standard stock solution (1), standard stock solution (2), standard stock solution (3), standard stock solution (4) and standard stock solution (5), respectively. Pipet 2 mL each of the sample stock solution and the standard stock solutions (1), (2), (3), (4) and (5), and heat them in a water bath for 20 minutes to evaporate acetone. After cooling, add exactly 5 mL of 2,7-dihydroxynaphthalene TS, mix, then add 15 mL of 2,7-dihydroxynaphthalene TS, mix, cover the mouth of the vessels with aluminum foil, and heat in a water bath for 20 minutes. After cooling, add sulfuric acid to make exactly 25 mL, mix, and designate them sample solution, standard solution (1), standard solution (2), standard solution (3), standard solution (4) and standard solution (5), respectively. Separately, to 10 mL of a mixture of water and acetic acid (100) (1:1) add acetone to make exactly 100 mL, and proceed with exactly 2 mL of this solution in the same manner for preparation of the sample solution, and use the solution so obtained as the blank solution. Determine the absorbances,  $A_T$ ,  $A_{S1}$ ,  $A_{S2}$ ,  $A_{S3}$ ,  $A_{S4}$  and  $A_{S5}$ , of the sample solution and the standard solutions (1), (2), (3), (4) and (5), respectively, at 540 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using the blank solution as the control. Determine the amount (g) of glycolic acid, X, in 100 mL of the sample solution from the calibration curve obtained with the standard solutions, and calculate the amount of sodium glycolate by the following formula.

$$\begin{aligned} &\text{Amount (\%)} \text{ of sodium glycolate} \\ &= (X/W) \times 100 \times 1.2890 \end{aligned}$$

W: Amount (g) of sample ♦

♦(3) Water-soluble substance—Weigh accurately about 10 g of Croscarmellose Sodium, disperse in 800 mL of water by stirring for 1 minute every 10 minutes during 30 minutes, and allow to stand for at most 1 hour to precipitate. Filter by suction or centrifuge the clear upper portion, and weigh accurately the mass of about 150 mL of the filtrate or supernatant liquid. Heat to concentrate this liquid avoiding to dryness, then dry at 105°C for 4 hours, and weigh the mass of the residue accurately. Calculate the amount of the water-soluble substance by the following formula: not less than 1.0 % and not more than 10.0%.

$$\begin{aligned} &\text{Amount (\%)} \text{ of water-soluble substance} \\ &= 100 W_3 (800 + W_1) / W_1 W_2 \end{aligned}$$

W<sub>1</sub>: Amount (g) of sample

W<sub>2</sub>: Amount (g) of the filtrate or supernatant liquid of about 150 mL

W<sub>3</sub>: Amount (g) of the residue ♦

**Precipitation test** Put 75 mL of water in a 100-mL glass-stoppered graduated cylinder, and add portion by portion with 1.5 g of Croscarmellose Sodium divided into three portions while shaking vigorously at each time. Then, add water to make 100 mL, shake until to get a homogenous dispersion, and allow to stand for 4 hours: the volume of the settled layer is not less than 10.0 mL and not more than 30.0 mL.

**Degree of substitution** Weigh accurately about 1 g of Croscarmellose Sodium, put in a 500-mL glass-stoppered conical flask, add 300 mL of sodium chloride TS, then add 25.0 mL of 0.1 mol/L sodium hydroxide VS, stopper, and allow to stand for 5 minutes with occasional shaking. Add 5 drops of *m*-cresol purple TS, then add exactly 15 mL of 0.1 mol/L hydrochloric acid VS using a buret, stopper the flask, and shake. If the color of the solution is purple, add exactly 1-mL portions of 0.1 mol/L hydrochloric acid VS using the buret, with shaking each time, until the color of the solution changes to yellow, then titrate <2.50> with 0.1 mol/L sodium hydroxide VS until the color changes from yellow to purple. Perform a blank determination in the same manner. Calculate the degrees of substitution of acid-carboxymethyl group and sodium-carboxymethyl group, A and S: A + S is not less than 0.60 and not more than 0.85.

$$\begin{aligned} A &= 1150M / (7102 - 412M - 80C) \\ S &= (162 + 58A)C / (7102 - 80C) \end{aligned}$$

M: Amount (mmol) of sodium hydroxide needed to neutralize 1 g of sample, calculated on the dried basis

C: The value (%) obtained in Residue on ignition

**Loss on drying** <2.41> Not more than 10.0% (1 g, 105°C, 6 hours).

**Residue on ignition** <2.44> 14.0 – 28.0% (after drying, 1 g).

**Containers and storage** Containers—Tight containers.

## Cyanamide

シアナミド

CH<sub>2</sub>N<sub>2</sub>: 42.04  
Aminonitrile [420-04-2]

Cyanamide contains not less than 97.0% and not more than 101.0% of CH<sub>2</sub>N<sub>2</sub>, calculated on the anhydrous basis.

**Description** Cyanamide occurs as white crystals or crystalline powder.

It is very soluble in water, in methanol, in ethanol (99.5) and in acetone.

The pH of a solution of Cyanamide (1 in 100) is between 5.0 and 6.5.

It is hygroscopic.

Melting point: about 46°C

**Identification (1)** To 1 mL of a solution of Cyanamide (1 in 100) add 1 mL of potassium 1,2-naphthoquinone-4-sulfonate TS and 0.2 mL of sodium hydroxide TS: a deep red color develops.

(2) Drop one or two drops of a solution of Cyanamide in acetone (1 in 100) onto a potassium bromide disk prepared as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and air-dry the disk. Determine the infrared absorption spectrum of the disk as directed in the film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cyanamide in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Cyanamide according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Water** <2.48> Not more than 1.0% (1 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 1 g of Cyanamide, and dissolve in water to make exactly 250 mL. Pipet 15 mL of this solution, add 2 to 3 drops of dilute nitric acid, 10 mL of ammonia TS and exactly 50 mL of 0.1 mol/L silver nitrate VS, and allow to stand for 15 minutes with occasional shaking. Add water to make exactly 100 mL, filter, discard the first 20 mL of the filtrate, and pipet the subsequent 50 mL. After neutralizing this solution with dilute nitric acid, add 3 mL of dilute nitric acid, and titrate <2.50> the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination.

Each mL of 0.1 mol/L silver nitrate VS  
= 2.102 mg of CH<sub>2</sub>N<sub>2</sub>

**Containers and storage** Containers—Tight containers.

Storage—In a cold place.

## Cyanocobalamin

Vitamin B<sub>12</sub>

シアノコバラミン

C<sub>63</sub>H<sub>88</sub>CoN<sub>14</sub>O<sub>14</sub>P: 1355.37

Co $\alpha$ -[ $\alpha$ -(5,6-Dimethyl-1*H*-benzimidazol-1-yl)]-Co $\beta$ -cyanocobamide [68-19-9]

Cyanocobalamin contains not less than 96.0% and not more than 102.0% of C<sub>63</sub>H<sub>88</sub>CoN<sub>14</sub>O<sub>14</sub>P, calculated on the dried basis.

**Description** Cyanocobalamin occurs as dark red crystals or powder.

It is sparingly soluble in water, and slightly soluble in ethanol (99.5).

It is hygroscopic.

**Identification (1)** Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cyanocobalamin Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Mix 1 mg of Cyanocobalamin with 0.05 g of potassium hydrogen sulfate, and fuse by igniting. Cool, break up the mass with a glass rod, add 3 mL of water, and dissolve by boiling. Add 1 drop of phenolphthalein TS, then add dropwise sodium hydroxide TS until a light red color just develops. Add 0.5 g of sodium acetate trihydrate, 0.5 mL of dilute acetic acid and 0.5 mL of a solution of disodium 1-nitroso-2-naphthol-3,6-disulfonate (1 in 500): a red to orange-red color is immediately produced. Then add 0.5 mL of hydrochloric acid, and boil for 1 minute: the red color does not disappear.

(3) Transfer 5 mg of Cyanocobalamin to a 50-mL distilling flask, dissolve in 5 mL of water, and add 2.5 mL of hypophosphorous acid. Connect the flask with a short con-

denser, and dips its tip into a test tube containing 1 mL of a solution of sodium hydroxide (1 in 50). Heat gently for 10 minutes, then distil 1 mL into a test tube. To the test tube add 4 drops of a saturated solution of ammonium iron (II) sulfate hexahydrate, shake gently, then add about 0.03 g of sodium fluoride, and heat the contents to boil. Immediately add dropwise diluted sulfuric acid (1 in 7) until a clear solution results, then add 3 to 5 drops more of diluted sulfuric acid (1 in 7): a blue to blue-green color develops.

**pH** <2.54> Dissolve 0.10 g of Cyanocobalamin in 20 mL of water: the pH of this solution is between 4.2 and 7.0.

**Purity** (1) Clarity and color of solution—Dissolve 20 mg of Cyanocobalamin in 10 mL of water: the solution is clear and red in color.

(2) Pseudocyanocobalamin—Dissolve 1.0 mg of Cyanocobalamin in 20 mL of water, transfer the solution to a separator, add 5 mL of a mixture of *m*-cresol and carbon tetrachloride (1:1), and shake vigorously for 1 minute. Allow to separate, draw off the lower layer into another separator, add 5 mL of diluted sulfuric acid (1 in 7), shake vigorously, and allow to separate completely. If necessary, centrifuge the mixture: the supernatant liquid is colorless or not more colored than the following control solution.

Control solution: Dilute 0.6 mL of 0.02 mol/L potassium permanganate VS with water to make 1000 mL.

**Loss on drying** <2.41> Not more than 12% (50 mg, in vacuum at a pressure not exceeding 0.67 kPa, phosphorus (V) oxide, 100°C, 4 hours).

**Assay** Weigh accurately about 20 mg each of Cyanocobalamin and Cyanocobalamin Reference Standard (previously determine the loss on drying <2.41> in the same manner as Cyanocobalamin), dissolve in water to make exactly 1000 mL, respectively, and use these solutions as the sample solution and the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and the standard solution, respectively, at 361 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

$$\begin{aligned} \text{Amount (mg) of } C_{63}H_{88}CoN_{14}O_{14}P \\ = W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Cyanocobalamin Reference Standard, calculated on the dried basis

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

## Cyanocobalamin Injection

### Vitamin B<sub>12</sub> Injection

シアノコバラミン注射液

Cyanocobalamin Injection is an aqueous solution for injection.

It contains not less than 95.0% and not more than 115.0% of the labeled amount of cyanocobalamin ( $C_{63}H_{88}CoN_{14}O_{14}P$ : 1355.37)

**Method of preparation** Prepare as directed under Injections, with Cyanocobalamin.

**Description** Cyanocobalamin Injection is a clear, light red to red liquid

It is gradually affected by light.

pH: 4.0 – 5.5

**Identification** Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 277 nm and 279 nm, between 360 nm, and 362 nm and between 548 nm and 552 nm. Determine the absorbances,  $A_1$  and  $A_2$ , of this solution at the wavelengths of maximum absorption between 360 nm and 362 nm, and between 548 nm and 552 nm, respectively: the ratio  $A_2/A_1$  is not less than 0.29 and not more than 0.32.

**Extractable volume** <6.05> It meets the requirement.

**Assay** Measure exactly a volume of Cyanocobalamin Injection, equivalent to about 2 mg of cyanocobalamin ( $C_{63}H_{88}CoN_{14}O_{14}P$ ), add water to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Cyanocobalamin Reference Standard (previously determine the loss on drying <2.41> in the same manner as Cyanocobalamin), add water to make exactly 1000 mL, and use this solution as the standard solution. With these solutions, proceed as directed in the Assay under Cyanocobalamin.

$$\begin{aligned} \text{Amount (mg) of cyanocobalamin } (C_{63}H_{88}CoN_{14}O_{14}P) \\ = W_S \times (A_T/A_S) \times (1/10) \end{aligned}$$

$W_S$ : Amount (mg) of Cyanocobalamin Reference Standard, calculated on the dried basis

**Containers and storage** Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant.

## Cyclopentolate Hydrochloride

シクロペントラート塩酸塩

$C_{17}H_{25}NO_3 \cdot HCl$ : 327.85

2-(Dimethylamino)ethyl (2*RS*)-2-(1-hydroxycyclopentyl)phenylacetate monohydrochloride [5870-29-1]

Cyclopentolate Hydrochloride, when dried, contains not less than 98.5% of  $C_{17}H_{25}NO_3 \cdot HCl$ .

**Description** Cyclopentolate Hydrochloride occurs as a white, crystalline powder. It is odorless, or has a characteristic odor.

It is very soluble in water, freely soluble in ethanol (95), in acetic acid (100) and in chloroform, sparingly soluble in acetic anhydride, and practically insoluble in diethyl ether.

**Identification** (1) To 1 mL of a solution of Cyclopentolate Hydrochloride (1 in 100) add 1 mL of Reinecke salt TS: a

light red precipitate is formed.

(2) Dissolve 0.2 g of Cyclopentolate Hydrochloride in 2 mL of water, add 2 mL of sodium hydroxide TS, and boil for 1 minute. After cooling, add 2 drops of nitric acid: a phenylacetic acid-like odor is perceptible.

(3) Determine the infrared absorption spectrum of Cyclopentolate Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Cyclopentolate Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**pH** <2.54> Dissolve 0.20 g of Cyclopentolate Hydrochloride in 20 mL of water: the pH of this solution is between 4.5 and 5.5.

**Melting point** <2.60> 135 – 138°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Cyclopentolate Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cyclopentolate Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.20 g of Cyclopentolate Hydrochloride in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 20 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 2-propanol, *n*-butyl acetate, water and ammonia solution (28) (100:60:23:17) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of sulfuric acid in ethanol (99.5) (1 in 10) on the plate, and heat at 120°C for 30 minutes. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.05% (1 g).

**Assay** Weigh accurately about 0.5 g of Cyclopentolate Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (4:1), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue-green to yellow-green (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 32.79 mg of  $C_{17}H_{25}NO_3 \cdot HCl$

**Containers and storage** Containers—Tight containers.

## Cyclophosphamide Hydrate

シクロホスファミド水和物

$C_7H_{15}Cl_2N_2O_2P \cdot H_2O$ : 279.10

*N,N*-Bis(2-chloroethyl)-3,4,5,6-tetrahydro-2*H*-1,3,2-oxazaphosphorin-2-amine 2-oxide monohydrate  
[6055-19-2]

Cyclophosphamide Hydrate contains not less than 97.0% of  $C_7H_{15}Cl_2N_2O_2P \cdot H_2O$ .

**Description** Cyclophosphamide Hydrate occurs as white crystals or crystalline powder. It is odorless.

It is very soluble in acetic acid (100), freely soluble in ethanol (95), in acetic anhydride and in chloroform, and soluble in water and in diethyl ether.

Melting point: 45 – 53°C

**Identification** (1) Dissolve 0.1 g of Cyclophosphamide Hydrate in 10 mL of water, and add 5 mL of silver nitrate TS: no precipitate is produced. Then boil this solution: a white precipitate is produced. Collect the precipitate, and add dilute nitric acid to a portion of this precipitate: it does not dissolve. Add excess ammonia TS to another portion of the precipitate: it dissolves.

(2) Add 1 mL of diluted sulfuric acid (1 in 25) to 0.02 g of Cyclophosphamide Hydrate, and heat until white fumes are evolved. After cooling, add 5 mL of water, and shake. Neutralize with ammonia TS, then acidify with dilute nitric acid: this solution responds to the Qualitative Tests <1.09> (2) for phosphate.

**Purity** (1) Clarity and color of solution—Dissolve 0.20 g of Cyclophosphamide Hydrate in 10 mL of water: the solution is clear and colorless.

(2) Chloride <1.03>—Perform the test with 0.40 g of Cyclophosphamide Hydrate at a temperature not exceeding 20°C. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Cyclophosphamide Hydrate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Water** <2.48> 5.5 – 7.0% (0.5 g, direct titration).

**Assay** Weigh accurately about 0.3 g of Cyclophosphamide Hydrate, add 15 mL of hydrogen chloride-ethanol TS, and heat in a water bath under a reflux condenser for 3.5 hours while protecting from moisture. Distil the ethanol under reduced pressure. Dissolve the residue in 40 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid-dioxane VS (indicator: 2 drops of crystal violet TS) until the color of the solution changes from blue through green to yellow. Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid-dioxane VS

= 13.96 mg of  $C_7H_{15}Cl_2N_2O_2P \cdot H_2O$

**Containers and storage** Containers—Tight containers.

Storage—Not exceeding 30°C.

## Cycloserine

サイクロセリン

$C_3H_6N_2O_2$ : 102.09

(4*R*)-4-Aminoisoxazolidin-3-one [68-41-7]

Cycloserine contains not less than 950  $\mu\text{g}$  (potency) and not more than 1020  $\mu\text{g}$  (potency) per mg, calculated on the dried basis. The potency of Cycloserine is expressed as mass (potency) of cycloserine ( $C_3H_6N_2O_2$ ).

**Description** Cycloserine occurs as white to light yellowish white, crystals or crystalline powder.

It is soluble in water, and sparingly soluble in ethanol (95).

**Identification** Determine the infrared absorption spectrum of Cycloserine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Cycloserine Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +108 – +114° (2.5 g calculated on the dried basis, 2 mol/L sodium hydroxide TS, 50 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cycloserine in 20 mL of water: the pH of the solution is between 5.0 and 7.4.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Cycloserine according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Condensation products—Dissolve 20 mg of Cycloserine in sodium hydroxide TS to make exactly 50 mL, and determine the absorbance of this solution at 285 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>: not more than 0.8.

**Loss on drying** <2.41> Not more than 1.5% (0.5 g, reduced pressure, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.5% (1 g).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) Medium for test organism [5] under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 6.0 to 6.1 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Cycloserine Reference Standard, previously dried at 60°C for 3 hours under reduced pressure of not exceeding 0.67 kPa,

equivalent to about 40 mg (potency), dissolve in water to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 24 hours. Take exactly a suitable amount of the standard stock solution before use, and add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 100  $\mu\text{g}$  (potency) and 50  $\mu\text{g}$  (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(4) Sample solutions—Weigh accurately an amount of Cycloserine equivalent to about 40 mg (potency), dissolve in water to make exactly 100 mL. Take exactly a suitable amount of this solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 100  $\mu\text{g}$  (potency) and 50  $\mu\text{g}$  (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Well-closed containers.

## Cyproheptadine Hydrochloride Hydrate

シプロヘプタジン塩酸塩水和物

$C_{21}H_{21}N \cdot HCl \cdot 1\frac{1}{2}H_2O$ : 350.88

4-(5*H*-Dibenzo[*a,d*]cyclohepten-5-ylidene)-1-methylpiperidine monohydrochloride sesquihydrate [41354-29-4]

Cyproheptadine Hydrochloride Hydrate, when dried, contains not less than 98.5% of cyproheptadine hydrochloride ( $C_{21}H_{21}N \cdot HCl$ : 323.86).

**Description** Cyproheptadine Hydrochloride Hydrate occurs as a white to pale yellow, crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in methanol and in acetic acid (100), soluble in chloroform, sparingly soluble in ethanol (95), slightly soluble in water, and practically insoluble in diethyl ether.

**Identification (1)** Dissolve 0.1 g of Cyproheptadine Hydrochloride Hydrate in 10 mL of methanol, apply 1 drop of this solution on filter paper, air-dry, and examine under ultraviolet light (main wavelength: 254 nm): the solution shows a pale blue fluorescence.

(2) Weigh 0.1 g of Cyproheptadine Hydrochloride Hydrate, transfer to a separator, dissolve in 5 mL of chloroform, add 4 mL of water and 1 mL of sodium carbonate TS, and shake. Transfer the chloroform layer to another separator, and wash with 4 mL of water by shaking well. Filter the chloroform layer through absorbent cotton moistened previously with chloroform, and evaporate the

filtrate to dryness. Dissolve the residue in 8 mL of dilute ethanol by warming at 65°C. Rub the inner wall of the container with a glass rod while cooling until crystallization begins, and allow to stand for 30 minutes. Collect the crystals, and dry at 80°C for 2 hours: the crystals melt <2.60> between 111°C and 115°C.

(3) Determine the absorption spectrum of a solution of Cyproheptadine Hydrochloride Hydrate in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) A saturated solution of Cyproheptadine Hydrochloride Hydrate responds to the Qualitative Tests <1.09> (2) for chloride.

**Purity (1) Acidity**—Dissolve 2.0 g of Cyproheptadine Hydrochloride Hydrate in 25 mL of methanol, and add 1 drop of methyl red TS and 0.30 mL of 0.1 mol/L sodium hydroxide VS: a yellow color develops.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cyproheptadine Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying <2.41>** 7.0 – 9.0% (1 g, in vacuum at a pressure not exceeding 0.67 kPa, 100°C, 5 hours).

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Cyproheptadine Hydrochloride Hydrate, previously dried, and dissolve in 20 mL of acetic acid (100) by warming at 50°C. After cooling, add 40 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 32.39 mg of C<sub>21</sub>H<sub>21</sub>N.HCl

**Containers and storage** Containers—Well-closed containers.

## Cytarabine

シタラビン

C<sub>9</sub>H<sub>13</sub>N<sub>3</sub>O<sub>5</sub>: 243.22  
1-β-D-Arabinofuranosylcytosine  
[147-94-4]

Cytarabine, when dried, contains not less than 98.5% and not more than 101.0% of C<sub>9</sub>H<sub>13</sub>N<sub>3</sub>O<sub>5</sub>.

**Description** Cytarabine occurs as white crystals or crystalline powder.

It is freely soluble in water, soluble in acetic acid (100), and

very slightly soluble in ethanol (99.5).

It dissolves in 0.1 mol/L hydrochloric acid TS.

Melting point: about 214°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Cytarabine in 0.1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cytarabine as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation <2.49>** [α]<sub>D</sub><sup>20</sup>: +154 – +160° (after drying, 0.1 g, water, 10 mL, 100 mm).

**pH <2.54>** Dissolve 0.20 g of Cytarabine in 20 mL of water: the pH of this solution is between 6.5 and 8.0.

**Purity (1) Clarity and color of solution**—Dissolve 1.0 g of Cytarabine in 10 mL of water: the solution is clear and colorless.

(2) Chloride <1.03>—Perform the test with 1.0 g of Cytarabine. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.009%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Cytarabine according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 0.10 g of Cytarabine in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution (1). Pipet 10 mL of the standard solution (1), add water to make exactly 25 mL and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with 1-butanol saturated with water to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (1), and the number of them which are more intense than the spot from the standard solution (2) is not more than two. Spray evenly acidic potassium permanganate TS on the plate: any spot other than the principal spot does not appear.

**Loss on drying <2.41>** Not more than 1.0% (1 g, in vacuum, silica gel, 4 hours).

**Residue on ignition <2.44>** Not more than 0.5% (1 g).

**Assay** Weigh accurately about 0.2 g of Cytarabine, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS  
= 12.16 mg of C<sub>9</sub>H<sub>13</sub>N<sub>3</sub>O<sub>5</sub>

**Containers and storage** Containers—Tight containers.

## Dantrolene Sodium Hydrate

ダントロレンナトリウム水和物

$C_{14}H_9N_4NaO_5 \cdot 3\frac{1}{2}H_2O$ : 399.29

Monosodium 3-[5-(4-nitrophenyl)furan-2-ylmethylene]amino-2,5-dioxo-1,3-imidazolidinate hemiheptahydrate [14663-23-1, anhydride]

Dantrolene Sodium Hydrate contains not less than 98.0% of dantrolene sodium ( $C_{14}H_9N_4NaO_5$ : 336.23), calculated on the anhydrous basis.

**Description** Dantrolene Sodium Hydrate occurs as a yellowish orange to deep orange, crystalline powder.

It is soluble in propylene glycol, sparingly soluble in methanol, slightly soluble in ethanol (95), very slightly soluble in water and in acetic acid (100), and practically insoluble in acetone, in tetrahydrofuran and in diethyl ether.

**Identification (1)** Determine the absorption spectrum of a solution of Dantrolene Sodium Hydrate in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dantrolene Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 0.1 g of Dantrolene Sodium Hydrate add 20 mL of water and 2 drops of acetic acid (100), shake well, and filter: the filtrate responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Purity (1)** Alkalinity—To 0.7 g of Dantrolene Sodium Hydrate add 10 mL of water, shake well, and centrifuge or filter through a membrane filter. To 5 mL of the supernatant or the filtrate add 45 mL of water, 3 drops of phenolphthalein TS and 0.10 mL of 0.1 mol/L hydrochloric acid VS: a red color is not produced.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Dantrolene Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related Substances—Dissolve 50 mg of Dantrolene Sodium Hydrate in 20 mL of tetrahydrofuran and 2 mL of acetic acid (100), add ethanol (99.5) to make 100 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (99.5) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area from these solutions by the automatic integration method: the total

area of all peaks other than the peak of dantrolene from the sample solution is not larger than the peak area of dantrolene from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 300 nm).

**Column:** A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 30°C.

**Mobile phase:** A mixture of hexane, acetic acid (100) and ethanol (99.5) (90:10:9).

**Flow rate:** Adjust the flow rate so that the retention time of dantrolene is about 8 minutes.

**Selection of column:** Dissolve 5 mg of Dantrolene Sodium Hydrate and 0.1 g of theophylline in 20 mL of tetrahydrofuran and 2 mL of acetic acid (100), and add ethanol (99.5) to make 100 mL. To 10 mL of this solution add ethanol (99.5) to make 100 mL. Proceed with 10  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of theophylline and dantrolene in this order with the resolution between these peaks being not less than 6.

**Detection sensitivity:** Adjust the detection sensitivity so that the peak height of dantrolene from 10  $\mu$ L of the standard solution is 10% to 40% of the full scale.

**Time span of measurement:** About twice as long as the retention time of dantrolene beginning after the solvent peak.

**Water <2.48>** 14.5 – 17.0% (0.2 g, direct titration).

**Assay** Weigh accurately about 0.7 g of Dantrolene Sodium Hydrate, dissolve in 180 mL of a mixture of propylene glycol and acetone (1:1), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 33.624 mg of  $C_{14}H_9N_4NaO_5$

**Containers and storage** Containers—Tight containers.

## Daunorubicin Hydrochloride

ダウノルビシン塩酸塩

$C_{27}H_{29}NO_{10} \cdot HCl$ : 563.98

(2S,4S)-2-Acetyl-4-(3-amino-2,3,6-trideoxy- $\alpha$ -L-lyxo-hexopyranosyloxy)-2,5,12-trihydroxy-7-methoxy-1,2,3,4-tetrahydrotetracene-6,11-dione monohydrochloride [23541-50-6]

Daunorubicin Hydrochloride is the hydrochloride of

an anthracycline substance having antitumor activity produced by the growth of *Streptomyces peucetius*.

It contains not less than 940  $\mu\text{g}$  (potency) and not more than 1050  $\mu\text{g}$  (potency) per mg, calculated on the dried basis. The potency of Daunorubicin Hydrochloride is expressed as mass (potency) of daunorubicin hydrochloride ( $\text{C}_{27}\text{H}_{29}\text{NO}_{10}\cdot\text{HCl}$ ).

**Description** Daunorubicin Hydrochloride occurs as a red powder.

It is soluble in water and in methanol, and slightly soluble in ethanol (99.5).

**Identification (1)** Determine the absorption spectrum of a solution of Daunorubicin Hydrochloride in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Daunorubicin Hydrochloride Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) A solution of Daunorubicin Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> (2) for chloride.

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ : +250 – +275° (15 mg calculated on the dried basis, methanol, 10 mL, 100 mm).

**pH** <2.54> Dissolve 0.15 g of Daunorubicin Hydrochloride in 30 mL of water: the pH of the solution is between 4.5 and 6.0.

**Purity (1)** Clarity and color of solution—Dissolve 20 mg of Daunorubicin Hydrochloride in 10 mL of water: the solution is clear and red.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Daunorubicin Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 10 mg of Daunorubicin Hydrochloride in 5 mL of methanol, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, water and acetic acid (100) (15:5:1:1) to a distance of about 10 cm, and air-dry the plate. Examine the spots with the naked eye: the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 7.5% (0.1 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Assay** Weigh accurately an amount of Daunorubicin Hydrochloride and Daunorubicin Hydrochloride Reference Standard, equivalent to about 20 mg (potency), dissolve each in a suitable amount of the mobile phase, add exactly 4 mL of the internal standard solution and the mobile phase to make 20 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 5  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_{\text{T}}$  and  $Q_{\text{S}}$ , of

the peak area of daunorubicin to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of } \text{C}_{27}\text{H}_{29}\text{NO}_{10}\cdot\text{HCl} \\ = W_{\text{S}} \times (Q_{\text{T}}/Q_{\text{S}}) \times 1000 \end{aligned}$$

$W_{\text{S}}$ : Amount [mg (potency)] of Daunorubicin Hydrochloride Reference Standard

**Internal standard solution**—A solution of 2-naphthalenesulfonic acid in the mobile phase (1 in 100).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Adjust the pH of a mixture of water and acetonitrile (31:19) to 2.2 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of daunorubicin is about 9 minutes.

**System suitability**—

System performance: When the procedure is run with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the internal standard and daunorubicin are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of daunorubicin to that of the internal standard is not more than 2.0%.

**Containers and storage** Containers—Tight containers.

## Deferoxamine Mesilate

デフェロキサミンメシル酸塩

$\text{C}_{25}\text{H}_{48}\text{N}_6\text{O}_8\cdot\text{CH}_4\text{O}_3\text{S}$ : 656.79

*N*-[5-(Acetylhydroxyamino)pentyl]-*N'*-(5-{3-[5-(5-aminopentyl)hydroxycarbonyl]propanoylamino}pentyl)-*N'*-hydroxysuccinamide monomethanesulfonate [138-14-7]

Deferoxamine Mesilate contains not less than 98.0% and not more than 102.0% of  $\text{C}_{25}\text{H}_{48}\text{N}_6\text{O}_8\cdot\text{CH}_4\text{O}_3\text{S}$ , calculated on the anhydrous basis.

**Description** Deferoxamine Mesilate occurs as a white to pale yellowish white, crystalline powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5), in 2-propanol and in diethyl ether.

Melting point: about 147°C (with decomposition).

**Identification (1)** To 5 mL of a solution of Deferoxamine Mesilate (1 in 500) add 1 drop of iron (III) chloride TS: a deep red color develops.

**(2)** To 0.05 g of Deferoxamine Mesilate add 0.2 g of sodium hydroxide, melt by heating over a small flame, and heat further for 2 to 3 seconds. To the residue add 0.5 mL of water, acidify with dilute hydrochloric acid, and warm: the gas evolved changes moistened potassium iodate-starch paper to blue.

**(3)** Determine the infrared absorption spectrum of Deferoxamine Mesilate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Deferoxamine Mesilate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**pH** <2.54> Dissolve 1.0 g of Deferoxamine Mesilate in 10 mL of water: the pH of this solution is between 3.5 and 5.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Deferoxamine Mesilate in 10 mL of water: the solution is clear and colorless to pale yellow.

**(2)** Chloride <1.03>—Perform the test with 1.0 g of Deferoxamine Mesilate. Prepare the control solution with 0.90 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.032%).

**(3)** Sulfate <1.14>—Perform the test with 0.6 g of Deferoxamine Mesilate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.040%).

**(4)** Heavy metals <1.07>—Proceed with 2.0 g of Deferoxamine Mesilate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(5)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Deferoxamine Mesilate according to Method 3, and perform the test. Use a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) (not more than 2 ppm).

**(6)** Related substances—Dissolve 50 mg of Deferoxamine Mesilate in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of all peaks other than the peak of deferoxamine is not larger than the peak area of deferoxamine from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 230 nm).

**Column:** A stainless steel column 4 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Dissolve 1.32 g of diammonium hydrogen phosphate, 0.37 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate and 1.08 g of sodium 1-heptanesulfonate in 950 mL of water, and adjust the pH of this solution

to 2.8 with phosphoric acid. To 800 mL of this solution add 100 mL of 2-propanol.

**Flow rate:** Adjust the flow rate so that the retention time of deferoxamine is about 15 minutes.

**Time span of measurement:** About two times as long as the retention time of deferoxamine beginning after the solvent peak.

**System suitability—**

**Test for required detection:** To exactly 2 mL of the standard solution add the mobile phase to make exactly 100 mL. Confirm that the peak area of deferoxamine obtained from 20  $\mu$ L of this solution is equivalent to 1.5 to 2.5% of that of deferoxamine obtained from 20  $\mu$ L of the standard solution.

**System performance:** Dissolve 16 mg of Deferoxamine Mesilate and 4 mg of methyl parahydroxybenzoate in 50 mL of the mobile phase. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, deferoxamine and methyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of deferoxamine is not more than 3.0%.

**Water** <2.48> Not more than 2.0% (0.2 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 60 mg of Deferoxamine Mesilate and Deferoxamine Mesilate Reference Standard (previously determine the water <2.48> in the same manner as Deferoxamine Mesilate), dissolve each in 20 mL of water, add 10 mL of 0.05 mol/L sulfuric acid TS, and add water to make exactly 50 mL. Pipet 5 mL each of these solutions, add exactly 5 mL of 0.05 mol/L sulfuric acid TS and exactly 0.2 mL of iron (III) chloride TS, then add water to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared by adding 0.05 mol/L sulfuric acid TS to 0.2 mL of iron (III) chloride TS to make exactly 50 mL as the blank, and determine the absorbances,  $A_T$  and  $A_S$ , of each solution from the sample solution and the standard solution at 430 nm.

$$\begin{aligned} \text{Amount (mg) of } C_{25}H_{48}N_6O_8 \cdot CH_4O_3S \\ = W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Deferoxamine Mesilate Reference Standard, calculated on the anhydrous basis

**Containers and storage** Containers—Tight containers.

## Dehydrocholic Acid

デヒドロコール酸

$C_{24}H_{34}O_5$ : 402.52  
3,7,12-Trioxo-5 $\beta$ -cholan-24-oic acid [81-23-2]

Dehydrocholic Acid, when dried, contains not less than 98.5% of  $C_{24}H_{34}O_5$ .

**Description** Dehydrocholic Acid occurs as a white, crystalline powder. It is odorless, and has a bitter taste.

It is sparingly soluble in 1,4-dioxane, slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.

It dissolves in sodium hydroxide TS.

**Identification (1)** Dissolve 5 mg of Dehydrocholic Acid in 1 mL of sulfuric acid and 1 drop of formaldehyde solution, and allow to stand for 5 minutes. Add 5 mL of water to the solution: the solution shows a yellow color and a blue-green fluorescence.

(2) To 0.02 g of Dehydrocholic Acid add 1 mL of ethanol (95), shake, add 5 drops of 1,3-dinitrobenzene TS and 0.5 mL of a solution of sodium hydroxide (1 in 8), and allow to stand: a purple to red-purple color develops, and gradually changes to brown.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +29 - +32° (after drying, 0.2 g, 1,4-dioxane, 10 mL, 100 mm).

**Melting point** <2.60> 233 - 242°C

**Purity (1)** Odor—To 2.0 g of Dehydrocholic Acid add 100 mL of water, and boil for 2 minutes: the solution is odorless.

(2) Clarity and color of solution—To 0.10 g of Dehydrocholic Acid, previously powdered in a mortar, add 30 mL of ethanol (95), and dissolve by shaking for 10 minutes: the solution is clear and colorless.

(3) Chloride <1.03>—To 2.0 g of Dehydrocholic Acid add 100 mL of water, shake for 5 minutes and filter, and use this filtrate as the sample solution. To 25 mL of the sample solution add 6 mL of dilute nitric acid, heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(4) Sulfate <1.14>—Add 1 mL of dilute hydrochloric acid to 25 mL of the sample solution obtained in (3), heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL, and perform the test using this solution as the test solution. Pre-

pare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(5) Heavy metals <1.07>—Proceed with 1.0 g of Dehydrocholic Acid according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(6) Barium—To the solution obtained in (1) add 2 mL of hydrochloric acid, and boil for 2 minutes. Cool, filter, and wash with water until 100 mL of the filtrate is obtained. To 10 mL of the filtrate add 1 mL of dilute sulfuric acid: no turbidity is produced.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.5 g of Dehydrocholic Acid, previously dried, add 40 mL of neutralized ethanol and 20 mL of water, and dissolve by warming. Add 2 drops of phenolphthalein TS, titrate <2.50> with 0.1 mol/L sodium hydroxide VS, adding 100 mL of freshly boiled and cooled water as the end point is approached, and continue the titration.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 40.25 mg of  $C_{24}H_{34}O_5$

**Containers and storage** Containers—Well-closed containers.

## Purified Dehydrocholic Acid

精製デヒドロコール酸

$C_{24}H_{34}O_5$ : 402.52  
3,7,12-Trioxo-5 $\beta$ -cholan-24-oic acid [81-23-2]

Purified Dehydrocholic Acid, when dried, contains not less than 99.0% of  $C_{24}H_{34}O_5$ .

**Description** Purified Dehydrocholic Acid occurs as a white, crystalline powder. It is odorless, and has a bitter taste.

It is sparingly soluble in 1,4-dioxane, slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.

It dissolves in sodium hydroxide TS.

**Identification (1)** Dissolve 5 mg of Purified Dehydrocholic Acid in 1 mL of sulfuric acid and 1 drop of formaldehyde solution, and allow to stand for 5 minutes. Add 5 mL of water to the solution: the solution shows a yellow color and blue-green fluorescence.

(2) To 0.02 g of Purified Dehydrocholic Acid add 1 mL of ethanol (95), shake, add 5 drops of 1,3-dinitrobenzene TS and 0.5 mL of a solution of sodium hydroxide (1 in 8), and allow to stand: a purple to red-purple color develops, and gradually changes to brown.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +29 – +32° (after drying, 0.2 g, 1,4-dioxane, 10 mL, 100 mm).

**Melting point** <2.60> 237 – 242°C

**Purity (1) Odor**—To 2.0 g of Purified Dehydrocholic Acid add 100 mL of water, and boil for 2 minutes: the solution is odorless.

(2) Clarity and color of solution—Dissolve 0.10 g of Purified Dehydrocholic Acid, previously powdered in a mortar, in 30 mL of ethanol (95) by shaking for 10 minutes: the solution is clear and colorless.

(3) Chloride <1.03>—To 2.0 g of Purified Dehydrocholic Acid add 100 mL of water, shake for 5 minutes and filter, and use this filtrate as the sample solution. To 25 mL of the sample solution add 6 mL of dilute nitric acid, heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(4) Sulfate <1.14>—Add 1 mL of dilute hydrochloric acid to 25 mL of the sample solution obtained in (3), heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(5) Heavy metals <1.07>—Proceed with 1.0 g of Purified Dehydrocholic Acid according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(6) Barium—To the solution obtained in (1) add 2 mL of hydrochloric acid, and boil for 2 minutes, cool, filter, and wash the filter with water until 100 mL of the filtrate is obtained. To 10 mL of the filtrate add 1 mL of dilute sulfuric acid: no turbidity is produced.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.5 g of Purified Dehydrocholic Acid, previously dried, add 40 mL of neutralized ethanol and 20 mL of water, and dissolve by warming. Add 2 drops of phenolphthalein TS, then titrate <2.50> with 0.1 mol/L sodium hydroxide VS, adding 100 mL of freshly boiled and cooled water as the end point is approached, and continue the titration.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 40.25 mg of  $C_{24}H_{34}O_5$

**Containers and storage** Containers—Well-closed containers.

## Dehydrocholic Acid Injection

### Dehydrocholate Sodium Injection

デヒドロコール酸注射液

Dehydrocholic Acid Injection is an aqueous solution for injection.

It contains not less than 95% and not more than 105% of the labeled amount of dehydrocholic acid ( $C_{24}H_{34}O_5$ ; 402.52).

**Method of preparation** Dissolve Purified Dehydrocholic Acid in a solution of Sodium Hydroxide, and prepare as directed under Injections.

**Description** Dehydrocholic Acid Injection is a clear, colorless to light yellow liquid, and has a bitter taste.

pH: 9 – 11

**Identification** Transfer a volume of Dehydrocholic Acid Injection, equivalent to 0.1 g of Purified Dehydrocholic Acid according to the labeled amount, to a separator, and add 10 mL of water and 1 mL of dilute hydrochloric acid: a white precipitate is produced. Extract the mixture with three 15-mL portions of chloroform, combine all the chloroform extracts, evaporate the chloroform on a water bath, and dry the residue at 105°C for 1 hour: the residue so obtained melts <2.60> between 235°C and 242°C.

**Purity** Heavy metals <1.07>—Evaporate a volume of Dehydrocholic Acid Injection, equivalent to 1.0 g of Purified Dehydrocholic Acid according to the labeled amount, on a water bath to dryness. Proceed with the residue according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Bacterial endotoxins** <4.01> Less than 0.30 EU/mg.

**Extractable volume** <6.05> It meets the requirement.

**Assay** Transfer an exactly measured volume of Dehydrocholic Acid Injection, equivalent to about 0.5 g of dehydrocholic acid ( $C_{24}H_{34}O_5$ ), to a 100-mL separator, and add, if necessary, water to make 25 mL. Add 2 mL of hydrochloric acid, and extract with 25-mL, 20-mL and 15-mL portions of chloroform successively. Combine the chloroform extracts, wash with cold water until the washings become negative to acid, and evaporate the chloroform on a water bath. Dissolve the residue in 40 mL of neutralized ethanol and 20 mL of water by warming. Add 2 drops of phenolphthalein TS to this solution, titrate <2.50> with 0.1 mol/L sodium hydroxide VS, adding 100 mL of freshly boiled and cooled water as the end point is approached, and continue the titration.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 40.25 mg of  $C_{24}H_{34}O_5$

**Containers and storage** Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant.

## Demethylchlortetracycline Hydrochloride

デメチルクロルテトラサイクリン塩酸塩

$C_{21}H_{21}ClN_2O_8 \cdot HCl$ : 501.31  
(4*S*,4*aS*,5*aS*,6*S*,12*aS*)-7-Chloro-4-dimethylamino-3,6,10,12,12*a*-pentahydroxy-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracyceno-2-carboxamide monohydrochloride [64-73-3]

Demethylchlortetracycline Hydrochloride is the hydrochloride of a tetracycline substance having antibacterial activity produced by the growth of the mutant of *Streptomyces aureofaciens*.

It contains not less than 900  $\mu$ g (potency) and not more than 1010  $\mu$ g (potency) per mg, calculated on the dried basis. The potency of Demethylchlortetracycline Hydrochloride is expressed as mass (potency) of demethylchlortetracycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ).

**Description** Demethylchlortetracycline Hydrochloride occurs as a yellow crystalline powder.

It is soluble in water, and slightly soluble in ethanol (99.5).

**Identification (1)** Dissolve 40 mg of Demethylchlortetracycline Hydrochloride in 250 mL of water. To 10 mL of this solution add 85 mL of water and 5 mL of a solution of sodium hydroxide (1 in 5). Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Demethylchlortetracycline Hydrochloride Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Demethylchlortetracycline Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Demethylchlortetracycline Hydrochloride Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Demethylchlortetracycline Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> (2) for chloride.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-248 - -263^\circ$  (0.25 g calculated on the dried basis, 0.1 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Demethylchlortetracycline Hydrochloride in 100 mL of water: the pH of the solution is between 2.0 and 3.0.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of

Demethylchlortetracycline Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Demethylchlortetracycline Hydrochloride according to Method 4, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 25 mg of Demethylchlortetracycline Hydrochloride in 50 mL of 0.01 mol/L hydrochloric acid TS, and use this solution as the sample solution. Pipet 5 mL of the sample solution, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area obtained from the chromatograms of these solutions by the automatic integration method: the peak area other than demethylchlortetracycline obtained from the sample solution is not more than 6/5 times that of demethylchlortetracycline from the standard solution, and the sum of the areas of the peaks other than demethylchlortetracycline from the sample solution is not more than 2 times the peak area of demethylchlortetracycline from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of demethylchlortetracycline beginning after the solvent peak.

**System suitability**—

Test for required detectability: Measure exactly 10 mL of the standard solution, add 0.01 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the solution for system suitability test. Pipet 5 mL of the solution for system suitability test, and add 0.01 mol/L hydrochloric acid TS to make exactly 50 mL. Confirm that the peak area of demethylchlortetracycline obtained from 20  $\mu$ L of this solution is equivalent to 7 to 13% of that from 20  $\mu$ L of the solution for system suitability test.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of demethylchlortetracycline is not more than 1.0%.

**Loss on drying** <2.41> Not more than 2.0% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately an amount of Demethylchlortetracycline Hydrochloride and Demethylchlortetracycline Hydrochloride Reference Standard, equivalent to about 25 mg (potency), dissolve each in 0.01 mol/L hydrochloric acid TS to make exactly 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of demethylchlortetracycline.

Amount [ $\mu$ g (potency)] of  $C_{21}H_{21}ClN_2O_8 \cdot HCl$

$$= W_S \times (A_T/A_S) \times 1000$$

$W_S$ : Amount [mg (potency)] of Demethylchlortetracycline Hydrochloride Reference Standard

#### Operating conditions—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.1 mm in inside diameter and 25 cm in length, packed with styrene-divinylbenzene copolymer for liquid chromatography (10  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 60°C.

**Mobile phase:** Dissolve 3.5 g of dipotassium hydrogen phosphate, 1.5 g of tetrabutylammonium hydrogensulfate and 0.4 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate in 300 mL of water, and adjust the pH to 8.5 with sodium hydroxide TS. To this solution add 75.0 g of *t*-butanol and water to make 1000 mL.

**Flow rate:** Adjust the flow rate so that the retention time of demethylchlortetracycline is about 8 minutes.

#### System suitability—

**System performance:** Heat 10 mL of the standard solution on a water bath for 60 minutes. When the procedure is run with 20  $\mu$ L of this solution so obtained under the above operating conditions, 4-epidemethylchlortetracycline and demethylchlortetracycline are eluted in this order with the resolution between these peaks being not less than 3. The relative retention time of 4-epidemethylchlortetracycline with respect to demethylchlortetracycline is about 0.7.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of demethylchlortetracycline is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Deslanoside

デスラノシド

$C_{47}H_{74}O_{19}$ : 943.08

3 $\beta$ -[ $\beta$ -D-Glucopyranosyl-(1 $\rightarrow$ 4)-2,6-dideoxy-

$\beta$ -D-ribo-hexopyranosyl-(1 $\rightarrow$ 4)-2,6-dideoxy-  
 $\beta$ -D-ribo-hexopyranosyl-(1 $\rightarrow$ 4)-2,6-dideoxy- $\beta$ -D-ribo-  
hexopyranosyloxy]-12 $\beta$ ,14-dihydroxy-5 $\beta$ ,14 $\beta$ -card-  
20(22)-enolide [17598-65-1]

Deslanoside, when dried, contains not less than 90.0% and not more than 102.0% of  $C_{47}H_{74}O_{19}$ .

**Description** Deslanoside occurs as colorless or white crystals or a white, crystalline powder. It is odorless.

It is freely soluble in anhydrous pyridine, sparingly soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.

It is hygroscopic.

**Identification** Transfer 1 mg of Deslanoside to a small test tube about 10 mm in inside diameter, dissolve in 1 mL of a solution of iron (III) chloride hexahydrate in acetic acid (100) (1 in 1000), and underlay gently with 1 mL of sulfuric acid: at the zone of contact of two liquids a brown ring is produced, and the color of the upper layer near to the contact zone changes gradually to blue through purple, and the entire acetic acid layer shows a blue-green color through a deep blue color.

**Purity (1)** Clarity and color of solution—Dissolve 20 mg of Deslanoside in 10 mL of ethanol (95) and 3 mL of water by warming, cool, and dilute to 100 mL with water: the solution is clear and colorless.

**(2)** Related substances—Dissolve 10 mg of Deslanoside in exactly 5 mL of methanol, and use this solution as the sample solution. Dissolve 1.0 mg of Deslanoside Reference Standard in exactly 5 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, methanol and water (84:15:1) to a distance of about 13 cm, and air-dry the plate. Spray evenly dilute sulfuric acid on the plate, and heat the plate at 110°C for 10 minutes: the spots other than the principal spot from the sample solution are not larger than and not more intense than the spot from the standard solution.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +6.5 – +8.5° (after drying, 0.5 g, anhydrous pyridine, 25 mL, 100 mm).

**Loss on drying** <2.41> Not more than 8.0% (0.5 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.5% (0.1 g).

**Assay** Dissolve about 12 mg each of Deslanoside and Deslanoside Reference Standard, previously dried and accurately weighed, in 20 mL each of methanol, add water to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Pipet 5 mL each of these solutions, transfer to light-resistant, 25-mL volumetric flasks, shake well with 5 mL each of 2,4,6-trinitrophenol TS and 0.5 mL each of a solution of sodium hydroxide (1 in 10), add diluted methanol (1 in 4) to make 25 mL, and allow to stand at a temperature between 18°C and 22°C for 25 minutes. Determine the absorbances,  $A_T$  and  $A_S$ , of the subsequent solutions of the sample solution and standard solution, respectively, at 485 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared

with 5 mL of diluted methanol (1 in 5) in the same manner as the blank.

$$\begin{aligned} \text{Amount (mg) of } C_{47}H_{74}O_{19} \\ = W_s \times (A_T/A_S) \end{aligned}$$

$W_s$ : Amount (mg) of Deslanoside Reference Standard

**Containers and storage** Containers—Tight containers.

## Deslanoside Injection

デスラノシド注射液

Deslanoside Injection is an aqueous solution for injection.

It contains not less than 90% and not more than 110% of the labeled amount of deslanoside ( $C_{47}H_{74}O_{19}$ ; 943.08).

**Method of preparation** Dissolve Deslanoside in 10 vol% ethanol and prepare as directed under Injections. It may contain Glycerin. It may be prepared with a suitable amount of Ethanol and Water for Injection.

**Description** Deslanoside Injection is a clear and colorless liquid.

pH: 5.0 – 7.0

**Identification (1)** Place a volume of Deslanoside Injection, equivalent to 2 mg of Deslanoside according to the labeled amount, in a separator, add sodium chloride in the ratio of 0.2 g to each mL of this solution, and extract with three 10-mL portions of chloroform. Combine the chloroform extracts, mix uniformly, pipet 15 mL of this solution, and evaporate the chloroform under reduced pressure. Proceed with the residue as directed in the Identification under Deslanoside.

(2) Place a volume of Deslanoside Injection, equivalent to 1 mg of Deslanoside according to the labeled amount, in a separator, add sodium chloride in the ratio of 0.2 g to each mL of this solution, and extract with three 5-mL portions of chloroform. Combine the chloroform extracts, evaporate the chloroform under reduced pressure, dissolve the residue in 5 mL of methanol, and use this solution as the sample solution. Separately, dissolve 1 mg of Deslanoside Reference Standard in 5 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu$ L each of these solutions on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, methanol and water (84:15:1) to a distance of about 13 cm, and air-dry the plate. Spray evenly dilute sulfuric acid upon the plate, and heat the plate at 110°C for 10 minutes: the spots from the sample solution and the standard solution show a black color and have the same  $R_f$  value.

**Extractable volume** <6.05> It meets the requirement.

**Assay** Measure exactly a volume of Deslanoside Injection, equivalent to about 3 mg of deslanoside ( $C_{47}H_{74}O_{19}$ ). Add 5 mL of methanol and water to make 25 mL. Use this solution as the sample solution, and proceed as directed in the Assay under Deslanoside.

Amount (mg) of deslanoside ( $C_{47}H_{74}O_{19}$ )

$$= W_s \times (A_T/A_S) \times (1/4)$$

$W_s$ : Amount (mg) of Deslanoside Reference Standard

**Containers and storage** Containers—Hermetic containers. Storage—Light-resistant.

## Dexamethasone

デキサメタゾン

$C_{22}H_{29}FO_5$ ; 392.46

9-Fluoro-11 $\beta$ ,17,21-trihydroxy-16 $\alpha$ -methylpregna-1,4-diene-3,20-dione [50-02-2]

Dexamethasone, when dried, contains not less than 97.0% and not more than 102.0% of  $C_{22}H_{29}FO_5$ .

**Description** Dexamethasone occurs as white to pale yellow crystals or crystalline powder.

It is sparingly soluble in methanol, in ethanol (95) and in acetone, slightly soluble in acetonitrile, and practically insoluble in water.

Melting point: about 245°C (with decomposition).

**Identification (1)** Proceed with 10 mg of Dexamethasone as directed under Oxygen Flask Combustion Method, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the solution obtained responds to the Qualitative Tests <1.09> for fluoride

(2) Dissolve 1 mg of Dexamethasone in 10 mL of ethanol (95). Mix 2 mL of the solution with 10 mL of phenylhydrazine hydrochloride TS, heat in a water bath at 60°C for 20 minutes, and cool the solution. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using as the blank the solution prepared with 2 mL of ethanol (95) in the same manner as the former solution, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Dexamethasone Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Dexamethasone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Dexamethasone Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Dexamethasone and Dexamethasone Reference Standard in acetone, respectively, then evaporate the acetone to dryness, and repeat the test on the residues.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +86 – +94° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of

Dexamethasone according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(2) Related substances—Dissolve 0.18 g of Dexamethasone in 100 mL of acetonitrile. To 33 mL of this solution add a solution, prepared by dissolving 1.32 g of ammonium formate in water to make 1000 mL and adjusted to pH 3.6 with formic acid, to make 100 mL, and use this solution as the sample solution. To exactly 1 mL of the sample solution add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than dexamethasone is not larger than the peak area of dexamethasone obtained from the standard solution, and the total area of the peaks other than the peak of dexamethasone from the sample solution is not larger than 2 times the peak area of dexamethasone from the standard solution

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with phenylsilylated silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 1.32 g of ammonium formate in 1000 mL of water, and adjust the pH to 3.6 with formic acid. To 670 mL of this solution add 330 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of dexamethasone is about 13 minutes.

Time span of measurement: About 4 times as long as the retention time of dexamethasone beginning after the solvent peak.

**System suitability—**

Test for required detectability: To exactly 1 mL of the standard solution add the mobile phase to make exactly 10 mL. Confirm that the peak area of dexamethasone obtained with 10  $\mu$ L of this solution is equivalent to 8 to 12% of that with 10  $\mu$ L of the standard solution.

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of dexamethasone are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of dexamethasone is not more than 1.0%.

**Loss on drying** <2.41> Not more than 0.5% (0.2 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.2 g, platinum crucible).

**Assay** Dissolve about 10 mg each of Dexamethasone and Dexamethasone Reference Standard, previously dried and accurately weighed, in 70 mL each of diluted methanol (1 in 2), add exactly 5 mL each of the internal standard solution, then add diluted methanol (1 in 2) to make 100 mL, and use these solutions as the sample solution and standard solution.

Perform the test with 10  $\mu$ L each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of dexamethasone to that of the internal standard, respectively.

$$\text{Amount (mg) of } C_{22}H_{29}FO_5 = W_S \times Q_T / Q_S$$

$W_S$ : Amount (mg) of Dexamethasone Reference Standard

**Internal standard solution**—A solution of propyl parahydroxybenzoate in diluted methanol (1 in 2) (1 in 1000).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and acetonitrile (2:1).

Flow rate: Adjust the flow rate so that the retention time of dexamethasone is about 6 minutes.

**System suitability—**

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, dexamethasone and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of dexamethasone to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Dextran 40

### デキストラン 40

Dextran 40 is a product obtained by partial decomposition of polysaccharide, which is produced by fermentation of sucrose with *Leuconostoc mesenteroides* van Tieghem (*Lactobacillaceae*), and the average molecular mass is about 40,000.

When dried, it contains not less than 98.0% and not more than 102.0% of dextran 40.

**Description** Dextran 40 occurs as a white, amorphous powder. It is odorless and tasteless.

It is practically insoluble in ethanol (95) and in diethyl ether.

It dissolves gradually in water.

It is hygroscopic.

**Identification** To 1 mL of a solution of Dextran 40 (1 in 3000) add 2 mL of anthrone TS: a blue-green color develops and turns gradually dark blue-green. Then to this solution add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100): the solution does not change in color.

**pH** <2.54> Dissolve 1.0 g of Dextran 40 in 10 mL of water:

the pH of this solution is between 5.0 and 7.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Dextran 40 in 10 mL of water by warming: the solution is clear and colorless.

(2) Chloride <1.03>—Perform the test with 2.0 g of Dextran 40. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid (not more than 0.018%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Dextran 40 according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.5 g of Dextran 40 according to Method 1, and perform the test (not more than 1.3 ppm).

(5) Nitrogen—Weigh accurately about 2 g of Dextran 40, previously dried, and perform the test as directed under Nitrogen Determination <1.08>, where 10 mL of sulfuric acid is used for decomposition, and 45 mL of a solution of sodium hydroxide (2 in 5) is added: the amount of nitrogen (N: 14.01) is not more than 0.010%.

(6) Reducing substances—Weigh exactly 3.00 g of Dextran 40, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh exactly 0.450 g of glucose, previously dried, dissolve in water to make exactly 500 mL, and use this solution as the control solution. Pipet 5 mL each of the sample solution and the control solution, and add water to make exactly 50 mL, respectively. Pipet 5 mL each of these solutions, add 5 mL of alkaline copper TS, exactly measured, and heat for 15 minutes in a water bath. After cooling, add 1 mL of a solution of potassium iodine (1 in 40) and 1.5 mL of dilute sulfuric acid, and titrate <2.50> with 0.005 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS).

The titrant consumed for the sample solution is not less than that for the control solution.

**Loss on drying** <2.41> Not more than 5.0% (1 g, 105°C, 6 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Viscosity** <2.53> (1) Dextran 40—Weigh accurately 0.2 to 0.5 g of Dextran 40, previously dried, dissolve in water to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and with water as directed in Method 1 at 25°C: the intrinsic viscosity is between 0.16 and 0.19.

(2) High-molecular fraction—Weigh accurately about 6 g of Dextran 40, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 7% to 10% of the precipitate (usually 80 to 90 mL) at 25 ± 1°C with stirring. Dissolve the precipitate at 35°C in a water bath with occasional shaking, and allow to stand for more than 15 hours at 25 ± 1°C. Remove the supernatant liquid by decantation, and heat the precipitate of the lower layer to dryness on a water bath. Dry the residue, and determine the intrinsic viscosity of the dried substance as directed in (1): the value is not more than 0.27.

(3) Low-molecular fraction—Weigh accurately about 6 g of Dextran 40, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 90% to 93% of the precipitate (usually 115 to 135 mL) at 25 ± 1°C with stirring, centrifuge at 25°C, and evaporate the supernatant liquid to dryness on a water bath.

Dry the residue, and determine the intrinsic viscosity of the dried substance as directed in (1): the value is not less than 0.09.

**Antigenicity** Dissolve 10.0 g of Dextran 40 in isotonic sodium chloride solution to make 100 mL, sterilize, and use this solution as the sample solution. Inject 1.0 mL of the sample solution on 3 occasions at intervals of 2 days into the peritoneal cavity of each of 4 well-nourished, healthy guinea pigs weighing 250 to 300 g. Inject 0.10 mL of horse serum into the peritoneal cavity of each of 4 guinea pigs of another group as a control. Inject 0.20 mL of the sample solution intravenously to each of 2 guinea pigs of the first group 14 days after the first intraperitoneal injection and into each of the remaining 2 guinea pigs 21 days after the injection, and inject 0.20 mL of horse serum intravenously in the same manner into each guinea pig of the second group. Observe the signs of respiratory distress, collapse or death of the animals for 30 minutes after each intravenous injection and 24 hours later: the animals of the first group exhibit no signs mentioned above.

All the animals of the second group exhibit symptoms of respiratory distress or collapse and not less than 3 animals are killed.

**Pyrogen** <4.04> Dissolve 10.0 g of Dextran 40 in isotonic sodium chloride solution to make 100 mL, and perform the test: this solution meets the requirement.

**Assay** Weigh accurately about 3 g of Dextran 40, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the sample solution. Determine the optical rotation  $\alpha_D$  with the sample solution as directed under Optical Rotation Determination <2.49> in a 100-mL cell at 20 ± 1°C.

$$\text{Amount (mg) of dextran 40} = \alpha_D \times 253.8$$

**Containers and storage** Containers—Tight containers.

## Dextran 40 Injection

デキストラン 40 注射液

Dextran 40 Injection is an aqueous solution for injection.

It contains not less than 9.5 w/v% and not more than 10.5 w/v% of dextran 40.

### Method of preparation

Dextran 40	10 g
Isotonic Sodium Chloride Solution	a sufficient quantity
To make 100 mL	

Prepare as directed under Injections, with the above ingredients.

No preservative is added.

**Description** Dextran 40 Injection is a clear and colorless liquid. It is slightly viscous.

**Identification (1)** Dilute 1 mL of Dextran 40 Injection with water to 200 mL, and to 1 mL of the diluted solution add 2 mL of anthrone TS: a blue-green color develops and

turns gradually dark blue-green. Add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100) to this solution: the solution does not change in color.

(2) Dextran 40 Injection responds to the Qualitative Tests <1.09> for sodium salt and for chloride.

**pH** <2.54> 4.5 – 7.0

**Bacterial endotoxins** <4.01> Less than 0.50 EU/mL.

**Extractable volume** <6.05> It meets the requirement.

**Viscosity** <2.53> Measure exactly 2 to 5 mL of Dextran 40 Injection, add isotonic sodium chloride solution to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and with isotonic sodium chloride solution as directed in Method 1 at 25°C: the intrinsic viscosity is between 0.16 and 0.19. Calculate the concentration of the sample solution (g/100 mL) as directed in the Assay.

**Assay** To exactly 30 mL of Dextran 40 Injection add water to make exactly 50 mL, and use this solution as the sample solution. Determine the optical rotation  $\alpha_D$  with the sample solution as directed under Optical Rotation Determination <2.49> in a 100-mL cell at  $20 \pm 1^\circ\text{C}$ .

$$\begin{aligned} &\text{Amount (mg) of dextran 40 in 100 mL of} \\ &\text{Dextran 40 Injection} \\ &= \alpha_D \times 846.0 \end{aligned}$$

**Containers and storage** Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

Storage—Avoid exposure to undue fluctuations in temperature.

## Dextran 70

デキストラン 70

Dextran 70 is a product obtained by partial decomposition of polysaccharide, which is produced by fermentation of sucrose with *Leuconostoc mesenteroides* van Tieghem (*Lactobacillaceae*), and the average molecular mass is about 70,000.

When dried, it contains not less than 98.0% and not more than 102.0% of dextran 70.

**Description** Dextran 70 occurs as a white, amorphous powder. It is odorless and tasteless.

It is practically insoluble in ethanol (95) and in diethyl ether.

It dissolves gradually in water.

It is hygroscopic.

**Identification** To 1 mL of a solution of Dextran 70 (1 in 3000) add 2 mL of anthrone TS: a blue-green color develops and turns gradually dark blue-green. Then to this solution add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100): the solution does not change in color.

**pH** <2.54> Dissolve 3.0 g of Dextran 70 in 50 mL of water: the pH of this solution is between 5.0 and 7.0.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Dextran 70 in 10 mL of water with warming: the solution is

clear and colorless.

(2) Chloride <1.03>—With 2.0 g of Dextran 70, perform the test. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.018%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Dextran 70 according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.5 g of Dextran 70 according to Method 1, and perform the test (not more than 1.3 ppm).

(5) Nitrogen—Weigh accurately about 2 g of Dextran 70, previously dried, perform the test as directed under Nitrogen Determination <1.08>, where 10 mL of sulfuric acid is used for decomposition, and 45 mL of a solution of sodium hydroxide (2 in 5) is added: the amount of nitrogen (N: 14.007) is not more than 0.010%.

(6) Reducing substances—Weigh exactly 3.00 g of Dextran 70, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh exactly 0.300 g of glucose, previously dried, dissolve in water to make exactly 500 mL, and use this solution as the control solution. Pipet 5 mL each of the sample solution and the control solution, and add water to make exactly 50 mL, respectively. Pipet 5 mL of these diluted solutions, add exactly 5 mL of alkaline copper TS, and heat for 15 minutes in a water bath. After cooling, add 1 mL of a solution of potassium iodide (1 in 40) and 1.5 mL of dilute sulfuric acid, and titrate <2.50> with 0.005 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS).

The titrant consumed for the sample solution is not less than that for the control solution.

**Loss on drying** <2.41> Not more than 5.0% (1 g, 105°C, 6 hours).

**Residue on ignition** <2.44> Not more than 0.10% (1 g).

**Viscosity** <2.53> (1) Dextran 70—Weigh accurately 0.2 to 0.5 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and with water as directed in Method 1 at 25°C: the intrinsic viscosity is between 0.21 and 0.26.

(2) High-molecular fraction—Weigh accurately about 6 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 7% to 10% of the precipitate (usually, 75 to 85 mL) at  $25 \pm 1^\circ\text{C}$  with stirring. Dissolve the precipitate in a water bath at 35°C with occasional shaking, and allow to stand for more than 15 hours at  $25 \pm 1^\circ\text{C}$ . Remove the supernatant liquid by decantation, and heat the precipitate of the lower layer on a water bath to dryness. Dry the residue, and determine the intrinsic viscosity of the dried residue as directed in (1): the value is not more than 0.35.

(3) Low-molecular fraction—Weigh accurately about 6 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 90% to 93% of the precipitate (usually 110 to 130 mL) at  $25 \pm 1^\circ\text{C}$  with stirring, centrifuge at 25°C, and evaporate the supernatant liquid to dryness on a water bath. Dry the residue, and determine the intrinsic viscosity of the dried residue as directed in (1): the value is not less than 0.10.

**Antigenicity** Dissolve 6.0 g of Dextran 70 in isotonic sodi-

um chloride solution to make 100 mL, sterilize, and use this solution as the sample solution. Inject 1.0 mL of the sample solution on 3 occasions at intervals of 2 days into the peritoneal cavity of each of 4 well-nourished, healthy guinea pigs weighing 250 to 300 g. Separately, inject 0.10 mL of horse serum into the peritoneal cavity of each of 4 guinea pigs of another group as a control. Inject 0.20 mL of the sample solution intravenously to each of 2 guinea pigs of the first group 14 days after the first intraperitoneal injection and into each of the remaining 2 guinea pigs 21 days after the injection, and inject 0.20 mL of horse serum intravenously in the same manner into each guinea pig of the second group. Observe the signs of respiratory distress, collapse or death of the animals for 30 minutes after each intravenous injection and 24 hours later: the animals of the first group exhibit not signs.

All the animals of the second group exhibit symptoms of respiratory distress or collapse and not less than 3 animals are killed.

**Pyrogen** <4.04> Dissolve 6.0 g of Dextran 70 in isotonic sodium chloride solution to make 100 mL, and perform the test: this solution meets the requirement.

**Assay** Weigh accurately about 3 g of Dextran 70, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the sample solution. Determine the optical rotation  $\alpha_D$  as directed under Optical Rotation Determination <2.49> in a 100-mL cell at  $20 \pm 1^\circ\text{C}$ .

$$\text{Amount (mg) of dextran 70} \times \alpha_D = 253.8$$

**Containers and storage** Containers—Tight containers.

## Dextran Sulfate Sodium Sulfur 5

デキストラン硫酸エステルナトリウム イオウ 5

Dextran Sulfate Sodium Sulfur 5 is a sodium salt of sulfate ester obtained by sulfation of partial decomposition products of dextran, which is produced by fermentation of sucrose with *Leuconostoc mesenteroides* Van Tieghem (*Lactobacillaceae*).

**Description** Dextran Sulfate Sodium Sulfur 5 occurs as a white to light yellowish white powder. It is odorless, and has a saline taste.

It is freely soluble in water and practically insoluble in ethanol (95) and in diethyl ether.

It is hygroscopic.

**Identification** (1) To 10 mL of a solution of toluidine blue (1 in 100,000) add 0.05 mL of a solution of Dextran Sulfate Sodium Sulfur 5 (3 in 50) dropwise: a color of the solution changes from blue to red-purple.

(2) To 1 mL of a solution of Dextran Sulfate Sodium Sulfur 5 (1 in 1500) add 2 mL of anthrone TS: a blue-green color develops, which turns dark blue-green gradually. Then, add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100) to this solution: the solution remains dark blue-green.

(3) A solution of Dextran Sulfate Sodium Sulfur 5 (1 in 100) responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +135.0 – +155.0° (calculated

on the dried basis, 1.5 g, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Dextran Sulfate Sodium Sulfur 5 in 20 mL of water: the pH of this solution is between 5.5 and 7.5.

**Purity** (1) Clarity of solution—Dissolve 2.5 g of Dextran Sulfate Sodium Sulfur 5 in 50 mL of water: the solution is clear. And, determine the absorbance of the solution at 420 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>: not more than 0.090.

(2) Chloride <1.03>—Perform the test with 0.10 g of Dextran Sulfate Sodium Sulfur 5. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (not more than 0.106%).

(3) Sulfate <1.14>—Dissolve 0.10 g of Dextran Sulfate Sodium Sulfur 5 in 6 mL of water, add 0.6 mL of barium chloride TS, and heat in a water bath for 4 minutes. After cooling, add 1 mL of dilute hydrochloric acid and water to make 50 mL, allow to stand for 10 minutes, and observe: the turbidity of the solution is not more intense than that of the control solution. Prepare the control solution as follows: to 0.50 mL of 0.005 mol/L sulfuric acid add 6 mL of water, and proceed in the same manner (not more than 0.240%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of Dextran Sulfate Sodium Sulfur 5 according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(5) Arsenic <1.11>—Prepare the test solution with 1.0 g of Dextran Sulfate Sodium Sulfur 5 according to Method 3, and perform the test (not more than 2 ppm).

**Sulfur content** Weigh accurately about 1.0 g of Dextran Sulfate Sodium Sulfur 5, dissolve in 5 mL of water, add 1.5 mL of hydrochloric acid, and heat in a water bath for 1 hour. After cooling, add water to make exactly 100 mL, and use this solution as the sample solution. To exactly 10 mL of the sample solution add exactly 20 mL of 0.02 mol/L barium chloride VS, add 5 mL of methanol, and heat in a water bath for 30 minutes. After cooling, neutralize with sodium hydroxide TS, and add 70 mL of water, 10 mL of a solution of zinc disodium ethylenediamine tetraacetate tetrahydrate (1 in 20), 3 mL of ammonium chloride TS and 7 mL of strong ammonium water, and titrate <2.50> with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red to light blue (indicator: 5 drops of eriochrome black T TS). Perform a blank determination. Amount of sulfur (S: 32.07), calculated on the dried basis, is between 3.0 and 6.0%.

$$\begin{aligned} \text{Each mL of 0.02 mol/L barium chloride VS} \\ = 0.6413 \text{ mg of S} \end{aligned}$$

**Loss on drying** <2.41> Not more than 10.0% (0.5 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

**Viscosity** <2.53> Weigh accurately about 1.5 g of Dextran Sulfate Sodium Sulfur 5, calculated on the dried basis, dissolve in a solution of sodium chloride (29 in 500) to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and a solution of sodium chloride (29 in 500) at  $25 \pm 0.02^\circ\text{C}$  as directed: the intrinsic viscosity is between 0.030 and 0.040.

**Containers and storage** Containers—Tight containers.

## Dextran Sulfate Sodium Sulfur 18

デキストラン硫酸エステルナトリウム イオウ 18

Dextran Sulfate Sodium Sulfur 18 is a sodium salt of sulfate ester obtained by sulfation of partial decomposition products of dextran, which is produced by fermentation of sucrose with *Leuconostoc mesenteroides* Van Tieghem (*Lactobacillaceae*).

**Description** Dextran Sulfate Sodium Sulfur 18 occurs as a white to light yellowish white powder. It is odorless, and has a saline taste.

It is freely soluble in water and practically insoluble in ethanol (95) and in diethyl ether.

It is hygroscopic.

**Identification (1)** To 10 mL of a solution of toluidine blue (1 in 100,000) add 0.05 mL of a solution of Dextran Sulfate Sodium Sulfur 18 (3 in 50) dropwise: a color of the solution changes from blue to red-purple.

**(2)** To 1 mL of a solution of Dextran Sulfate Sodium Sulfur 18 (1 in 1500) add 2 mL of anthrone TS: a blue-green color develops, which turns dark blue-green gradually. Then, add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100) to this solution: the solution remains dark blue-green.

**(3)** A solution of Dextran Sulfate Sodium Sulfur 18 (1 in 100) responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +90.0 – +110.0° (calculated on the dried basis, 1.5 g, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Dextran Sulfate Sodium Sulfur 18 in 20 mL of water: the pH of this solution is between 5.5 and 7.5.

**Purity (1) Chloride** <1.03>—Perform the test with 0.10 g of Dextran Sulfate Sodium Sulfur 18. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (not more than 0.106%).

**(2) Sulfate** <1.14>—Dissolve 0.10 g of Dextran Sulfate Sodium Sulfur 18 in 6 mL of water, add 0.6 mL of barium chloride TS, and heat in a water bath for 4 minutes. After cooling, add 1 mL of dilute hydrochloric acid and water to make 50 mL, allow to stand for 10 minutes, and observe: the turbidity of the solution is not more intense than that of the control solution. Prepare the control solution as follows: to 1.0 mL of 0.005 mol/L sulfuric acid add 6 mL of water, and proceed in the same manner (not more than 0.480%).

**(3) Heavy metals** <1.07>—Proceed with 1.0 g of Dextran Sulfate Sodium Sulfur 18 according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(4) Arsenic** <1.11>—Prepare the test solution with 1.0 g of Dextran Sulfate Sodium Sulfur 18 according to Method 3, and perform the test (not more than 2 ppm).

**Sulfur content** Weigh accurately about 0.5 g of Dextran Sulfate Sodium Sulfur 18, dissolve in 5 mL of water, add 1.5 mL of hydrochloric acid, and heat in a water bath for 1 hour. After cooling, add water to make exactly 100 mL, and use this solution as the sample solution. To exactly 10 mL of the

sample solution add exactly 20 mL of 0.02 mol/L barium chloride VS, add 5 mL of methanol, and heat in a water bath for 30 minutes. After cooling, neutralize with sodium hydroxide TS, and add 70 mL of water, 10 mL of a solution of zinc disodium ethylenediamine tetraacetate tetrahydrate (1 in 20), 3 mL of ammonium chloride TS and 7 mL of strong ammonium water, and titrate <2.50> with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red to light blue (indicator: 5 drops of eriochrome black T TS). Perform a blank determination. Amount of sulfur (S: 32.07), calculated on the dried basis, is between 15.0 and 20.0%.

Each mL of 0.02 mol/L barium chloride VS  
= 0.6413 mg of S

**Loss on drying** <2.41> Not more than 10.0% (0.5 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

**Viscosity** <2.53> Weigh accurately about 1.5 g of Dextran Sulfate Sodium Sulfur 18, calculated on the dried basis, dissolve in a solution of sodium chloride (29 in 500) to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and a solution of sodium chloride (29 in 500) at  $25 \pm 0.02^\circ\text{C}$  as directed: the intrinsic viscosity is between 0.020 and 0.032.

**Containers and storage** Containers—Tight containers.

## Dextrin

デキストリン

**Description** Dextrin occurs as a white or light yellow, amorphous powder or granules. It has a slight, characteristic odor and a sweet taste. It does not irritate the tongue. Dextrin is freely soluble in boiling water, soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

**Identification** To 0.1 g of Dextrin add 100 mL of water, shake, and filter if necessary. To 5 mL of the filtrate add 1 drop of iodine TS: a light red-brown or light red-purple color develops.

**Purity (1) Clarity and color of solution**—Take 2.0 g of Dextrin in a Nessler tube, add 40 mL of water, dissolve by heating, cool, and add water to make 50 mL: the solution is colorless or light yellow. It is clear, and even if turbid, the turbidity is not more than that of the following control solution.

Control solution: To 1.0 mL of 0.005 mol/L sulfuric acid VS add 1 mL of dilute hydrochloric acid, 46 mL of water and 2 mL of barium chloride TS, allow to stand for 10 minutes, and shake before use.

**(2) Acidity**—To 1.0 g of Dextrin add 5 mL of water, dissolve by heating, cool, and add 1 drop of phenolphthalein TS and 0.50 mL of 0.1 mol/L sodium hydroxide VS: a red color develops.

**(3) Chloride** <1.03>—To 2.0 g of Dextrin add 80 mL of water, dissolve by heating, cool, add water to make 100 mL, and filter. Take 40 mL of the filtrate, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more

than 0.013%).

(4) Sulfate <1.14>—To 45 mL of the filtrate obtained in (3) add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.019%).

(5) Oxalate—To 1.0 g of Dextrin add 20 mL of water, dissolve by heating, cool, add 1 mL of acetic acid (31), and filter. To 5 mL of the filtrate add 5 drops of calcium chloride TS: no turbidity is produced immediately.

(6) Calcium—To a 5-mL portion of the filtrate obtained in (5) add 5 drops of ammonium oxalate TS: no turbidity is immediately produced.

(7) Heavy metals <1.07>—Proceed with 0.5 g of Dextrin according to Method 2, and perform the test. Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 50 ppm).

**Loss on drying** <2.41> Not more than 10% (0.5 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.5% (0.5 g).

**Containers and storage** Containers—Well-closed containers.

## Dextromethorphan Hydrobromide Hydrate

デキストロメトルファン臭化水素酸塩水和物

$C_{18}H_{25}NO \cdot HBr \cdot H_2O$ : 370.32  
(9*S*,13*S*,14*S*)-3-Methoxy-17-methylmorphinan  
monohydrobromide monohydrate [6700-34-1]

Dextromethorphan Hydrobromide Hydrate contains not less than 98.0% of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr$ : 352.31), calculated on the anhydrous basis.

**Description** Dextromethorphan Hydrobromide Hydrate occurs as white crystals or crystalline powder.

It is very soluble in methanol, freely soluble in ethanol (95) and in acetic acid (100), and sparingly soluble in water.

Melting point: about 126°C (Insert the capillary tube into the bath preheated to 116°C, and continue the heating so that the temperature rises at a rate of about 3°C per minute.)

**Identification** (1) Determine the absorption spectrum of a solution of Dextromethorphan Hydrobromide Hydrate (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dextromethorphan Hydrobromide Hydrate as directed in the potassium bromide disk method under Infrared Spec-

trophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 50 mL of a solution of Dextromethorphan Hydrobromide Hydrate (1 in 100) add 2 drops of phenolphthalein TS and sodium hydroxide TS until a red color develops. Add 50 mL of chloroform, shake, and add 5 mL of dilute nitric acid to 40 mL of the water layer. This solution responds to the Qualitative Tests <1.09> for bromide.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +26 – +30° (0.34 g, calculated on the anhydrous basis, water, 20 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Dextromethorphan Hydrobromide Hydrate in 100 mL of water: the pH of this solution is between 5.2 and 6.5.

**Purity** (1) Clarity and color of solution—Dissolve 0.20 g of Dextromethorphan Hydrobromide Hydrate in 20 mL of water: the solution is clear and colorless.

(2) *N,N*-dimethylaniline—To 0.50 g of Dextromethorphan Hydrobromide Hydrate add 20 mL of water, and dissolve by heating on a water bath. After cooling, add 2 mL of dilute acetic acid, 1 mL of sodium nitrite TS and water to make 25 mL: the solution has no more color than the following control solution.

Control solution: Dissolve 0.10 g of *N,N*-dimethylaniline in 400 mL of water by warming on a water bath, cool, and add water to make 500 mL. Pipet 5 mL of this solution, and add water to make 200 mL. To 1.0 mL of this solution add 2 mL of dilute acetic acid, 1 mL of sodium nitrite TS and water to make 25 mL.

(3) Heavy metals <1.07>—Proceed with 1.0 g of Dextromethorphan Hydrobromide Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Phenolic compounds—Dissolve 5 mg of Dextromethorphan Hydrobromide Hydrate in 1 drop of dilute hydrochloric acid and 1 mL of water, add 2 drops of iron (III) chloride TS and 2 drops of potassium hexacyanoferrate (III) TS, shake, and allow to stand for 15 minutes: no blue-green color develops.

(5) Related substances—Dissolve 0.25 g of Dextromethorphan Hydrobromide Hydrate in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, ethyl acetate, methanol, dichloromethane and 13.5 mol/L ammonia TS (55:20:13:10:2) to a distance of about 15 cm, and air-dry the plate. Spray evenly bismuth potassium iodide TS on the plate, and then spray evenly hydrogen peroxide TS on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Water** <2.48> 4.0 – 5.5% (0.2 g, back titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Dextromethorphan Hydrobromide Hydrate, dissolve in 10 mL of acetic acid (100) and add 40 mL of acetic anhydride. Titrate <2.50> with

0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 35.23 mg of  $C_{18}H_{25}NO \cdot HBr$

**Containers and storage** Containers—Well-closed containers.

## Diastase

ジアスターゼ

Diastase is an enzyme drug mainly prepared from malt.

It has amylolytic activity.

It contains not less than 440 starch saccharifying activity units per g.

It is usually diluted with suitable diluents.

**Description** Diastase occurs as a light yellow to light brown powder.

It is hygroscopic.

**Purity** Rancidity—Diastase has no unpleasant or rancid odor, and has no unpleasant or rancid taste.

**Loss on drying** <2.41> Not more than 4.0% (1 g, 105°C, 5 hours).

**Assay** (i) Substrate solution—Use potato starch TS for amylolytic activity test.

(ii) Sample solution—Weigh accurately about 0.1 g of Diastase, and dissolve in water to make exactly 100 mL.

(iii) Procedure—Proceed as directed in (i) Measurement of starch saccharifying activity of (1) Assay for starch digestive activity under Digestion Test <4.03>.

**Containers and storage** Containers—Tight containers.

Storage—Not exceeding 30°C.

## Diastase and Sodium Bicarbonate Powder

ジアスターゼ・重曹散

### Method of preparation

Diastase	200 g
Sodium Bicarbonate	300 g
Precipitated Calcium Carbonate	400 g
Magnesium Oxide	100 g
To make 1000 g	

Prepare before use as directed under Powders, with the above ingredients.

**Description** Diastase and Sodium Bicarbonate Powder occurs as a light yellow powder. It has a characteristic, salty taste.

**Containers and storage** Containers—Well-closed containers.

## Compound Diastase and Sodium Bicarbonate Powder

複方ジアスターゼ・重曹散

### Method of preparation

Diastase	200 g
Sodium Bicarbonate	600 g
Magnesium Oxide	150 g
Powdered Gentian	50 g
To make 1000 g	

Prepare before use as directed under Powders, with the above ingredients.

**Description** Compound Diastase and Sodium Bicarbonate Powder occurs as a slightly brownish, light yellow powder. It has a characteristic odor and a bitter taste.

**Containers and storage** Containers—Well-closed containers.

## Diazepam

ジアゼパム

$C_{16}H_{13}ClN_2O$ : 284.74

7-Chloro-1-methyl-5-phenyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one [439-14-5]

Diazepam, when dried, contains not less than 98.0% of  $C_{16}H_{13}ClN_2O$ .

**Description** Diazepam occurs as a white to light yellow, crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in acetone, soluble in acetic anhydride and in ethanol (95), sparingly soluble in diethyl ether, slightly soluble in ethanol (99.5), and practically insoluble in water.

**Identification** (1) Dissolve 0.01 g of Diazepam in 3 mL of sulfuric acid, and observe under ultraviolet light (main wavelength: 365 nm): the solution shows a yellow-green fluorescence.

(2) Dissolve 2 mg of Diazepam in 200 mL of a solution of sulfuric acid in ethanol (99.5) (3 in 1000). Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Perform the test with Diazepam as directed under Flame Coloration Test <1.04> (2): a blue to blue-green color appears.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (285 nm): 425 – 445 [after drying, 2 mg, a solution of sulfuric acid in ethanol (99.5) (3 in 1000), 200 mL].

**Melting point** <2.60> 130 – 134°C

**Purity** (1) Clarity of solution—Dissolve 0.10 g of Diazepam in 20 mL of ethanol (95); the solution is clear.

(2) Chloride <1.03>—To 1.0 g of Diazepam add 50 mL of water, allow to stand for 1 hour, with occasional shaking, and filter. To 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Diazepam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 1.0 g of Diazepam in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add acetone to make exactly 100 mL. Pipet 1 mL of this solution, add acetone to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and hexane (1:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Diazepam, previously dried, dissolve in 60 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 28.48 mg of  $\text{C}_{16}\text{H}_{13}\text{ClN}_2\text{O}$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Dibasic Sodium Phosphate Hydrate

リン酸水素ナトリウム水和物

$\text{Na}_2\text{HPO}_4 \cdot 12\text{H}_2\text{O}$ : 358.14

Dibasic Sodium Phosphate Hydrate, when dried, contains not less than 98.0% of disodium hydrogen phosphate ( $\text{Na}_2\text{HPO}_4$ : 141.96)

**Description** Dibasic Sodium Phosphate Hydrate occurs as colorless or white crystals. It is odorless.

It is freely soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

It effloresces in warm, dry air.

**Identification** A solution of Dibasic Sodium Phosphate Hydrate (1 in 10) responds to the Qualitative Tests <1.09> (1) and (2) for sodium salt, and the Qualitative Tests <1.09> for phosphate.

**pH** <2.54> Dissolve 1.0 g of Dibasic Sodium Phosphate Hydrate in 50 mL of water: the pH of this solution is between 9.0 and 9.4.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Dibasic Sodium Phosphate Hydrate in 20 mL of water: the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 1.0 g of Dibasic Sodium Phosphate Hydrate in 7 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(3) Sulfate <1.14>—Dissolve 0.5 g of Dibasic Sodium Phosphate Hydrate in 2 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.038%).

(4) Carbonate—To 2.0 g of Dibasic Sodium Phosphate Hydrate add 5 mL of water, boil, and add 2 mL of hydrochloric acid after cooling: the solution does not effervesce.

(5) Heavy metals <1.07>—Dissolve 2.0 g of Dibasic Sodium Phosphate Hydrate in 4 mL of acetic acid (31) and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution by adding 2 mL of dilute acetic acid and water to make 50 mL (not more than 10 ppm).

(6) Arsenic <1.11>—Prepare the test solution with 1.0 g of Dibasic Sodium Phosphate Hydrate according to Method 1, and perform the test (not more than 2 ppm).

**Loss on drying** <2.41> 57.0 – 61.0% (10 g, at 40°C for 3 hours at first and then at 105°C for 5 hours).

**Assay** Dissolve about 3 g of Dibasic Sodium Phosphate Hydrate, previously dried and accurately weighed, in 50 mL of water. Titrate <2.50> it with 0.5 mol/L sulfuric acid VS at 15°C until the green color of the solution changes to dark-greenish red-purple (indicator: 3 to 4 drops of methyl orange-xylencyanol FF TS).

Each mL of 0.5 mol/L sulfuric acid VS  
= 142.0 mg of  $\text{Na}_2\text{HPO}_4$

**Containers and storage** Containers—Tight containers.

## Dibekacin Sulfate

ジベカシン硫酸塩

$C_{18}H_{37}N_5O_8 \cdot xH_2SO_4$

3-Amino-3-deoxy- $\alpha$ -D-glucopyranosyl-(1  $\rightarrow$  6)-[2,6-diamino-2,3,4,6-tetra-deoxy- $\alpha$ -D-erythro-hexopyranosyl-(1  $\rightarrow$  4)]-2-deoxy-D-streptamine sulfate [58580-55-5]

Dibekacin Sulfate is the sulfate of a derivative of bekanamycin.

It contains not less than 640  $\mu$ g (potency) and not more than 740  $\mu$ g (potency) per mg, calculated on the dried basis. The potency of Dibekacin Sulfate is expressed as mass (potency) of dibekacin ( $C_{18}H_{37}N_5O_8$ : 451.52).

**Description** Dibekacin Sulfate occurs as a white to yellowish white powder.

It is very soluble in water, and practically insoluble in ethanol (99.5).

**Identification** (1) Dissolve 20 mg each of Dibekacin Sulfate and Dibekacin Sulfate Reference Standard in 1 mL of water, and use these solutions as the sample solution and the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ammonia solution (28) and methanol (1:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS, and heat at 100°C for 10 minutes: the principal spots obtained from the sample solution and standard solution show a purple-brown color and the same *R<sub>f</sub>* value.

(2) To 5 mL of a solution of Dibekacin Sulfate (1 in 50) add 1 drop of barium chloride TS: a white precipitate is produced.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +96 – +106° (0.25 g calculated on the dried basis, water, 25 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 1.0 g of Dibekacin Sulfate in 20 mL of water is between 6.0 and 8.0.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Dibekacin Sulfate in 10 mL of water: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Dibekacin Sulfate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** <2.41> Not more than 5.0% (1 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) Medium for test organism [5] under (1) Agar media for seed and base layer having pH 6.5 to 6.6 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Dibekacin Sulfate Reference Standard, previously dried, equivalent to about 20 mg (potency), dissolve in diluted phosphate buffer solution, pH 6.0 (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5 to 15°C and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20  $\mu$ g (potency) and 5  $\mu$ g (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Dibekacin Sulfate, equivalent to about 20 mg (potency), and dissolve in water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20  $\mu$ g (potency) and 5  $\mu$ g (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Dibucaine Hydrochloride

### Cinchocaine Hydrochloride

ジブカイン塩酸塩

$C_{20}H_{29}N_3O_2 \cdot HCl$ : 379.92

2-Butyloxy-*N*-(2-diethylaminoethyl)-4-quinolinecarboxamide monohydrochloride [61-12-1]

Dibucaine Hydrochloride, when dried, contains not less than 98.0% of  $C_{20}H_{29}N_3O_2 \cdot HCl$ .

**Description** Dibucaine Hydrochloride occurs as white crystals or crystalline powder.

It is very soluble in water, in ethanol (95) and in acetic acid (100), freely soluble in acetic anhydride, and practically insoluble in diethyl ether.

It is hygroscopic.

**Identification (1)** Determine the absorption spectrum of a solution of Dibucaine Hydrochloride in 1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dibucaine Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Dibucaine Hydrochloride (1 in 10) responds to the Qualitative Tests <1.09> for chloride.

**Melting point** <2.60> 95 – 100 °C Charge Dibucaine Hydrochloride into a capillary tube for melting point determination, and dry in vacuum over phosphorus (V) oxide at 80 °C for 5 hours. Seal immediately the open end of the tube, and determine the melting point.

**pH** <2.54> Dissolve 1.0 g of Dibucaine Hydrochloride in 50 mL of water: the pH of this solution is between 5.0 and 6.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Dibucaine Hydrochloride in 20 mL of water: the solution is clear and colorless. Determine the absorbance of this solution at 430 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the blank: it is not more than 0.03.

(2) Sulfate <1.14>—Perform the test with 0.30 g of Dibucaine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.056%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Dibucaine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 0.20 g of Dibucaine Hydrochloride in 5 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 20 mL, then pipet 2 mL of this solution, add ethanol (95) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 2.0% (1 g, in vacuum, phosphorus (V) oxide, 80 °C, 5 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Dibucaine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 19.00 mg of C<sub>20</sub>H<sub>29</sub>N<sub>3</sub>O<sub>2</sub>·HCl

**Containers and storage** Containers—Tight containers.

## Diclofenac Sodium

ジクロフェナクナトリウム

C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>NNaO<sub>2</sub>: 318.13

Monosodium 2-(2,6-dichlorophenylamino)phenylacetate  
[15307-79-6]

Diclofenac Sodium, when dried, contains not less than 98.5% of C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>NNaO<sub>2</sub>.

**Description** Diclofenac Sodium occurs as white to pale yellowish white crystals or crystalline powder.

It is freely soluble in methanol and in ethanol (95), sparingly soluble in water and in acetic acid (100), and practically insoluble in diethyl ether.

It is hygroscopic.

**Identification (1)** To 1 mL of a solution of Diclofenac Sodium in methanol (1 in 250) add 1 mL of nitric acid: a dark red color develops.

(2) Perform the test with 5 mg of Diclofenac Sodium as directed under Flame Coloration Test <1.04> (2): a light green color appears.

(3) Determine the infrared absorption spectrum of Diclofenac Sodium, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Diclofenac Sodium (1 in 100) responds to the Qualitative Tests <1.09> for sodium salt.

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Diclofenac Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Diclofenac Sodium according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.05 g of Diclofenac Sodium in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of these solutions as directed under Liquid Chromatography <2.01>. Determine each peak area of these solutions by the automatic integration method: the area of each peak other than the peak of diclofenac from the sample solution is not larger than the peak area of the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of methanol and diluted acetic acid (100) (3 in 2500) (4:3).

Flow rate: Adjust the flow rate so that the retention time of diclofenac is about 20 minutes.

Time span of measurement: About twice as long as the retention time of diclofenac beginning after the solvent peak.

**System suitability—**

System performance: Dissolve 35 mg of ethyl parahydroxybenzoate and 0.05 g of propyl parahydroxybenzoate in 100 mL of the mobile phase. To 1 mL of this solution add the mobile phase to make 50 mL. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, ethyl parahydroxybenzoate and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of diclofenac is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Assay** Weigh accurately about 0.5 g of Diclofenac Sodium, previously dried, dissolve with 40 mL of water in a separator, add 2 mL of dilute hydrochloric acid, and extract the precipitate formed with 50 mL of chloroform. Extract again with two 20-mL portions of chloroform, and filter the extract each time through a pledget of absorbent cotton moistened with chloroform. Wash the tip of the separator and the absorbent cotton with 15 mL of chloroform, combine the washing with the extracts, add 10 mL of a solution of 1 mol/L hydrochloric acid TS in ethanol (99.5) (1 in 100), and titrate <2.50> with 0.1 mol/L potassium hydroxide-ethanol VS from the first equivalent point to the second equivalent point (potentiometric titration).

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS = 31.81 mg of  $C_{14}H_{10}Cl_2NNaO_2$

**Containers and storage** Containers—Tight containers.

**Diclofenamide****Dichlorphenamide**

ジクロフェナミド

$C_6H_6Cl_2N_2O_4S_2$ : 305.16

4,5-Dichlorobenzene-1,3-disulfonamide [120-97-8]

Diclofenamide, when dried, contains not less than 98.0% of  $C_6H_6Cl_2N_2O_4S_2$ .

**Description** Diclofenamide occurs as a white, crystalline powder.

It is very soluble in *N,N*-dimethylformamide, soluble in ethanol (95), and very slightly soluble in water.

It dissolves in sodium hydroxide TS.

**Identification (1)** Dissolve 0.01 g of Diclofenamide in 100 mL of 0.01 mol/L sodium hydroxide TS. To 10 mL of the solution add 0.1 mL of hydrochloric acid. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Diclofenamide Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Diclofenamide, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Diclofenamide Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 237 – 240°C

**Purity (1)** Chloride <1.03>—Dissolve 0.10 g of Diclofenamide in 10 mL of *N,N*-dimethylformamide, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.45 mL of 0.01 mol/L hydrochloric acid VS add 10 mL of *N,N*-dimethylformamide, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.160%).

**(2)** Selenium—To 0.10 g of Diclofenamide add 0.5 mL of a mixture of perchloric acid and sulfuric acid (1:1) and 2 mL of nitric acid, and heat on a water bath until no more brown gas evolves and the solution becomes to be a light yellow clear solution. After cooling, add 4 mL of nitric acid to this solution, then add water to make exactly 50 mL, and use this solution as the sample solution. Separately, pipet 3 mL of Standard Selenium Solution, add 0.5 mL of a mixture of perchloric acid and sulfuric acid (1:1) and 6 mL of nitric acid, then add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Atomic Ab-

sorption Spectrophotometry <2.23> according to the following conditions, and determine constant absorbances,  $A_T$  and  $A_S$ , obtained on a recorder after rapid increasing of the absorption:  $A_T$  is smaller than  $A_S$  (not more than 30 ppm).

Perform the test by using a hydride generating system and a thermal absorption cell.

Lamp: An selenium hollow cathode lamp

Wavelength: 196.0 nm

Temperature of sample atomizer: When an electric furnace is used, about 1000°C.

Carrier gas: Nitrogen or Argon

(3) Heavy metals <1.07>—Proceed with 2.0 g of Diclofenamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Dissolve 0.10 g of Diclofenamide in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than the peak of diclofenamide from the sample solution is not larger than the peak area of diclofenamide from the standard solution.

*Operating conditions*—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 5 times as long as the retention time of diclofenamide.

*System suitability*—

Test for required detection: To exactly 5 mL of the standard solution add the mobile phase to make exactly 100 mL. Confirm that the peak area of diclofenamide obtained from 10  $\mu$ L of this solution is equivalent to 3.5 to 6.5% of that of diclofenamide obtained from 10  $\mu$ L of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of diclofenamide is not more than 1.0%.

**Loss on drying** <2.41> Not more than 1.0% (1 g, in vacuum at a pressure not exceeding 0.67 kPa, 100°C, 5 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 50 mg each of Diclofenamide and Diclofenamide Reference Standard, previously dried, and dissolve each in 30 mL of the mobile phase. To each add exactly 10 mL of the internal standard solution and the mobile phase to make 50 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of diclofenamide to that of the internal standard, respectively.

$$\text{Amount (mg) of } C_6H_6Cl_2N_2O_4S_2 = W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of Diclofenamide Reference Standard

*Internal standard solution*—A solution of butyl parahydroxy benzoate in the mobile phase (3 in 5000).

*Operating conditions*—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of sodium phosphate TS and acetonitrile (1:1).

Flow rate: Adjust the flow rate so that the retention time of diclofenamide is about 7 minutes.

*System suitability*—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, diclofenamide and the internal standard are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of diclofenamide to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Diclofenamide Tablets

### Dichlorphenamide Tablets

ジクロフェナミド錠

Diclofenamide Tablets contain not less than 92% and not more than 108% of the labeled amount of diclofenamide ( $C_6H_6Cl_2N_2O_4S_2$ ; 305.16).

**Method of preparation** Prepare as directed under Tablets, with Diclofenamide.

**Identification** To a quantity of powdered Diclofenamide Tablets, equivalent to 0.2 g of Diclofenamide according to the labeled amount, add 20 mL of methanol, shake, and filter. Evaporate the filtrate on a water bath to dryness, and dissolve 0.01 g of the residue in 100 mL of 0.01 mol/L sodium hydroxide TS. To 10 mL of this solution add 0.1 mL of hydrochloric acid TS, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 284 nm and 288 nm, and between 293 nm and 297 nm.

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Diclofenamide Tablets at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the test solution. Take 20 mL or more of the dissolved solution 60 minutes after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8  $\mu$ m. Discard the first 10 mL of the filtrate, and use the subsequent as the sample solution. Separately, weigh accurately about 55 mg of Diclofenamide Reference Stan-

ard, previously dried in vacuum at a pressure not exceeding 0.67 kPa at 100°C for 5 hours, dissolve in 10 mL of methanol, and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and the standard solution at 285 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>. The dissolution rate of Diclofenamide Tablets in 60 minutes is not less than 70%.

Dissolution rate (%) with respect to the labeled amount of diclofenamide ( $C_6H_6Cl_2N_2O_4S_2$ )

$$= W_S \times (A_T/A_S) \times (1/C) \times 90$$

$W_S$ : Amount (mg) of Diclofenamide Reference Standard.

$C$ : Labeled amount (mg) of diclofenamide

( $C_6H_6Cl_2N_2O_4S_2$ ) in 1 tablet.

**Assay** Weigh accurately, and powder not less than 20 tablets of Diclofenamide Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of diclofenamide ( $C_6H_6Cl_2N_2O_4S_2$ ), add exactly 25 mL of the mobile phase, shake for 15 minutes, and centrifuge. Pipet 10 mL of the supernatant liquid, add exactly 4 mL of the internal standard solution and the mobile phase to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Diclofenamide Reference Standard, previously dried at 100°C in vacuum at a pressure not exceeding 0.67 kPa for 5 hours, dissolve in 30 mL of the mobile phase, add exactly 10 mL of the internal standard solution and the mobile phase to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Diclofenamide.

Amount (mg) of diclofenamide ( $C_6H_6Cl_2N_2O_4S_2$ )

$$= W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of Diclofenamide Reference Standard

**Internal standard solution**—A solution of butyl parahydroxybenzoate in the mobile phase (3 in 5000).

**Containers and storage** Containers—Well-closed containers.

## Dicloxacillin Sodium Hydrate

ジクロキサシリンナトリウム水和物

$C_{19}H_{16}Cl_2N_3NaO_5S \cdot H_2O$ : 510.32

Monosodium (2*S*,5*R*,6*R*)-6-[[3-(2,6-dichlorophenyl)-5-methylisoxazole-4-carbonyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrate [13412-64-1]

Dicloxacillin Sodium Hydrate contains not less than 910  $\mu$ g (potency) and not more than 1020  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Dicloxacillin Sodium Hydrate is expressed as

mass (potency) of dicloxacillin ( $C_{19}H_{17}Cl_2N_3O_5S$ : 470.33).

**Description** Dicloxacillin Sodium Hydrate occurs as a white to light yellowish white crystalline powder.

It is freely soluble in water and in methanol, and soluble in ethanol (95).

**Identification (1)** Determine the absorption spectrum of a solution of Dicloxacillin Sodium Hydrate (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Dicloxacillin Sodium Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dicloxacillin Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Dicloxacillin Sodium Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dicloxacillin Sodium Hydrate responds to the Quantitative Tests <1.09> (1) for sodium salt.

**Water** <2.48> Not less than 3.0% and not more than 4.5% (0.1 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) Medium for test organism [5] under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 6.5 to 6.6 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Dicloxacillin Sodium Reference Standard equivalent to about 50 mg (potency), dissolve in phosphate buffer solution, pH 6.0 to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 24 hours. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10  $\mu$ g (potency) and 2.5  $\mu$ g (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Dicloxacillin Sodium Hydrate equivalent to about 50 mg (potency), dissolve in phosphate buffer solution, pH 6.0 to make exactly 50 mL. Take exactly a suitable amount of the solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10  $\mu$ g (potency) and 2.5  $\mu$ g (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Diethylcarbamazine Citrate

ジエチルカルバマジンクエン酸塩

$C_{10}H_{21}N_3O \cdot C_6H_8O_7$ ; 391.42  
*N,N*-Diethyl-4-methylpiperazine-1-carboxamide  
 monocitrate [1642-54-2]

Diethylcarbamazine Citrate, when dried, contains not less than 98.0% of  $C_{10}H_{21}N_3O \cdot C_6H_8O_7$ .

**Description** Diethylcarbamazine Citrate occurs as a white, crystalline powder. It is odorless, and has an acid and bitter taste.

It is very soluble in water, soluble in ethanol (95), and practically insoluble in acetone, in chloroform and in diethyl ether.

A solution of Diethylcarbamazine Citrate (1 in 20) is acid. It is hygroscopic.

**Identification (1)** Dissolve 0.5 g of Diethylcarbamazine Citrate in 2 mL of water, add 10 mL of sodium hydroxide TS, and extract with four 5-mL portions of chloroform. Wash the combined chloroform extracts with 10 mL of water, and evaporate the chloroform on a water bath. Add 1 mL of iodoethane to the residue, and boil gently under a reflux condenser for 5 minutes. Evaporate the excess iodoethane with the aid of a current of air, and dissolve the residue in 4 mL of ethanol (95). Cool the ethanol solution in an ice bath, with continuous stirring, add diethyl ether until precipitates are formed, and stir until crystallization is evident. Allow to stand in the ice bath for 30 minutes, and collect the precipitate. Dissolve the precipitate in 4 mL of ethanol (95), repeat the recrystallization in the same manner, then dry at 105°C for 4 hours: the crystals so obtained melt <2.60> between 151°C and 155°C.

(2) Neutralize the remaining aqueous layer obtained in (1) with dilute sulfuric acid: the solution responds to the Qualitative Tests <1.09> (2) and (3) for citrate.

**Melting point** <2.60> 135.5 – 138.5°C

**Purity** Heavy metals <1.07>—Proceed with 2.0 g of Diethylcarbamazine Citrate according to Method 4, and perform the test. Prepare the control solution with 4.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** <2.41> Not more than 1.0% (2 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.75 g of Diethylcarbamazine Citrate, previously dried, dissolve in 50 mL of acetic acid (100) by warming, cool, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
 = 39.14 mg of  $C_{10}H_{21}N_3O \cdot C_6H_8O_7$

**Containers and storage** Containers—Tight containers.

## Diethylcarbamazine Citrate Tablets

ジエチルカルバマジンクエン酸塩錠

Diethylcarbamazine Citrate Tablets contain not less than 95% and not more than 105% of the labeled amount of diethylcarbamazine citrate ( $C_{10}H_{21}N_3O \cdot C_6H_8O_7$ ; 391.42).

**Method of preparation** Prepare as directed under Tablets, with Diethylcarbamazine Citrate.

**Identification (1)** To a quantity of powdered Diethylcarbamazine Citrate Tablets, equivalent to 0.5 g of Diethylcarbamazine Citrate according to the labeled amount, add 10 mL of water, shake, and filter. Add 10 mL of sodium hydroxide TS to the filtrate, and proceed as directed in the Identification (1) under Diethylcarbamazine Citrate.

(2) To a quantity of powdered Diethylcarbamazine Citrate Tablets, equivalent to 0.8 g of diethylcarbamazine citrate according to the labeled amount, add 10 mL of water, shake, centrifuge, and filter the supernatant liquid. To 5 mL of the filtrate add 5 mL of sodium hydroxide TS, and extract with two 20-mL portions of chloroform. Separate the aqueous layer, and neutralize with dilute hydrochloric acid: the solution responds to the Qualitative Tests <1.09> (2) and (3) for citrate.

**Assay** Weigh accurately and powder not less than 20 Diethylcarbamazine Citrate Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of diethylcarbamazine citrate ( $C_{10}H_{21}N_3O \cdot C_6H_8O_7$ ), add 10 mL of water, shake well, add 5 mL of sodium hydroxide TS, then add exactly 20 mL of the internal standard solution, and shake vigorously for 10 minutes. Centrifuge, discard the aqueous layer, and use the chloroform layer as the sample solution. Separately, weigh accurately about 50 mg of Diethylcarbamazine Citrate Reference Standard, previously dried at 105°C for 4 hours, dissolve in 10 mL of water, add 5 mL of sodium hydroxide TS, proceed in the same manner as the preparation of the sample solution, and use the chloroform layer as the standard solution. Perform the test with 2  $\mu$ L of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of diethylcarbamazine to that of the internal standard, respectively.

$$\begin{aligned} & \text{Amount (mg) of diethylcarbamazine citrate} \\ & (C_{10}H_{21}N_3O \cdot C_6H_8O_7) \\ & = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Diethylcarbamazine Citrate Reference Standard

**Internal standard solution**—A solution of *n*-octadecane in chloroform (1 in 1250).

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A glass tube 3 mm in inside diameter and 1 m in length, packed with silanized siliceous earth for gas chro-

matography (180 to 250  $\mu\text{m}$  in particle diameter) coated with 35% methylphenyldimethyl silicone polymer for gas chromatography in the ratio of 3%.

Column temperature: A constant temperature of about 145  $^{\circ}\text{C}$ .

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of diethylcarbamazine is about 4 minutes.

System suitability—

System performance: When the procedure is run with 2  $\mu\text{L}$  of the standard solution under the above operating conditions, diethylcarbamazine and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 2  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of diethylcarbamazine to that of the internal standard is not more than 1.5%.

**Containers and storage** Containers—Well-closed containers.

## Difenidol Hydrochloride

ジフェニドール塩酸塩

$\text{C}_{21}\text{H}_{27}\text{NO}\cdot\text{HCl}$ : 345.91

1,1-Diphenyl-4-piperidin-1-ylbutan-1-ol  
monohydrochloride [3254-89-5]

Difenidol Hydrochloride, when dried, contains not less than 98.5% of  $\text{C}_{21}\text{H}_{27}\text{NO}\cdot\text{HCl}$ .

**Description** Difenidol Hydrochloride occurs as white crystals or crystalline powder. It is odorless.

It is freely soluble in methanol, soluble in ethanol (95), sparingly soluble in water and in acetic acid (100), and practically insoluble in diethyl ether.

Melting point: about 217 $^{\circ}\text{C}$  (with decomposition).

**Identification** (1) Dissolve 0.01 g of Difenidol Hydrochloride in 1 mL of sulfuric acid: an orange-red color develops. To this solution add carefully 3 drops of water: the solution becomes yellowish brown, and colorless on the addition of 10 mL of water.

(2) To 5 mL of a solution of Difenidol Hydrochloride (1 in 100) add 2 mL of Reinecke salt TS: a light red precipitate is formed.

(3) To 10 mL of a solution of Difenidol Hydrochloride (1 in 100) add 2 mL of sodium hydroxide TS, and extract with two 15-mL portions of chloroform. Combine the extracts, wash with three 10-mL portions of water, evaporate the chloroform on a water bath, and dry the residue in a desiccator (in vacuum, silica gel, 55 $^{\circ}\text{C}$ ) for 5 hours: the residue melts <2.60> between 103 $^{\circ}\text{C}$  and 106 $^{\circ}\text{C}$ .

(4) A solution of Difenidol Hydrochloride (1 in 100)

responds to the Qualitative Tests <1.09> for chloride.

**pH** <2.54> Dissolve 1.0 g of Difenidol Hydrochloride in 100 mL of freshly boiled and cooled water: the pH of this solution is between 4.7 and 6.5.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Difenidol Hydrochloride in 10 mL of methanol: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Difenidol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 2.0 g of Difenidol Hydrochloride according to Method 3, and perform the test (not more than 1 ppm).

(4) Related substances—Dissolve 0.10 g of Difenidol Hydrochloride in methanol to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 10 mg of 1,1-diphenyl-4-piperidino-1-butene hydrochloride for thin-layer chromatography in methanol to make exactly 20 mL, pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene, methanol and acetic acid (100) (10:2:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, silica gel, 5 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.35 g of Difenidol Hydrochloride, previously dried, dissolve in 30 mL of acetic acid (100) by warming if necessary, cool, add 30 mL of acetic anhydride, and titrate <2.50> with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS  
= 17.30 mg of  $\text{C}_{21}\text{H}_{27}\text{NO}\cdot\text{HCl}$

**Containers and storage** Containers—Well-closed containers.

## Digitoxin

ジギトキシシ

 $C_{41}H_{64}O_{13}$ : 764.94

3 $\beta$ -[2,6-Dideoxy- $\beta$ -D-ribo-hexopyranosyl-(1 $\rightarrow$ 4)-2,6-dideoxy- $\beta$ -D-ribo-hexopyranosyl-(1 $\rightarrow$ 4)-2,6-dideoxy- $\beta$ -D-ribo-hexopyranosyloxy]-14-hydroxy-5 $\beta$ ,14 $\beta$ -card-20(22)-enolide [71-63-6]

Digitoxin, when dried, contains not less than 90.0% of  $C_{41}H_{64}O_{13}$ .

**Description** Digitoxin occurs as a white to light yellowish white, crystalline powder. It is odorless.

It is soluble in chloroform, sparingly soluble in methanol and in ethanol (95), and practically insoluble in water and in diethyl ether.

**Identification** (1) Transfer 1 mg of Digitoxin to a small test tube about 10 mm in inside diameter, dissolve in 1 mL of a solution of iron (III) chloride hexahydrate in acetic acid (100) (1 in 10,000), and underlay gently with 1 mL of sulfuric acid: at the zone of contact of the two liquids a brown ring free from a reddish color is produced, and the color of the upper layer near the contact zone changes to green through purple. Finally the color of the entire acetic acid layer changes to green through deep blue.

(2) To 2 mg of Digitoxin add 25 mL of a freshly prepared solution of 1,3-dinitrobenzene in ethanol (95) (1 in 100), and dissolve by shaking. Take 2 mL of this solution, add 2 mL of a solution of tetramethylammonium hydroxide in ethanol (95) (1 in 200), and mix: a red-purple color develops slowly, and then fades.

(3) Dissolve 1 mg each of Digitoxin and Digitoxin Reference Standard in a mixture of chloroform and ethanol (95) (1:1) to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, methanol and water (84:15:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly dilute sulfuric acid upon the plate, and heat at 110°C for 10 minutes: the spot from the sample solution shows the same *R<sub>f</sub>* value as

the spot from the standard solution.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +16 – +18° (after drying, 0.5 g, chloroform, 20 mL, 200 mm).

**Purity** Digitonin—Dissolve 10 mg of Digitoxin in 2 mL of ethanol (95) in a test tube, having the inner walls which are free from scratches, add 2 mL of a solution of cholesterol in ethanol (95) (1 in 200), mix gently, and allow to stand for 10 minutes: no turbidity is produced.

**Loss on drying** <2.41> Not more than 1.5% (0.5 g, in vacuum, 100°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.5% (0.1 g).

**Assay** Dissolve about 20 mg each of Digitoxin and Digitoxin Reference Standard, previously dried and accurately weighed, in methanol to make exactly 200 mL. Pipet 5 mL each of these solutions, add exactly 10 mL of the internal standard solution to each solution, add 12.5 mL of water, then add methanol to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 50  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of digitoxin to that of the internal standard, respectively.

$$\begin{aligned} \text{Amount (mg) of } C_{41}H_{64}O_{13} \\ = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Digitoxin Reference Standard

**Internal standard solution**—A solution of acenaphthene in methanol (3 in 1,000,000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 230 nm).

**Column**: A stainless steel column about 4 mm in inside diameter and 15 to 20 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: Room temperature.

**Mobile phase**: A mixture of methanol and water (3:1).

**Flow rate**: Adjust the flow rate so that the retention time of digitoxin is about 5 minutes.

**Selection of column**: Proceed with 50  $\mu$ L of the standard solution under the above operating conditions, and calculate the resolution. Use a column giving elution of digitoxin and the internal standard in this order with the resolution between these peaks being not less than 6.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Digitoxin Tablets

ジギトキシシ錠

Digitoxin Tablets contain not less than 90% and not more than 110% of the labeled amount of digitoxin ( $C_{41}H_{64}O_{13}$ : 764.94).

**Method of preparation** Prepare as directed under Tablets, with Digitoxin.

**Identification (1)** Place a portion of powdered Digitoxin Tablets, equivalent to 2 mg of digitoxin ( $C_{41}H_{64}O_{13}$ ) according to the labeled amount, in a separator, shake with 30 mL of water, and shake vigorously with 30 mL of chloroform. Filter the chloroform extract with a funnel on which a small amount of anhydrous sodium sulfate is placed, and transfer to a round-bottomed flask connected by a universal joint. Evaporate the solution to dryness by warming under reduced pressure, and dissolve the residue in 10 mL of chloroform. Transfer 5 mL of this solution to a small test tube about 10 mm in inside diameter, and evaporate to dryness on a water bath with the aid of a current of air. Proceed with the residue as directed in the Identification (1) under Digitoxin.

**(2)** Evaporate 4 mL of the chloroform solution obtained in (1) to dryness, by warming under reduced pressure, add a freshly prepared solution of 1,3-dinitrobenzene in ethanol (95) (1 in 100) to the residue, and dissolve by shaking. Proceed with 2 mL of this solution as directed in the Identification (2) under Digitoxin.

**Uniformity of dosage units <6.02>** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Transfer 1 tablet of Digitoxin Tablets to a 50-mL beaker, add 0.5 mL of water to disintegrate the tablet, add 5 mL of acetonitrile, and warm on a water bath for 5 minutes, covering the beaker with a watch glass. After cooling, transfer the solution to separator A, rinse the beaker with 30 mL of chloroform and then with 20 mL of water, transfer the rinsings to separator A, and extract by vigorous shaking. Transfer the chloroform extract to separator B containing 5 mL of a solution of sodium hydrogen carbonate (1 in 100), and shake to wash. Filter the chloroform layer through a pledget of absorbent cotton, previously moistened with chloroform. Extract the water layer in separator A with two 30-mL portions of chloroform, wash the chloroform extract with a solution of sodium hydrogen carbonate (1 in 100) in separator B, filter in the same manner, and combine the filtrate with the first one. Evaporate this filtrate to dryness under reduced pressure by warming, add diluted ethanol (95) (4 in 5) to make exactly  $V$  mL of a solution containing  $5 \mu\text{g}$  of digitoxin ( $C_{41}H_{64}O_{13}$ ) per mL. Shake vigorously for 20 minutes to dissolve, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Digitoxin Reference Standard, previously dried at  $100^\circ\text{C}$  for 2 hours, and dissolve in diluted ethanol (95) (4 in 5) to make exactly 100 mL. Pipet 5 mL of this solution, add diluted ethanol (95) (4 in 5) to make exactly 100 mL, and use this solution as the standard solution. Pipet 2 mL each of the sample solution, the standard solution and diluted ethanol (95) (4 in 5) into brown glass-stoppered test tubes T, S and B. Add exactly 10 mL each of 0.02 w/v% L-ascorbic acid-hydrochloric acid TS, shake well, and immediately add exactly 1 mL each of dilute hydrogen peroxide TS. Shake vigorously, and allow to stand at a constant temperature between  $25^\circ\text{C}$  and  $30^\circ\text{C}$  for 45 minutes. Determine the fluorescence intensities,  $F_T$ ,  $F_S$  and  $F_B$ , of these solutions at 400 nm of the excitation wavelength and at about 570 nm of the fluorescence wavelength as directed under Fluorometry <2.22>, respectively.

$$\begin{aligned} &\text{Amount (mg) of digitoxin (C}_{41}\text{H}_{64}\text{O}_{13}) \\ &= W_S \times \{(F_T - F_B)/(F_S - F_B)\} \times (V/2000) \end{aligned}$$

$W_S$ : Amount (mg) of Digitoxin Reference Standard

**Dissolution <6.10>** Perform the test according to the following method: it meets the requirement.

Take 1 tablet of Digitoxin Tablets, and perform the test using 500 mL of diluted hydrochloric acid (3 in 500), degassed by a suitable method, as the test solution at 100 revolutions per minute as directed in the Basket method. At 30 minutes after starting the test, take  $a + 15$  mL of the dissolved solution, and immediately add the same volume of fresh test solution, previously warmed at  $37 \pm 0.5^\circ\text{C}$ , to the vessel carefully. Filter  $a + 15$  mL of the dissolved solution through a membrane filter (less than  $0.8 \mu\text{m}$  in pore size). Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Measure exactly  $a$  mL of the sample solution, equivalent to about  $2 \mu\text{g}$  of digitoxin ( $C_{41}H_{64}O_{13}$ ) according to the labeled amount, transfer to a glass-stoppered centrifuge tube  $T_{30}$ , and warm at  $37 \pm 0.5^\circ\text{C}$  for 30 minutes. Further, at 60 minutes after starting the test, take  $a + 15$  mL of the dissolved solution, proceed in the same manner, measure exactly  $a$  mL of the sample solution, and transfer to a glass-stoppered centrifuge tube  $T_{60}$ . Separately, weigh accurately 100 times the labeled amount of Digitoxin Reference Standard, previously dried under reduced pressure at  $100^\circ\text{C}$  for 2 hours, and dissolve in ethanol (95) to make exactly 100 mL. Measure exactly 1 mL of this solution, add the test solution to make exactly 500 mL, warm at  $37 \pm 0.5^\circ\text{C}$  for 60 minutes, and filter through a membrane filter (less than  $0.8 \mu\text{m}$  in pore size). Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the standard solution. Measure exactly  $a$  mL each of the standard solution and the test solution, transfer to glass-stoppered centrifuge tubes  $T_S$  and  $T_B$ , respectively. Add exactly 7 mL of chloroform to each of the glass-stoppered centrifuge tubes  $T_{30}$ ,  $T_{60}$ ,  $T_S$  and  $T_B$ , shake vigorously for 10 minutes and centrifuge. Discard the aqueous layer, measure exactly 5 mL of the chloroform layer, transfer to brown test tubes  $T'_{30}$ ,  $T'_{60}$ ,  $T'_S$  and  $T'_B$ , evaporate the chloroform, add exactly 4 mL each of 0.05 w/v% L-ascorbic acid-hydrochloric acid TS, shake well, and allow to stand for 10 minutes. Then add exactly 0.5 mL each of dilute hydrogen peroxide TS, shake well, and allow to stand at a constant temperature between  $25^\circ\text{C}$  and  $30^\circ\text{C}$  for 45 minutes. Determine the fluorescence intensities,  $F_{30}$ ,  $F_{60}$ ,  $F_S$  and  $F_B$ , of these solutions at about 395 nm of the excitation wavelength and at about 560 nm of the fluorescence wavelength as directed under Fluorometry <2.22>, respectively. Dissolution rates of Digitoxin Tablets after 30 minutes and 60 minutes should be not less than 60% and 85%, respectively.

No retest requirement is applied to Digitoxin Tablets.

$$\begin{aligned} &\text{Dissolution rate (\%)} \text{ with respect to the labeled} \\ &\text{amount of digitoxin (C}_{41}\text{H}_{64}\text{O}_{13}) \text{ for 30 minutes} \\ &= W_S \times \{(F_{30} - F_B)/(F_S - F_B)\} \times (1/C) \end{aligned}$$

$$\begin{aligned} &\text{Dissolution rate (\%)} \text{ with respect to the labeled} \\ &\text{amount of digitoxin (C}_{41}\text{H}_{64}\text{O}_{13}) \text{ for 60 minutes} \\ &= W_S \times \left( \frac{F_{60} - F_B}{F_S - F_B} + \frac{F_{30} - F_B}{F_S - F_B} \times \frac{a + 15}{500} \right) \\ &\quad \times \frac{1}{C} \end{aligned}$$

$W_S$ : Amount (mg) of Digitoxin Reference Standard.

$C$ : The labeled amount (mg) of digitoxin ( $C_{41}H_{64}O_{13}$ ) in 1 tablet.

$a + 15$ : Measured volume (mL) of dissolved solution at the

specified time.

**Assay** Weigh accurately and powder not less than 20 Digoxin Tablets. Weigh accurately a portion of the powder, equivalent to about 0.5 mg of digitoxin ( $C_{41}H_{64}O_{13}$ ), and shake with 12.5 mL of water for 10 minutes. Add exactly 10 mL of the internal standard solution, shake for 20 minutes, and add methanol to make 50 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 20 mg of Digoxin Reference Standard, previously dried in vacuum at 100°C for 2 hours, dissolve in methanol to make exactly 200 mL. Pipet 5 mL of the solution, add exactly 10 mL of the internal standard solution, add 12.5 mL of water, then methanol to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Digitoxin.

$$\begin{aligned} &\text{Amount (mg) of digitoxin (C}_{41}\text{H}_{64}\text{O}_{13}) \\ &= W_S \times (Q_T/Q_S) \times 0.025 \end{aligned}$$

$W_S$ : Amount (mg) of Digoxin Reference Standard

**Internal standard solution**—A solution of acenaphthene in methanol (3 in 1,000,000).

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

## Digoxin

ジゴキシン

$C_{41}H_{64}O_{14}$ : 780.94

3 $\beta$ -[2,6-Dideoxy- $\beta$ -D-ribo-hexopyranosyl-(1 $\rightarrow$ 4)-2,6-dideoxy- $\beta$ -D-ribo-hexopyranosyl-(1 $\rightarrow$ 4)-2,6-dideoxy- $\beta$ -D-ribo-hexopyranosyloxy]-12 $\beta$ ,14-dihydroxy-5 $\beta$ ,14 $\beta$ -card-20(22)-enolide [20830-75-5]

Digoxin, when dried, contains not less than 96.0% and not more than 106.0% of  $C_{41}H_{64}O_{14}$ .

**Description** Digoxin occurs as colorless or white crystals or a white crystalline powder.

It is freely soluble in pyridine, slightly soluble in ethanol (95), very slightly soluble in acetic acid (100), and practically insoluble in water.

**Identification (1)** Transfer 1 mg of Digoxin to a small test tube about 10 mm in inside diameter, dissolve in 1 mL of a

solution of iron (III) chloride hexahydrate in acetic acid (100) (1 in 10,000), and underlay gently with 1 mL of sulfuric acid: at the zone of contact of the two liquids a brown ring free from a reddish color is produced, and the color of the upper layer near the contact zone changes to green through purple. Finally the entire acetic acid layer shows a green color through a deep blue color.

(2) Determine the infrared absorption spectrum of Digoxin, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +10.0 – +13.0° (after drying, 0.20 g, dehydratead pyridine, 10 mL, 100 mm).

**Purity (1)** Clarity and color of solution—Dissolve 0.10 g of Digoxin in 15 mL of diluted ethanol (95) (4 in 5) by warming: the solution is clear and colorless.

(2) Related substances—Dissolve exactly 25.0 mg of Digoxin in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet 10 mL of this solution, add 10 mL of water and dilute ethanol to make 50 mL, and use this solution as the sample solution. Separately, dissolve exactly 5.0 mg of Gitoxin Reference Standard, previously dried under reduced pressure at 105°C for 1 hour, in a mixture of acetonitrile and water (7:3) to make exactly 200 mL. Pipet 2 mL of this solution, add dilute ethanol to make 50 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of gitoxin:  $A_T$  is not larger than  $A_S$ , and the total of the areas of the peaks other than digitoxin and gitoxin, obtained by the area percentage method, is not more than 3%.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 4 times as long as the retention time of digoxin beginning after the solvent peak.

**System suitability**—

Test for required detectability: Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of digoxin obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that from the solution for system suitability test.

System performance: Dissolve 25 mg of digoxin in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 5 mL of a solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000), 10 mL of water and dilute ethanol to make 50 mL. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, digoxin and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of digoxin is not more than 1.0%.

**Loss on drying** <2.41> Not more than 1.0% (0.5 g, in vacuum, 105°C, 1 hour).

**Residue on ignition** <2.44> Not more than 0.5% (0.1 g).

**Assay** Weigh accurately about 25 mg each of Digoxin and Digoxin Reference Standard, previously dried, dissolve in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet 10 mL of these solutions, add exactly 5 mL of the internal standard solution, 10 mL of water and dilute ethanol to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of digoxin to that of the internal standard.

$$\text{Amount (mg) of } C_{41}H_{64}O_{14} = W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of Digoxin Reference Standard

**Internal standard solution**—A solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 220 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 30°C.

**Mobile phase**: A mixture of water and acetonitrile (7:3).

**Flow rate**: Adjust the flow rate so that the retention time of digoxin is about 10 minutes.

**System suitability**—

**System performance**: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, digoxin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability**: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of digoxin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Digoxin Injection

ジゴキシン注射液

Digoxin Injection is an aqueous solution for injection.

It contains not less than 90.0% and not more than 105.0% of the labeled amount of digoxin ( $C_{41}H_{64}O_{14}$ ; 780.94).

**Method of preparation** Prepare as directed under Injections, with a solution of Digoxin in 5 to 50 vol% ethanol.

**Description** Digoxin Injection is a clear, colorless liquid.

**Identification** Dilute Digoxin Injection, if necessary, with methanol so that each mL contains about 0.25 mg of Digoxin according to the labeled amount, and use this solution as the sample solution. In case where ingredients are suspected to affect the test, remove them by means of a solid-phase extraction. Separately, dissolve 0.5 mg of Digoxin Reference Standard in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of octadecylsilanized silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and water (7:3) to a distance of about 10 cm, and air-dry the plate. Spray evenly a mixture of a solution of trichloroacetic acid in ethanol (99.5) (1 in 4) and a freshly prepared solution of sodium toluenesulfonchloramide trihydrate (3 in 100) (4:1) on the plate, heat at 110°C for 10 minutes, and examine under ultraviolet light (main wavelength: 366 nm): the  $R_f$  values of the principal spots with the sample solution and the standard solution are not different each other.

**Bacterial endotoxins** <4.01> Less than 200 EU/mg.

**Extractable volume** <6.05> It meets the requirements.

**Foreign insoluble matter** <6.06> Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> Perform the test according to Method 1: it meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** To an exact volume of Digoxin Injection, equivalent to about 2.5 mg of digoxin ( $C_{41}H_{64}O_{14}$ ), add exactly 5 mL of the internal standard solution and dilute ethanol to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Digoxin Reference Standard, previously dried under reduced pressure at 105°C for 1 hour, dissolve in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, 10 mL of water and dilute ethanol to make 50 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of digoxin to that of the internal standard.

$$\begin{aligned} \text{Amount (mg) of digoxin (} C_{41}H_{64}O_{14} \text{)} \\ = W_S \times (Q_T/Q_S) \times (1/10) \end{aligned}$$

$W_S$ : Amount (mg) of Digoxin Reference Standard

**Internal standard solution**—A solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 220 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 30°C.

Mobile phase: A mixture of water and acetonitrile (7:3).

Flow rate: Adjust the flow rate so that the retention time of digoxin is about 10 minutes.

*System suitability*—

System performance: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, digoxin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of digoxin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant.

## Digoxin Tablets

ジゴキシン錠

Digoxin Tablets contain not less than 90.0% and not more than 105.0% of the labeled amount of digoxin ( $\text{C}_{41}\text{H}_{64}\text{O}_{14}$ ; 780.94).

**Method of preparation** Prepare as directed under Tablets, with Digoxin.

**Identification** To an amount of pulverized Digoxin Tablets, equivalent to 0.5 mg of Digoxin according to the labeled amount, add 2 mL of methanol, shake for 10 minutes, filter, and use the filtrate as the sample solution. Separately, dissolve 0.5 mg of Digoxin Reference Standard in 2 mL of methanol, and use this as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu\text{L}$  each of the sample solution and standard solution on a plate of octadecylsilylanized silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and water (7:3) to a distance of about 10 cm, and air-dry the plate. Spray evenly a mixture of a solution of trichloroacetic acid in ethanol (99.5) (1 in 4) and a freshly prepared solution of sodium toluenesulfonchloramide trihydrate (3 in 100) (4:1) on the plate, heat at 110°C for 10 minutes, and examine under ultraviolet light (main wavelength: 366 nm): the *R<sub>f</sub>* values of the principal spots with the sample solution and the standard solution are not different each other.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Digoxin Tablets add 0.5 mL of water to disintegrate, then add exactly 0.5 mL of the internal standard solution, and add *V* mL of dilute ethanol so that each mL contains about 21  $\mu\text{g}$  of digoxin ( $\text{C}_{41}\text{H}_{64}\text{O}_{14}$ ). Exposure this solution to ultrasonic waves for 20 minutes, shake for 5 minutes, filter, and use the filtrate as the sample solution. Separately, weigh accurately about 25 mg of Digoxin Reference Standard, previously dried under reduced pressure at 105°C for 1 hour, dissolve in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet

10 mL of this solution, and add ethanol (95) to make exactly 20 mL. Pipet 1 mL of this solution, add exactly 0.5 mL of the internal standard solution, then add 1.5 mL of water and (*V* - 2) mL of dilute ethanol, and use this as the standard solution. Proceed with the sample solution and standard solution as directed in the Assay.

$$\begin{aligned} & \text{Amount (mg) of digoxin (C}_{41}\text{H}_{64}\text{O}_{14}) \\ & = W_S \times (Q_T/Q_S) \times (1/200) \end{aligned}$$

*W<sub>S</sub>*: Amount (mg) of Digoxin Reference Standard

*Internal standard solution*—A solution of propyl parahydroxybenzoate in ethanol (95) (1 in 40,000/*V*).

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Digoxin Tablets, using 500 mL of diluted hydrochloric acid (3 in 500) at 100 revolutions per minute according to the Basket method as the dissolution medium. Withdraw 30 mL or more of the dissolved solution 60 minutes after starting the test, and filter through a membrane filter (less than 0.8  $\mu\text{m}$  in pore size). Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg of Digoxin Reference Standard, previously dried in vacuum at 105°C for 1 hour, dissolve in a small portion of ethanol (95), and add a mixture of ethanol (95) and water (4:1) to make exactly 500 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 500 mL, and use this solution as the standard solution. Pipet 2 mL each of the sample solution, the standard solution and the dissolution medium, and transfer to brown glass-stoppered test tubes. Add exactly 10 mL of 0.012 g/dL L-ascorbic acid-hydrochloric acid TS to these tubes, and shake. Immediately add exactly 1 mL of dilute hydrogen peroxide TS, shake well, and allow to stand at a constant temperature between 25°C and 30°C for 45 minutes. Determine the fluorescence intensities, *F<sub>T</sub>*, *F<sub>S</sub>*, and *F<sub>B</sub>*, of these solutions at 360 nm of the excitation wavelength and at 485 nm of the fluorescence wavelength as directed under Fluorometry <2.22>, respectively: the dissolution rate in 60 minutes is not less than 65%. No retest requirement is applied to Digoxin Tablets.

Dissolution rate (%) with respect to the labeled amount of digoxin ( $\text{C}_{41}\text{H}_{64}\text{O}_{14}$ )

$$= W_S \times \{(F_T - F_B)/(F_S - F_B)\} \times (1/C)$$

*W<sub>S</sub>*: Amount (mg) of Digoxin Reference Standard

*C*: The labeled amount (mg) of digoxin ( $\text{C}_{41}\text{H}_{64}\text{O}_{14}$ ) in 1 tablet

**Assay** Weigh accurately the mass of not less than 20 Digoxin Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 2.5 mg of digoxin ( $\text{C}_{41}\text{H}_{64}\text{O}_{14}$ ), add 30 mL of dilute ethanol, exposure to ultrasonic waves for 20 minutes, and shake for 5 minutes. Add exactly 5 mL of the internal standard solution and dilute ethanol to make 50 mL, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 25 mg of Digoxin Reference Standard, previously dried under reduced pressure at 105°C for 1 hour, dissolve in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, 10 mL of water and dilute ethanol to make 50 mL, and use this solution as the standard solution. Perform

the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of digoxin to that of the internal standard.

$$\begin{aligned} \text{Amount (mg) of digoxin (C}_{41}\text{H}_{64}\text{O}_{14}) \\ = W_S \times (Q_T/Q_S) \times (1/10) \end{aligned}$$

$W_S$ : Amount (mg) of Digoxin Reference Standard

**Internal standard solution**—A solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 220 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 30°C.

**Mobile phase:** A mixture of water and acetonitrile (7:3).

**Flow rate:** Adjust the flow rate so that the retention time of digoxin is about 10 minutes.

**System suitability**—

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, digoxin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of digoxin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Dihydrocodeine Phosphate

ジヒドロコデインリン酸塩

$\text{C}_{18}\text{H}_{23}\text{NO}_3 \cdot \text{H}_3\text{PO}_4$ : 399.38

(5*R*,6*S*)-4,5-Epoxy-3-methoxy-17-methylmorphinan-6-ol monophosphate [24204-13-5]

Dihydrocodeine Phosphate contains not less than 98.0% of  $\text{C}_{18}\text{H}_{23}\text{NO}_3 \cdot \text{H}_3\text{PO}_4$ , calculated on the dried basis.

**Description** Dihydrocodeine Phosphate occurs as a white to yellowish white, crystalline powder.

It is freely soluble in water and in acetic acid (100), slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution of Dihydrocodeine Phosphate (1 in 10) is between 3.0 and 5.0.

It is affected by light.

**Identification (1)** Determine the absorption spectrum of a solution of Dihydrocodeine Phosphate (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared spectrum of Dihydrocodeine Phosphate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Dihydrocodeine Phosphate (1 in 20) responds to the Qualitative Tests <1.09> (1) for phosphate.

**Purity (1) Chloride <1.03>**—Perform the test with 0.5 g of Dihydrocodeine Phosphate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (not more than 0.021%).

**(2) Sulfate <1.14>**—Perform the test with 0.20 g of Dihydrocodeine Phosphate. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid (not more than 0.240%).

**(3) Related substances**—Dissolve 0.20 g of Dihydrocodeine Phosphate in 10 mL of diluted ethanol (95) (1 in 2), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add diluted ethanol (95) (1 in 2) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-chromatography. Develop the plate with a mixture of ethanol (99.5), toluene, acetone and ammonia solution (28) (14:14:7:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying <2.41>** Not more than 1.0% (0.5 g, 105°C, 4 hours).

**Assay** Weigh accurately about 0.5 g of Dihydrocodeine Phosphate, dissolve in 70 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue to greenish blue (indicator: 3 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L perchloric acid VS} \\ = 39.94 \text{ mg of } \text{C}_{18}\text{H}_{23}\text{NO}_3 \cdot \text{H}_3\text{PO}_4 \end{aligned}$$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## 1% Dihydrocodeine Phosphate Powder

ジヒドロコデインリン酸塩散 1%

1% Dihydrocodeine Phosphate Powder contains not less than 0.90% and not more than 1.10% of dihydrocodeine phosphate ( $C_{18}H_{23}NO_3 \cdot H_3PO_4$ ; 399.38).

### Method of preparation

Dihydrocodeine Phosphate	10 g
Lactose Hydrate	a sufficient quantity
To make 1000 g	

Prepare as directed under Powders, with the above ingredients.

**Identification** Determine the absorption spectrum of a solution of 1% Dihydrocodeine Phosphate Powder (1 in 100) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 281 nm and 285 nm.

**Assay** Weigh accurately about 5 g of 1% Dihydrocodeine Phosphate Powder, dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of dihydrocodeine phosphate for assay (previously determine the loss on drying <2.41> (105°C, 4 hours)), dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of dihydrocodeine to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of dihydrocodeine phosphate} \\ & (C_{18}H_{23}NO_3 \cdot H_3PO_4) \\ & = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of dihydrocodeine phosphate for assay, calculated on the dried basis

**Internal standard solution**—A solution of ethylefrin hydrochloride (3 in 10,000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 280 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran.

**Flow rate**: Adjust the flow rate so that the retention time of dihydrocodeine is about 9 minutes.

**System suitability**—

**System performance**: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, dihydrocodeine and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability**: When the test is repeated 5 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of dihydrocodeine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## 10% Dihydrocodeine Phosphate Powder

ジヒドロコデインリン酸塩散 10%

10% Dihydrocodeine Phosphate Powder contains not less than 9.3% and not more than 10.7% of dihydrocodeine phosphate ( $C_{18}H_{23}NO_3 \cdot H_3PO_4$ ; 399.38).

### Method of preparation

Dihydrocodeine Phosphate	100 g
Lactose Hydrate	a sufficient quantity
To make 1000 g	

Prepare as directed under Powders, with the above ingredients.

**Identification** Determine the absorption spectrum of a solution of 10% Dihydrocodeine Phosphate Powder (1 in 1000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 281 nm and 285 nm.

**Assay** Weigh accurately about 2.5 g of 10% Dihydrocodeine Phosphate Powder, dissolve in water to make exactly 100 mL, then pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution and water to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of dihydrocodeine phosphate for assay, (previously determine the loss on drying <2.41> (105°C, 4 hours)), dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of dihydrocodeine to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of dihydrocodeine phosphate} \\ & (C_{18}H_{23}NO_3 \cdot H_3PO_4) \\ & = W_S \times (Q_T/Q_S) \times 5 \end{aligned}$$

$W_S$ : Amount (mg) of dihydrocodeine phosphate for assay, calculated on the dried basis

**Internal standard solution**—A solution of ethylefrin hydrochloride (3 in 10,000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wave-

length: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran.

Flow rate: Adjust the flow rate so that the retention time of dihydrocodeine is about 9 minutes.

System suitability—

System performance: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, dihydrocodeine and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 5 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of dihydrocodeine to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

## Dihydroergotamine Mesilate

ジヒドロエルゴタミンメシル酸塩

$C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$ : 679.78  
 (5'S,10R)-5'-Benzyl-12'-hydroxy-2'-methyl-9,10-dihydroergotaman-3',6',18-trione monomethanesulfonate  
 [6190-39-2]

Dihydroergotamine Mesilate contains not less than 97.0% of  $C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$ , calculated on the dried basis.

**Description** Dihydroergotamine Mesilate occurs as a white to yellowish white or grayish white to reddish white powder.

It is freely soluble in acetic acid (100), sparingly soluble in methanol and in chloroform, slightly soluble in water and in ethanol (95), and practically insoluble in acetic anhydride and in diethyl ether.

It is gradually colored by light.

Melting point: about 214°C (with decomposition).

**Identification (1)** Dissolve 1 mg of Dihydroergotamine Mesilate in 5 mL of a solution of L-tartaric acid (1 in 100). To 1 mL of this solution add 2 mL of 4-dimethylaminobenzaldehyde-ferric chloride TS, and shake: a blue color develops.

(2) To 0.1 g of Dihydroergotamine Mesilate add 0.4 g of sodium hydroxide, stir well, and incinerate by gradual ignition. After cooling, add 10 mL of water to the residue, heat to boiling, cool, and filter. To the filtrate add 0.5 mL of hydrochloric acid: the solution responds to the Qualitative Tests <1.09> for sulfate. Separately, to 0.1 g of Dihydroergotamine Mesilate add 5 mL of dilute hydrochloric acid, shake for 5 minutes, filter, and to the filtrate add 1 mL of barium chloride TS: the solution is clear.

(3) Determine the absorption spectrum of a solution of Dihydroergotamine Mesilate in methanol (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Dihydroergotamine Mesilate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-16.7 - -22.7^\circ$  [0.5 g, calculated on the dried basis, a mixture of ethanol (99.5), chloroform and ammonia solution (28) (10:10:1), 20 mL, 100 mm].

**pH** <2.54> Dissolve 0.05 g of Dihydroergotamine Mesilate in 50 mL of water: the pH of this solution is between 4.4 and 5.4.

**Purity (1)** Clarity and color of solution—Dissolve 0.10 g of Dihydroergotamine Mesilate in 0.1 mL of a solution of methanesulfonic acid (7 in 100) and 50 mL of water: the solution is clear, and has no more color than the following control solutions [1] or [2].

Control solution [1]: Pipet 0.6 mL of Ferric Chloride Stock CS and 0.15 mL of Cobaltous Chloride Stock CS, mix, and add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

Control solution [2]: Pipet 0.6 mL of Ferric Chloride Stock CS, 0.25 mL of Cobaltous Chloride Stock CS and 0.1 mL of copper (II) sulfate CS, mix, and add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

(2) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.10 g of Dihydroergotamine Mesilate in 5 mL of a mixture of chloroform and methanol (9:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (9:1) to make exactly 200 mL, and use this solution as the standard solution (1). Pipet 10 mL of the standard solution (1), add a mixture of chloroform and methanol (9:1) to make exactly 25 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:6:1) to a distance of about 15 cm, and dry the plate with cold wind within 1 minute. Develop the plate again immediately with a freshly prepared mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:6:1) to a distance of about 15 cm, and air-dry

the plate. Spray evenly 4-dimethylaminobenzaldehyde TS for spraying on the plate, and dry the plate with warm wind: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (1), and the spots, which are more intense than the spot from the standard solution (2), are not more than two.

**Loss on drying** <2.41> Not more than 4.0% (0.5 g, in vacuum at a pressure not exceeding 0.67 kPa, 100°C, 6 hours).

**Assay** Weigh accurately about 0.2 g of Dihydroergotamine Mesilate, dissolve in 170 mL of a mixture of acetic anhydride and acetic acid (100) (10:1), and titrate <2.50> with 0.02 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.02 mol/L perchloric acid VS  
= 13.60 mg of  $C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Dihydroergotoxine Mesilate

ジヒドロエルゴトキシンメシル酸塩

### Dihydroergocornine Mesilate

$C_{31}H_{41}N_5O_5 \cdot CH_4O_3S$ : 659.79  
(5'S,10R)-12'-Hydroxy-2',5'-bis(1-methylethyl)-9,10-dihydroergotaman-3',6',18-trione monomethanesulfonate

### Dihydro- $\alpha$ -ergocryptine Mesilate

$C_{32}H_{43}N_5O_5 \cdot CH_4O_3S$ : 673.82  
(5'S,10R)-12'-Hydroxy-2'-(1-methylethyl)-5'-(2-methylpropyl)-9,10-dihydroergotaman-3',6',18-trione monomethanesulfonate

### Dihydro- $\beta$ -ergocryptine Mesilate

$C_{32}H_{43}N_5O_5 \cdot CH_4O_3S$ : 673.82  
(5'S,10R)-12'-Hydroxy-2'-(1-methylethyl)-5'-(1-methylpropyl)-9,10-dihydroergotaman-3',6',18-trione monomethanesulfonate

### Dihydroergocristine Mesilate

$C_{35}H_{41}N_5O_5 \cdot CH_4O_3S$ : 707.84  
(5'S,10R)-5'-Benzyl-12'-hydroxy-2'-(1-methylethyl)-9,10-dihydroergotaman-3',6',18-trione

monomethanesulfonate

[8067-24-1, Dihydroergotoxine Mesilate]

Dihydroergotoxine Mesilate contains not less than 97.0% and not more than 103.0% of dihydroergotoxine mesilate [as a mixture of dihydroergocornine mesilate ( $C_{31}H_{41}N_5O_5 \cdot CH_4O_3S$ ), dihydro- $\alpha$ -ergocryptine mesilate ( $C_{32}H_{43}N_5O_5 \cdot CH_4O_3S$ ), dihydro- $\beta$ -ergocryptine mesilate ( $C_{32}H_{43}N_5O_5 \cdot CH_4O_3S$ ) and dihydroergocristine mesilate ( $C_{35}H_{41}N_5O_5 \cdot CH_4O_3S$ )], calculated on the anhydrous basis. The relative contents of dihydroergocornine mesilate ( $C_{31}H_{41}N_5O_5 \cdot CH_4O_3S$ ), dihydroergocryptine mesilate ( $C_{32}H_{43}N_5O_5 \cdot CH_4O_3S$ ) and dihydroergocristine mesilate ( $C_{35}H_{41}N_5O_5 \cdot CH_4O_3S$ ) are 30.3–36.3% each, and the content ratio of dihydro- $\alpha$ -ergocryptine mesilate and dihydro- $\beta$ -ergocryptine mesilate is 1.5–2.5:1.

**Description** Dihydroergotoxine Mesilate occurs as a white to pale yellow powder.

It is soluble in methanol, sparingly soluble in ethanol (95), slightly soluble in water, in acetonitrile and in chloroform, and practically insoluble in diethyl ether.

**Identification** Determine the infrared absorption spectrum of Dihydroergotoxine Mesilate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +11.0 – +15.0° (0.2 g, calculated on the anhydrous basis, dilute ethanol, 20 mL, 100 mm).

**Purity (1)** Clarity and color of solution—Dissolve 0.10 g of Dihydroergotoxine Mesilate in 20 mL of water: the solution is clear and the color of the solution is not more intense than that of the following control solution.

Control solution: To a mixture of 1.0 mL of Cobaltous Chloride Stock CS, 0.4 mL of Cupric Sulfate Stock CS and 2.4 mL of Ferric Chloride Stock CS add diluted hydrochloric acid (1 in 40) to make exactly 200 mL.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Dihydroergotoxine Mesilate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Weigh accurately 0.100 g of Dihydroergotoxine Mesilate, dissolve it in a mixture of chloroform and methanol (9:1) to make exactly 5 mL, and use this solution as the sample solution. Separately, weigh accurately 10 mg of dihydroergocristine mesilate for thin-layer chromatography, and dissolve in a mixture of chloroform and methanol (9:1) to make exactly 100 mL. Pipet 6 mL, 4 mL and 2 mL of this solution, add a mixture of chloroform and methanol (9:1) to make exactly 10 mL, respectively, and use these solutions as the standard solutions (1), (2) and (3), respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03> without putting the filter paper in the developing vessel. Spot 5  $\mu$ L each of the sample solution and standard solutions (1), (2) and (3) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:3:1) to a distance of about 15 cm, and dry the plate with the aid of a cool air

stream. Immediately after that, develop the plate again with a newly prepared mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:3:1) to a distance of about 15 cm, and dry the plate within 1 minute with the aid of a cool air stream. Spray evenly *p*-dimethylaminobenzaldehyde-hydrochloric acid TS on the plate, dry the plate within 2 minutes with the aid of a cool air stream, and heat it at 40°C for 15 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (1), not more than 2 spots are more intense than that from the standard solution (2), and not more than 4 spots are more intense than that from the standard solution (3).

**Water** <2.48> Not more than 5.0% (0.2 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** (1) Dihydroergotoxine mesilate—Weigh accurately about 30 mg each of Dihydroergotoxine Mesilate and Dihydroergotoxine Mesilate Reference Standard, and dissolve them separately in a suitable amount of a mixture of water and acetonitrile (3:1). To these solutions add exactly 10 mL of the internal standard solution and an amount of a mixture of water and acetonitrile (3:1) to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 20  $\mu$ L of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and calculate the ratios of the peak areas of dihydroergocornine, dihydro- $\alpha$ -ergocryptine, dihydroergocristine and dihydro- $\beta$ -ergocryptine to the peak area of the internal standard of these solutions.

$$\begin{aligned} & \text{Amount (mg) of dihydroergotoxine mesilate} \\ & = W_S \times \{(M_{TA} + M_{TB} + M_{TC} + M_{TD}) / \\ & \quad (M_{SA} + M_{SB} + M_{SC} + M_{SD})\} \end{aligned}$$

$W_S$ : Amount (mg) of Dihydroergotoxine Mesilate Reference Standard, calculated on the anhydrous basis

$M_{TA}$ : Ratio of the peak area of dihydroergocornine to that of the internal standard of the sample solution  $\times$  659.80

$M_{TB}$ : Ratio of the peak area of dihydro- $\alpha$ -ergocryptine to that of the internal standard of the sample  $\times$  673.83

$M_{TC}$ : Ratio of the peak area of dihydroergocristine to that of the internal standard of the sample solution  $\times$  707.85

$M_{TD}$ : Ratio of the peak area of dihydro- $\beta$ -ergocryptine to that of the internal standard of the sample solution  $\times$  673.83

$M_{SA}$ : Ratio of the peak area of dihydroergocornine to that of the internal standard of the standard solution  $\times$  659.80

$M_{SB}$ : Ratio of the peak area of dihydro- $\alpha$ -ergocryptine to that of the internal standard of the standard solution  $\times$  673.83

$M_{SC}$ : Ratio of the peak area of dihydroergocristine to that of the internal standard of the standard solution  $\times$  707.85

$M_{SD}$ : Ratio of the peak area of dihydro- $\beta$ -ergocryptine to that of the internal standard of the standard solution  $\times$  673.83

**Internal standard solution**—Dissolve 0.04 g of chloramphenicol in a mixture of water and acetonitrile (3:1) to make 250 mL.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water, acetonitrile and triethylamine (30:10:1).

Flow rate: Adjust the flow rate so that the retention time of chloramphenicol is about 5 minutes.

**System suitability**—

System performance: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, the internal standard, dihydroergocornine, dihydro- $\alpha$ -ergocryptine, dihydroergocristine and dihydro- $\beta$ -ergocryptine are eluted in this order with the resolution between the peaks of dihydro- $\alpha$ -ergocryptine and dihydroergocristine being not less than 1.5.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of dihydroergocornine, dihydro- $\alpha$ -ergocryptine, dihydroergocristine and dihydro- $\beta$ -ergocryptine to that of the internal standard is not more than 0.5%.

(2) Relative contents of dihydroergocornine mesilate, dihydroergocryptine mesilate and dihydroergocristine mesilate—Calculate the relative amounts of dihydroergocornine mesilate, dihydroergocryptine mesilate (dihydro- $\alpha$ -ergocryptine mesilate and dihydro- $\beta$ -ergocryptine mesilate) and dihydroergocristine mesilate from the chromatogram obtained in Assay (1) for the sample solution using the following equations:

$$\begin{aligned} & \text{Relative amount (\% of dihydroergocornine mesilate} \\ & = \{M_{TA} / (M_{TA} + M_{TB} + M_{TC} + M_{TD})\} \times 100 \end{aligned}$$

$$\begin{aligned} & \text{Relative amount (\% of dihydroergocryptine mesilate} \\ & = \{(M_{TB} + M_{TD}) / (M_{TA} + M_{TB} + M_{TC} + M_{TD})\} \times 100 \end{aligned}$$

$$\begin{aligned} & \text{Relative amount (\% of dihydroergocristine mesilate} \\ & = \{M_{TC} / (M_{TA} + M_{TB} + M_{TC} + M_{TD})\} \times 100 \end{aligned}$$

(3) Ratio of the content of dihydro- $\alpha$ -ergocryptine mesilate to dihydro- $\beta$ -ergocryptine mesilate—Calculate the ratio of the amount of dihydro- $\alpha$ -ergocryptine mesilate to dihydro- $\beta$ -ergocryptine mesilate from the chromatogram obtained in the Assay (1) for the sample solution using the following equations:

$$\begin{aligned} & \text{Ratio of the content of dihydro-}\alpha\text{-ergocryptine} \\ & \text{mesilate to dihydro-}\beta\text{-ergocryptine mesilate} \\ & = (M_{TB} / M_{TD}) \end{aligned}$$

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Dilazep Hydrochloride Hydrate

ジラゼブ塩酸塩水和物

$C_{31}H_{44}N_2O_{10} \cdot 2HCl \cdot H_2O$ : 695.63  
3,3'-(1,4-Diazepane-1,4-diyl)dipropyl bis(3,4,5-trimethoxybenzoate) dihydrochloride monohydrate [20153-98-4, anhydride]

Dilazep Hydrochloride Hydrate contains not less than 98.0% of dilazep hydrochloride ( $C_{31}H_{44}N_2O_{10} \cdot 2HCl$ : 677.62), calculated on the dried basis.

**Description** Dilazep Hydrochloride Hydrate occurs as a white, crystalline powder. It is odorless.

It is freely soluble in acetic acid (100) and in chloroform, soluble in water, slightly soluble in ethanol (95) and in acetic anhydride, and practically insoluble in diethyl ether.

Melting point: 200 – 204°C Immerse the sample in a bath of 110°C, and raise the temperature at the rate of about 3°C per minute from 140°C to 150°C, about 10°C per minute from 160°C to 195°C and about 1°C per minute from 195°C.

**Identification (1)** To 1 mL of a solution of Dilazep Hydrochloride Hydrate (1 in 100) add 0.1 mL of a solution of hydroxylammonium chloride (1 in 10) and 0.1 mL of 8 mol/L potassium hydroxide TS, and warm in a water bath of 70°C for 10 minutes. After cooling, add 0.5 mL of dilute hydrochloric acid and 0.1 mL of iron (III) chloride TS: a purple color develops.

(2) To 5 mL of a solution of Dilazep Hydrochloride Hydrate (3 in 500) add 0.3 mL of Reinecke salt TS: a light red precipitate is formed.

(3) Determine the absorption spectrum of a solution of Dilazep Hydrochloride Hydrate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Dilazep Hydrochloride Hydrate as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**pH** <2.54> Dissolve 1.0 g of Dilazep Hydrochloride Hydrate in 100 mL of water: the pH of this solution is between 3.0 and 4.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Dilazep Hydrochloride Hydrate in 20 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Perform the test with 0.5 g of Dilazep Hydrochloride Hydrate. Prepare the control solution with

0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Dilazep Hydrochloride Hydrate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Dilazep Hydrochloride Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.40 g of Dilazep Hydrochloride Hydrate in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add chloroform to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, ethyl acetate, dichloromethane and hydrochloric acid (500:200:100:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff's TS for spraying on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> 2.0 – 3.0% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Dilazep Hydrochloride Hydrate, dissolve in 40 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 33.88 mg of  $C_{31}H_{44}N_2O_{10} \cdot 2HCl$

**Containers and storage** Containers—Tight containers.

## Diltiazem Hydrochloride

ジルチアゼム塩酸塩

$C_{22}H_{26}N_2O_4S \cdot HCl$ : 450.98  
(2*S*,3*S*)-5-[2-(Dimethylamino)ethyl]-2-(4-methoxyphenyl)-4-oxo-2,3,4,5-tetrahydro-1,5-benzothiazepin-3-yl acetate monohydrochloride [33286-22-5]

Diltiazem Hydrochloride, when dried, contains not less than 98.5% of  $C_{22}H_{26}N_2O_4S \cdot HCl$ .

**Description** Diltiazem Hydrochloride occurs as white crystals or crystalline powder. It is odorless.

It is very soluble in formic acid, freely soluble in water, in methanol and in chloroform, sparingly soluble in acetonitrile, slightly soluble in acetic anhydride and in ethanol (99.5), and practically insoluble in diethyl ether.

**Identification (1)** Dissolve 0.05 g of Diltiazem Hydrochloride in 1 mL of 1 mol/L hydrochloric acid TS, add 2 mL of ammonium thiocyanate-cobaltous nitrate TS and 5 mL of chloroform, shake well, and allow to stand: a blue color develops in the chloroform layer.

(2) Proceed as directed under Oxygen Flask Combustion Method <1.06> with 0.03 g of Diltiazem Hydrochloride, using 20 mL of water as the absorbing liquid, and prepare the test solution: the test solution responds to the Qualitative Tests <1.09> (1) for sulfate.

(3) Dissolve 0.01 g of Diltiazem Hydrochloride in 0.01 mol/L hydrochloric acid TS to make 100 mL. To 2 mL of the solution add 0.01 mol/L hydrochloric acid TS to make 20 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Diltiazem Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave numbers of about  $1741\text{ cm}^{-1}$ ,  $1678\text{ cm}^{-1}$ ,  $1252\text{ cm}^{-1}$  and  $1025\text{ cm}^{-1}$ .

(5) A solution of Diltiazem Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> (2) for chloride.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +115 – +120° (after drying, 0.20 g, water, 20 mL, 100 mm).

**Melting point** <2.60> 210 – 215°C (with decomposition).

**pH** <2.54> Dissolve 1.0 g of Diltiazem Hydrochloride in 100 mL of water: the pH of this solution is between 4.3 and 5.3.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Diltiazem Hydrochloride in 20 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Perform the test with 1.0 g of Diltiazem Hydrochloride. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Diltiazem Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.11>—Place 1.0 g of Diltiazem Hydrochloride in a decomposition flask, add 5 mL of nitric acid and 2 mL of sulfuric acid, put a small funnel on the neck of the flask, and heat cautiously until white fumes are evolved. After cooling, add 2 mL of nitric acid, heat, and repeat this procedure twice, add several 2-mL portions of hydrogen peroxide (30), and heat until the solution becomes colorless to pale yellow. After cooling, add 2 mL of saturated solution of ammonium oxalate monohydrate, and heat again until white fumes are evolved. After cooling, add water to make 5 mL, use this solution as the test solution, and perform the test: the test solution has no more color than the following control solution (not more than 2 ppm).

Control solution: Proceed in the same manner as the test solution without Diltiazem Hydrochloride, add 2.0 mL of

Standard Arsenic Solution and water to make 5 mL, and proceed in the same manner as the test solution.

(5) Related substances—Dissolve 50 mg of Diltiazem Hydrochloride in 50 mL of diluted ethanol (99.5) (4 in 5), and use this solution as the sample solution. Measure exactly 1 mL of the sample solution, add diluted ethanol (99.5) (4 in 5) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by automatic integration method: the total peak area of peaks other than the peak of diltiazem obtained from the sample solution is not more than 3/5 times the peak area of diltiazem obtained from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: Dissolve 8 g of sodium acetate trihydrate and 1.5 g of *d*-camphorsulfonic acid in 500 mL of water, and filter using a membrane filter (0.4  $\mu\text{m}$  in pore size). Add 250 mL each of acetonitrile and methanol to the filtrate, and adjust the solution to a pH of 6.6 by adding sodium acetate trihydrate.

Flow rate: Adjust the flow rate so that the retention time of diltiazem is about 9 minutes.

Time span of measurement: About twice as long as the retention time of diltiazem beginning after the solvent peak.

**System suitability—**

Test for required detection: To exactly 2 mL of the standard solution add diluted ethanol (99.5) (4 in 5) to make exactly 10 mL. Confirm that the peak area of diltiazem obtained from 20  $\mu\text{L}$  of this solution is equivalent to 15 to 25% of that of diltiazem obtained from 20  $\mu\text{L}$  of the standard solution.

System performance: Dissolve 0.03 g of Diltiazem Hydrochloride, 0.02 g of *d*-3-hydroxy-*cis*-2,3-dihydro-5-[2-(dimethylamino)ethyl]-2-(4-methoxyphenyl)-1,5-benzothiazepin-4(5*H*)-one hydrochloride and 0.02 g of phenylbenzoate in 160 mL of ethanol (99.5), and add water to make 200 mL. Perform the test with 20  $\mu\text{L}$  of this solution as directed under Liquid Chromatography under the above operating conditions: *d*-3-hydroxy-*cis*-2,3-dihydro-5-[2-(dimethylamino)ethyl]-2-(4-methoxyphenyl)-1,5-benzothiazepin-4(5*H*)-one, diltiazem and phenyl benzoate are eluted in this order with the resolutions between the peaks of *d*-3-hydroxy-*cis*-2,3-dihydro-5-[2-(dimethylamino)ethyl]-2-(4-methoxyphenyl)-1,5-benzothiazepin-4(5*H*)-one and diltiazem and between the peaks of diltiazem and phenyl benzoate being not less than 2.5, respectively.

System repeatability: When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of diltiazem is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.7 g of Diltiazem Hydrochloride, previously dried, dissolve in 2.0 mL of formic acid, add 60 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 45.10 mg of  $C_{22}H_{26}N_2O_4S \cdot HCl$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Dimemorfan Phosphate

ジメモルファンリン酸塩

$C_{18}H_{25}N \cdot H_3PO_4$ : 353.39  
(9*S*,13*S*,14*S*)-3,17-Dimethylmorphinan monophosphate  
[36304-84-4]

Dimemorfan Phosphate, when dried, contains not less than 98.5% of  $C_{18}H_{25}N \cdot H_3PO_4$ .

**Description** Dimemorfan Phosphate occurs as white to pale yellowish white crystals or crystalline powder.

It is freely soluble in acetic acid (100), sparingly soluble in water and in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 265°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Dimemorfan Phosphate (1 in 5000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dimemorfan Phosphate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibits similar intensities of absorption at the same wave numbers.

(3) To 2 mL of a solution of Dimemorfan Phosphate (1 in 100) add 2 to 3 drops of silver nitrate TS: a yellow precipitate is formed, and it dissolves on the addition of dilute nitric acid.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +25 – +27° (after drying, 1 g, methanol, 100 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Dimemorfan Phosphate in 100 mL of water: the pH of this solution is between 4.0 and 5.0.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Dimemorfan Phosphate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Dimemorfan Phosphate according to Method 3, and perform the test. Use 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) (not more than 2 ppm).

(3) Related substances—Dissolve 0.10 g of Dimemorfan Phosphate in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, chloroform and ammonia solution (28) (150:150:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly the plate with Dragendorff's TS for spraying: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Assay** Weigh accurately about 0.6 g of Dimemorfan Phosphate, previously dried, dissolve in 100 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 35.34 mg of  $C_{18}H_{25}N \cdot H_3PO_4$

**Containers and storage** Containers—Tight containers.

## Dimenhydrinate

ジメンヒドリナート

$C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$ : 469.96  
2-(Diphenylmethoxy)-*N,N*-dimethylethylamine—  
8-chloro-1,3-dimethyl-1*H*-purine-2,6(3*H*,7*H*)-dione  
(1/1) [523-87-5]

Dimenhydrinate, when dried, contains not less than 53.0% and not more than 55.5% of diphenhydramine ( $C_{17}H_{21}NO$ : 255.36), and not less than 44.0% and not more than 47.0% of 8-chlorotheophylline ( $C_7H_7ClN_4O_2$ : 214.61).

**Description** Dimenhydrinate occurs as a white, crystalline powder. It is odorless, and has a bitter taste.

It is very soluble in chloroform, freely soluble in ethanol (95), and slightly soluble in water and in diethyl ether.

**Identification (1)** Dissolve 0.5 g of Dimenhydrinate in 30 mL of dilute ethanol, add 30 mL of water, and use this solution as the sample solution. Transfer 30 mL of the sample solution to a separator, and add 2 mL of ammonia solution (28). Extract with two 10-mL portions of diethyl ether, com-

bine the diethyl ether extracts, wash the combined extracts with 5 mL of water, and then extract the combined extracts with 15 mL of diluted hydrochloric acid (1 in 100). With this acid extract perform the following tests.

(i) To 5 mL of this acid extract add 5 drops of Reinecke salt TS: a light red precipitate is produced.

(ii) To 10 mL of this acid extract add 10 mL of 2,4,6-trinitrophenol TS dropwise, and allow to stand for 30 minutes. Collect the precipitate by filtering, recrystallize from dilute ethanol, and dry at 105°C for 30 minutes: the crystals melt <2.60> between 128°C and 133°C.

(2) To 30 mL of the sample solution obtained in the Identification (1) add 2 mL of dilute sulfuric acid, and cool for 30 minutes. Scratch the inside wall of the container frequently to facilitate crystallization. Filter, and wash the white crystals with a small amount of ice-cooled water. Dry the crystals for 1 hour at 105°C: the crystals melt <2.60> between 300°C and 305°C with decomposition.

(3) To 0.01 g of the crystals obtained in the Identification (2) add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, and evaporate on a water bath to dryness: the residue shows a yellow-red color. When the dish containing the residue is held over a vessel containing 2 to 3 drops of ammonia TS, the color changes to red-purple, which is discharged on the addition of 2 to 3 drops of sodium hydroxide TS.

(4) Mix well 0.05 g of the crystals obtained in the Identification (2) with 0.5 g of sodium peroxide in a nickel crucible, and heat until the mass melts. Cool, dissolve the melted mass in 20 mL of water, and acidify with dilute nitric acid: the solution responds to the Qualitative Tests for chloride <1.09>.

**Melting point** <2.60> 102 – 107°C

**Purity** (1) Chloride <1.03>—Transfer 50 mL of the filtrate obtained in the Assay (2) to a Nessler tube, add 1 mL of nitric acid, and allow to stand for 5 minutes: the turbidity of the solution is not greater than that of the following control solution.

Control solution: Dilute 0.25 mL of 0.01 mol/L hydrochloric acid VS with 6 mL of dilute nitric acid and with water to make 50 mL, add 1 mL of silver nitrate TS, and allow to stand for 5 minutes (not more than 0.044%).

(2) Bromide and iodide—Place 0.10 g of Dimenhydrinate in a glass-stoppered test tube, and add 0.05 g of sodium nitrite, 10 mL of chloroform and 10 mL of dilute hydrochloric acid. Stopper, shake well, and allow to stand: the chloroform layer remains colorless.

**Loss on drying** <2.41> Not more than 0.5% (3 g, in vacuum, phosphorus (V) oxide, 24 hours).

**Residue on ignition** <2.44> Not more than 0.3% (1 g).

**Assay** (1) Diphenhydramine—Weigh accurately about 0.5 g of Dimenhydrinate, previously dried, transfer to a 250-mL separator, and add 50 mL of water, 3 mL of ammonia TS and 10 g of sodium chloride. Extract with six 15-mL portions of diethyl ether with shaking, combine the diethyl ether extracts, and wash the combined diethyl ether extracts with three 50-mL portions of water. To the diethyl ether extracts add exactly 25 mL of 0.05 mol/L sulfuric acid VS, and add 25 mL of water. Shake thoroughly, and evaporate the diethyl ether gently. Cool, and titrate the excess sulfuric acid with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of methyl

red TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L sulfuric acid VS  
= 25.54 mg  $C_{17}H_{21}NO$

(2) 8-Chlorotheophylline—Weigh accurately about 0.8 g of Dimenhydrinate, previously dried, transfer to a 200-mL volumetric flask, add 50 mL of water, 3 mL of ammonia TS and 6 mL of a solution of ammonium nitrate (1 in 10), and heat on a water bath for 5 minutes. Add exactly 25 mL of 0.1 mol/L silver nitrate VS, heat on a water bath for 15 minutes with occasional shaking, cool, and add water to make exactly 200 mL. Allow to stand overnight to settle the precipitate, and filter through a dry filter paper, discarding the first 20 mL of the filtrate. Measure exactly 100 mL of the subsequent filtrate, acidify with nitric acid, add 3 mL of nitric acid, and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L silver nitrate VS  
= 21.46 mg of  $C_7H_7ClN_4O_2$

**Containers and storage** Containers—Well-closed containers.

## Dimenhydrinate Tablets

ジメンヒドリナート錠

Dimenhydrinate Tablets contain not less than 95% and not more than 105% of the labeled amount of dimenhydrinate ( $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$ ; 469.96).

**Method of preparation** Prepare as directed under Tablets, with Dimenhydrinate.

**Identification** (1) Triturate a quantity of powdered Dimenhydrinate Tablets, equivalent to 0.5 g of Dimenhydrinate according to the labeled amount, with 25 mL of warm ethanol (95), and filter. Dilute the filtrate with 40 mL of water, and filter again. Use the filtrate as the sample solution. Transfer 30 mL of the sample solution to a separator, and proceed as directed in the Identification (1) under Dimenhydrinate.

(2) With 30 mL of the sample solution obtained in (1), proceed as directed in the Identification (2), (3) and (4) under Dimenhydrinate.

**Assay** Weigh accurately, and powder not less than 20 Dimenhydrinate Tablets. Weigh accurately a portion of the powder, equivalent to about 0.5 g of dimenhydrinate ( $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$ ), transfer to a flask, add 40 mL of ethanol (95), and heat with swirling on a water bath until the solution just boils. Continue to heat for 30 seconds, and filter through a glass filter (G4). Wash the filter with warm ethanol (95), transfer the filtrate and washings to a flask, and evaporate the ethanol on a water bath to make 5 mL. Add 50 mL of water, 3 mL of ammonia TS and 6 mL of a solution of ammonium nitrate (1 in 10), heat the mixture on a water bath for 5 minutes, add exactly 25 mL of 0.1 mol/L silver nitrate VS, and heat on a water bath for 15 minutes with occasional shaking. Transfer the mixture to a 200-mL volumetric flask,

using water to rinse the flask, cool, add water to make exactly 200 mL, and proceed as directed in the Assay (2) under Dimenhydrinate.

Each mL of 0.1 mol/L silver nitrate VS  
= 47.00 mg of  $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$

**Containers and storage** Containers—Well-closed containers.

## Dimercaprol

ジメルカプロール

$C_3H_8OS_2$ : 124.23  
(2*RS*)-2,3-Disulfanylpropan-1-ol [59-52-9]

Dimercaprol contains not less than 98.5% and not more than 101.5% of  $C_3H_8OS_2$ .

**Description** Dimercaprol is a colorless or pale yellow liquid. It has a mercaptan-like, disagreeable odor.

It is miscible with methanol and with ethanol (99.5)

It is soluble in peanut oil, and sparingly soluble in water.

It shows no optical rotation.

**Identification (1)** Add 1 drop of Dimercaprol to a mixture of 1 drop of a solution of cobalt (II) chloride hexahydrate (1 in 200) and 5 mL of water: a yellow-brown color develops.

(2) Determine the infrared absorption spectrum of Dimercaprol as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Refractive index** <2.45>  $n_D^{20}$ : 1.570 – 1.575

**Specific gravity** <2.56>  $d_{20}^{20}$ : 1.238 – 1.248

**Purity (1)** Clarity and color of solution—Dissolve 1.0 mL of Dimercaprol in 20 mL of peanut oil: the solution is clear and colorless to pale yellow.

(2) Bromide—To 2.0 g of Dimercaprol add 25 mL of dilute potassium hydroxide-ethanol TS, and heat in a water bath under a reflux condenser for 2 hours. Evaporate the ethanol in a current of warm air, add 20 mL of water, and cool. Add a mixture of 10 mL of strong hydrogen peroxide and 40 mL of water, boil gently under a reflux condenser for 10 minutes, and filter rapidly after cooling. Wash the residue with two 10-mL portions of water, combine the washings with the filtrate, add 10 mL of dilute nitric acid and exactly 5 mL of 0.1 mol/L silver nitrate VS, and titrate <2.50> the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination: not more than 1.0 mL of 0.1 mol/L silver nitrate VS is consumed.

(3) Heavy metals <1.07>—Proceed with 1.0 g of Dimercaprol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Assay** Weigh accurately about 0.15 g of Dimercaprol into a glass-stoppered flask, dissolve in 10 mL of methanol, and ti-

trate <2.50> immediately with 0.05 mol/L iodine VS until a pale yellow color is produced. Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L iodine VS = 6.211 mg of  $C_3H_8OS_2$

**Containers and storage** Containers—Tight containers.  
Storage—Not exceeding 5°C.

## Dimercaprol Injection

ジメルカプロール注射液

Dimercaprol Injection is an oily solution for injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of dimercaprol ( $C_3H_8OS_2$ : 124.23).

**Method of preparation** Prepare as directed under Injections, with Dimercaprol. Benzyl Benzoate or Benzyl Alcohol may be added to increase the solubility.

**Description** Dimercaprol Injection is a clear, colorless or light yellow liquid. It has an unpleasant odor.

**Identification** Measure a volume of Dimercaprol Injection, equivalent to 30 mg of Dimercaprol according to the labeled amount, and proceed as directed in the Identification (1).

**Extractable volume** <6.05> It meets the requirement.

**Foreign insoluble matter** <6.06> Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> Perform the test according to Method 2: it meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Pipet a volume of Dimercaprol Injection, equivalent to about 0.1 g of dimercaprol ( $C_3H_8OS_2$ ), into a flask, and rinse the pipet several times with a mixture of methanol and diethyl ether (3:1), adding the rinsings to the flask. Add the mixture of methanol and diethyl ether (3:1) to make 50 mL, and titrate <2.50> with 0.05 mol/L iodine VS until a yellow color persists. Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L iodine VS  
= 6.211 mg of  $C_3H_8OS_2$

**Containers and storage** Containers—Hermetic containers.  
Storage—In a cold place.

## Dimorpholamine

ジモルホラミン

$C_{20}H_{38}N_4O_4$ : 398.54

*N,N'*-Ethylenebis(*N*-butylmorpholine-4-carboxamide)

[119-48-2]

Dimorpholamine, when dried, contains not less than 98.0% and not more than 101.0% of  $C_{20}H_{38}N_4O_4$ .

**Description** Dimorpholamine is a white to light yellow, crystalline powder, masses or syrupy liquid.

It is very soluble in ethanol (99.5) and in acetic anhydride, and soluble in water.

The pH of a solution prepared by dissolving 1.0 g of Dimorpholamine in 10 mL of water is between 6.0 and 7.0.

It is hygroscopic.

**Identification (1)** Determine the absorption spectrum of a solution of Dimorpholamine (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Dimorpholamine, previously dried, as directed in the potassium bromide disk method under the Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Dimorpholamine in 50 mL of water: the solution is clear and colorless to pale yellow.

**(2)** Chloride <1.03>—To 20 mL of the solution obtained in (1) add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

**(3)** Sulfate <1.14>—To 10 mL of the solution obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.096%).

**(4)** Heavy metals <1.07>—Proceed with 2.0 g of Dimorpholamine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(5)** Related substances—Dissolve 0.20 g of Dimorpholamine in 10 mL of ethanol (99.5), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (99.5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>.

Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethanol (99.5) and water (4:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 10 minutes: the spot other than the principal spot from the sample solution is not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 8 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Dimorpholamine, previously dried, dissolve in 50 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 39.85 mg of  $C_{20}H_{38}N_4O_4$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Dimorpholamine Injection

ジモルホラミン注射液

Dimorpholamine Injection is an aqueous solution for injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of dimorpholamine ( $C_{20}H_{38}N_4O_4$ : 398.54).

**Method of preparation** Prepare as directed under Injections, with Dimorpholamine.

**Description** Dimorpholamine Injection is a clear, colorless liquid.

pH: 3.0 – 5.5

**Identification (1)** To a volume of Dimorpholamine Injection, equivalent to 0.1 g of Dimorpholamine according to the labeled amount, add 3 drops of Dragendorff's TS: an orange color develops.

**(2)** To a volume of Dimorpholamine Injection, equivalent to 50 mg of Dimorpholamine according to the labeled amount, add 1 mL of dilute hydrochloric acid, and evaporate on a water bath to dryness. Dissolve the residue in 2 mL of hydrochloric acid, boil for 10 minutes under a reflux condenser, and evaporate to dryness on a water bath. Dissolve the residue with 1 mL of water, neutralize with sodium hydroxide TS, and add 0.2 mL of a solution of acetaldehyde (1 in 20), 0.1 mL of sodium pentacyanonitrosyl ferrate (III) TS and 0.5 mL of sodium carbonate TS: a blue color develops.

**Bacterial endotoxins** <4.01> Less than 5.0 EU/mg. Perform the test with the sample diluted to 0.15 w/v% with water for bacterial endotoxins test.

**Extractable volume** <6.05> It meets the requirement.

**Foreign insoluble matter** <6.06> Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> Perform the test according to Method 1: it meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Measure exactly a volume of Dimorpholamine Injection, equivalent to about 30 mg of dimorpholamine ( $C_{20}H_{38}N_4O_4$ ), and add water to make exactly 200 mL. Pipet 1 mL of this solution, shake with exactly 4 mL of the internal standard solution for 5 minutes, and use this solution as the sample solution. Separately, weigh accurately about 0.15 g of dimorpholamine for assay, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 8 hours, and dissolve in water to make exactly 1000 mL. Pipet 1 mL of this solution, shake with exactly 4 mL of the internal standard solution for 5 minutes, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of dimorpholamine to that of the internal standard.

$$\begin{aligned} \text{Amount (mg) of dimorpholamine } (C_{20}H_{38}N_4O_4) \\ = W_S \times (Q_T/Q_S) \times (1/5) \end{aligned}$$

$W_S$ : Amount (mg) of dimorpholamine for assay

**Internal standard solution**—A solution of butyl parahydroxybenzoate in acetonitrile (1 in 25,000).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 216 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** A mixture of water and acetonitrile (1:1).

**Flow rate:** Adjust the flow rate so that the retention time of dimorpholamine is about 4 minutes.

**System suitability**—

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, dimorpholamine and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.0.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of dimorpholamine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

## Dinoprost

### Prostaglandin $F_{2\alpha}$

ジノプロスト

$C_{20}H_{34}O_5$ : 354.48  
(5*Z*)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-Dihydroxy-2-[(1*E*,3*S*)-3-hydroxyoct-1-en-1-yl]cyclopentyl]hept-5-enoic acid  
[551-11-1]

Dinoprost contains not less than 98.5% of  $C_{20}H_{34}O_5$ , calculated on the anhydrous basis.

**Description** Dinoprost occurs as white, waxy masses or powder, or a clear, colorless to light yellow and viscous liquid. It is odorless.

It is very soluble in *N,N*-dimethylformamide, freely soluble in methanol, in ethanol (99.5) and in diethyl ether, and very slightly soluble in water.

**Identification (1)** To 5 mg of Dinoprost add 2 mL of sulfuric acid, and dissolve by shaking for 5 minutes: a dark red color develops. To this solution add 30 mL of sulfuric acid: an orange color develops with a green fluorescence.

**(2)** Dissolve 1 mg of Dinoprost in 50 mL of diluted sulfuric acid (7 in 10), and warm in a water bath heated at 50°C for 40 minutes. After cooling, determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(3)** Warm Dinoprost at 40°C to effect a liquid, and determine the infrared absorption spectrum of the liquid as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +24 – +31° (0.2 g, ethanol (99.5), 10 mL, 100 mm).

**Purity (1)** Clarity and color of solution—Dissolve 0.20 g of Dinoprost in 5 mL of ethanol (99.5): the solution is clear and colorless to pale yellow.

**(2)** Related substances—Dissolve 10 mg of Dinoprost in 2 mL of methanol, add water to make 10 mL, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add diluted methanol (1 in 5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the total area of the peaks other than the peak of dinoprost from the sample solution is not larger than the peak area of dinoprost from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 205 nm).

**Column:** A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of 0.02 mol/L potassium dihydrogenphosphate TS and acetonitrile (5:2).

**Flow rate:** Adjust the flow rate so that the retention time of dinoprost is about 20 minutes.

**Selection of column:** Dissolve 0.01 g each of isopropyl parahydroxybenzoate and propyl parahydroxybenzoate in 2 mL of methanol, and add water to make 10 mL. To 1 mL of this solution add diluted methanol (1 in 5) to make 30 mL, proceed with 10  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of isopropyl parahydroxybenzoate and propyl parahydroxybenzoate in this order with the resolution between these peaks being not less than 2.5.

**Detection sensitivity:** Adjust the detection sensitivity so that the peak height of dinoprost from the standard solution composes 5% to 15% of the full scale.

**Time span of measurement:** About 1.5 times as long as the retention time of dinoprost beginning after the solvent peak.

**Water** <2.48> Not more than 0.5% (0.3 g, direct titration).

**Assay** Weigh accurately about 50 mg of Dinoprost, dissolve in 30 mL of *N,N*-dimethylformamide, and titrate <2.50> with 0.02 mol/L tetramethylammonium hydroxide VS under a stream of nitrogen (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.02 mol/L tetramethylammonium hydroxide VS  
= 7.090 mg of C<sub>20</sub>H<sub>34</sub>O<sub>5</sub>

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and in a place not exceeding 5°C.

## Diphenhydramine

ジフェンヒドรามミン

C<sub>17</sub>H<sub>21</sub>NO: 255.35

2-(Diphenylmethoxy)-*N,N*-dimethylethylamine [58-73-1]

Diphenhydramine contains not less than 96.0% of C<sub>17</sub>H<sub>21</sub>NO.

**Description** Diphenhydramine is a clear, light yellow to yellow liquid. It has a characteristic odor, and has a burning taste at first, followed by a slight sensation of numbness on the tongue.

It is miscible with acetic anhydride, with acetic acid (100), with ethanol (95) and with diethyl ether.

It is very slightly soluble in water.

Boiling point: about 162°C (in vacuum, 0.67 kPa).

Refractive index  $n_D^{20}$ : about 1.55

It is gradually affected by light.

**Identification (1)** To 0.05 g of Diphenhydramine add 2 mL of sulfuric acid: an orange-red precipitate is produced immediately, and its color changes to red-brown on standing. Add carefully 2 mL of water to this solution: the intensity of the color changes, but the color tone does not change.

**(2)** Dissolve 0.1 g of Diphenhydramine in 10 mL of dilute ethanol, add an excess of a saturated solution of 2,4,6-trinitrophenol in dilute ethanol with stirring, and cool in ice. Collect the produced crystals, recrystallize from dilute ethanol, and dry at 105°C for 30 minutes: the crystals melt between 128°C and 133°C.

**Specific gravity** <2.56>  $d_{20}^{20}$ : 1.013 – 1.020

**Purity (1)**  $\beta$ -Dimethylaminoethanol—Dissolve 1.0 g of Diphenhydramine in 20 mL of diethyl ether, and extract with two 10-mL portions of water with thorough shaking. Combine the water extracts, and add 2 drops of phenolphthalein TS and 1.0 mL of 0.05 mol/L sulfuric acid VS: no red color develops.

**(2)** Benzohydrol—Transfer 1.0 g of Diphenhydramine to a separator, dissolve in 20 mL of diethyl ether, and extract with two 25-mL portions of diluted hydrochloric acid (1 in 15) with thorough shaking. Separate the diethyl ether layer, evaporate slowly on a water bath, and dry in a desiccator (in vacuum, silica gel) for 2 hours: the mass of the residue is not more than 20 mg.

**(3)** Heavy metals <1.07>—Proceed with 1.0 g of Diphenhydramine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Diphenhydramine, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 25.54 mg of C<sub>17</sub>H<sub>21</sub>NO

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and almost well-filled.

## Diphenhydramine and Bromovalerylurea Powder

ジフェンヒドรามミン・バレリル尿素散

### Method of preparation

Diphenhydramine Tannate	90 g
Bromovalerylurea	500 g
Starch, Lactose Hydrate, or their mixture	a sufficient quantity

To make 1000 g

Prepare as directed under Powders, with the above ingredients.

**Description** Diphenhydramine and Bromovalerylurea Powder occurs as a slightly grayish white powder.

**Identification (1)** To 0.1 g of Diphenhydramine and Bromovalerylurea Powder add 5 mL of dilute hydrochloric acid, 1 mL of ethanol (95) and 10 mL of water, shake, and filter. To the filtrate add 10 mL of sodium hydroxide TS, and extract with 10 mL of chloroform. Separate the chloroform layer, add 1 mL of bromophenol blue TS, and shake: a yellow color develops in the chloroform layer (diphenhydramine tannate).

(2) Shake 0.02 g of Diphenhydramine and Bromovalerylurea Powder with 10 mL of diethyl ether, filter, and evaporate the filtrate on a water bath. Dissolve the residue in 2 mL of sodium hydroxide TS, and add 5 mL of dimethylglyoxime-thiosemicarbazide TS, and heat on a water bath for 30 minutes: a red color develops (bromovalerylurea).

(3) Shake 0.3 g of Diphenhydramine and Bromovalerylurea with 5 mL of methanol, filter, and use the filtrate as the sample solution. Dissolve 0.15 g of bromovalerylurea and 0.03 g of diphenhydramine tannate in 5 mL each of methanol, and use the solutions as standard solution (1) and standard solution (2). Perform the test as directed under Thin-layer Chromatography <2.03> with these solutions. Spot 5  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate in a mixture of ethyl acetate, ethanol (99.5) and ammonia solution (28) (50:5:1) to a distance of about 10 cm. Air-dry the plate, and examine under ultraviolet light (main wavelength: 254 nm): 3 spots from the sample solution and the corresponding spot from standard solutions (1) and (2) show the same *R<sub>f</sub>* value. Spray Dragendorff's TS for spraying evenly on the plate: the spot from the standard solution (2) and the corresponding spot from the sample solution reveal an orange color.

**Containers and storage** Containers—Well-closed containers.

## Diphenhydramine Hydrochloride

ジフェンヒドรามミン塩酸塩

$C_{17}H_{21}NO \cdot HCl$ : 291.82

2-(Diphenylmethoxy)-*N,N*-dimethylethylamine monohydrochloride [147-24-0]

Diphenhydramine Hydrochloride, when dried, contains not less than 98.0% of  $C_{17}H_{21}NO \cdot HCl$ .

**Description** Diphenhydramine Hydrochloride occurs as white crystals or crystalline powder. It is odorless, and has a

bitter taste, followed by a sensation of numbness on the tongue.

It is very soluble in methanol and in acetic acid (100), freely soluble in water and in ethanol (95), sparingly soluble in acetic anhydride, and practically insoluble in diethyl ether.

It is gradually affected by light.

**Identification (1)** Determine the absorption spectrum of a solution of Diphenhydramine Hydrochloride in methanol (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Diphenhydramine Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Diphenhydramine Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**pH <2.54>** Dissolve 1.0 g of Diphenhydramine Hydrochloride in 10 mL of water: the pH of this solution is between 4.0 and 5.0.

**Melting point <2.60>** 166 – 170°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Diphenhydramine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Diphenhydramine Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.20 g of Diphenhydramine Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of hexane, ethyl acetate, methanol and ammonia solution (28) (10:4:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly iodine TS on the plate: the spots other than the principal spot from the sample solution and the spot on the original point are not more intense than the spot from the standard solution.

**Loss on drying <2.41>** Not more than 0.5% (2 g, 105°C, 3 hours).

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Diphenhydramine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3). Titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 29.18 mg of  $C_{17}H_{21}NO \cdot HCl$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Diphenhydramine, Phenol and Zinc Oxide Liniment

ジフェンヒドラミン・フェノール・亜鉛華リニメント

### Method of preparation

Diphenhydramine	20 g
Phenol and Zinc Oxide Liniment	980 g
To make 1000 g	

Dissolve and mix the above ingredients.

**Description** Diphenhydramine, Phenol and Zinc Oxide Liniment is a white to whitish, pasty mass. It has a slight odor of phenol.

**Identification (1)** To 3 g of Diphenhydramine, Phenol and Zinc Oxide Liniment add 20 mL of hexane, shake well, and separate the hexane layer. Shake thoroughly the hexane solution with 10 mL of 0.2 mol/L hydrochloric acid. Separate the aqueous layer, and adjust with sodium hydroxide TS to a pH of 4.6. Add 1 mL of bromophenol blue-potassium biphthalate TS and 10 mL of chloroform, and shake: a yellow color develops in the chloroform layer (diphenhydramine).

**(2)** Place 1 g of Diphenhydramine, Phenol and Zinc Oxide Liniment in a porcelain crucible, gradually raise the temperature by heating until the mass is charred, and ignite strongly: a yellow color is produced, and disappears on cooling. To the residue add 10 mL of water and 5 mL of dilute hydrochloric acid, shake well, and filter. Add 2 to 3 drops of potassium hexacyanoferrate (II) TS to the filtrate: a white precipitate is produced (zinc oxide).

**(3)** Shake 0.5 g of Diphenhydramine, Phenol and Zinc Oxide Liniment with 1 mL of water and 5 mL of chloroform, filter, and use the filtrate as the sample solution. Dissolve 0.01 g each of diphenhydramine and phenol in 5 mL each of chloroform, and use these solutions as standard solution (1) and standard solution (2). Perform the test as directed under Thin-layer Chromatography <2.03> with the sample solution and the standard solutions. Spot 5  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, ethanol (99.5) and ammonia solution (28) (50:5:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor: two spots from the sample solution and each spot from standard solution (1) and standard solution (2) show the same  $R_f$  value. Sublime iodine, and spray Dragendorff's TS evenly upon the plate: the spot from standard solution (1) and the corresponding spot from the sample solution reveal an orange color.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Diphenhydramine Tannate

タンニン酸ジフェンヒドラミン

Diphenhydramine Tannate is a compound of diphenhydramine and tannic acid, and contains not less than 25.0% and not more than 35.0% of diphenhydramine ( $C_{17}H_{21}NO$ : 255.35).

**Description** Diphenhydramine Tannate occurs as a grayish white to light brown powder. It is odorless or has a slight, characteristic odor. It is tasteless.

It is slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.

**Identification (1)** To 1 g of Diphenhydramine Tannate add 15 mL of water and 0.3 mL of dilute hydrochloric acid, shake thoroughly for 1 minute, filter, and use this filtrate as the sample solution. Transfer 10 mL of the sample solution to a separator, extract with two 20-mL portions of chloroform, combine the chloroform extracts, and evaporate on a water bath to dryness. To 5 mL of a solution of the residue (1 in 100) add 5 drops of Reinecke salt TS: a light red precipitate is produced.

**(2)** To 10 mL of a solution of the residue obtained in (1) (1 in 100) add 10 mL of 2,4,6-trinitrophenol TS dropwise, and allow to stand for 30 minutes. Collect the precipitate by filtration, recrystallize from dilute ethanol, and dry at 105°C for 30 minutes: the crystals melt <2.60> between 128°C and 133°C.

**(3)** To 1 mL of the sample solution obtained in (1) add 1 drop of iron (III) chloride TS: a dark blue-purple color develops.

**Purity** Heavy metals <1.07>—Proceed with 1.0 g of Diphenhydramine Tannate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** <2.41> Not more than 7.0% (1 g, 105°C, 5 hours).

**Residue on ignition** <2.44> Not more than 1.0% (1 g).

**Assay** Transfer about 1.7 g of Diphenhydramine Tannate, accurately weighed, to a separator, dissolve in 20 mL of water and 3.0 mL of dilute hydrochloric acid with thorough shaking, add 20 mL of a solution of sodium hydroxide (1 in 10) and exactly 25 mL of isooctane, shake vigorously for 5 minutes, dissolve 2 g of sodium chloride with shaking, and allow to stand. To 20 mL of the isooctane layer add exactly 80 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 25.54 mg of  $C_{17}H_{21}NO$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Freeze-dried Diphtheria Antitoxin, Equine

乾燥ジフテリアウマ抗毒素

Freeze-dried Diphtheria Antitoxin, Equine, is a preparation for injection which is dissolved before use.

It contains diphtheria antitoxin in immunoglobulin of horse origin.

It conforms to the requirements of Freeze-dried Diphtheria Antitoxin, Equine, in the Minimum Requirements for Biological Products.

**Description** Freeze-dried Diphtheria Antitoxin, Equine, becomes a colorless or light yellow-brown, clear liquid or a slightly whitish turbid liquid on addition of solvent.

## Diphtheria Toxoid

ジフテリアトキソイド

Diphtheria Toxoid is a liquid for injection containing diphtheria toxoid prepared by treating diphtheria toxin with formaldehyde by a method involving no appreciable loss of the immunogenicity.

It conforms to the requirements of Diphtheria Toxoid in the Minimum Requirements for Biological Products.

**Description** Diphtheria Toxoid is a clear, colorless to light yellow-brown liquid.

## Adsorbed Diphtheria Toxoid for Adult Use

成人用沈降ジフテリアトキソイド

Adsorbed Diphtheria Toxoid for Adult Use is a liquid for injection containing diphtheria toxoid prepared by treating diphtheria toxin with formaldehyde by a method involving no appreciable loss of the immunogenicity and very few antigenic substances other than toxoid, and rendered insoluble with aluminum salt.

It conforms to the requirements of Adsorbed Diphtheria Toxoid for Adult Use in the Minimum Requirements of Biological Products.

**Description** Adsorbed Diphtheria Toxoid for Adult Use becomes a homogeneous, whitish turbid liquid on shaking.

## Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine

沈降精製百日せきジフテリア破傷風混合ワクチン

Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine is a liquid for injection consisting of a liquid containing the protective antigen of *Bordetella pertussis*, Diphtheria Toxoid and a liquid containing tetanus toxoid obtained by detoxifying the tetanus toxin with formaldehyde solution without impairing its immunogenicity, to which aluminum is added to make the antigen and the toxoids insoluble.

It conforms to the requirements of Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine in the Minimum Requirements for Biological Products.

**Description** Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine becomes a homogeneous, white turbid liquid on shaking.

## Diphtheria-Tetanus Combined Toxoid

ジフテリア破傷風混合トキソイド

Diphtheria-Tetanus Combined Toxoid is a liquid for injection containing diphtheria toxoid and tetanus toxoid which are prepared by treating diphtheria toxin and tetanus toxin, respectively, with formaldehyde by a method involving no appreciable loss of the immunogenicity.

It conforms to the requirements of Diphtheria-Tetanus Combined Toxoid in the Minimum Requirements of Biological Products.

**Description** Diphtheria-Tetanus Combined Toxoid is a colorless or light yellow-brown, clear liquid.

## Adsorbed Diphtheria-Tetanus Combined Toxoid

沈降ジフテリア破傷風混合トキソイド

Adsorbed Diphtheria-Tetanus Combined Toxoid is a liquid for injection containing diphtheria toxoid and tetanus toxoid which are prepared by treating diphtheria toxin and tetanus toxin, respectively, with formaldehyde by a method involving no appreciable loss of the immunogenicity and rendered insoluble by adding aluminum salt.

It conforms to the requirements of Adsorbed

Diphtheria-Tetanus Combined Toxoid in the Minimum Requirements for Biological Products.

**Description** Adsorbed Diphtheria-Tetanus Combined Toxoid becomes a homogeneous, whitish turbid liquid on shaking.

## Dipyridamole

ジピリダモール

$C_{24}H_{40}N_8O_4$ : 504.63

2,2',2'',2'''-[4,8-Di(piperidin-1-yl)pyrimido[5,4-d]pyrimidine-2,6-diyl]dinitrilo}tetraethanol [58-32-2]

Dipyridamole, when dried, contains not less than 98.5% of  $C_{24}H_{40}N_8O_4$ .

**Description** Dipyridamole occurs as yellow crystals or crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in chloroform, sparingly soluble in methanol and in ethanol (99.5), and practically insoluble in water and in diethyl ether.

**Identification (1)** Dissolve 5 mg of Dipyridamole in 2 mL of sulfuric acid, add 2 drops of nitric acid, and shake: a deep purple color develops.

(2) Determine the absorption spectrum of a solution of Dipyridamole in a mixture of methanol and hydrochloric acid (99:1) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Dipyridamole, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 165 – 169°C

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Dipyridamole in 10 mL of chloroform: the solution is clear, and shows a yellow color.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Dipyridamole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Dipyridamole according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 50 mg of Dipyridamole in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 0.5 mL of the sample solution, add

the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than the peak of dipyridamole from the sample solution is not larger than the peak area of dipyridamole from the standard solution.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 280 nm).

**Column:** A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Dissolve 0.2 g of potassium dihydrogen phosphate in 200 mL of water, and add 800 mL of methanol.

**Flow rate:** Adjust the flow rate so that the retention time of dipyridamole is about 4 minutes.

**Time span of measurement:** About 5 times as long as the retention time of dipyridamole.

**System suitability**—

**Test for required detection:** To exactly 5 mL of the standard solution add the mobile phase to make exactly 25 mL. Confirm that the peak area of dipyridamole obtained from 20  $\mu$ L of this solution is equivalent to 15 to 25% of that of dipyridamole obtained from 20  $\mu$ L of the standard solution.

**System performance:** Dissolve 7 mg of Dipyridamole and 3 mg of terphenyl in 50 mL of methanol. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, dipyridamole and terphenyl are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of dipyridamole is not more than 1.0%.

**Loss on drying** <2.41> Not more than 0.2% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Dipyridamole, previously dried, dissolve in 70 mL of methanol, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 50.46 mg of  $C_{24}H_{40}N_8O_4$

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Disodium Edetate Hydrate

### EDTA Sodium Hydrate

エデト酸ナトリウム水和物

$C_{10}H_{14}N_2Na_2O_8 \cdot 2H_2O$ : 372.24

Disodium dihydrogen ethylenediaminetetraacetate dihydrate [6381-92-6]

Disodium Edetate Hydrate contains not less than 99.0% of  $C_{10}H_{14}N_2Na_2O_8 \cdot 2H_2O$ .

**Description** Disodium Edetate Hydrate occurs as white crystals or crystalline powder. It is odorless and has a slight, acid taste.

It is soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

**Identification (1)** Dissolve 0.01 g of Disodium Edetate Hydrate in 5 mL of water, add 2 mL of a solution of potassium chromate (1 in 200) and 2 mL of arsenic (III) trioxide TS, and heat in a water bath for 2 minutes: a purple color develops.

**(2)** Dissolve 0.5 g of Disodium Edetate Hydrate in 20 mL of water, and add 1 mL of dilute hydrochloric acid: a white precipitate is produced. Collect the precipitate, wash with 50 mL of water, and dry at 105°C for 1 hour: the precipitate melts <2.60> between 240°C and 244°C (with decomposition).

**(3)** A solution of Disodium Edetate Hydrate (1 in 20) responds to the Qualitative Tests <1.09> (1) for sodium salt.

**pH <2.54>** Dissolve 1 g of Disodium Edetate Hydrate in 100 mL of water: the pH of this solution is between 4.3 and 4.7.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Disodium Edetate Hydrate in 50 mL of water: the solution is clear and colorless.

**(2)** Cyanide—Transfer 1.0 g of Disodium Edetate Hydrate to a round-bottomed flask, dissolve in 100 mL of water, add 10 mL of phosphoric acid, and distil. Place 15 mL of 0.5 mol/L sodium hydroxide VS in a 100-mL measuring cylinder, which is used as a receiver, and immerse the bottom end of the condenser into the solution. Distil the mixture until the distillate measures 100 mL, and use this solution as the sample solution. Transfer 20 mL of the sample solution to a glass-stoppered test tube, add 1 drop of phenolphthalein TS, neutralize with dilute acetic acid, and add 5 mL of phosphate buffer solution, pH 6.8, and 1.0 mL of diluted sodium toluensulfonchloramide TS (1 in 5). Immediately stopper the tube, mix gently, and allow to stand for a few minutes. Mix well with 5 mL of pyridine-pyrazolone TS, and allow to stand between 20°C and 30°C for 50 minutes: the solution has no more color than the following control solution.

Control solution: Pipet 1.0 mL of Standard Cyanide Solution, add 15 mL of 0.5 mol/L sodium hydroxide VS and water to make exactly 1000 mL, transfer 20 mL of this solution to a glass-stoppered test tube, and proceed as directed

for the sample solution.

**(3)** Heavy metals <1.07>—Proceed with 2.0 g of Disodium Edetate Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(4)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Disodium Edetate Hydrate according to Method 1, and perform the test (not more than 2 ppm).

**Residue on ignition <2.44>** 37.0 – 39.0% (1 g).

**Assay** Weigh accurately about 1 g of Disodium Edetate Hydrate, dissolve in 50 mL of water, add 2 mL of ammonia-ammonium chloride buffer solution, pH 10.7, and 0.04 g of eriochrome black T-sodium chloride indicator, and titrate <2.50> with 0.1 mol/L zinc VS until the color of the solution changes from blue to red.

Each mL of 0.1 mol/L zinc VS  
= 37.22 mg of  $C_{10}H_{14}N_2Na_2O_8 \cdot 2H_2O$

**Containers and storage** Containers—Well-closed containers.

## Disopyramide

ジソピラミド

$C_{21}H_{29}N_3O$ : 339.47

(2*RS*)-4-Bis(1-methylethyl)amino-2-phenyl-2-(pyridin-2-yl)butanamide [3737-09-5]

Disopyramide contains not less than 98.5% of  $C_{21}H_{29}N_3O$ , calculated on the dried basis.

**Description** Disopyramide occurs as white crystals or crystalline powder.

It is very soluble in methanol and in ethanol (95), freely soluble in acetic anhydride, in acetic acid (100) and in diethyl ether, and slightly soluble in water.

**Identification (1)** To 1 mL of a solution of Disopyramide in ethanol (95) (1 in 20) add 10 mL of 2,4,6-trinitrophenol TS, and warm: a yellow precipitate is formed. Filter this precipitate, wash with water, and dry at 105°C for 1 hour: the residue melts <2.60> between 172°C and 176°C.

**(2)** Determine the absorption spectrum of a solution of Disopyramide in 0.05 mol/L sulfuric acid-methanol TS (1 in 25,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(3)** Determine the infrared absorption spectrum of Disopyramide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (269 nm): 194 – 205 (10 mg, 0.05 mol/L sulfuric acid-methanol TS, 500 mL).

**Purity (1)** Heavy metals <1.07>—Dissolve 1.0 g of Disopyramide in 10 mL of ethanol (95), and add 2 mL of dilute acetic acid (31) and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 10 mL of ethanol (95), 2 mL of dilute acetic acid and water to make 50 mL (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Disopyramide according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.40 g of Disopyramide in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 400 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and ammonia solution (28) (45:4:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, in vacuum, 80°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.20% (1 g).

**Assay** Weigh accurately about 0.25 g of Disopyramide, dissolve in 30 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 16.97 mg of  $\text{C}_{21}\text{H}_{29}\text{N}_3\text{O}$

**Containers and storage** Containers—Tight containers.

## Distigmine Bromide

ジスチグミン臭化物

$\text{C}_{22}\text{H}_{32}\text{Br}_2\text{N}_4\text{O}_4$ ; 576.32

3,3'-[Hexamethylenebis(methyliminocarbonyloxy)]bis(1-methylpyridinium) dibromide [I5876-67-2]

Distigmine Bromide contains not less than 98.5% of  $\text{C}_{22}\text{H}_{32}\text{Br}_2\text{N}_4\text{O}_4$ , calculated on the anhydrous basis.

**Description** Distigmine Bromide occurs as a white, crystalline powder.

It is very soluble in water, freely soluble in methanol, in

ethanol (95) and in acetic acid (100), and slightly soluble in acetic anhydride.

The pH of a solution of Distigmine Bromide (1 in 100) is between 5.0 and 5.5.

It is slightly hygroscopic.

It is gradually colored by light.

Melting point: about 150°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Distigmine Bromide (1 in 25,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Distigmine Bromide as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 5 mL of a solution of Distigmine Bromide (1 in 10) add 2 mL of dilute nitric acid: the solution responds to the Qualitative Tests <1.09> (1) for bromide.

**Purity (1)** Clarity and color of solution—Dissolve 0.25 g of Distigmine Bromide in 5 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Perform the test with 0.40 g of Distigmine Bromide. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Distigmine Bromide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Dissolve 40 mg of Distigmine Bromide in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of this solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu\text{L}$  each of the sample solution and standard solution on a plate of cellulose with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water, ethanol (99.5) and acetic acid (100) (8:3:2:1) to a distance of about 13 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution. Spray evenly Dragendorff's TS for spraying on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Water** <2.48> Not more than 1.0% (1 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Distigmine Bromide, dissolve in 60 mL of a mixture of acetic anhydride and acetic acid (100) (8:1), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration with platinum electrode). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 28.82 mg of  $\text{C}_{22}\text{H}_{32}\text{Br}_2\text{N}_4\text{O}_4$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Distigmine Bromide Tablets

ジスチグミン臭化物錠

Distigmine Bromide Tablets contain not less than 95% and not more than 105% of the labeled amount of distigmine bromide ( $C_{22}H_{32}Br_2N_4O_4$ : 576.32).

**Method of preparation** Prepare as directed under Tablets, with Distigmine Bromide.

**Identification** Determine the absorption spectrum of the solution obtained in the Assay, as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 268 nm and 272 nm, and a minimum between 239 nm and 243 nm.

**Assay** Weigh accurately and powder not less than 20 tablets of Distigmine Bromide Tablets. Weigh accurately a portion of the powder, equivalent to about 15 mg of Distigmine Bromide ( $C_{22}H_{32}Br_2N_4O_4$ ), add 30 mL of 0.1 mol/L hydrochloric acid TS, shake for 1 hour, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and filter. Discard the first 20 mL of the filtrate, pipet 10 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of distigmine bromide for assay (previously determine the water), and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 10 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances of the sample solution and standard solution,  $A_{T2}$  and  $A_{S2}$ , at 270 nm and,  $A_{T1}$  and  $A_{S1}$ , at 241 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, respectively.

$$\text{Amount (mg) of distigmine bromide } (C_{22}H_{32}Br_2N_4O_4) \\ = W_S \times \{(A_{T2} - A_{T1}) / (A_{S2} - A_{S1})\} \times (1/2)$$

$W_S$ : Amount (mg) of distigmine bromide for assay, calculated on the anhydrous basis

**Containers and storage** Containers—Tight containers.

## Disulfiram

ジスルフィラム

$C_{10}H_{20}N_2S_4$ : 296.54

Tetraethylthiuram disulfide [97-77-8]

Disulfiram, when dried, contains not less than 99.0% of  $C_{10}H_{20}N_2S_4$ .

**Description** Disulfiram occurs as white to yellowish white crystals or crystalline powder.

It is freely soluble in acetone and in toluene, sparingly soluble in methanol and in ethanol (95), and practically insoluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Disulfiram in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Disulfiram, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 70 – 73°C

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Disulfiram according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(2)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Disulfiram according to Method 4, and perform the test (not more than 2 ppm).

**(3)** Diethyldithiocarbamic acid—Dissolve 0.10 g of Disulfiram in 10 mL of toluene, and shake with 10 mL of diluted sodium carbonate TS (1 in 20). Discard the toluene layer, wash the water layer with 10 mL of toluene, shake with 5 drops of a solution of cupric sulfate (1 in 250) and 2 mL of toluene, and allow to stand: no light yellow color develops in the toluene layer.

**(4)** Related substances—Dissolve 50 mg of Disulfiram in 40 mL of methanol, add water to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and the standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of the peaks other than the peak of disulfiram from the sample solution is not larger than the peak area of disulfiram from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 210 nm).

**Column:** A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of methanol and water (7:3).

**Flow rate:** Adjust the flow rate so that the retention time of disulfiram is about 8 minutes.

**Selection of column:** Dissolve 50 mg of Disulfiram and 50 mg of benzophenone in 40 mL of methanol, and add water to make 50 mL. To 1 mL of this solution add the mobile phase to make 200 mL. Proceed with 10  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of benzophenone and disulfiram in this order with the resolution between these peaks being

not less than 4.

**Detection sensitivity:** Adjust the detection sensitivity so that the peak height of disulfiram obtained from 10  $\mu$ L of the standard solution is 15 – 30 mm.

**Time span of measurement:** About 3.5 times of the retention time of disulfiram.

**Loss on drying** <2.41> Not more than 0.20% (2 g, silica gel, 24 hours).

**Residue on ignition** <2.44> Not more than 0.1% (2 g).

**Assay** Weigh accurately about 0.2 g of Disulfiram, previously dried, in an iodine bottle, dissolve in 20 mL of acetone, add 1.5 mL of water and 1.0 g of potassium iodide, and dissolve by shaking thoroughly. To this solution add 3.0 mL of hydrochloric acid, stopper the bottle tightly, shake, and allow to stand in a dark place for 3 minutes. Add 70 mL of water, and titrate <2.50> with 0.1 mol/L sodium thiosulfate VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS  
= 14.83 mg of  $C_{10}H_{20}N_2S_4$

**Containers and storage** Containers—Tight containers.

## Dobutamine Hydrochloride

ドブタミン塩酸塩

$C_{18}H_{23}NO_3 \cdot HCl$ : 337.84

4-{2-[(1*RS*)-3-(4-Hydroxyphenyl)-1-methylpropylamino]ethyl} benzene-1,2-diol monohydrochloride [49745-95-1]

Dobutamine Hydrochloride, when dried, contains not less than 98.0% of  $C_{18}H_{23}NO_3 \cdot HCl$ .

**Description** Dobutamine Hydrochloride occurs as white to very pale orange crystalline powder or grains.

It is freely soluble in methanol, sparingly soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

A solution of Dobutamine Hydrochloride (1 in 100) shows no optical rotation.

**Identification (1)** Determine the infrared absorption spectra of Dobutamine Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Dobutamine Hydrochloride Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) A solution of Dobutamine Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> (2) for chloride.

**pH** <2.54> Dissolve 1.0 g of Dobutamine Hydrochloride in 100 mL of water: the pH of this solution is between 4.0 and 5.5.

**Melting point** <2.60> 188 – 191°C

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Dobutamine Hydrochloride in 30 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Dissolve 1.0 g of Dobutamine Hydrochloride in 40 mL of water by warming, cool, and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add water to make 50 mL (not more than 20 ppm).

(3) Related substances—Dissolve 0.10 g of Dobutamine Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and formic acid (78:22:5) to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand for 5 minutes in iodine vapor: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.30% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.1 g each of Dobutamine Hydrochloride and Dobutamine Hydrochloride Reference Standard, each previously dried, dissolve separately in exactly 10 mL of the internal standard solution, add diluted methanol (1 in 2) to make 50 mL, and use these solutions as the sample solution and standard solution respectively. Perform the test with 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of dobutamine to that of the internal standard, respectively.

Amount (mg) of  $C_{18}H_{23}NO_3 \cdot HCl$  =  $W_S \times (Q_T/Q_S)$

$W_S$ : Amount (mg) of Dobutamine Hydrochloride Reference Standard

**Internal standard solution**—A solution of salicylamide in diluted methanol (1 in 2) (1 in 125).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.0 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of tartrate buffer solution, pH 3.0 and methanol (7:3).

Flow rate: Adjust the flow rate so that the retention time of dobutamine is about 7 minutes.

**System suitability**—

System performance: When the procedure is run with 5  $\mu$ L of the standard solution under the above operating conditions, dobutamine and internal standard are eluted in this

order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 5  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of dobutamine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Dopamine Hydrochloride

ドパミン塩酸塩

$\text{C}_8\text{H}_{11}\text{NO}_2 \cdot \text{HCl}$ : 189.64

4-(2-Aminoethyl)benzene-1,2-diol monohydrochloride  
[62-31-7]

Dopamine Hydrochloride, when dried, contains not less than 98.5% of  $\text{C}_8\text{H}_{11}\text{NO}_2 \cdot \text{HCl}$ .

**Description** Dopamine Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in water and in formic acid, and sparingly soluble in ethanol (95).

Melting point: about 248°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Dopamine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 25,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dopamine Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Dopamine Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> (1) for chloride.

**pH** <2.54> Dissolve 1.0 g of Dopamine Hydrochloride in 50 mL of water: the pH of this solution is between 4.0 and 5.5.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Dopamine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Perform the test with 0.8 g of Dopamine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.021%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Dopamine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Dopamine Hydrochloride according to Method 1, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.10 g of Dopamine Hydrochloride in 10 mL of water, and use this solution as the

sample solution. Pipet 1 mL of the sample solution, add water to make exactly 250 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of cellulose with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-propanol, water and acetic acid (100) (16:8:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and heat at 90°C for 10 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Dopamine Hydrochloride, previously dried, dissolve in 5 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid VS, and heat on a water bath for 15 minutes. After cooling, add 50 mL of acetic acid (100), and titrate <2.50> the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS  
= 18.96 mg of  $\text{C}_8\text{H}_{11}\text{NO}_2 \cdot \text{HCl}$

**Containers and storage** Containers—Tight containers.

## Dopamine Hydrochloride Injection

ドパミン塩酸塩注射液

Dopamine Hydrochloride Injection is an aqueous solution for injection.

It contains not less than 97% and not more than 103% of the labeled amount of dopamine hydrochloride ( $\text{C}_8\text{H}_{11}\text{NO}_2 \cdot \text{HCl}$ : 189.64).

**Method of preparation** Prepare as directed under Injections, with Dopamine Hydrochloride.

**Description** Dopamine Hydrochloride Injection occurs as a clear, colorless liquid.

**Identification** To a volume of Dopamine Hydrochloride Injection, equivalent to 0.04 g of Dopamine Hydrochloride according to the labeled amount, add 0.1 mol/L hydrochloric acid TS to make 100 mL. To 5 mL of this solution add 0.1 mol/L hydrochloric acid TS to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 278 nm and 282 nm.

**pH** <2.54> 3.0 – 5.0

**Bacterial endotoxins** <4.01> Less than 4.2 EU/mg.

**Extractable volume** <6.05> It meets the requirement.

**Assay** To an exact volume of Dopamine Hydrochloride Injection, equivalent to about 30 mg of dopamine hydrochloride ( $\text{C}_8\text{H}_{11}\text{NO}_2 \cdot \text{HCl}$ ), add the mobile phase to make exactly 50 mL. Pipet 2.5 mL of this solution, add exactly 2.5 mL of

the internal standard solution and the mobile phase to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of dopamine hydrochloride for assay, previously dried at 105°C for 3 hours, dissolve in the mobile phase to make exactly 50 mL. Pipet 2.5 mL of this solution, add exactly 2.5 mL of the internal standard solution and the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of dopamine to that of the internal standard.

$$\text{Amount (mg) of dopamine hydrochloride (C}_8\text{H}_{11}\text{NO}_2\cdot\text{HCl)} \\ = W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of dopamine hydrochloride for assay

**Internal standard solution**—A solution of uracil in the mobile phase (3 in 10,000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 280 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 25°C.

**Mobile phase**: Disodium hydrogen phosphate-citric acid buffer solution, pH 3.0

**Flow rate**: Adjust the flow rate so that the retention time of dopamine is about 10 minutes.

**System suitability**—

**System performance**: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the internal standard and dopamine are eluted in this order with the resolution between these peaks being not less than 10.

**System repeatability**: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of peak area of dopamine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

Plastic containers for aqueous injections may be used.

## Doxapram Hydrochloride Hydrate

ドキサプラム塩酸塩水和物

$\text{C}_{24}\text{H}_{30}\text{N}_2\text{O}_2\cdot\text{HCl}\cdot\text{H}_2\text{O}$ : 432.98  
(4*RS*)-1-Ethyl-4-[2-(morpholin-4-yl)ethyl]-3,3-diphenylpyrrolidin-2-one monohydrochloride

monohydrate [7081-53-0]

Doxapram Hydrochloride Hydrate contains not less than 98.0% of doxapram hydrochloride ( $\text{C}_{24}\text{H}_{30}\text{N}_2\text{O}_2\cdot\text{HCl}$ : 414.97), calculated on the anhydrous basis.

**Description** Doxapram Hydrochloride Hydrate occurs as white crystals or crystalline powder.

It is freely soluble in methanol and in acetic acid (100), sparingly soluble in water, in ethanol (95) and in acetic anhydride, and practically insoluble in diethyl ether.

**Identification** (1) Determine the absorption spectrum of a solution of Doxapram Hydrochloride Hydrate (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Doxapram Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Doxapram Hydrochloride Hydrate (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**pH** <2.54> Dissolve 1.0 g of Doxapram Hydrochloride Hydrate in 50 mL of water: the pH of this solution is between 3.5 and 5.0.

**Melting point** <2.60> 218 – 222°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Doxapram Hydrochloride Hydrate in 50 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Perform the test with 1.0 g of Doxapram Hydrochloride Hydrate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Doxapram Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Doxapram Hydrochloride Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.5 g of Doxapram Hydrochloride Hydrate in 10 mL of methanol, and use this solution as the sample solution. Pipet 3 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 6  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, formic acid, ethyl formate and methanol (8:3:3:2) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Water** <2.48> 3.5 – 4.5% (0.5 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.3% (1 g).

**Assay** Weigh accurately about 0.8 g of Doxapram Hydrochloride, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 41.50 mg of  $C_{24}H_{30}N_2O_2 \cdot HCl$

**Containers and storage** Containers—Tight containers.

## Doxifluridine

ドキシフルリジン

$C_9H_{11}FN_2O_5$ : 246.19  
5'-Deoxy-5-fluorouridine  
[3094-09-5]

Doxifluridine, when dried, contains not less than 98.5% and not more than 101.0% of  $C_9H_{11}FN_2O_5$ .

**Description** Doxifluridine occurs as a white crystalline powder.

It is freely soluble in *N,N*-dimethylformamide, soluble in water and in methanol, and slightly soluble in ethanol (99.5).

It dissolves in 0.1 mol/L hydrochloric acid TS and in 0.01 mol/L sodium hydroxide TS.

Melting point: about 191°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Doxifluridine in 0.1 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Doxifluridine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +160 – +174° (after drying, 0.1 g, water, 10 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 0.10 g of Doxifluridine in 10 mL of water is between 4.2 and 5.2.

**Purity (1) Fluoride**—Dissolve 0.10 g of Doxifluridine in 10.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20). Transfer 5.0 mL of this solution into a 20-mL volumetric flask, add 5 mL of a mixture of acetone and lanthanum-alizarin complexone TS (2:1) and water to make 20 mL, allow to stand for 1 hour, and use this solution as the sample solution. Separately, put 1.0 mL of Standard Fluorine Solution in a

20-mL volumetric flask, add 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) and 5 mL of the mixture of acetone and alizarin complexone TS (2:1), then proceed in the same manner as for preparation of the sample solution, and use the solution so obtained as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 620 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution obtained in the same way with 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) as a blank:  $A_T$  is not larger than  $A_S$ .

(2) Chloride <1.03>—Perform the test with 0.30 g of Doxifluridine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.035%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Doxifluridine according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 20 mg of Doxifluridine in 2 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 25 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid (100) and water (17:2:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the number of the spot other than the principal spot is not more than three, and they are not more intense than the spot with the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g, platinum crucible)

**Assay** Weigh accurately about 0.25 g of Doxifluridine, previously dried, dissolve in 50 mL of *N,N*-dimethylformamide, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS  
= 24.62 mg of  $C_9H_{11}FN_2O_5$

**Containers and storage** Containers—Tight containers.

## Doxifluridine Capsules

ドキシフルリジンカプセル

Doxifluridine Capsules contain not less than 95.0% and not more than 105.0% of doxifluridine ( $C_9H_{11}FN_2O_5$ : 246.19).

**Method of preparation** Prepare as directed under Capsules, with Doxifluridine.

**Identification (1)** Dissolve an amount of the contents of Doxifluridine Capsules, equivalent to 20 mg of Doxifluridine

according to the labeled amount, in 0.1 mol/L hydrochloric acid TS to make 100 mL, and filter. To 1 mL of the filtrate add 0.1 mol/L hydrochloric acid TS to make 20 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using 0.1 mol/L hydrochloric acid TS as the blank: it exhibits a maximum between 267 nm and 271 nm.

(2) To an amount of powdered contents of Doxifluridine Capsules, equivalent to 20 mg of Doxifluridine according to the labeled amount, add 2 mL of methanol, shake, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 20 mg of doxifluridine in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid (100) and water (17:2:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot with the sample solution and the spot with the standard solution show a dark purple color and these R<sub>f</sub> values are the same.

**Uniformity of dosage units** <6.02> It meets the requirement of the Mass variation test.

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with one capsule of Doxifluridine Capsules at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, using the sinker. Withdraw 20 mL or more of the dissolution medium 30 minutes after starting the test, and filter through a membrane filter with pore size of not more than 0.45  $\mu$ m. Discard the first 10 mL of the filtrate, pipet the subsequent  $V$  mL, add water to make exactly  $V'$  mL so that each mL contains about 13  $\mu$ g of doxifluridine ( $C_9H_{11}FN_2O_5$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 26 mg of doxifluridine for assay, previously dried at 105°C for 4 hours, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of these solutions at 269 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>. The dissolution rate in 30 minutes is not less than 85%.

Dissolution rate (%) with respect to the labeled amount of doxifluridine ( $C_9H_{11}FN_2O_5$ )

$$= W_S \times (A_T/A_S) \times (V/V') \times (1/C) \times 9$$

$W_S$ : Amount (mg) of doxifluridine for assay

C: Labeled amount (mg) of doxifluridine ( $C_9H_{11}FN_2O_5$ ) in 1 capsule

**Assay** Weigh accurately the mass and powder the contents of not less than 20 Doxifluridine Capsules. Weigh accurately a portion of the powder, equivalent to about 50 mg of doxifluridine ( $C_9H_{11}FN_2O_5$ ) according to the labeled amount, add 40 mL of water, shake for about 10 minutes, add water to make exactly 50 mL, and filter. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add exactly 10 mL of the internal standard solution, then add a mixture of water and methanol (5:3) to make 100 mL, and use this solu-

tion as the sample solution. Separately, weigh accurately about 50 mg of doxifluridine for assay, previously dried at 105°C for 4 hours, and dissolve in water to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 10 mL of the internal standard solution, then add the mixture of water and methanol (5:3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak height of doxifluridine to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of doxifluridine (C}_9\text{H}_{11}\text{FN}_2\text{O}_5\text{)} \\ &= W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of doxifluridine for assay

**Internal standard solution**—A solution of anhydrous caffeine (1 in 1000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Column**: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 25°C.

**Mobile phase**: A mixture of water and methanol (13:7).

**Flow rate**: Adjust the flow rate so that the retention time of doxifluridine is about 2.5 minutes.

**System suitability**—

**System performance**: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, doxifluridine and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability**: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak height of doxifluridine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Doxorubicin Hydrochloride

ドキシロルビシン塩酸塩

$C_{27}H_{29}NO_{11} \cdot HCl$ : 579.98

(2*S*,4*S*)-4-(3-Amino-2,3,6-trideoxy- $\alpha$ -L-lyxo-hexopyranosyloxy)-2,5,12-trihydroxy-2-hydroxyacetyl-7-methoxy-1,2,3,4-tetrahydrotetracene-6,11-dione monohydrochloride [25316-40-9]

Doxorubicin Hydrochloride is the hydrochloride of

a derivative of daunorubicin.

It contains not less than 980  $\mu\text{g}$  (potency) and not more than 1080  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis. The potency of Doxorubicin Hydrochloride is expressed as mass (potency) of doxorubicin hydrochloride ( $\text{C}_{27}\text{H}_{29}\text{NO}_{11}\cdot\text{HCl}$ ).

**Description** Doxorubicin Hydrochloride occurs as a red-orange crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, very slightly soluble in ethanol (99.5), and practically insoluble in acetonitrile.

**Identification (1)** Determine the absorption spectrum of a solution of Doxorubicin Hydrochloride in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Doxorubicin Hydrochloride Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Doxorubicin Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Doxorubicin Hydrochloride Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Doxorubicin Hydrochloride (1 in 200) responds to the Qualitative Tests <1.09> (1) for chloride.

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ : +240 – +290° (20 mg calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 50 mg of Doxorubicin Hydrochloride in 10 mL of water is between 4.0 and 5.5.

**Purity (1)** Clarity and color of solution—Dissolve 50 mg of Doxorubicin Hydrochloride in 10 mL of water: the solution is clear and red.

(2) Related substances—Dissolve 25 mg of Doxorubicin Hydrochloride in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than doxorubicin obtained from the sample solution is not more than 1/4 times the peak area of doxorubicin from the standard solution, and the total area of the peaks other than doxorubicin is not more than the peak area of doxorubicin from the standard solution.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 3 g of sodium lauryl sulfate in 1000

mL of diluted phosphoric acid (7 in 5000), and add 1000 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of doxorubicin is about 8 minutes.

**Time span of measurement:** About 3 times as long as the retention time of doxorubicin.

**System suitability**—

**Test for required detectability:** Measure 1 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of doxorubicin obtained from 20  $\mu\text{L}$  of this solution is equivalent to 3.5 to 6.5% of that from 20  $\mu\text{L}$  of the standard solution.

**System performance:** Dissolve 5 mg of Doxorubicin Hydrochloride in 20 mL of water, add 1.5 mL of phosphoric acid, and allow to stand at room temperature for 30 minutes. Adjust the pH of this solution to 2.5 with 2 mol/L sodium hydroxide TS. When the procedure is run with 20  $\mu\text{L}$  of this solution under the above operating conditions, doxorubicinone, having the relative retention time of about 0.6 with respect to doxorubicin, and doxorubicin are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doxorubicin is not more than 2.0%.

**Water** <2.48> Not more than 3.0% (0.3 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Doxorubicin Hydrochloride and Doxorubicin Hydrochloride Reference Standard, equivalent to about 10 mg (potency), dissolve each in water to make exactly 25 mL. Pipet 5 mL each of these solutions, add water to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Determine the absorbances at 495 nm,  $A_{\text{T}}$  and  $A_{\text{S}}$ , of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] \text{ of } \text{C}_{27}\text{H}_{29}\text{NO}_{11}\cdot\text{HCl} \\ = W_{\text{S}} \times (A_{\text{T}}/A_{\text{S}}) \times 1000 \end{aligned}$$

$W_{\text{S}}$ : Amount [mg (potency)] of Doxorubicin Hydrochloride Reference Standard

**Containers and storage** Containers—Tight containers.

## Doxycycline Hydrochloride Hydrate

ドキシサイクリン塩酸塩水和物

$\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8\cdot\text{HCl}\cdot\frac{1}{2}\text{C}_2\text{H}_6\text{O}\cdot\frac{1}{2}\text{H}_2\text{O}$ : 512.94  
(4*S*,4*aR*,5*S*,5*aR*,6*R*,12*aS*)-4-Dimethylamino-3,5,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydro-tetracyceno-2-carboxamide monohydrochloride hemimethanolate hemihydrate [564-25-0, Doxycycline]

Doxycycline Hydrochloride Hydrate is the hydrochloride of a derivative of oxytetracycline.

It contains not less than 880  $\mu\text{g}$  (potency) and not more than 943  $\mu\text{g}$  (potency) per mg, calculated on the anhydrous basis and corrected by the amount of ethanol. The potency of Doxycycline Hydrochloride Hydrate is expressed as mass (potency) of doxycycline ( $\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8$ : 444.43).

**Description** Doxycycline Hydrochloride Hydrate occurs as yellow to dark yellow, crystals or crystalline powder.

It is freely soluble in water and in methanol, and slightly soluble in ethanol (99.5).

**Identification (1)** Determine the infrared absorption spectrum of Doxycycline Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Doxycycline Hydrochloride Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Dissolve 10 mg of Doxycycline Hydrochloride Hydrate in 10 mL of water, and add silver nitrate TS: a white turbidity is produced.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (349 nm): 285 – 315 (10 mg, 0.01 mol/L hydrochloric acid-methanol TS, 500 mL).

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ :  $-105 - -120^\circ$  (0.25 g calculated on the anhydrous basis and corrected by the amount of ethanol, 0.01 mol/L hydrochloric acid-methanol TS, 25 mL, 100 mm). Determine within 5 minutes after the sample solution is prepared.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Doxycycline Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 5.0 mL of Standard Lead Solution (not more than 50 ppm).

(2) Related substance—Dissolve 20 mg of Doxycycline Hydrochloride Hydrate in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the sample solution. Separately, dissolve 20 mg of 6-epidoxycycline hydrochloride in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as 6-epidoxycycline hydrochloride stock solution. Separately, dissolve 20 mg of metacycline hydrochloride in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as metacycline hydrochloride stock solution. Pipet 2 mL each of 6-epidoxycycline hydrochloride stock solution and metacycline hydrochloride stock solution, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of metacycline and 6-epidoxycycline obtained from the sample solution are not more than the peak areas of them obtained from the standard solution, respectively, and the areas of the two peaks, appeared between the solvent peak and metacycline and behind of doxycycline, obtained from the sample solution are not more than 1/4 of the peak area of 6-epidoxycycline from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with styrene-divinylbenzene copolymer for liquid chromatography (8  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 60°C.

Mobile phase: Mix 125 mL of 0.2 mol/L potassium dihydrogen phosphate TS, 117 mL of 0.2 mol/L sodium hydroxide TS, and add water to make 500 mL. To 400 mL of this solution add 50 mL of a solution of tetrabutylammonium hydrogensulfate (1 in 100), 10 mL of a solution of disodium dihydrogen ethylenediamine tetraacetate dihydrate (1 in 25), 60 g of *t*-butanol and 200 mL of water, adjust the pH to 8.0 with 2 mol/L sodium hydroxide TS, and add water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of doxycycline is about 19 minutes.

Time span of measurement: About 2.4 times as long as the retention time of doxycycline beginning after the solvent peak.

**System suitability—**

Test for required detectability: Measure exactly 1 mL of the standard solution, and add 0.01 mol/L hydrochloric acid TS to make exactly 20 mL. Confirm that the peak areas of 6-epidoxycycline and metacycline obtained from 20  $\mu\text{L}$  of this solution are equivalent to 3.5 to 6.5% of them obtained from 20  $\mu\text{L}$  of the standard solution, respectively.

System performance: To 8 mL of the sample solution, 3 mL of 6-epidoxycycline hydrochloride stock solution and 2 mL of metacycline hydrochloride stock solution add 0.01 mol/L hydrochloric acid TS to make 50 mL. When the procedure is run with 20  $\mu\text{L}$  of this solution under the above operating conditions, metacycline, 6-epidoxycycline and doxycycline are eluted in this order with the resolutions between the peaks, metacycline and 6-epidoxycycline, and 6-epidoxycycline and doxycycline, being not less than 1.3 and not less than 2.0, respectively, and the symmetry factor of the peak of doxycycline is not more than 1.3.

System repeatability: When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviations of the peak area of metacycline and 6-epidoxycycline are not more than 3.0% and not more than 2.0%, respectively.

**Ethanol** Weigh accurately about 0.1 g of Doxycycline Hydrochloride Hydrate, dissolve in the internal standard solution to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.4 g of ethanol (99.5), and add the internal standard solution to make exactly 100 mL. Pipet 1 mL of this solution, add the internal standard solution to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 1  $\mu\text{L}$  each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of ethanol to that of the internal standard: the amount of ethanol is not less than 4.3% and not more than 6.0%.

$$\text{Amount (\%)} \text{ of ethanol} = (W_S/W_T) \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of ethanol (99.5)

$W_T$ : Amount (mg) of the sample

**Internal standard solution**—A solution of 1-propanol (1 in 2000).

**Operating conditions**—

Detector: An hydrogen flame-ionization detector.

Column: A glass column 3.2 mm in inside diameter and 1.5 m in length, packed with porous ethylvinylbenzene-divinylbenzene copolymer for gas chromatography (0.0075  $\mu\text{m}$  in average pore size, 500 – 600  $\text{m}^2/\text{g}$  in specific surface area) (150 – 180  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 135°C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of ethanol is about 5 minutes.

**System suitability**—

System performance: When the procedure is run with 1  $\mu\text{L}$  of the standard solution under the above operating conditions, ethanol and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 5 times with 1  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ethanol to that of the internal standard is not more than 2.0%.

**Water** <2.48> Not less than 1.4% and not more than 2.8% (0.6 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.3% (1 g).

**Assay** Weigh accurately an amount of Doxycycline Hydrochloride Hydrate and Doxycycline Hydrochloride Reference Standard, equivalent to about 50 mg (potency), dissolve each in water to make exactly 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of doxycycline.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of doxycycline } (\text{C}_{22}\text{H}_{24}\text{N}_2\text{O}_8) \\ &= W_S \times (A_T/A_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Doxycycline Hydrochloride Reference Standard

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: Dissolve 7.0 g of sodium dihydrogen phosphate dihydrate in 450 mL of water, add 553 mL of a mixture of methanol and *N,N*-dimethyl-*n*-octylamine (550:3), and adjust the pH to 8.0 with a solution of sodium hydroxide (43 in 200).

Flow rate: Adjust the flow rate so that the retention time of doxycycline is about 6 minutes.

**System suitability**—

System performance: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the theoretical plates and the symmetry factor of the peak of doxycycline are not less than 1000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doxycycline is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Droperidol

ドロペリドール

$\text{C}_{22}\text{H}_{22}\text{FN}_3\text{O}_2$ : 379.43

1-[1-[4-(4-Fluorophenyl)-4-oxobutyl]-1,2,3,6-tetrahydropyridin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one [548-73-2]

Droperidol, when dried, contains not less than 98.0% of  $\text{C}_{22}\text{H}_{22}\text{FN}_3\text{O}_2$ .

**Description** Droperidol occurs as a white to light yellow powder.

It is freely soluble in acetic acid (100), soluble in dichloromethane, slightly soluble in ethanol (99.5), and practically insoluble in water.

It is gradually colored by light.

**Identification** (1) Put 30 mg of Droperidol in a brown volumetric flask, and dissolve in 10 mL of 0.1 mol/L hydrochloric acid TS and ethanol (95) to make 100 mL. Transfer 5 mL of the solution to a brown volumetric flask, and add 10 mL of 0.1 mol/L hydrochloric acid TS and ethanol (95) to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Droperidol, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Droperidol in acetone, evaporate the acetone, dry the residue in a desiccator (in vacuum, silica gel, 70°C) for 4 hours, and perform the test with the residue.

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Droperidol in a platinum crucible according to Method 2, and perform the test. Prepare the control solution with 2.0

mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 50 mg of Droperidol in 5 mL of dichloromethane, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add dichloromethane to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, chloroform, methanol and acetic acid-sodium acetate buffer solution, pH 4.7, (54:23:18:5) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 3.0% (0.5 g, in vacuum, silica gel, 70°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g, platinum crucible).

**Assay** Weigh accurately about 0.5 g of Droperidol, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 37.94 mg of  $C_{22}H_{22}FN_3O_2$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Dydrogesterone

ジドロゲステロン

$C_{21}H_{28}O_2$ : 312.45  
9 $\beta$ ,10 $\alpha$ -Pregna-4,6-diene-3,20-dione [152-62-5]

Dydrogesterone, when dried, contains not less than 98.0% and not more than 102.0% of  $C_{21}H_{28}O_2$ .

**Description** Dydrogesterone occurs as white to light yellowish white crystals or crystalline powder. It is odorless.

It is freely soluble in chloroform, soluble in acetonitrile, sparingly soluble in methanol and in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water.

**Identification** (1) To 5 mg of Dydrogesterone add 5 mL of 4-methoxybenzaldehyde-acetic acid TS and 2 to 3 drops of sulfuric acid, and heat in a water bath for 2 minutes: an orange-red color develops.

(2) Determine the absorption spectrum of a solution of Dydrogesterone in methanol (1 in 200,000) as directed under

Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Dydrogesterone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-470 - -500^\circ$  (after drying, 0.1 g, chloroform, 10 mL, 100 mm).

**Melting point** <2.60> 167 – 171°C

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Dydrogesterone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 10 mg of Dydrogesterone in 200 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the total area of peaks other than the peak of dydrogesterone from the sample solution is not larger than the peak area of dydrogesterone from the standard solution.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 280 nm).

**Column:** A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (3  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** A mixture of water, ethanol (95) and acetonitrile (53:26:21).

**Flow rate:** Adjust the flow rate so that the retention time of dydrogesterone is about 12 minutes.

**Selection of column:** Dissolve 1 mg each of Dydrogesterone and progesterone in 20 mL of the mobile phase. Proceed with 10  $\mu$ L each of these solutions under the above operating conditions, and calculate the resolution. Use a column giving elution of dydrogesterone and progesterone in this order with the resolution between these peaks being not less than 8. Wavelength is 265 nm.

**Detection sensitivity:** Adjust the detection sensitivity so that the peak height of dydrogesterone obtained from 10  $\mu$ L of the standard solution is between 5 mm and 10 mm.

**Time span of measurement:** About twice as long as the retention time of dydrogesterone beginning after the solvent peak.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 24 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 50 mg of Dydrogesterone, previously dried, and dissolve in methanol to make exactly

100 mL. Pipet 1 mL of this solution, and add methanol to make exactly 100 mL. Determine the absorbance  $A$  of this solution at the wavelength of maximum absorption at about 286 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

$$\text{Amount (mg) of } C_{21}H_{28}O_2 = (A/845) \times 100,000$$

**Containers and storage** Containers—Tight containers.

## Dydrogesterone Tablets

ジドロゲステロン錠

Dydrogesterone Tablets contain not less than 95% and not more than 105% of the labeled amount of dydrogesterone ( $C_{21}H_{28}O_2$ ; 312.45).

**Method of preparation** Prepare as directed under Tablets, with Dydrogesterone.

**Identification (1)** To a quantity of powdered Dydrogesterone Tablets, equivalent to 0.05 g of Dydrogesterone according to the labeled amount, add 50 mL of methanol, shake well, and filter. Evaporate 5 mL of the filtrate on a water bath to dryness. Proceed with the residue as directed in the Identification (1) under Dydrogesterone.

(2) To 1 mL of the filtrate obtained in (1) add methanol to make 200 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 284 nm and 288 nm.

**Dissolution <6.10>** Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Dydrogesterone Tablets at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium. Take 20 mL or more of the dissolved solution 30 minutes after starting the test, and filter. Discard the first 10 mL of the filtrate, and use the subsequent as the sample solution. Separately, weigh accurately about 50 mg of dydrogesterone for assay, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 24 hours, and dissolve in methanol to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 296 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

The dissolution rate of Dydrogesterone Tablets in 30 minutes is not less than 80%.

$$\begin{aligned} &\text{Dissolution rate (\%)} \text{ with respect to} \\ &\text{the labeled amount of dydrogesterone (} C_{21}H_{28}O_2 \text{)} \\ &= W_S \times (A_T/A_S) \times (1/C) \times 9 \end{aligned}$$

$W_S$ : Amount (mg) of dydrogesterone for assay

$C$ : Labeled amount (mg) of dydrogesterone ( $C_{21}H_{28}O_2$ ) in 1 tablet.

**Assay** Weigh accurately and powder not less than 20 Dydrogesterone Tablets. Weigh accurately a portion of the powder, equivalent to about 10 mg of dydrogesterone ( $C_{21}H_{28}O_2$ ), shake well with 50 mL of methanol, and add methanol to make exactly 100 mL. Filter this solution, dis-

card the first 20 mL of the filtrate, pipet the subsequent 5 mL, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.01 g of dydrogesterone for assay, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 24 hours, proceed in the same manner as the preparation of the sample solution, and use the solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 286 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

$$\begin{aligned} &\text{Amount (mg) of dydrogesterone (} C_{21}H_{28}O_2 \text{)} \\ &= W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of dydrogesterone for assay

**Containers and storage** Containers—Tight containers.

## Ecothiopate Iodide

エコチオパートヨウ化物

$C_9H_{23}INO_3PS$ : 383.23

2-(Diethoxyphosphorylsulfanyl)-*N,N,N*-trimethylethylammonium iodide [513-10-0]

Ecothiopate Iodide contains not less than 95.0% of  $C_9H_{23}INO_3PS$ , calculated on the dried basis.

**Description** Ecothiopate Iodide occurs as white crystals or crystalline powder.

It is very soluble in water, freely soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

**Identification (1)** Dissolve 0.1 g of Ecothiopate Iodide in 2 mL of water, and add 1 mL of nitric acid: a brown precipitate is formed. To 1 drop of the turbid solution containing this precipitate add 1 mL of hexane, and shake: a light red color develops in the hexane layer.

(2) Heat the suspension of the precipitate obtained in (1) until it becomes colorless, cool, add 10 mL of water, and use this solution as the sample solution. Two mL of the sample solution responds to the Qualitative Tests <1.09> (2) for phosphate.

(3) Two mL of the sample solution obtained in (2) responds to the Qualitative Tests <1.09> for sulfate.

**pH <2.54>** Dissolve 0.1 g of Ecothiopate Iodide in 40 mL of water: the pH of this solution is between 3.0 and 5.0.

**Melting point <2.60>** 116 – 122°C

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Ecothiopate Iodide in 5 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—To 1.0 g of Ecothiopate Iodide in a Kjeldahl flask add 5 mL of nitric acid and 2 mL of sulfuric acid, put a small funnel on the mouth of the flask, and heat carefully until white fumes are evolved. After cooling, add 2 mL of nitric acid, and heat. Repeat this procedure twice, add several 2-mL portions of hydrogen peroxide (30), and heat

until the solution becomes colorless, and white fumes are evolved. After cooling, transfer the solution together with a small quantity of water to a Nessler tube, and add water to make about 20 mL. Adjust the solution with ammonia solution (28) and ammonia TS to a pH between 3.0 and 3.5, add water to make 50 mL, and use this solution as the test solution. Prepare the control solution as follows: proceed in the same manner as the preparation of the test solution, and add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 20 ppm).

(3) Related substances—Dissolve 0.20 g of Ecotioipate Iodide in 10 mL of methanol, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of cellulose for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (4:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff's TS for spraying on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (1 g, in vacuum, phosphorus (V) oxide, 50°C, 3 hours).

**Assay** Weigh accurately about 0.125 g of Ecotioipate Iodide, and dissolve in water to make exactly 100 mL. Pipet 10 mL of of this solution, add 30 mL of water, then add exactly 10 mL of phosphate buffer solution, pH 12, stopper the container, and allow to stand at  $25 \pm 3^\circ\text{C}$  for 20 minutes. To this solution add quickly 2 mL of acetic acid (100), and titrate <2.50> with 0.002 mol/L iodine VS (potentiometric titration). Perform the test in the same manner without phosphate buffer solution, pH 12, and make any necessary correction.

Each mL of 0.002 mol/L iodine VS  
= 1.533 mg of  $\text{C}_9\text{H}_{23}\text{INO}_3\text{PS}$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and not exceeding 0°C.

## Edrophonium Chloride

エドロホニウム塩化物

$\text{C}_{10}\text{H}_{16}\text{ClNO}$ : 201.69

*N*-Ethyl-3-hydroxy-*N,N*-dimethylanilinium chloride  
[116-38-1]

Edrophonium Chloride, when dried, contains not less than 98.0% of  $\text{C}_{10}\text{H}_{16}\text{ClNO}$ .

**Description** Edrophonium Chloride occurs as white crystals or crystalline powder. It is odorless.

It is very soluble in water, freely soluble in ethanol (95) and

in acetic acid (100), and practically insoluble in acetic anhydride and in diethyl ether.

It is hygroscopic.

It is gradually colored by light.

**Identification** (1) To 5 mL of a solution of Edrophonium Chloride (1 in 100) add 1 drop of iron (III) chloride TS: a light red-purple color develops.

(2) Determine the absorption spectrum of a solution of Edrophonium Chloride in 0.1 mol/L hydrochloric acid TS (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Edrophonium Chloride Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) A solution of Edrophonium Chloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**pH** <2.54> Dissolve 1.0 g of Edrophonium Chloride in 10 mL of water: the pH of this solution is between 3.5 and 5.0.

**Melting point** <2.60> 166 – 171°C (with decomposition).

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Edrophonium Chloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Edrophonium Chloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Edrophonium Chloride according to Method 1, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.50 g of Edrophonium Chloride in 10 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add ethanol (95) to make exactly 100 mL. Pipet 3 mL of this solution, add ethanol (95) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol, chloroform and ammonia solution (28) (16:4:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.20% (1 g, in vacuum, phosphorus (V) oxide, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Edrophonium Chloride, previously dried, and dissolve in 100 mL of a mixture of acetic anhydride and acetic acid (100) (7:3). Titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 20.17 mg of  $\text{C}_{10}\text{H}_{16}\text{ClNO}$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Edrophonium Chloride Injection

エドロホニウム塩化物注射液

Edrophonium Chloride Injection is an aqueous solution for injection. It contains not less than 95% and not more than 105% of the labeled amount of edrophonium chloride ( $C_{10}H_{16}ClNO$ ; 201.69).

**Method of preparation** Prepare as directed under Injections, with Edrophonium Chloride.

**Description** Edrophonium Chloride Injection is a clear and colorless liquid.

**Identification (1)** To a volume of Edrophonium Chloride Injection, equivalent to 0.04 g of Edrophonium Chloride according to the labeled amount, add 4 mL of barium nitrate TS, shake, and filter. Proceed with the filtrate as directed in the Identification (1) under Edrophonium Chloride.

**(2)** Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 272 nm and 276 nm.

**pH** <2.54> 6.5 – 8.0

**Extractable volume** <6.05> It meets the requirement.

**Assay** Conduct this procedure without exposure to daylight, using light-resistant containers. Measure exactly a volume of Edrophonium Chloride Injection, equivalent to about 50 mg of edrophonium chloride ( $C_{10}H_{16}ClNO$ ), place in a chromatographic column prepared by pouring 10 mL of weakly basic DEAE-bridged dextran anion exchanger (Cl type) (50 to 150  $\mu$ m in particle diameter) into a chromatographic tube about 2 cm in inside diameter and about 10 cm in length, add 25 mL of water, and elute at the flow rate of 1 to 2 mL per minute. Wash the column with two 25-mL portions of water at the flow rate of 1 to 2 mL per minute. Combine the washings with above effluent solutions, and add water to make exactly 100 mL. Measure exactly 10 mL of this solution, and add 10 mL of phosphate buffer solution, pH 8.0, and 5 g of sodium chloride. Wash this solution with four 20-mL portions of a mixture of diethyl ether and hexane (1:1), collect the water layer, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Edrophonium Chloride Reference Standard, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 3 hours, and dissolve in water to make exactly 100 mL. Measure exactly 10 mL of this solution, and prepare the standard solution in the same manner as the sample solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 273 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

$$\begin{aligned} &\text{Amount (mg) of edrophonium chloride (C}_{10}\text{H}_{16}\text{ClNO)} \\ &= W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Edrophonium Chloride Reference Standard

**Containers and storage** Containers—Hermetic containers,

and colored containers may be used.

Storage—Light-resistant.

## Elcatonin

エルカトニン

$C_{148}H_{244}N_{42}O_{47}$ ; 3363.77  
[60731-46-6]

Elcatonin contains not less than 5000 Elcatonin Units and not more than 7000 Elcatonin Units per 1 mg of peptide, calculated on the dehydrated and de-acetic acid basis.

**Description** Elcatonin is a white powder.

It is very soluble in water, freely soluble in ethanol (95), and practically insoluble in acetonitrile.

It is hygroscopic.

The pH of its solution (1 in 500) is between 4.5 and 7.0.

**Identification** Dissolve 5 mg of Elcatonin in 5 mL of water. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Constituent amino acids** Put about 1 mg of Elcatonin in a test tube for hydrolysis, add phenol-hydrochloric acid TS to dissolve, replace the air inside with Nitrogen, seal the tube under reduced pressure, and heat at  $110 \pm 2^\circ\text{C}$  for 24 hours. After cooling, open the tube, evaporate the hydrolyzate to dryness under reduced pressure, dissolve the residue in 1 mL of 0.02 mol/L hydrochloric acid TS, and use this solution as the sample solution. Separately, weigh exactly 1.33 mg of L-aspartic acid, 1.19 mg of L-threonine, 1.05 mg of L-serine, 1.47 mg of L-glutamic acid, 1.15 mg of L-proline, 0.75 mg of glycine, 0.89 mg of L-alanine, 1.17 mg of L-valine, 1.89 mg of L-2-aminosuberic acid, 1.31 mg of L-leucine, 1.81 mg of L-tyrosine, 1.83 mg of L-lysine hydrochloride, 2.10 mg of L-histidine hydrochloride monohydrate and 2.11 mg of L-arginine hydrochloride, dissolve them in 0.02 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions: 14 peaks of amino acids appear on the chromatogram obtained from the sample solution, and their respective molar ratios against alanine are 1.7 – 2.2 for aspartic acid, 3.5 – 4.2 for threonine, 2.4 – 3.0 for serine, 2.7 – 3.2 for glutamic acid, 1.7 – 2.2 for proline, 2.7 – 3.2 for glycine, 1.6 – 2.2 for valine, 0.8 – 1.2 for 2-aminosuberic acid, 4.5 – 5.2 for leucine, 0.7 – 1.2 for tyrosine, 1.7 – 2.2 for lysine, 0.8 – 1.2 for histidine and 0.7 – 1.2 for arginine.

**Operating conditions**—

Detector: A visible spectrophotometer (wavelength: 440

nm and 570 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 8 cm in length, packed with strongly acidic ion-exchange resin for liquid chromatography composed with a sulfonated styrene-divinylbenzene copolymer (3  $\mu$ m in particle diameter).

Column temperature: Varied between 50°C and 65°C.

Chemical reaction vessel temperature: A constant temperature of about 130°C.

Color developing time: About 1 minute.

Mobile phase: Buffer solutions A, B, C and D, with sodium ion concentrations of 0.10 mol/L, 0.135 mol/L, 1.26 mol/L and 0.20 mol/L, respectively. The ion concentration of the mobile phase is changed stepwise from 0.10 mol/L to 1.26 mol/L by using these buffer solutions.

Buffer solution:	Components of buffer solutions			
	A	B	C	D
Citric acid	8.85 g	7.72 g	6.10 g	—
Sodium citrate	3.87 g	10.05 g	26.67 g	—
Sodium hydroxide	—	—	2.50 g	8.00 g
Sodium chloride	3.54 g	1.87 g	54.35 g	—
Ethanol	60.0 mL	—	—	60.0 mL
Thiodiglycol	5.0 mL	5.0 mL	—	—
Purified water	a sufficient amount	a sufficient amount	a sufficient amount	a sufficient amount
Total amount	1000 mL	1000 mL	1000 mL	1000 mL

Reaction reagent: Mix 407 g of lithium acetate dihydrate, 245 mL of acetic acid (100) and 801 mL of 1-methoxy-2-propanol, add water to make 2000 mL, stir for about 20 minutes while passing Nitrogen, and use this solution as solution A. Separately, to 1957 mL of 1-methoxy-2-propanol add 77 g of ninhydrin and 0.134 g of sodium borohydride, stir for about 20 minutes while passing Nitrogen, and use this solution as solution B. Mix solution A and solution B before use.

Flow rate of mobile phase: Adjust the flow rate so that the retention time of arginine is about 75 minutes.

Flow rate of reaction reagent: About 0.2 mL per minute.

Selection of column: Proceed with 10  $\mu$ L of the standard solution under the above operating conditions. Use a column from which aspartic acid, threonine, serine, glutamic acid, proline, glycine, alanine, valine, 2-aminosuberic acid, leucine, tyrosine, lysine, histidine and arginine are eluted in this order, with complete separation of each peak.

**Purity (1)** Acetic acid—Weigh accurately 3–6 mg of Elcatonin quickly under conditions of 25  $\pm$  2°C and 50  $\pm$  5% relative humidity, add exactly 1 mL of the internal standard solution to dissolve it, and use this solution as the sample solution. Separately, weigh accurately about 0.5 g of acetic acid (100), and add the internal standard solution to make exactly 100 mL. Pipet 5 mL of this solution, add the internal standard solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of acetic acid to that of the internal standard: the amount of acetic acid is not more than 7.0%.

Amount (%) of acetic acid (CH<sub>3</sub>COOH)

$$= (W_{ST}/W_{SA}) \times (Q_T/Q_S) \times 50$$

$W_{ST}$ : Amount (g) of acetic acid (100)

$W_{SA}$ : Amount (mg) of sample

**Internal standard solution**—A solution of citric acid (1 in 4000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 13.2 g of diammonium hydrogenphosphate in 900 mL of water, add phosphoric acid to adjust the pH to 2.5, and add water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of acetic acid is about 4 minutes.

Selection of column: Proceed with 20  $\mu$ L of the standard solution under the above operating conditions, and calculate the resolution. Use a column from which acetic acid and citric acid are eluted in this order with the resolution between their peaks being not less than 2.0.

**(2) Related substances**—Dissolve 1.0 mg of Elcatonin in 1 mL of a mixture of trifluoroacetic acid TS and acetonitrile (2:1), and use this solution as the sample solution. Take exactly 0.3 mL of the sample solution, add a mixture of trifluoroacetic acid TS and acetonitrile (2:1) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total of the peak areas other than the peak of elcatonin of the sample solution is not larger than the peak area of elcatonin of the standard solution, and each peak area other than the peak of elcatonin of the sample solution is not larger than 1/3 of the peak area of elcatonin of the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of trifluoroacetic acid TS and acetonitrile (change the ratio linearly from 85:15 to 55:45 in 30 minutes).

Flow rate: Adjust the flow rate so that the retention time of elcatonin is about 25 minutes.

Selection of column: Dissolve 2 mg of Elcatonin in 200  $\mu$ L of trypsin TS for test of elcatonin, warm at 37°C for 1 hour, then add 1 drop of acetic acid (100), and heat at 95°C for 1 minute. To 10  $\mu$ L of this solution add 50  $\mu$ L of the sample solution, and mix. Proceed with 10  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column such that the resolution between the peak of elcatonin and the peak which appears immediately before the

peak of elcatonin is not less than 2.0, and the retention time of elcatonin is about 25 minutes.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of elcatonin from 10  $\mu$ L of the standard solution is between 50 mm and 200 mm.

Time span of measurement: Continue measurement until the regularly changing base-line of the chromatogram disappears, beginning after the solvent peak.

**Water** <2.48> Weigh accurately 1 – 3 mg of Elcatonin quickly under conditions of  $25 \pm 2^\circ\text{C}$  and  $50 \pm 5\%$  relative humidity, and perform the test as directed in 2. Coulometric titration: not more than 8.0%.

**Nitrogen content** Weigh accurately 0.015 – 0.02 g of Elcatonin quickly under conditions of  $25 \pm 2^\circ\text{C}$  and  $50 \pm 5\%$  relative humidity, and perform the test as directed under Nitrogen Determination <1.08>: it contains not less than 16.1% and not more than 18.7% of nitrogen (N: 14.01) in the peptide, calculated on the dehydrated and de-acetic acid basis.

**Assay** (i) Animals: Select healthy male Sprague-Dawley rats each weighing between 90 g and 110 g. Keep the rats for not less than 3 days before use, providing an appropriate uniform diet and water.

(ii) Diluent for elcatonin: Dissolve 2.72 g of sodium acetate in water to make 200 mL, add 0.2 g of bovine serum albumin, and adjust the pH to 6.0 with acetic acid (100). Prepare before use.

(iii) Standard solution: Dissolve Elcatonin Reference Standard in the diluent for elcatonin to make two standard solutions, one to contain exactly 0.075 Unit in each mL which is designated as the high-dose standard solution,  $S_H$ , and the other to contain exactly 0.0375 Unit in each mL which is designated as the low-dose standard solution,  $S_L$ .

(iv) Sample solution: Weigh accurately 0.5 – 2.0 mg of Elcatonin quickly under conditions of  $25 \pm 2^\circ\text{C}$  and  $50 \pm 5\%$  relative humidity, and dissolve in the diluent for elcatonin to make two sample solutions, the high-dose sample solution,  $T_H$ , which contains the Units per mL equivalent to  $S_H$  and the low-dose sample solution,  $T_L$ , which contains the Units per mL equivalent to  $S_L$ .

(v) Deproteinizing solution for elcatonin: Dissolve 160 g of trichloroacetic acid and 30.6 g of strontium chloride in water to make 3600 mL.

(vi) Procedure: Divide the animals into 4 equal groups of not less than 10 animals each. Withhold all food, but not water, for 18 to 24 hours before the injections, and withhold water during the assay until the final blood sample is taken. Handle the animals with care in order to avoid undue excitement.

Inject exactly 0.2 mL each of the standard solutions and the sample solutions into the tail vein of each animal as indicated in the following design:

First group	$S_H$	Third group	$T_H$
Second group	$S_L$	Fourth group	$T_L$

At 1 hour after the injection, take a sufficient blood sample to perform the test from the carotid artery and vein of each animal under ether anesthesia, centrifuge the blood samples to separate serum, and determine the serum calcium according to the following (vii).

(vii) Serum calcium determination: Take exactly 0.3 mL of the serum, add the deproteinizing solution for elcatonin to

make exactly 3 mL, mix well, centrifuge, and use the supernatant liquid as the sample solution for calcium determination. Separately, pipet 1 mL of Standard Calcium Solution for Atomic Absorption Spectrophotometry <2.23>, and add a solution of sodium chloride (17 in 2000) to make exactly 10 mL. Pipet 5 mL of this solution, add the deproteinizing solution for elcatonin to make exactly 50 mL, and use this solution as the standard solution for calcium determination. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and the standard solution as directed under Atomic Absorption Spectrophotometry <2.23> according to the following conditions. Determine the absorbance,  $A_0$ , of a solution obtained in the same manner used for preparation of the standard solution, but with 1 mL of water instead of the standard solution.

$$\text{Amount (mg) of calcium (Ca) in 100 mL of the serum} \\ = 0.01 \times \{(A_T - A_0)/(A_S - A_0)\} \times 10 \times 100$$

Gas: Combustible gas—Acetylene

Supporting gas—Air

Lamp: Calcium hollow-cathode lamp

Wavelength: 422.7 nm

(viii) Calculation: Amounts of calcium in 100 mL of the serum obtained with  $S_H$ ,  $S_L$ ,  $T_H$  and  $T_L$  in (vii) are symbolized as  $y_1$ ,  $y_2$ ,  $y_3$  and  $y_4$ , respectively. Sum up individual  $y_1$ ,  $y_2$ ,  $y_3$  and  $y_4$  to obtain  $Y_1$ ,  $Y_2$ ,  $Y_3$  and  $Y_4$ , respectively.

Units per mg of peptide, calculated on the dehydrated and de-acetic acid basis

$$= \text{antilog } M \times (\text{units per mL of } S_H \times (b/a))$$

$$M = 0.3010 \times (Y_a/Y_b)$$

$$Y_a = -Y_1 - Y_2 + Y_3 + Y_4$$

$$Y_b = Y_1 - Y_2 + Y_3 - Y_4$$

$a$ : Amount (mg) of the sample

$$\times \{100 - [\text{water content (\%)} + \text{acetic acid content (\%)}]/100\}$$

$b$ : Total volume (mL) of the high-dose sample solution prepared by dissolving the sample with diluent for elcatonin.

$F'$  computed by the following equation should be smaller than  $F$  shown in the table against  $n$  with which  $s^2$  is calculated. Calculate  $L$  ( $P=0.95$ ) by use of the following equation:  $L$  should be not more than 0.20. If  $F'$  exceeds  $F$ , or if  $L$  exceeds 0.20, repeat the test, increasing the number of animals or arranging the assay conditions so that  $F'$  is not more than  $F$  and  $L$  is not more than 0.20.

$$F' = (-Y_1 + Y_2 + Y_3 - Y_4)^2/4fs^2$$

$f$ : Number of the animals of each group.

$$s^2 = \{\sum y^2 - (Y/f)\}/n$$

$\sum y^2$ : The sum of squares of  $y_1$ ,  $y_2$ ,  $y_3$  and  $y_4$  in each group.

$$Y = Y_1^2 + Y_2^2 + Y_3^2 + Y_4^2$$

$$n = 4(f - 1)$$

$$L = 2\sqrt{(C - 1)(CM^2 + 0.09062)}$$

$$C = Y_b^2/(Y_b^2 - 4fs^2t^2)$$

$t^2$ : Value shown in the following table against  $n$  used to calculate  $s^2$ .

<i>n</i>	$t^2 = F$	<i>n</i>	$t^2 = F$	<i>n</i>	$t^2 = F$
1	161.45	13	4.667	25	4.242

12	4.747	24	4.260		

**Containers and storage** Containers—Tight containers.  
Storage—Not exceeding 8°C.

## Enflurane

エンフルラン

$C_3H_2ClF_5O$ : 184.49  
(2*RS*)-2-Chloro-1-(difluoromethoxy)-1,1,2-trifluoroethane  
[13838-16-9]

**Description** Enflurane is a clear, colorless liquid.

- It is slightly soluble in water.
- It is miscible with ethanol (95) and with diethyl ether.
- It is a volatile, and not an inflammable.
- It shows no optical rotation.
- Boiling point: 54 – 57°C

**Identification** (1) Take 50  $\mu$ L of Enflurane, and prepare the test solution as directed to the Oxygen Flask Combustion Method <1.06> using 40 mL of water as the absorbing liquid. The test solution responds to the Qualitative Tests <1.09> for chloride and fluoride.

(2) Determine the infrared absorption spectrum of Enflurane as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Refractive index** <2.45>  $n_D^{20}$ : 1.302 – 1.304

**Specific gravity** <2.56>  $d_{20}^{20}$ : 1.520 – 1.540

**Purity** (1) Acidity or alkalinity—To 60 mL of Enflurane add 60 mL of freshly boiled and cooled water, shake for 3 minutes, separate the water later, and use the layer as the sample solution. To 20 mL of the sample solution add one drop of bromocresol purple TS and 0.10 mL of 0.01 mol/L sodium hydroxide TS: the color of the solution is purple. To 20 mL of the sample solution add one drop of bromocresol purple TS and 0.06 mL of 0.01 mol/L hydrochloric acid TS: the color of the solution is yellow.

(2) Chloride <1.03>—To 20 g of Enflurane add 20 mL of water, shake well, and separate the water layer. Take 10 mL

of the water layer add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid (not more than 0.001%).

(3) Nonvolatile residue—Evaporate exactly 65 mL of Enflurane on a water bath to dryness, and dry the residue at 105°C for 1 hour: the of the residue is not more than 1.0 mg.

(4) Related substances—Proceed the test with 5  $\mu$ L of Enflurane as directed under Gas chromatography <2.02> according to the following conditions. Determine each peak area other than the peak of air which appears soon after injection of the sample by the automatic integration method, and calculate the amount of each peak by the area percentage method: the amount of the substances other than enflurane is not more than 0.10%.

**Operating conditions**—

Detector: A thermal conductivity detector.

Column: A column 3 mm in inside diameter and 3 m in length, packed with siliceous earth for gas chromatography, 180 to 250  $\mu$ m in particle diameter, coated with diethylene glycol succinate ester for gas chromatography in the ratio of 20%.

Column temperature: A constant temperature of about 80°C.

Carrier gas: Helium

Flow rate: Adjust the flow rate so that the retention time of enflurane is about 3 minutes.

Time span of measurement: About three times as long as the retention time of enflurane.

**System suitability**—

Test for required detection: Pipet exactly 1 mL of enflurane add 2-propanol to make exactly 100 mL. To exactly 2 mL of this solution add 2-propanol to make exactly 10 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution, and add 2-propanol to make exactly 10 mL. Confirm that the peak area of enflurane obtained from 5  $\mu$ L of this solution is equivalent to 7 to 13% of that of enflurane obtained from 5  $\mu$ L of the solution for system suitability test.

System performance: Mix 5 mL of Enflurane and 5 mL of 2-propanol. When the procedure is run with 5  $\mu$ L of this mixture under the above operating conditions, enflurane and 2-propanol are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 5  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of enflurane is not more than 2.0%.

**Water** <2.48> Not more than 0.10% (10 g, direct titration).

**Containers and storage** Containers—Tight containers.

Storage—Not exceeding 30°C.

## Enoxacin Hydrate

エノキサシン水和物

$C_{15}H_{17}FN_4O_3 \cdot 1\frac{1}{2}H_2O$ : 347.34

1-Ethyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydro-1,8-naphthyridine-3-carboxylic acid sesquihydrate  
[84294-96-2]

Enoxacin Hydrate, when dried, contains not less than 98.5% of enoxacin ( $C_{15}H_{17}FN_4O_3$ : 320.32).

**Description** Enoxacin Hydrate occurs as white to pale yellow-brown crystals or crystalline powder.

It is freely soluble in acetic acid (100), slightly soluble in methanol, very slightly soluble in chloroform, and practically insoluble in water, in ethanol (95) and in diethyl ether.

It dissolves in dilute sodium hydroxide TS.

It is gradually colored by light.

**Identification (1)** Place 0.02 g of Enoxacin Hydrate and 0.05 g of sodium in a test tube, and heat gradually to ignition with precaution. After cooling, add 0.5 mL of methanol and then 5 mL of water, and heat to boiling. To this solution add 2 mL of dilute acetic acid, and filter: the filtrate responds to the Qualitative Tests <1.09> (2) for fluoride.

(2) Dissolve 0.05 g of Enoxacin Hydrate in dilute sodium hydroxide TS to make 100 mL. To 1 mL of the solution add water to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Enoxacin Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 225 – 229°C (after drying).

**Purity (1)** Sulfate <1.14>—Dissolve 1.0 g of Enoxacin Hydrate in 50 mL of dilute sodium hydroxide TS, shake with 10 mL of dilute hydrochloric acid, and centrifuge. Filter the supernatant liquid, and to 30 mL of the filtrate add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.50 mL of 0.005 mol/L sulfuric acid VS add 25 mL of dilute sodium hydroxide TS, 5 mL of dilute hydrochloric acid TS and water to make 50 mL (not more than 0.048%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Enoxacin Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Enoxacin Hydrate according to Method 3, and perform

the test (not more than 2 ppm).

(4) Related substances—Dissolve 50 mg of Enoxacin Hydrate in 25 mL of a mixture of chloroform and methanol (7:3), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (7:3) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> 7.0 – 9.0% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g, platinum crucible).

**Assay** Weigh accurately about 0.3 g of Enoxacin Hydrate, previously dried, dissolve in 30 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 32.03 mg of  $C_{15}H_{17}FN_4O_3$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Enviomycin Sulfate

エンビオマイシン硫酸塩

Tuberactinomycin N Sulfate

$C_{25}H_{43}N_{13}O_{10} \cdot 1\frac{1}{2}H_2SO_4$ : 832.81

Tuberactinomycin O Sulfate

$C_{25}H_{43}N_{13}O_9 \cdot 1\frac{1}{2}H_2SO_4$ : 816.81

Tuberactinomycin N Sulfate

(3*R*,4*R*)-*N*-[(3*S*,9*S*,12*S*,15*S*)-9,12-Bis(hydroxymethyl)-3-[(4*R*)-2-iminohexahydropyrimidin-4-yl]-2,5,8,11,14-pentaazo-6-(*Z*)-ureidomethylene-1,4,7,10,13-pentaazacyclohexadec-15-yl]-3,6-diamino-4-hydroxyhexanamide sesquisulfate

[33103-22-9, Tuberactinomycin N]

Tuberactinomycin O Sulfate  
(3*S*)-*N*-[(3*S*,9*S*,12*S*,15*S*)-9,12-Bis(hydroxymethyl)-3-[(4*R*)-2-iminohexahydropyrimidin-4-yl]-2,5,8,11,14-pentaoxo-6-(*Z*)-ureidomethylene-1,4,7,10,13-pentaazacyclohexadec-15-yl]-3,6-diaminohexanamide sesquisulfate  
[33137-73-4, Tuberactinomycin O]

Enviomycin Sulfate is the sulfate of a mixture of peptide substances having antibacterial activity produced by the growth of *Streptomyces griseoverticillatus* var. *tuberacticus*.

It contains not less than 770  $\mu\text{g}$  (potency) per mg, calculated on the dried basis. The potency of Enviomycin Sulfate is expressed as mass (potency) of tuberactinomycin N ( $\text{C}_{25}\text{H}_{43}\text{N}_{13}\text{O}_{10}$ : 685.69).

**Description** Enviomycin Sulfate occurs as a white powder.

It is very soluble in water, and practically insoluble in ethanol (99.5).

**Identification (1)** To 5 mL of a solution of Enviomycin Sulfate (1 in 200) add 1.5 mL of sodium hydroxide TS, and add 1 drop of a mixture of 0.01 mol/L citric acid TS and copper (II) sulfate TS (97:3): a blue-purple color develops.

(2) Determine the absorption spectrum of a solution of Enviomycin Sulfate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) To 2 mL of a solution of Enviomycin Sulfate (1 in 20) add 1 drop of barium chloride TS: a white precipitate is produced.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-16 - -22^\circ$  (0.5 g calculated on the dried basis, water, 50 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 2.0 g of Enviomycin Sulfate in 20 mL of water is between 5.5 and 7.5.

**Content ratio of the active principle** Dissolve 0.1 g of Enviomycin Sulfate in water to make 100 mL, and use this solution as the sample solution. Perform the test with 3  $\mu\text{L}$  of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_{T1}$  and  $A_{T2}$ , of tuberactinomycin N and tuberactinomycin O, having the relative retention time,  $1.4 \pm 0.4$ , with respect to tuberactinomycin N, by the automatic integration method:  $A_{T2}/(A_{T1} + A_{T2})$  is between 0.090 and 0.150.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of ammonium acetate TS, 1,4-dioxane, tetrahydrofuran, water and ammonia solution (28) (100:75:50:23:2).

Flow rate: Adjust the flow rate so that the retention time of tuberactinomycin N is about 9 minutes.

**System suitability**—

**System performance:** When the procedure is run with 3  $\mu\text{L}$  of the sample solution under the above operating conditions, tuberactinomycin N and tuberactinomycin O are eluted in this order with the resolution between these peaks being not less than 1.5.

**System repeatability:** When the test is repeated 6 times with 3  $\mu\text{L}$  of the sample solution under the above operating conditions, the relative standard deviation of the peak area of tuberactinomycin N is not more than 2.0%.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Enviomycin Sulfate in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Enviomycin Sulfate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 2.0 g of Enviomycin Sulfate according to Method 1, and perform the test (not more than 1 ppm).

**Loss on drying** <2.41> Not more than 4.0% (0.2 g, in vacuum, phosphorus (V) oxide, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) Medium for test organism [5] under (1) Agar media for seed and base layer.

(iii) Standard solutions—Weigh accurately an amount of Enviomycin Sulfate Reference Standard, equivalent to about 20 mg (potency), dissolve in water to make exactly 20 mL, and use this solution as the standard stock solution. Keep the standard stock solution at a temperature not exceeding 5°C and use within 10 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 400  $\mu\text{g}$  (potency) and 100  $\mu\text{g}$  (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Enviomycin Sulfate, equivalent to about 20 mg (potency), and dissolve in water to make exactly 20 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 400  $\mu\text{g}$  (potency) and 100  $\mu\text{g}$  (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Eperisone Hydrochloride

エペリゾン塩酸塩

$C_{17}H_{25}NO \cdot HCl$ : 295.85

(2*RS*)-1-(4-Ethylphenyl)-2-methyl-3-piperidin-1-ylpropan-1-one monohydrochloride [56839-43-1]

Eperisone Hydrochloride contains not less than 98.5% and not more than 101.0% of  $C_{17}H_{25}NO \cdot HCl$ , calculated on the anhydrous basis.

**Description** Eperisone Hydrochloride occurs as a white crystalline powder.

It is freely soluble in water, in methanol and in acetic acid (100), and soluble in ethanol (99.5).

Melting point: about 167°C (with decomposition).

A solution of Eperisone Hydrochloride in methanol (1 in 100) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Eperisone Hydrochloride in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Eperisone Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Eperisone Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Eperisone Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Piperidine hydrochloride—Dissolve 1.0 g of Eperisone Hydrochloride in 20 mL of water, add 2.0 mL of diluted hydrochloric acid (1 in 2), 2.0 mL of a solution of copper (II) sulfate pentahydrate (1 in 20) and 1.5 mL of ammonia solution (28), and use this solution as the sample solution. Separately, to 2.0 mL of a solution of piperidine hydrochloride (1 in 1000) add 18 mL of water, 2.0 mL of diluted hydrochloric acid (1 in 2), 2.0 mL of a solution of copper (II) sulfate pentahydrate (1 in 20) and 1.5 mL of ammonia solution (28), and use this solution as the standard solution. To each of the sample solution and standard solution add 10 mL of a mixture of isopropylether and carbon disulfide (3:1), shake for 30 seconds, allow them to stand for 2 minutes, and compare the color of the upper layer: the color obtained from the sample solution is not more darker than that from the standard solution.

(3) Related substances—Dissolve 0.1 g of Eperisone

Hydrochloride in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than the peak of eperisone is not more than 1/5 of the peak area of eperisone from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 30°C.

**Mobile phase:** A mixture of methanol, 0.0375 mol/L sodium 1-decanesulfonate TS and perchloric acid (600:400:1).

**Flow rate:** Adjust the flow rate so that the retention time of eperisone is about 17 minutes.

**Time span of measurement:** About 2 times as long as the retention time of eperisone.

**System suitability—**

**Test for required detectability:** Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of eperisone obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that obtained from 10  $\mu$ L of the standard solution.

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of eperisone are not less than 4000 steps and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of eperisone is not more than 3.0%.

**Water <2.48>** Not more than 0.2% (0.1 g, coulometric titration).

**Residue on ignition <2.44>** Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.6 g of Eperisone Hydrochloride, dissolve in 20 mL of acetic acid (100), add 80 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 29.58 mg of  $C_{17}H_{25}NO \cdot HCl$

**Containers and storage** Containers—Well-closed containers.

## Ephedrine Hydrochloride

エフェドリン塩酸塩

$C_{10}H_{15}NO \cdot HCl$ : 201.69  
(1*R*,2*S*)-2-Methylamino-1-phenylpropan-1-ol  
monohydrochloride [50-98-6]

Ephedrine Hydrochloride, when dried, contains not less than 99.0% of  $C_{10}H_{15}NO \cdot HCl$ .

**Description** Ephedrine Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in water, soluble in ethanol (95), slightly soluble in acetic acid (100), and practically insoluble in acetonitrile and in acetic anhydride.

**Identification (1)** Determine the absorption spectrum of a solution of Ephedrine Hydrochloride (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ephedrine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Ephedrine Hydrochloride (1 in 15) responds to the Qualitative Tests <1.09> for chloride.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-33.0 - -36.0^\circ$  (after drying, 1 g, water, 20 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Ephedrine Hydrochloride in 20 mL of water: the pH of this solution is between 4.5 and 6.5.

**Melting point** <2.60> 218 – 222°C

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Ephedrine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Dissolve 0.05 g of Ephedrine Hydrochloride in 40 mL of water, add 1 mL of dilute hydrochloric acid and 1 mL of barium chloride TS, and allow to stand for 10 minutes: no turbidity is produced.

(3) Heavy metals <1.07>—Proceed with 1.0 g of Ephedrine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Dissolve 0.05 g of Ephedrine Hydrochloride in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> ac-

ording to the following conditions, and calculate the areas of each peak by the automatic integration method: the total area of the peaks other than ephedrine from the sample solution is not larger than the peak area of ephedrine from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 210 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 45°C.

**Mobile phase:** A mixture of a solution of sodium lauryl sulfate (1 in 128), acetonitrile and phosphoric acid (640:360:1).

**Flow rate:** Adjust the flow rate so that the retention time of ephedrine is about 14 minutes.

**Time span of measurement:** About 3 times as long as the retention time of ephedrine beginning after the solvent peak.

**System suitability—**

**Test for required detectability:** To exactly 1 mL of the standard solution add the mobile phase to make exactly 20 mL. Confirm that the peak area of ephedrine obtained from 10  $\mu$ L of this solution is equivalent to 4 to 6% of that from the standard solution.

**System performance:** Dissolve 1 mg of ephedrine hydrochloride for assay and 4 mg of atropine sulfate in 100 mL of diluted methanol (1 in 2). When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, ephedrine and atropine are eluted in this order with the resolution between these peaks being not less than 1.5.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of ephedrine is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Ephedrine Hydrochloride, previously dried, and dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3) by warming. Cool, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 20.17 mg of  $C_{10}H_{15}NO \cdot HCl$

**Containers and storage** Containers—Well-closed containers.

## Ephedrine Hydrochloride Injection

エフェドリン塩酸塩注射液

Ephedrine Hydrochloride Injection is aqueous solution for injection. It contains not less than 95% and not more than 105% of the labeled amount of ephed-

drine hydrochloride ( $C_{10}H_{15}NO.HCl$ : 201.69).

**Method of preparation** Prepare as directed under Injections, with Ephedrine Hydrochloride.

**Description** Ephedrine Hydrochloride Injection is a clear, colorless liquid.

pH: 4.5 – 6.5

**Identification** To a volume of Ephedrine Hydrochloride Injection, equivalent to 0.05 g of Ephedrine Hydrochloride according to the labeled amount, add water to make 100 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

**Bacterial endotoxins** <4.01> Less than 7.5 EU/mg.

**Extractable volume** <6.05> It meets the requirement.

**Assay** To an exact volume of Ephedrine Hydrochloride Injection, equivalent to about 40 mg of ephedrine hydrochloride ( $C_{10}H_{15}NO.HCl$ ) according to the labeled amount, add exactly 10 mL of the internal standard solution and water to make 200 mL, and use this solution as the sample solution. Separately, weigh accurately about 40 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, add exactly 10 mL of the internal standard solution to dissolve, add water to make 200 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of ephedrine to that of the internal standard of each solution.

$$\text{Amount (mg) of ephedrine hydrochloride (C}_{10}\text{H}_{15}\text{NO.HCl)} \\ = W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of ephedrine hydrochloride for assay

**Internal standard solution**—A solution of etilefrine hydrochloride (1 in 500).

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Purity (4) under Ephedrine Hydrochloride.

**System suitability**—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the internal standard and ephedrine are eluted in this order with the resolution between these peaks being not less than 15.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ephedrine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

Storage—Light-resistant.

## 10% Ephedrine Hydrochloride Powder

### Ephedrine Hydrochloride Powder

エフェドリン塩酸塩散 10%

10% Ephedrine Hydrochloride Powder contains not less than 9.3% and not more than 10.7% of ephedrine hydrochloride ( $C_{10}H_{15}NO.HCl$ : 201.69).

#### Method of preparation

Ephedrine Hydrochloride	100 g
Starch, Lactose Hydrate or their mixture	a sufficient quantity
To make 1000 g	

Prepare as directed under Powders, with the above ingredients.

**Identification** To 0.5 g of 10% Ephedrine Hydrochloride Powder add 100 mL of water, shake for 20 minutes, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

**Assay** Weigh accurately about 0.4 g of 10% Ephedrine Hydrochloride Powder, add 150 mL of water, and extract with the aid of ultrasonicator for 10 minutes with occasional shaking. Shake more for 10 minutes, then add exactly 10 mL of the internal standard solution and water to make 200 mL, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 40 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, add exactly 10 mL of the internal standard solution to dissolve, add water to make 200 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of ephedrine to that of the internal standard of each solution.

$$\text{Amount (mg) of ephedrine hydrochloride (C}_{10}\text{H}_{15}\text{NO.HCl)} \\ = W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of ephedrine hydrochloride for assay

**Internal standard solution**—A solution of etilefrine hydrochloride (1 in 500).

**Operating conditions**—

Detector, column, column temperature, mobile phase and flow rate: Perform as directed in the operating conditions in the Purity (4) under Ephedrine Hydrochloride.

**System suitability**—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the internal standard and ephedrine are eluted in this order with the resolution between these peaks being not less than 15.

System repeatability: When the test is repeated 6 times with

10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ephedrine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

## Ephedrine Hydrochloride Tablets

エフェドリン塩酸塩錠

Ephedrine Hydrochloride Tablets contain not less than 93% and not more than 107% of the labeled amount of ephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ; 201.69).

**Method of preparation** Prepare as directed under Tablets, with Ephedrine Hydrochloride.

**Identification** To an amount of powdered Ephedrine Hydrochloride Tablets, equivalent to 0.05 g of Ephedrine Hydrochloride, add 100 mL of water, shake for 20 minutes, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

**Assay** Weigh accurately not less than 20 tablets of Ephedrine Hydrochloride Tablets, and powder. Weigh accurately an amount of the powder, equivalent to about 40 mg of ephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ), add 150 mL of water, and extract with the aid of ultrasonicator for 10 minutes with occasional shaking. Shake more for 10 minutes, then add exactly 10 mL of the internal standard solution and water to make 200 mL, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 40 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, add exactly 10 mL of the internal standard solution to dissolve, add water to make 200 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of ephedrine to that of the internal standard of each solution.

$$\begin{aligned} \text{Amount (mg) of ephedrine hydrochloride (} C_{10}H_{15}NO \cdot HCl \text{)} \\ = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of ephedrine hydrochloride for assay

**Internal standard solution**—A solution of ephedrine hydrochloride (1 in 500).

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Purity (4) under Ephedrine Hydrochloride.

**System suitability**—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the internal standard and ephedrine are eluted in this order with the resolution between these peaks being not less than 15.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ephedrine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

## Epirizole

### Mepirizole

エピリゾール

$C_{11}H_{14}N_4O_2$ : 234.25

4-Methoxy-2-(5-methoxy-3-methyl-1*H*-pyrazol-1-yl)-6-methylpyrimidine [18694-40-1]

Epirizole, when dried, contains not less than 99.0% of  $C_{11}H_{14}N_4O_2$ .

**Description** Epirizole occurs as white crystals or crystalline powder. It is odorless, and has a bitter taste.

It is very soluble in methanol and in acetic acid (100), freely soluble in ethanol (95), and sparingly soluble in water and in diethyl ether.

It dissolves in dilute hydrochloric acid and in sulfuric acid.

The pH of a solution of Epirizole (1 in 100) is between 6.0 and 7.0.

**Identification (1)** To 0.1 g of Epirizole add 0.1 g of vanillin, 5 mL of water and 2 mL of sulfuric acid, and mix with shaking for a while: a yellow precipitate is formed.

**(2)** Dissolve 0.1 g of Epirizole in 10 mL of water, and add 10 mL of 2,4,6-trinitrophenol TS: a yellow precipitate is produced. Collect the precipitate by filtration, wash with 50 mL of water, and dry at 105°C for 1 hour: it melts <2.60> between 163°C and 169°C.

**(3)** Determine the absorption spectrum of a solution of Epirizole in 0.1 mol/L hydrochloric acid TS (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Melting point** <2.60> 88 – 91°C

**Purity (1)** Clarity and color of solution—Dissolve 0.20 g of Epirizole in 20 mL of water: the solution is clear and colorless.

**(2)** Chloride <1.03>—Add 0.5 g of Epirizole to a ground mixture of 0.7 g of potassium nitrate and 1.2 g of anhydrous sodium carbonate, mix well, transfer little by little to a platinum crucible, previously heated, and heat until the reaction is completed. After cooling, add 15 mL of dilute sulfuric acid and 5 mL of water to the residue, boil for 5 minutes, filter, wash the insoluble matter with 10 mL of water, and add 6 mL

of dilute nitric acid and water to the combined filtrate and washings to make 50 mL. Perform the test with this solution as the test solution. Prepare the control solution as follows: proceed with the same quantities of the same reagents as directed for the preparation of the test solution, and add 0.25 mL of 0.01 mol/L hydrochloric acid VS and water to make 50 mL (not more than 0.018%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Epirizole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Epirizole according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 1.0 g of Epirizole in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 50 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of isopropyl diethyl ether, ethanol (95) and water (23:10:2) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution. Place this plate in a chamber filled with iodine vapor: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

(6) Readily carbonizable substances <1.15>—Perform the test with 0.10 g of Epirizole: the solution has no more color than Matching Fluid A.

**Loss on drying** <2.41> Not more than 0.5% (1 g, silica gel, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Epirizole, previously dried, dissolve in 40 mL of acetic acid (100) and titrate <2.50> with 0.1 mol/L perchloric acid VS (indicator: 2 drops of crystal violet TS) until the color of the solution changes from purple through blue-green to green.

Perform a blank determination, and make any necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L perchloric acid VS} \\ = 23.43 \text{ mg of } C_{11}H_{14}N_4O_2 \end{aligned}$$

**Containers and storage** Containers—Well-closed containers.

## Epirubicin Hydrochloride

エピルビシン塩酸塩

$C_{27}H_{29}NO_{11} \cdot HCl$ : 579.98

(2*S*,4*S*)-4-(3-Amino-2,3,6-trideoxy- $\alpha$ -L-arabino-hexopyranosyloxy)-2,5,12-trihydroxy-2-hydroxyacetyl-7-methoxy-1,2,3,4-tetrahydrotetracene-6,11-dione monohydrochloride [56390-09-1]

Epirubicin Hydrochloride is the hydrochloride of a derivative of daunorubicin.

It contains not less than 970  $\mu$ g (potency) and not more than 1020  $\mu$ g (potency) per mg, calculated on the anhydrous basis and corrected by the amount of the residual solvent. The potency of Epirubicin Hydrochloride is expressed as mass (potency) of epirubicin hydrochloride ( $C_{27}H_{29}NO_{11} \cdot HCl$ ).

**Description** Epirubicin Hydrochloride occurs as a pale yellowish red to brownish red powder.

It is soluble in water and in methanol, slightly soluble in ethanol (95), and practically insoluble in acetonitrile.

It is hygroscopic.

**Identification** (1) Determine the absorption spectrum of a solution of Epirubicin Hydrochloride in methanol (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Epirubicin Hydrochloride and Epirubicin Hydrochloride Reference Standard as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +310 – +340° (10 mg calculated on the anhydrous basis and collected by the amount of the residual solvent, methanol, 20 mL, 100 mm).

**pH** <2.54> Dissolve 10 mg of Epirubicin Hydrochloride in 2 mL of water: the pH of the solution is between 4.0 and 5.5.

**Purity** (1) Clarity and color of solution—Dissolve 50 mg of Epirubicin Hydrochloride in 5 mL of water: the solution is clear and dark red.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Epirubicin Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Perform the test with 10  $\mu$ L of

the sample solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the following conditions, determine each peak area by the automatic integration method, and calculate the sum amount of the peaks other than epirubicin and 2-naphthalenesulfonic acid by the area percentage method: not more than 5.0%.

**Operating conditions—**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of epirubicin beginning after the solvent peak.

**System suitability—**

Test for required detectability: To 1 mL of the sample solution add the mobile phase to make 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of epirubicin obtained from 10  $\mu$ L of this solution is equivalent to 7 to 13% of that obtained from 10  $\mu$ L of the solution for system suitability test.

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

(4) Residual solvents <2.46>—Weigh accurately about 0.3 g of Epirubicin Hydrochloride, add exactly 0.6 mL of the internal standard solution, add *N,N*-dimethylformamide to make 6 mL, and use this solution as the sample solution. Separately, pipet 1 mL of methanol, add *N,N*-dimethylformamide to make exactly 25 mL, and use this solution as methanol standard stock solution. Take exactly 125  $\mu$ L of acetone, 30  $\mu$ L of ethanol (99.5), 32  $\mu$ L of 1-propanol and 17  $\mu$ L of the methanol standard stock solution, add exactly 10 mL of the internal standard solution and *N,N*-dimethylformamide to make 100 mL, and use this solution as the standard solution. Perform the test with 1  $\mu$ L each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following condition, and determine the ratios of the peak areas of acetone, ethanol, 1-propanol and methanol to that of the internal standard,  $Q_{TA}$  and  $Q_{SA}$ ,  $Q_{TB}$  and  $Q_{SB}$ ,  $Q_{TC}$  and  $Q_{SC}$ , and  $Q_{TD}$  and  $Q_{SD}$ , respectively. Calculate the amounts of acetone, ethanol, 1-propanol and methanol by the following equations: the amounts of acetone, ethanol, 1-propanol and methanol are not more than 1.5%, not more than 0.5%, not more than 0.5% and not more than 0.1%, respectively.

$$\begin{aligned} \text{Amount (\%)} & \text{ of acetone} \\ & = (1/W_T) \times (Q_{TA}/Q_{SA}) \times 593 \end{aligned}$$

$$\begin{aligned} \text{Amount (\%)} & \text{ of ethanol} \\ & = (1/W_T) \times (Q_{TB}/Q_{SB}) \times 142 \end{aligned}$$

$$\begin{aligned} \text{Amount (\%)} & \text{ of 1-propanol} \\ & = (1/W_T) \times (Q_{TC}/Q_{SC}) \times 154 \end{aligned}$$

$$\begin{aligned} \text{Amount (\%)} & \text{ of methanol} \\ & = (1/W_T) \times (Q_{TD}/Q_{SD}) \times 2.23 \end{aligned}$$

$W_T$ : Amount (mg) of Epirubicin Hydrochloride

**Internal standard solution—**A solution of 1,4-dioxane in *N,N*-dimethylformamide (1 in 100).

**Operating conditions—**

Detector: Hydrogen flame-ionization detector.

Column: A fused silica column 0.53 mm in inside diameter

and 30 m in length, coated with polyethylene glycol for gas-chromatography 1  $\mu$ m in thickness.

Column temperature: 40°C for 11 minutes after injection of the sample, then rise to 90°C at a rate of 10°C per minute. If necessary, rise to 130°C at a rate of 50°C per minute and maintain the temperature for 30 minutes.

Injection port temperature: A constant temperature of about 120°C.

Detector temperature: A constant temperature of about 150°C.

Carrier gas: Helium

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 8 minutes.

Split ratio: 1:15

**System suitability—**

System performance: When the procedure is run with 1  $\mu$ L of the standard solution under the above operating conditions, acetone, methanol, ethanol, 1-propanol and the internal standard are eluted in this order with the resolution between the peaks of acetone and the internal standard being not less than 30.

System repeatability: When the test is repeated 6 times with 1  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviations of the peak areas of acetone, methanol, ethanol and 1-propanol are not more than 4.0%, respectively.

**Water** Not more than 8.0% (0.1 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.5% (0.1 g).

**Assay** Weigh accurately an amount of Epirubicin Hydrochloride and Epirubicin Hydrochloride Reference Standard, equivalent to about 50 mg (potency), dissolve each in the internal standard solution to make exactly 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of epirubicin to that of the internal standard.

$$\begin{aligned} \text{Amount } [\mu\text{g (potency)}] & \text{ of } C_{27}H_{29}NO_{11}.HCl \\ & = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Epirubicin Hydrochloride Reference Standard

**Internal standard solution—**A solution of sodium 2-naphthalene sulfonate in a mixture of water, acetonitrile, methanol and phosphoric acid (540:290:170:1) (1 in 2000).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with trimethylsilylated silica gel for liquid chromatography (6  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 2 g of sodium lauryl sulfate in a mixture of water, acetonitrile, methanol and phosphoric acid (540:290:170:1) to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of epirubicin is about 9.5 minutes.

**System suitability—**

**System performance:** When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the internal standard and epirubicin are eluted in this order with the resolution between these peaks being not less than 20.

**System repeatability:** When the test is repeated 5 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of epirubicin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—At a temperature between 0°C and 5°C.

## Ergocalciferol

### Calciferol

### Vitamin D<sub>2</sub>

エルゴカルシフェロール

$\text{C}_{28}\text{H}_{44}\text{O}$ : 396.65  
(3*S*,5*Z*,7*E*,22*E*)-9,10-Secoergosta-5,7,10(19),22-tetraen-3-ol  
[50-14-6]

Ergocalciferol contains not less than 97.0% and not more than 103.0% of  $\text{C}_{28}\text{H}_{44}\text{O}$ .

**Description** Ergocalciferol occurs as white crystals. It is odorless, or has a faint, characteristic odor.

It is freely soluble in ethanol (95), in diethyl ether and in chloroform, sparingly soluble in isooctane, and practically insoluble in water.

It is affected by air and by light.

**Melting point:** 115 – 118°C Transfer Ergocalciferol to a capillary tube, and dry for 3 hours in a desiccator (in vacuum at a pressure not exceeding 2.67 kPa). Immediately fire-seal the capillary tube, put it in a bath fluid, previously heated to a temperature about 10°C below the expected melting point, and heat at a rate of rise of about 3°C per minute, and read the melting point.

**Identification (1)** Dissolve 0.5 mg of Ergocalciferol in 5 mL of chloroform, add 0.3 mL of acetic anhydride and 0.1 mL of sulfuric acid, and shake: a red color is produced, and rapidly changes through purple and blue to green.

**(2)** Determine the infrared absorption spectrum of Ergocalciferol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ergocalciferol Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Absorbance** <2.24>  $E_{1\text{cm}}^{1\%}$  (265 nm): 445 – 485 (0.01 g, ethanol (95), 100 mL).

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ : +102 – +107° (0.3 g, ethanol (95), 20 mL, 100 mm). Prepare the solution of Ergocalciferol within 30 minutes after the container has been opened, and determine the rotation within 30 minutes after the solution has been prepared.

**Purity** Ergosterol—Dissolve 10 mg of Ergocalciferol in 2.0 mL of diluted ethanol (95) (9 in 10), add a solution of 20 mg of digitonin in 2.0 mL of diluted ethanol (95) (9 in 10), and allow the mixture to stand for 18 hours: no precipitate is formed.

**Assay** Weigh accurately about 30 mg each of Ergocalciferol and Ergocalciferol Reference Standard, and dissolve each in isooctane to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 3 mL each of the internal standard solution, then add the mobile phase to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 to 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_{\text{T}}$  and  $Q_{\text{S}}$ , of the peak area of ergocalciferol to that of the internal standard. Perform the procedure rapidly avoiding contact with air or other oxidizing agents and using light-resistant containers.

$$\text{Amount (mg) of } \text{C}_{28}\text{H}_{44}\text{O} = W_{\text{S}} \times (Q_{\text{T}}/Q_{\text{S}})$$

$W_{\text{S}}$ : Amount (mg) of Ergocalciferol Reference Standard

**Internal standard solution**—A solution of dimethyl phthalate in isooctane (1 in 100).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with a silica gel for liquid chromatography (10  $\mu\text{m}$  particle diameter).

**Column temperature:** A constant temperature of about 20°C.

**Mobile phase:** A mixture of hexane and n-amylalcohol (997:3).

**Flow rate:** Adjust the flow rate so that the retention time of ergocalciferol is about 25 minutes.

**System suitability**—

**System performance:** Dissolve 15 mg of Ergocalciferol Reference Standard in 25 mL of isooctane. Transfer this solution to a flask, heat in an oil bath under a reflux condenser for 2 hours, and cool immediately to room temperature. Transfer the solution to a quartz test tube, and irradiate with a short-wave lamp (main wavelength: 254 nm) and a long-wave lamp (main wavelength: 365 nm) for 3 hours. To 10 mL of this solution add the mobile phase to make 50 mL. When the procedure is run with 10  $\mu\text{L}$  of this solution under the above operating conditions. Use a column with the ratios of the retention time of previtamin D<sub>2</sub>, trans-vitamin D<sub>2</sub> and tachysterol<sub>2</sub> to that of ergocalciferol being about 0.5, about 0.6 and about 1.1, respectively, and with resolution between previtamin D<sub>2</sub> and trans-vitamin D<sub>2</sub> being not less than 0.7, and that between ergocalciferol and tachysterol<sub>2</sub> being not less than 1.0.

**System repeatability:** When the test is repeated 6 times with

10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ergocalciferol to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

Storage—Light-resistant, under Nitrogen atmosphere, and in a cold place.

## Ergometrine Maleate

エルゴメトリンマレイン酸塩

$C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ : 441.48

(8*S*)-*N*-[(1*S*)-2-Hydroxy-1-methylethyl]-6-methyl-9,10-didehydroergoline-8-carboxamide monomaleate  
[129-51-1]

Ergometrine Maleate, when dried, contains not less than 98.0% of  $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ .

**Description** Ergometrine Maleate occurs as a white to pale yellow, crystalline powder. It is odorless.

It is sparingly soluble in water, slightly soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 185°C (with decomposition).

It gradually changes to yellow in color on exposure to light.

**Identification (1)** Prepare a solution of Ergometrine Maleate (1 in 50): the solution shows a blue fluorescence.

(2) Dissolve 1 mg of Ergometrine Maleate in 5 mL of water. To 1 mL of this solution add 2 mL of 4-dimethylaminobenzaldehyde-ferric chloride TS, shake, and allow to stand for 5 to 10 minutes: a deep blue color develops.

(3) To 5 mL of a solution of Ergometrine Maleate (1 in 500) add 1 drop of potassium permanganate TS: the red color of the solution disappears immediately.

**Optical rotation** <2.49>  $[\alpha]_D^{20} +48 - +57^\circ$  (after drying 0.25 g, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 0.10 g of Ergometrine Maleate in 10 mL of water. The pH of the solution is between 3.0 and 5.0.

**Purity (1)** Clarity and color of solution—Dissolve 0.10 g of Ergometrine Maleate in 10 mL of water: the solution is clear and colorless to light yellow.

(2) Ergotamine and ergotamine—To 0.02 g of Ergometrine Maleate add 2 mL of a solution of sodium hydroxide (1 in 10), and heat to boiling: the gas evolved does not change moistened red litmus paper to blue.

(3) Related substances—Dissolve 5 mg each of Ergometrine Maleate and Ergometrine Maleate Reference Standard in 1.0 mL of methanol, and use these solutions as the sample solution and standard solution, respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>.

Spot 10  $\mu$ L each of the sample solution and standard solution on a plate, prepared with silica gel for thin-layer chromatography and dilute sodium hydroxide TS. Develop the plate with a mixture of chloroform and methanol (4:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS on the plate: the spots obtained from the sample solution and the standard solution show a red-purple color and the same *R<sub>f</sub>* value, and any spot from the sample solution other than that corresponding to the spot from the standard solution does not appear.

**Loss on drying** <2.41> Not more than 2.0% (0.2 g, silica gel, 4 hours).

**Assay** Weigh accurately about 10 mg each of Ergometrine Maleate and Ergometrine Maleate Reference Standard, previously dried in a desiccator (silica gel) for 4 hours, dissolve in water to make exactly 250 mL, and use these solutions as the sample solution and the standard solution, respectively. Pipet 2 mL of each solution into a separate brown glass-stoppered tube. To each tube add 4 mL of 4-dimethylaminobenzaldehyde-iron (III) chloride TS, exactly measured, while cooling in an ice bath, then warm at 45°C for 10 minutes. Allow to stand at room temperature for 20 minutes, and perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution, prepared with 2 mL of water in the same manner, as the blank. Determine the absorbances,  $A_T$  and  $A_S$ , of the subsequent solutions of the sample solution and the standard solution at 550 nm, respectively.

$$\begin{aligned} \text{Amount (mg) of } C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4 \\ = W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Ergometrine Maleate Reference Standard

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Ergometrine Maleate Injection

エルゴメトリンマレイン酸塩注射液

Ergometrine Maleate Injection is an aqueous solution for injection.

It contains not less than 90% and not more than 110% of the labeled amount of ergometrine maleate ( $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ : 441.48).

**Method of preparation** Prepare as directed under Injections, with Ergometrine Maleate.

**Description** Ergometrine Maleate Injection is a clear, colorless to pale yellow liquid.

pH: 2.7 – 3.5

**Identification (1)** Measure a volume of Ergometrine Maleate Injection, equivalent to 3 mg of Ergometrine Maleate according to the labeled amount, if necessary, dilute with water or evaporate on a water bath to make 15 mL, and use this solution as the sample solution. The sample solution shows a blue fluorescence.

(2) To 1 mL of the sample solution obtained in (1) add 1

mL of ammonia TS, and extract with 20 mL of diethyl ether. To the diethyl ether extract add 1 mL of dilute sulfuric acid, shake, and warm to remove diethyl ether in a water bath. Cool, to the residue obtained add 2 mL of 4-dimethylaminobenzaldehyde-iron (III) chloride TS, and allow to stand for 5 to 10 minutes: a deep blue color develops.

(3) To 5 mL of the sample solution obtained in (1) add 1 drop of potassium permanganate TS: a red color disappears immediately.

**Extractable volume** <6.05> It meets the requirement.

**Assay** Transfer an exactly measured volume of Ergometrine Maleate Injection, equivalent to about 2 mg of ergometrine maleate ( $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ ), and add sodium chloride in a ratio of 0.3 g to 1 mL of the solution. To this mixture add 20 mL of diethyl ether and 2 mL of ammonia TS, shake, and extract. Further, extract with three 15-mL portions of diethyl ether, combine all the extracts, add 5 g of anhydrous sodium sulfate, filter through a pledget of absorbent cotton, and wash with three 5-mL portions of diethyl ether. Add the washings to the filtrate, shake with 5 mL of dilute sulfuric acid, evaporate the diethyl ether by warming in a current of nitrogen, to the remaining solution add water to make exactly 50 mL, and use this solution as the sample solution. Weigh accurately about 2 mg of Ergometrine Maleate Reference Standard, previously dried in a desiccator (silica gel) for 4 hours, add water to make exactly 50 mL, and use this solution as the standard solution. Transfer 2 mL each of the sample solution and standard solution, accurately measured, to separate glass-stoppered test tubes, and proceed as directed in the Assay under Ergometrine Maleate.

Amount (mg) of ergometrine maleate ( $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ )  
 $= W_S \times (A_T/A_S)$

$W_S$ : Amount (mg) of Ergometrine Maleate Reference Standard

**Containers and storage** Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant, and in a cold place.

## Ergometrine Maleate Tablets

エルゴメトリンマレイン酸塩錠

Ergometrine Maleate Tablets contain not less than 90% and not more than 110% of the labeled amount of ergometrine maleate ( $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ : 441.48).

**Method of preparation** Prepare as directed under Tablets, with Ergometrine Maleate.

**Identification** To a quantity of powdered Ergometrine Maleate Tablets, equivalent to 3 mg of Ergometrine Maleate according to the labeled amount, add 15 mL of warm water, shake, and filter: the filtrate shows a blue fluorescence. Proceed with this solution as directed in the Identification (2) and (3) under Ergometrine Maleate.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Transfer 1 tablet of Ergometrine Maleate Tablets to a

glass-stoppered centrifuge tube, and add a solution of L-tartaric acid (1 in 100) to make exactly  $V$  mL of a solution containing about  $40 \mu\text{g}$  of ergometrine maleate ( $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ ) per mL. Stopper the tube, shake for 30 minutes vigorously, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 4 mg of Ergometrine Maleate Reference Standard, previously dried in a desiccator (silica gel) for 4 hours, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Pipet 4 mL each of the sample solution and standard solution into separate brown glass-stoppered test tubes, add exactly 8 mL each of 4-dimethylaminobenzaldehyde-iron (III) chloride TS while cooling in an ice bath, after shaking, and allow to stand for 1 hour at ordinary temperature. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution, prepared with 4 mL of water in the same manner, as the blank. Determine the absorbances,  $A_T$  and  $A_S$ , of the subsequent solutions of the sample solution and the standard solution at 550 nm, respectively.

Amount (mg) of ergometrine maleate ( $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ )  
 $= W_S \times (A_T/A_S) \times (V/100)$

$W_S$ : Amount (mg) of Ergometrine Maleate Reference Standard

**Assay** Weigh accurately, and powder not less than 20 Ergometrine Maleate Tablets. Weigh accurately a portion of the powder, equivalent to about 2 mg of ergometrine maleate ( $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ ), transfer to a glass filter (G4), add 10 mL of a solution of L-tartaric acid (1 in 100), and filter with thorough shaking. Repeat the procedures 3 times, combine the filtrates, add a solution of L-tartaric acid (1 in 100) to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 2 mg of Ergometrine Maleate Reference Standard, previously dried in a desiccator (silica gel) for 4 hours, dissolve in a solution of L-tartaric acid (1 in 100) to make exactly 50 mL, and use this solution as the standard solution. Pipet 2 mL each of the sample solution and standard solution, and proceed as directed in the Assay under Ergometrine Maleate.

Amount (mg) of ergometrine maleate ( $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ )  
 $= W_S \times (A_T/A_S)$

$W_S$ : Amount (mg) of Ergometrine Maleate Reference Standard

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Ergotamine Tartrate

エルゴタミン酒石酸塩

$(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$ ; 1313.41  
(5'S)-5'-Benzyl-12'-hydroxy-2'-methylergotaman-3',6',18-trione hemitartrate [379-79-3]

Ergotamine Tartrate contains not less than 98.0% of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$ , calculated on the dried basis.

**Description** Ergotamine Tartrate occurs as colorless crystals, or a white to pale yellowish white or grayish white, crystalline powder.

It is slightly soluble in water and in ethanol (95).

Melting point: about 180°C (with decomposition).

**Identification (1)** Dissolve 1 mg of Ergotamine Tartrate in 10 mL of a mixture of acetic acid (100) and ethyl acetate (1:1). To 0.5 mL of this solution add slowly 0.5 mL of sulfuric acid, with shaking in cold water, and allow to stand: a purple color develops. To this solution add 0.1 mL of diluted iron (III) chloride TS (1 in 12): the color of the solution changes to blue to blue-purple.

(2) Dissolve 1 mg of Ergotamine Tartrate in 5 mL of a solution of L-tartaric acid (1 in 100). To 1 mL of this solution add 2 mL of 4-dimethylaminobenzaldehyde-iron (III) chloride TS, and shake: a blue color develops.

**Optical rotation** <2.49> Ergotamine base  $[\alpha]_D^{20}$ : -155 - -165°. Dissolve 0.35 g of Ergotamine Tartrate in 25 mL of a solution of L-tartaric acid (1 in 100), add 0.5 g of sodium hydrogen carbonate, shake gently and sufficiently, and extract with four 10-mL portions of ethanol-free chloroform. Filter the extracts successively through a small filter paper, moistened with ethanol-free chloroform, into a 50-mL volumetric flask. Allow the flask to stand in a water bath at 20°C for 10 minutes, and determine the optical rotation in a 100-mm cell. Separately, pipet 25 mL of this solution, evaporate to dryness under reduced pressure at a temperature not higher than 45°C, dissolve the residue in 25 mL of acetic acid (100), and titrate <2.50> with 0.05 mol/L perchloric acid VS (indicator: 1 drop of crystal violet TS). Perform a blank determination, and make any necessary correction. Calculate the specific rotation of the ergotamine base from the consumed volume of 0.05 mol/L perchloric acid VS and the optical rotation.

Each mL of 0.05 mol/L perchloric acid VS  
= 29.08 mg of  $C_{33}H_{35}N_5O_5$

**Purity** Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. To 40 mg of Ergotamine Tartrate add 10 mL of a solution of L-

tartaric acid in diluted methanol (1 in 2) (1 in 1000), dissolve with thorough shaking, and use this solution as the sample solution. Pipet 1 mL of this solution, add a solution of L-tartaric acid in diluted methanol (1 in 2) (1 in 1000) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (9:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 5.0% (0.1 g, in vacuum, 60°C, 4 hours).

**Assay** Weigh accurately about 0.2 g of Ergotamine Tartrate, dissolve in 15 mL of a mixture of acetic acid (100) and acetic anhydride (50:3), and titrate <2.50> with 0.05 mol/L perchloric acid VS (indicator: 1 drop of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS  
= 32.84 mg of  $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and almost well-filled, or under nitrogen atmosphere, and not exceeding 5°C.

## Erythromycin

エリスロマイシン

$C_{37}H_{67}NO_{13}$ ; 733.93  
(2R,3S,4S,5R,6R,8R,10R,11R,12S,13R)-5-(3,4,6-Trideoxy-3-dimethylamino-β-D-xylo-hexopyranosyloxy)-3-(2,6-dideoxy-3-C-methyl-3-O-methyl-α-L-ribo-hexopyranosyloxy)-6,11,12-trihydroxy-2,4,6,8,10,12-hexamethyl-9-oxopentadecan-13-olide [114-07-8]

Erythromycin is a macrolide substance having antibacterial activity produced by the growth of *Saccharopolyspora erythraea*.

It contains not less than 930 μg (potency) and not more than 1020 μg (potency) per mg, calculated on the anhydrous basis. The potency of Erythromycin is expressed as mass (potency) of erythromycin ( $C_{37}H_{67}NO_{13}$ ).

**Description** Erythromycin occurs as a white to light yellow-

ish white powder.

It is very soluble in *N,N*-dimethylformamide, freely soluble in methanol and in ethanol (95), and very slightly soluble in water.

**Identification (1)** Determine the infrared absorption spectrum of Erythromycin as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Erythromycin Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Dissolve 10 mg each of Erythromycin and Erythromycin Reference Standard in 1 mL of methanol, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and ammonia solution (28) (50:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-methoxybenzaldehyde-sulfuric acid TS on the plate, and heat at 100°C for 15 minutes: the principal spot from the sample solution and the spot from the standard solution are dark purple in color, and their *R<sub>f</sub>* values are the same.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-71 - -78^\circ$  (1 g calculated on the anhydrous basis, ethanol (95), 50 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Erythromycin according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Erythromycin according to Method 5 using hydrochloric acid instead of diluted hydrochloric acid (1 in 2), and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 40 mg of Erythromycin in 2 mL of methanol, add a mixture of phosphate buffer solution, pH 7.0 and methanol (15:1) to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 16 mg of Erythromycin Reference Standard in 2 mL of methanol, add a mixture of phosphate buffer solution, pH 7.0 and methanol (15:1) to make exactly 10 mL, and use this solution as the standard stock solution. Dissolve 5 mg each of erythromycin B and erythromycin C in 2 mL of methanol, add exactly 2 mL of the standard stock solution, add a mixture of phosphate buffer solution, pH 7.0 and methanol (15:1) to make exactly 25 mL, and use this solution as the standard solution. Perform the test with exactly 100  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of erythromycin B and erythromycin C from the sample solution are not more than those of erythromycin B and erythromycin C from the standard solution, respectively, and each area of the peaks other than erythromycin, erythromycin B and erythromycin C is not more than the area of the peak of erythromycin from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 215 nm).

Column: A stainless steel column 4.6 mm in inside di-

ameter and 25 cm in length, packed with styrene-divinylbenzene copolymer for liquid chromatography (8  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 70°C.

Mobile phase: Dissolve 3.5 g of dipotassium hydrogen phosphate in water to make 100 mL, and adjust the pH to 9.0 with diluted phosphoric acid (1 in 10). To 50 mL of this solution add 190 mL of *t*-butanol, 30 mL of acetonitrile and water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of erythromycin is about 20 minutes.

Time span of measurement: About 4 times as long as the retention time of erythromycin beginning after the solvent peak.

**System suitability**—

System performance: Dissolve 2 mg of *N*-demethylerythromycin in 10 mL of the standard solution. When the procedure is run with 100  $\mu$ L of this solution under the above operating conditions, *N*-demethylerythromycin, erythromycin C, erythromycin and erythromycin B are eluted in this order, with the resolution between the peaks of *N*-demethylerythromycin and erythromycin C being not less than 0.8, and with the resolution between the peaks of *N*-demethylerythromycin and erythromycin being not less than 5.5.

System repeatability: When the test is repeated 3 times with 100  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of erythromycin is not more than 3.0%.

**Water** <2.48> Not more than 10.0% (0.2 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Staphylococcus aureus* ATCC 6538 P

(ii) Culture medium—Use the medium i in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to 8.0 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Erythromycin Reference Standard, equivalent to about 25 mg (potency), dissolve in 25 mL of methanol, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below, and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20  $\mu$ g (potency) and 5  $\mu$ g (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Erythromycin, equivalent to about 25 mg (potency), dissolve in 25 mL of methanol, and add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20  $\mu$ g (potency) and 5  $\mu$ g (potency), and use these solutions as the high concentration sample solution and low

concentration sample solution, respectively.

**Containers and storage** Containers—Well-closed containers.

## Erythromycin Ethylsuccinate

エリスロマイシンエチルコハク酸エステル

$C_{43}H_{75}NO_{16}$ : 862.05  
(2*R*,3*S*,4*S*,5*R*,6*R*,8*R*,10*R*,11*R*,12*S*,13*R*)-5-[3,4,6-Trideoxy-2-*O*-(3-ethoxycarbonylpropanoyl)-3-dimethylamino- $\beta$ -D-xylo-hexopyranosyloxy]-3-(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl- $\alpha$ -L-ribo-hexopyranosyloxy)-6,11,12-trihydroxy-2,4,6,8,10,12-hexamethyl-9-oxopentadecan-13-olide [41342-53-4]

Erythromycin Ethylsuccinate is a derivative of erythromycin.

It contains not less than 780  $\mu$ g (potency) and not more than 900  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Erythromycin Ethylsuccinate is expressed as mass (potency) of erythromycin ( $C_{37}H_{67}NO_{13}$ : 733.93).

**Description** Erythromycin Ethylsuccinate occurs as a white powder.

It is freely soluble in methanol and in acetone, soluble in ethanol (95), and practically insoluble in water.

**Identification (1)** Dissolve 3 mg of Erythromycin Ethylsuccinate in 2 mL of acetone, and add 2 mL of hydrochloric acid: an orange color develops and is immediately changed to red to deep purple.

**(2)** Determine the infrared absorption spectrum of Erythromycin Ethylsuccinate, previously dried in a desiccator (reduced pressure, silica gel) for 24 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Water** <2.48> Not more than 5.0% (0.5 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Staphylococcus aureus* ATCC 6538 P

(ii) Culture medium—Use the medium i in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to

8.0 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Erythromycin Reference Standard equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20  $\mu$ g (potency) and 5  $\mu$ g (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Erythromycin Ethylsuccinate equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, and add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL. Take exactly a suitable amount of the solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20  $\mu$ g (potency) and 5  $\mu$ g (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Erythromycin Lactobionate

エリスロマイシンラクトビオン酸塩

$C_{37}H_{67}NO_{13} \cdot C_{12}H_{22}O_{12}$ : 1092.22  
(2*R*,3*S*,4*S*,5*R*,6*R*,8*R*,10*R*,11*R*,12*S*,13*R*)-5-(3,4,6-Trideoxy-3-dimethylamino- $\beta$ -D-xylo-hexopyranosyloxy)-3-(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl- $\alpha$ -L-ribo-hexopyranosyloxy)-6,11,12-trihydroxy-2,4,6,8,10,12-hexamethyl-9-oxopentadecan-13-olide mono(4-*O*- $\beta$ -D-galactopyranosyl-D-gluconate) [3847-29-8]

Erythromycin Lactobionate is the lactobionate of erythromycin.

It contains not less than 590  $\mu$ g (potency) and not more than 700  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Erythromycin Lactobionate is expressed as mass (potency) of erythromycin ( $C_{37}H_{67}NO_{13}$ : 733.93).

**Description** Erythromycin Lactobionate occurs as a white powder.

It is freely soluble in water, in methanol and in ethanol (99.5), and very slightly soluble in acetone.

**Identification (1)** To 3 mg of Erythromycin Lactobionate add 2 mL of acetone, and add 2 mL of hydrochloric acid: an orange color is produced, and it changes immediately to red

to deep purple.

(2) Transfer about 0.3 g of Erythromycin Lactobionate to a separator, add 15 mL of ammonia TS and 15 mL of chloroform, shake, and take the separated aqueous layer. Wash the aqueous layer with three 15-mL portions of chloroform, and evaporate the aqueous liquid on a water bath to dryness. Dissolve the residue in 10 mL of a mixture of methanol and water (3:2), and use this solution as the sample solution. Separately, dissolve 0.10 g of lactobionic acid in 10 mL of a mixture of methanol and water (3:2), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatograph. Develop the plate with the upper layer obtained from a mixture of water, 1-butanol and acetic acid (100) (3:3:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly dilute sulfuric acid, and heat at 105°C for 20 minutes: the principal spot obtained from the sample solution shows a deep brown and the *R<sub>f</sub>* value which are the same as those of the principal spot from the standard solution.

**pH** <2.54> The pH of a solution obtained by dissolving 0.5 g of Erythromycin Lactobionate in 10 mL of water is between 5.0 and 7.5.

**Water** <2.48> Not more than 5.0% (0.5 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Staphylococcus aureus* ATCC 6538 P

(ii) Culture medium—Use the medium i in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to 8.0 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Erythromycin Reference Standard, equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 5°C and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20  $\mu$ g (potency) and 5  $\mu$ g (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Erythromycin Lactobionate, equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, and add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20  $\mu$ g (potency) and 5  $\mu$ g (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Erythromycin Stearate

エリスロマイシンステアリン酸塩

$\text{C}_{37}\text{H}_{67}\text{NO}_{13} \cdot \text{C}_{18}\text{H}_{36}\text{O}_2$ : 1018.40

(2*R*,3*S*,4*S*,5*R*,6*R*,8*R*,10*R*,11*R*,12*S*,13*R*)-5-(3,4,6-Trideoxy-3-dimethylamino- $\beta$ -D-xyllo-hexopyranosyloxy)-3-(2,6-dideoxy-3-C-methyl-3-O-methyl- $\alpha$ -L-ribo-hexopyranosyloxy)-6,11,12-trihydroxy-2,4,6,8,10,12-hexamethyl-9-oxopentadecan-13-olide monostearate [643-22-1]

Erythromycin Stearate is the stearate of erythromycin.

It contains not less than 600  $\mu$ g (potency) and not more than 720  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Erythromycin Stearate is expressed as mass (potency) of erythromycin ( $\text{C}_{37}\text{H}_{67}\text{NO}_{13}$ : 733.93).

**Description** Erythromycin Stearate occurs as a white powder.

It is freely soluble in ethanol (95) and in acetone, soluble in methanol, and practically insoluble in water.

**Identification** (1) Dissolve 3 mg of Erythromycin Stearate in 2 mL of acetone, and add 2 mL of hydrochloric acid: an orange color develops and is immediately changed to red to deep purple.

(2) Determine the infrared absorption spectrum of Erythromycin Stearate, previously dried in a desiccator (reduced pressure, silica gel) for 24 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Water** <2.48> Not more than 5.0% (0.5 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Staphylococcus aureus* ATCC 6538 P

(ii) Culture medium—Use the medium i in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to 8.0 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Erythromycin Reference Standard equivalent to about 50 mg

(potency), dissolve in 50 mL of methanol, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Erythromycin Stearate equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, and add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL. Take exactly a suitable amount of the solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Estazolam

エスタゾラム

$C_{16}H_{11}ClN_4$ : 294.74  
8-Chloro-6-phenyl-4*H*-[1,2,4]triazolo[4,3-*a*][1,4]benzodiazepine [29975-16-4]

Estazolam, when dried, contains not less than 98.5% of  $C_{16}H_{11}ClN_4$ .

**Description** Estazolam occurs as white to pale yellowish white crystals or crystalline powder. It is odorless, and has a bitter taste.

It is soluble in methanol and in acetic anhydride, sparingly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.

**Identification (1)** Dissolve 0.01 g of Estazolam in 3 mL of sulfuric acid: the solution shows a yellow-green fluorescence under ultraviolet light (main wavelength: 365 nm).

(2) Determine the absorption spectrum of a solution of Estazolam in 1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Perform the test with Estazolam as directed under Flame Coloration Test (2) <1.04>: a green color appears.

**Melting point** <2.60> 229 – 233°C

**Purity (1)** Clarity and color of solution—Dissolve 0.10 g of Estazolam in 10 mL of ethanol (95): the solution is clear

and colorless.

(2) Chloride <1.03>—Dissolve 1.0 g of Estazolam in 10 mL of ethanol (95) by heating, add 40 mL of water, cool with shaking in ice water, allow to stand to attain ordinary temperature, and filter. To 30 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS and 6 mL of ethanol (95) (not more than 0.015%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Estazolam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Estazolam according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.20 g of Estazolam in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of hexane, chloroform and methanol (5:3:1) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the principal spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (2 g).

**Assay** Weigh accurately about 0.25 g of Estazolam, previously dried, dissolve in 100 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration), until the solution changes to the second equivalence point. Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 14.74 mg of  $C_{16}H_{11}ClN_4$

**Containers and storage** Containers—Well-closed containers.

## Estradiol Benzoate

エストラジオール安息香酸エステル

$C_{25}H_{28}O_3$ : 376.49  
Estra-1,3,5(10)-triene-3,17β-diol 3-benzoate [50-50-0]

Estradiol Benzoate, when dried, contains not less

than 97.0% of  $C_{25}H_{28}O_3$ .

**Description** Estradiol Benzoate occurs as a white, crystalline powder. It is odorless.

It is sparingly soluble in acetone, slightly soluble in methanol, in ethanol (95) and in diethyl ether, and practically insoluble in water.

**Identification (1)** To 2 mg of Estradiol Benzoate add 2 mL of sulfuric acid: a yellowish green color with a blue fluorescence is produced, and the color of the solution changes to light orange on the careful addition of 2 mL of water.

(2) Determine the infrared absorption spectrum of Estradiol Benzoate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Estradiol Benzoate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +54 – +58° (after drying, 0.1 g, acetone, 10 mL, 100 mm).

**Melting point** <2.60> 191 – 198°C

**Purity (1)** 3,17 $\alpha$ -Estradiol—Dissolve 5.0 mg each of Estradiol Benzoate and Estradiol Benzoate Reference Standard in acetone to make exactly 100 mL, and use these solutions as the sample solution and standard solution, respectively. Place exactly 2 mL each of the sample solution and standard solution in separate glass-stoppered test tube, add boiling stones, evaporate the acetone by heating in a water bath, and dry the residue in a desiccator (in vacuum, phosphorus (V) oxide) for 1 hour. Add 1.0 mL of dilute iron-phenol TS to each test tube. Stopper the test tubes loosely, heat for 30 seconds in a water bath, shake in a water bath for several seconds, and heat for 2 minutes. Cool the solutions in ice for 2 minutes, add 4.0 mL of diluted sulfuric acid (7 in 20), and mix well: the solution obtained from the sample solution has no more color than that from the standard solution.

(2) Related substances—Dissolve 40 mg of Estradiol Benzoate in 2 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of this solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and diethylamine (19:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Residue on ignition** <2.44> Not more than 0.2% (0.1 g).

**Assay** Weigh accurately about 10 mg each of Estradiol Benzoate and Estradiol Benzoate Reference Standard, previously dried, and dissolve each in methanol to make exactly 20 mL. Pipet 5 mL each of these solutions, add 5 mL of the internal standard solution, then add methanol to make 20 mL, and use these solutions as the sample solution and standard solu-

tion, respectively. Perform the test with 5  $\mu$ L of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of estradiol benzoate to that of the internal standard.

$$\text{Amount (mg) of } C_{25}H_{28}O_3 = W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of Estradiol Benzoate Reference Standard

**Internal standard solution**—A solution of progesterone in methanol (13 in 80,000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 230 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 35°C.

**Mobile phase**: A mixture of acetonitrile and water (7:3).

**Flow rate**: Adjust the flow rate so that the retention time of estradiol benzoate is about 10 minutes.

**System suitability**—

**System performance**: When the procedure is run with 5  $\mu$ L of the standard solution under the above operating conditions, the internal standard and estradiol benzoate are eluted in this order with the resolution between these peaks being not less than 9.

**System repeatability**: When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of estradiol benzoate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Estradiol Benzoate Injection

エストラジオール安息香酸エステル注射液

Estradiol Benzoate Injection is an oily solution for injection.

It contains not less than 90% and not more than 110% of the labeled amount of estradiol benzoate ( $C_{25}H_{28}O_3$ ; 376.49).

**Method of preparation** Prepare as directed under Injections, with Estradiol Benzoate.

**Description** Estradiol Benzoate Injection is a clear, oily liquid.

**Identification** To a volume of Estradiol Benzoate Injection, equivalent to 1 mg of Estradiol Benzoate according to the labeled amount, add chloroform to make 5 mL, and use this solution as the sample solution. Separately dissolve 1 mg of Estradiol Benzoate Reference Standard in 5 mL of chloroform, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 50  $\mu$ L each of the sample so-

lution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with dichloromethane to a distance of about 15 cm, and air-dry the plate. Then develop the plate with a mixture of chloroform and methanol (99:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution and the spot obtained from the standard solution show the same *R<sub>f</sub>* value.

**Extractable volume** <6.05> It meets the requirement.

**Assay** Transfer an exactly measured volume of Estradiol Benzoate Injection, equivalent to about 10 mg of estradiol benzoate (C<sub>25</sub>H<sub>28</sub>O<sub>3</sub>), to a separator, add 30 mL of hexane saturated with diluted methanol (9 in 10), and extract with five 15-mL portions of dilute methanol (9 in 10) saturated with hexane. Filter the extract through a filter paper washed with 10 mL of diluted methanol (9 in 10), to the filtrate add methanol to make exactly 200 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Estradiol Benzoate Reference Standard, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 4 hours, and dissolve in methanol to make exactly 100 mL. Pipet 10 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Transfer 2 mL each of the sample solution and standard solution, exactly measured, to light-resistant 20-mL volumetric flasks, and evaporate to dryness on a water bath with the aid of a current of air. Dissolve the residue in 1 mL of methanol, add 10 mL of boric acid-methanol buffer solution, shake, and boil under a reflux condenser for 30 minutes. Cool, add 5 mL of boric acid-methanol buffer solution, shake, and cool with ice. To each solution add 2 mL of ice-cold diazo TS quickly, shake vigorously, add 2 mL of sodium hydroxide TS, then add water to make 20 mL, and filter after shaking. Discard the first 3 mL of the filtrate, and perform the test with the subsequent filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24> using a solution, prepared with 2 mL of methanol in the same manner, as the blank. Determine the absorbances, *A<sub>T</sub>* and *A<sub>S</sub>*, of the subsequent solutions obtained from the sample solution and standard solution in a 4-cm cell at 490 nm, respectively.

$$\begin{aligned} &\text{Amount (mg) of estradiol benzoate (C}_{25}\text{H}_{28}\text{O}_3) \\ &= W_S \times (A_T/A_S) \times (2/5) \end{aligned}$$

*W<sub>S</sub>*: Amount (mg) of Estradiol Benzoate Reference Standard

**Containers and storage** Containers—Hermetic containers.

## Estradiol Benzoate Injection (Aqueous Suspension)

エストロジオール安息香酸エステル水性懸濁注射液

Estradiol Benzoate Injection (Aqueous Suspension) is an aqueous suspension for injection. It contains not less than 90% and not more than 110% of the labeled amount of estradiol benzoate (C<sub>25</sub>H<sub>28</sub>O<sub>3</sub>; 376.49).

**Method of preparation** Prepare as directed under Injection,

with Estradiol Benzoate.

**Description** Estradiol Benzoate Injection (Aqueous Suspension) produces a white turbidity on shaking.

**Identification** Extract a volume of Estradiol Benzoate Injection (Aqueous Suspension), equivalent to 1 mg of Estradiol Benzoate according to the labeled amount, with 5 mL of chloroform, and use this extract as the sample solution. Separately, dissolve 1 mg of Estradiol Benzoate Reference Standard in 5 mL of chloroform, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 50 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (99:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution and the spot obtained from the standard solution show the same *R<sub>f</sub>* value.

**Extractable volume** <6.05> It meets the requirement.

**Assay** Measure exactly a volume of well-mixed Estradiol Benzoate Injection (Aqueous Suspension), equivalent to about 2 mg of estradiol benzoate (C<sub>25</sub>H<sub>28</sub>O<sub>3</sub>), dissolve the crystals with an appropriate quantity of methanol, and add methanol to make exactly 20 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add methanol to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Estradiol Benzoate Reference Standard, previously dried in desiccator (reduced pressure, phosphorus (V) oxide) for 4 hours, and dissolve in methanol to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and methanol to make 100 mL, and use this solution as the standard solution. Proceed with these solutions as directed in the Assay under Estradiol Benzoate.

$$\begin{aligned} &\text{Amount (mg) of estradiol benzoate (C}_{25}\text{H}_{28}\text{O}_3) \\ &= W_S \times (Q_T/Q_S) \times (1/5) \end{aligned}$$

*W<sub>S</sub>*: Amount (mg) of Estradiol Benzoate Reference Standard

**Internal standard solution**—A solution of progesterone in methanol (13 in 100,000).

**Containers and storage** Containers—Hermetic containers.

## Estriol

エストリオール

C<sub>18</sub>H<sub>24</sub>O<sub>3</sub>: 288.38

Estra-1,3,5(10)-triene-3,16α,17β-triol [50-27-1]

Estriol, when dried, contains not less than 97.0% and not more than 102.0% of C<sub>18</sub>H<sub>24</sub>O<sub>3</sub>.

**Description** Estriol occurs as a white, crystalline powder. It is odorless.

It is sparingly soluble in methanol, slightly soluble in ethanol (95) and in 1,4-dioxane, and practically insoluble in water and in diethyl ether.

**Identification (1)** Dissolve 0.01 g of Estriol in 100 mL of ethanol (95) by warming, and use this solution as the sample solution. Evaporate 1 mL of this solution on a water bath to dryness, add 5 mL of a solution of sodium *p*-phenolsulfonate in diluted phosphoric acid (1 in 50), heat at 150°C for 10 minutes, and cool: a red-purple color develops.

(2) Determine the absorption spectrum of the sample solution obtained in (1) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Estriol Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Estriol, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Estriol Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +54 – +62° (after drying, 40 mg, 1,4-dioxane, 10 mL, 100 mm).

**Melting point** <2.60> 281 – 286°C

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Estriol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 40 mg of Estriol in 10 mL of ethanol (95) by warming, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, acetone and acetic acid (100) (18:1:1:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly diluted sulfuric acid (1 in 2) on the plate, and heat at 105°C for 15 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 25 mg each of Estriol and Estriol Reference Standard, previously dried, and dissolve each in methanol to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 5 mL of the internal standard solution, add methanol to make 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of

estriol to that of the internal standard, respectively.

$$\text{Amount (mg) of } C_{18}H_{24}O_3 = W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of Estriol Reference Standard

**Internal standard solution**—A solution of methyl benzoate for estriol limit test in methanol (1 in 1000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and methanol (51:49).

Flow rate: Adjust the flow rate so that the retention time of estriol is about 10 minutes.

**System suitability**—

System performance: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, estriol and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of estriol to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Estriol Injection (Aqueous Suspension)

エストリオール水性懸濁注射液

Estriol Injection (Aqueous Suspension) is an aqueous suspension for injection. It contains not less than 90% and not more than 110% of the labeled amount of estriol ( $C_{18}H_{24}O_3$ ; 288.38).

**Method of preparation** Prepare as directed under Injections, with Estriol.

**Description** Shake Estriol Injection (Aqueous Suspension): a white turbidity is produced.

**Identification (1)** Shake well, take a volume of Estriol Injection (Aqueous Suspension), equivalent to 2 mg of Estriol according to the labeled amount, add ethanol (95) to make 20 mL, and use this solution as the sample solution. Proceed with the sample solution as directed in the Identification (1) under Estriol.

(2) Determine the absorption spectrum of the sample solution obtained in (1) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 279 nm and 283 nm.

**Extractable volume** <6.05> It meets the requirement.

**Assay** Shake well, pipet a volume of Estriol Injection (Aqueous Suspension), equivalent to about 5 mg of estriol

( $C_{18}H_{24}O_3$ ), and dissolve in methanol to make exactly 20 mL. Pipet 4 mL of this solution, add exactly 5 mL of the internal standard solution, then add methanol to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Estriol Reference Standard, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, add exactly 5 mL of the internal standard solution, then add methanol to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Estriol.

$$\begin{aligned} &\text{Amount (mg) of estriol (C}_{18}\text{H}_{24}\text{O}_3\text{)} \\ &= W_S \times (Q_T/Q_S) \times (1/5) \end{aligned}$$

$W_S$ : Amount (mg) of Estriol Reference Standard

**Internal standard solution**—A solution of methyl benzoate for estriol limit test in ethanol (95) (1 in 5000).

**Containers and storage** Containers—Hermetic containers.

## Estriol Tablets

エストリオール錠

Estriol Tablets contain not less than 90% and not more than 110% of the labeled amount of estriol ( $C_{18}H_{24}O_3$ ; 288.38).

**Method of preparation** Prepare as directed under Tablets, with Estriol.

**Identification (1)** Weigh a portion of powdered Estriol Tablets, equivalent to 2 mg of Estriol according to the labeled amount, add ethanol (95) to make 20 mL, shake for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Proceed with the sample solution as directed in the Identification (1) under Estriol.

(2) Determine the absorption spectrum of the sample solution obtained in (1) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 279 nm and 283 nm.

**Uniformity of dosage units <6.02>** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Estriol Tablets add exactly 5 mL of water, disperse the fine particles with ultrasonic wave, add exactly 15 mL of methanol, and shake for 15 minutes. Centrifuge this solution for 10 minutes, pipet a definite amount of the supernatant liquid, and add methanol to make exactly a definite amount of solution so that each mL of the solution contains about 5  $\mu$ g of estriol ( $C_{18}H_{24}O_3$ ). Pipet 5 mL of this solution, add exactly 1 mL of the internal standard solution, and use this solution as the sample solution. Proceed with 20  $\mu$ L of the sample solution as directed in the Assay under Estriol. Use a solution of methyl benzoate in methanol (1 in 40,000) as the internal standard solution. Calculate the mean value from each ratio of peak areas of 10 samples: the samples conform to the requirements if the deviation (%) of the mean value and each ratio of peak areas is within 15%. If the deviation (%) exceeds 15%, and 1 sample shows deviation within 25%, repeat the test with 20 samples. Calculate the deviation (%) of the mean value from each ratio of peak areas of the 30

samples used in the 2 tests and each ratio of peak areas: the samples conform to the requirements if the deviation exceeds 15%, not more than 1 sample shows deviation within 25%, and no sample shows deviation exceeding 25%.

**Dissolution <6.10>** Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Estriol Tablets at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium. Take 20 mL or more of the dissolved solution 30 minutes after starting the test, and filter through a membrane filter with pore size of not more than 0.8  $\mu$ m. Discard the first 10 mL of the filtrate, pipet the subsequent  $V$  mL, add water to make exactly  $V'$  mL so that each mL contains about 0.1  $\mu$ g of estriol ( $C_{18}H_{24}O_3$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Estriol Reference Standard, previously dried at 105°C for 3 hours, dissolve in methanol to make exactly 100 mL, then pipet 5 mL of this solution, and add water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 100  $\mu$ L each of the sample solution and standard solution according to the operating conditions as directed in the Assay under Estriol, and determine the peak areas of estriol,  $A_T$  and  $A_S$ , from these solutions.

The dissolution rate of Estriol Tablets in 30 minutes is not less than 80%.

$$\begin{aligned} &\text{Dissolution rate (\%)} \text{ with respect to} \\ &\text{the labeled amount of estriol (C}_{18}\text{H}_{24}\text{O}_3\text{)} \\ &= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times (9/10) \end{aligned}$$

$W_S$ : Amount (mg) of Estriol Reference Standard

$C$ : Labeled amount (mg) of estriol ( $C_{18}H_{24}O_3$ ) in 1 tablet

**Assay** Weigh accurately and powder not less than 20 Estriol Tablets. Weigh accurately a portion of the powder, equivalent to about 1 mg of estriol ( $C_{18}H_{24}O_3$ ), add exactly 5 mL of water, disperse the fine particles with ultrasonic wave, shake with 25 mL of methanol for 10 minutes, centrifuge, and take the supernatant liquid. Add 25 mL of methanol, repeat the above procedure twice, combine the supernatant liquid, add exactly 5 mL of the internal standard solution, then add methanol to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Estriol Reference Standard, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, add exactly 5 mL of the internal standard solution, then add methanol to make 100 mL, and use this solution as the standard solution. Proceed with 20  $\mu$ L each of the sample solution and standard solution as directed in the Assay under Estriol.

$$\begin{aligned} &\text{Amount (mg) of estriol (C}_{18}\text{H}_{24}\text{O}_3\text{)} \\ &= W_S \times (Q_T/Q_S) \times (1/25) \end{aligned}$$

$W_S$ : Amount (mg) of Estriol Reference Standard

**Internal standard solution**—A solution of methyl benzoate for estriol limit test in methanol (1 in 5000).

**Containers and storage** Containers—Tight containers.

## Etacrynic Acid

エタクリン酸

$C_{13}H_{12}Cl_2O_4$ : 303.14  
[2,3-Dichloro-4-(2-ethylacryloyl)phenoxy]acetic acid  
[58-54-8]

Etacrynic Acid, when dried, contains not less than 98.0% of  $C_{13}H_{12}Cl_2O_4$ .

**Description** Etacrynic Acid occurs as a white, crystalline powder. It is odorless, and has a slightly bitter taste.

It is very soluble in methanol, freely soluble in ethanol (95), in acetic acid (100) and in diethyl ether, and very slightly soluble in water.

**Identification (1)** Dissolve 0.2 g of Etacrynic Acid in 10 mL of acetic acid (100), and to 5 mL of this solution add 0.1 mL of bromine TS: the color of the test solution disappears. To the remaining 5 mL of the solution add 0.1 mL of potassium permanganate TS: the color of the test solution changes to light orange immediately.

(2) To 0.01 g of Etacrynic Acid add 1 mL of sodium hydroxide TS, and heat in a water bath for 3 minutes. After cooling, add 1 mL of disodium chlorotroponate TS, and heat in a water bath for 10 minutes: a deep purple color develops.

(3) Determine the absorption spectrum of a solution of Etacrynic Acid in methanol (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Perform the test with Etacrynic Acid as directed under Flame Coloration Test (2) <1.04>: a green color appears.

**Melting point** <2.60> 121 – 125°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Etacrynic Acid in 10 mL of methanol: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Etacrynic Acid according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Etacrynic Acid according to Method 3, and perform the test. Add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 50), then add 1.5 mL of hydrogen peroxide (30), and fire to burn (not more than 2 ppm).

(4) Related substances—Dissolve 0.20 g of Etacrynic Acid in 10 mL of ethanol (95), and use this solution as the sample solution. Pipet 3 mL of the sample solution, add ethanol (95) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer

chromatography. Develop the plate with a mixture of chloroform, ethyl acetate and acetic acid (100) (6:5:2) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.25% (1 g, in vacuum, 60°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.1 g of Etacrynic Acid, previously dried, place in an iodine bottle, dissolve in 20 mL of acetic acid (100), and add exactly 20 mL of 0.05 mol/L bromine VS. To this solution add 3 mL of hydrochloric acid, stopper tightly at once, shake, and allow to stand in a dark place for 60 minutes. Add carefully 50 mL of water and 15 mL of potassium iodide TS, stopper tightly at once, shake well, and titrate <2.50> the liberated iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank determination.

Each mL of 0.05 mol/L bromine VS  
= 15.16 mg of  $C_{13}H_{12}Cl_2O_4$

**Containers and storage** Containers—Well-closed containers.

## Etacrynic Acid Tablets

エタクリン酸錠

Etacrynic Acid Tablets contain not less than 90% and not more than 110% of the labeled amount of etacrynic acid ( $C_{13}H_{12}Cl_2O_4$ : 303.14).

**Method of preparation** Prepare as directed under Tablets, with Etacrynic Acid.

**Identification (1)** Weigh a quantity of powdered Etacrynic Acid Tablets, equivalent to 0.3 g of Etacrynic Acid according to the labeled amount, add 25 mL of 0.1 mol/L hydrochloric acid TS, and extract with 50 mL of Dichloromethane. Filter the dichloromethane extract, and evaporate the filtrate on a water bath to dryness. Proceed with the residue as directed in the Identification (1), (2) and (4) under Etacrynic Acid.

(2) Prepare a solution of the residue obtained in (1), equivalent to a solution of Etacrynic Acid in methanol (1 in 20,000), and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 268 nm and 272 nm.

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Etacrynic Acid Tablets at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the test solution. Take 20 mL or more of the dissolved solution 45 minutes after starting the test, and filter through a membrane filter with pore size of not more than 0.8  $\mu$ m. Discard the first 10 mL of the filtrate, and use the subsequent as the sample solution. Separately, weigh accurately about 55 mg of etacrynic acid for assay, previously dried at 60°C for 2 hours, dissolve in 10 mL of methanol, and add water to make exactly 100 mL. Pipet 5 mL of this so-

lution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 277 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

The dissolution rate of Etacrylic Acid Tablets in 45 minutes is not less than 70%.

$$\begin{aligned} & \text{Dissolution rate (\%)} \text{ with respect to} \\ & \text{the labeled amount of etacrylic acid (C}_{13}\text{H}_{12}\text{Cl}_2\text{O}_4) \\ & = W_S \times (A_T/A_S) \times (1/C) \times 45 \end{aligned}$$

$W_S$ : Amount (mg) of etacrylic acid for assay

C: Labeled amount (mg) of etacrylic acid (C<sub>13</sub>H<sub>12</sub>Cl<sub>2</sub>O<sub>4</sub>) in 1 tablet

**Assay** Weigh accurately and powder not less than 20 Etacrylic Acid Tablets. Weigh accurately a portion of the powder, equivalent to about 0.1 g of etacrylic acid (C<sub>13</sub>H<sub>12</sub>Cl<sub>2</sub>O<sub>4</sub>), add 25 mL of 0.1 mol/L hydrochloric acid TS, and extract with three 30-mL portions of dichloromethane. Filter the dichloromethane extracts through a pledget of absorbent cotton into an iodine bottle. Wash the pledget of absorbent cotton with a small amount of dichloromethane, and combine the washing with the extracts. Evaporate this solution on a water bath to dryness in a current of air, to the residue add 20 mL of acetic acid (100), and proceed as directed in the Assay under Etacrylic Acid.

$$\begin{aligned} & \text{Each mL of 0.05 mol/L bromine VS} \\ & = 15.16 \text{ mg of C}_{13}\text{H}_{12}\text{Cl}_2\text{O}_4 \end{aligned}$$

**Containers and storage** Containers—Well-closed containers.

## Ethambutol Hydrochloride

エタンブトール塩酸塩

C<sub>10</sub>H<sub>24</sub>N<sub>2</sub>O<sub>2</sub>·2HCl: 277.23

2,2'-(Ethylenediimino)bis[(2*S*)-butan-1-ol] dihydrochloride [1070-11-7]

Ethambutol Hydrochloride, when dried, contains not less than 98.5% of C<sub>10</sub>H<sub>24</sub>N<sub>2</sub>O<sub>2</sub>·2HCl.

**Description** Ethambutol Hydrochloride occurs as white crystals or crystalline powder. It is odorless, and has a bitter taste.

It is very soluble in water, soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution of Ethambutol Hydrochloride (1 in 20) is between 3.4 and 4.0.

**Identification (1)** To 10 mL of a solution of Ethambutol Hydrochloride (1 in 100) add 0.5 mL of copper (II) sulfate TS and 2 mL of sodium hydroxide TS: a deep blue color is produced.

(2) Dissolve 0.1 g of Ethambutol Hydrochloride in 40 mL

of water, add 20 mL of 2,4,6-trinitrophenol TS, and allow to stand for 1 hour. Collect the precipitate, wash with 50 mL of water, and dry at 105°C for 2 hours: the precipitate melts <2.60> between 193°C and 197°C.

(3) A solution of Ethambutol Hydrochloride (1 in 30) responds to the Qualitative Tests <1.09> for chloride.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +5.5 – +6.1° (after drying, 5 g, water, 50 mL, 200 mm).

**Melting point** <2.60> 200 – 204°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Ethambutol Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g Ethambutol Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Ethambutol Hydrochloride according to Method 1, and perform the test (not more than 2 ppm).

(4) 2-Aminobutanol—Dissolve 5.0 g of Ethambutol Hydrochloride in methanol to make exactly 100 mL, and use this solution as the sample solution. Dissolve 0.05 g of 2-amino-1-butanol in methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid (100), hydrochloric acid and water (11:7:1:1) to a distance of about 10 cm, air-dry the plate, and heat at 105°C for 5 minutes. Cool, spray evenly ninhydrin-L-ascorbic acid TS upon the plate, air-dry the plate, and heat at 105°C for 5 minutes: the spot from the sample solution, corresponding to that from the standard solution, has no more color than that from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Ethambutol Hydrochloride, previously dried, dissolve in 20 mL of water, and add 1.8 mL of copper (II) sulfate TS. To the solution add 7 mL of sodium hydroxide TS with shaking, add water to make exactly 50 mL, and centrifuge. Pipet 10 mL of the supernatant liquid, add 10 mL of ammonia-ammonium chloride buffer solution, pH 10.0 and 100 mL of water, and titrate <2.50> with 0.01 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from blue-purple through light red to light yellow (indicator: 0.15 mL of Cu-PAN TS). Perform a blank determination, and make any necessary correction.

$$\begin{aligned} & \text{Each mL of 0.01 mol/L disodium dihydrogen} \\ & \text{ethylenediamine tetraacetate VS} \\ & = 2.772 \text{ mg of C}_{10}\text{H}_{24}\text{N}_2\text{O}_2\cdot 2\text{HCl} \end{aligned}$$

**Containers and storage** Containers—Tight containers.

## Ethanol

### Alcohol

エタノール

$\text{C}_2\text{H}_6\text{O}$ : 46.07

Ethanol [64-17-5]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbols (♦ ◆).

Ethanol contains not less than 95.1 vol% and not more than 96.9 vol% (by specific gravity) of  $\text{C}_2\text{H}_6\text{O}$  at 15°C.

♦**Description** Ethanol is a clear, colorless liquid.

It is miscible with water.

It is flammable and burns with a light blue flame on ignition.

It is volatile. ◆

**Identification (1)** Determine the infrared absorption spectrum of Ethanol as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Specific gravity** <2.56>  $d_{15}^{15}$ : 0.809 – 0.816

**Purity (1)** Clarity and color of solution—Ethanol is clear and colorless. To 1.0 mL of Ethanol add water to make 20 mL, and allow to stand for 5 minutes: the resulting liquid is clear. Control solution: water.

(2) Acidity or alkalinity—To 20 mL of Ethanol add 20 mL of freshly boiled and cooled water and 0.1 mL of a solution prepared by addition of 7.0 mL of ethanol (95) and 2.0 mL of water to 1.0 mL of phenolphthalein TS: no color develops. Add 1.0 mL of 0.01 mol/L sodium hydroxide VS to this solution: a light red color develops.

(3) Volatile impurities—Pipet 500 mL of Ethanol, add 150  $\mu\text{L}$  of 4-methylpentan-2-ol, and use this solution as the sample solution. Separately, to 100  $\mu\text{L}$  of anhydrous methanol add Ethanol to make exactly 50 mL. Pipet 5 mL of this solution, add Ethanol to make exactly 50 mL, and use this solution as the standard solution (1). Separately, to exactly 50  $\mu\text{L}$  each of anhydrous methanol and acetaldehyde add Ethanol to make exactly 50 mL. To exactly 100  $\mu\text{L}$  of this solution add Ethanol to make exactly 10 mL, and use this solution as the standard solution (2). Separately, to exactly 150  $\mu\text{L}$  of acetal add Ethanol to make exactly 50 mL. To exactly 100  $\mu\text{L}$  of this solution add Ethanol to make exactly 10 mL, and use this solution as the standard solution (3). Separately, to exactly 100  $\mu\text{L}$  of benzene add Ethanol to make exactly 100 mL. To exactly 100  $\mu\text{L}$  of this solution add Ethanol to make exactly 50 mL, and use this solution as the standard solution (4). Perform the test with exactly 1  $\mu\text{L}$  each of Ethanol, the sample solution and standard solutions (1), (2), (3) and (4) as directed under Gas Chromatography <2.02> according to the following conditions, and determine the

peak areas of acetaldehyde,  $A_E$ , benzene,  $B_E$  and acetal,  $C_E$  obtained with Ethanol, and the peak area of methanol with the standard solution (1), the peak area of acetaldehyde,  $A_T$  with the standard solution (2), the peak area of acetal,  $C_T$  with the standard solution (3) and the peak area of benzene,  $B_T$ : the peak area of methanol is not more than 1/2 times the peak area of methanol with the standard solution (1). When calculate the amounts of the volatile impurities by the following equation, the total amount of acetaldehyde and acetal is not more than 10 vol ppm as acetaldehyde, and the amount of benzene is not more than 2 vol ppm. The total area of the peaks other than the peak mentioned above and the peak having the area not more than 3% that of 4-methylpentan-2-ol is not larger than the peak area of 4-methylpentan-2-ol.

Total amount (vol ppm) of acetaldehyde and acetal  
 $= \{(10 \times A_E)/(A_T - A_E)\} + \{(30 \times C_E)/(C_T - C_E)\}$

Amount (vol ppm) of benzene =  $2B_E/(B_T - B_E)$

If necessary, identify the peak of benzene by using a different stationary liquid phase and suitable chromatographic conditions.

**Operating conditions—**

Detector: A hydrogen flame-ionization detector

Column: A fused silica tube 0.32 mm in inside diameter and 30 m in length, coated with 6% cyanopropyl phenyl-94% dimethyl silicone polymer for gas chromatography in 1.8  $\mu\text{m}$  thickness.

Column temperature: Inject at a constant temperature of about 40°C, maintain the temperature for 12 minutes, then rise up to 240°C at the rate of 10°C per minute, and maintain at a constant temperature of about 240°C for 10 minutes.

Carrier gas: Helium

Flow rate: 35 cm/min.

Split ratio: 1: 20

**System suitability—**

System performance: When the procedure is run with 1  $\mu\text{L}$  of the standard solution (2) under the above operating conditions, acetaldehyde and methanol are eluted in this order with the resolution between these peaks being not less than 1.5.

(4) Other impurities (absorbance)—Perform the test with Ethanol as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbances at 240 nm, between 250 nm and 260 nm and between 270 nm and 340 nm are not more than 0.40, 0.30, and 0.10, respectively. The absorption spectrum determined in a 5-cm cell using water as a blank shows a flat absorption curve between 235 nm and 340 nm.

(5) Residue on evaporation—Evaporate 100 mL of Ethanol, exactly measured, in a tared dish on a water bath, and dry for 1 hour at 105°C: the mass of the residue does not exceed 2.5 mg.

**Containers and storage** ♦Containers—Tight containers. ◆

Storage—Without exposure to light.

## Anhydrous Ethanol

### Dehydrated Alcohol

無水エタノール

C<sub>2</sub>H<sub>6</sub>O: 46.07

Ethanol [64-17-5]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols (♦ ◆).

Anhydrous Ethanol contains not less than 99.5 vol% (by specific gravity) of C<sub>2</sub>H<sub>6</sub>O at 15°C.

♦**Description** Anhydrous Ethanol is a clear, colorless liquid.

It is miscible with water.

It is flammable and burns with a light blue flame on ignition.

It is volatile.

Boiling point: 78 – 79°C◆

**Identification (1)** Determine the infrared absorption spectrum of Anhydrous Ethanol as directed in the solution method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Specific gravity** <2.56>  $d_{4}^{15}$ : 0.794 – 0.797

**Purity (1)** Clarity and color of solution—Anhydrous Ethanol is clear and colorless. To 1.0 mL of Anhydrous Ethanol add water to make 20 mL, and allow to stand for 5 minutes: the resulting liquid is clear. Control solution: water

(2) Acidity or alkalinity—To 20 mL of Anhydrous Ethanol add 20 mL of freshly boiled and cooled water and 0.1 mL of a solution obtained by addition of 7.0 mL of ethanol (95) and 2.0 mL of water to 1.0 mL of phenolphthalein TS: no color develops. Add 1.0 mL of 0.01 mol/L sodium hydroxide VS to this solution: a light red color develops.

(3) Volatile impurities—Pipet 500 mL of Anhydrous Ethanol, add 150 μL of 4-methylpentan-2-ol, and use this solution as the sample solution. Separately, to 100 μL of anhydrous ethanol add Anhydrous Ethanol to make exactly 50 mL. Pipet 5 mL of this solution, add Anhydrous Ethanol to make exactly 50 mL, and use this solution as the standard solution (1). Separately, to exactly 50 μL each of anhydrous methanol and acetaldehyde add Anhydrous Ethanol to make exactly 50 mL. To exactly 100 μL of this solution add Anhydrous Ethanol to make exactly 10 mL, and use this solution as the standard solution (2). Separately, to exactly 150 μL of acetal add Anhydrous Ethanol to make exactly 50 mL. To exactly 100 μL of this solution add Anhydrous Ethanol to make exactly 10 mL, and use this solution as the standard solution (3). Separately, to exactly 100 μL of benzene add Anhydrous Ethanol to make exactly 100 mL. To exactly 100 μL of this solution add Anhydrous Ethanol to make exactly 50 mL, and

use this solution as the standard solution (4). Perform the test with exactly 1 μL each of Anhydrous Ethanol, the sample solution and standard solutions (1), (2), (3) and (4) as directed under Gas Chromatography <2.02> according to the following conditions, and determine the peak areas of acetaldehyde,  $A_E$ , benzene,  $B_E$  and acetal,  $C_E$  obtained with Anhydrous Ethanol, and the peak area of methanol with the standard solution (1), the peak area of acetaldehyde,  $A_T$  with the standard solution (2), the peak area of acetal,  $C_T$  with the standard solution (3) and the peak area of benzene,  $B_T$ : the peak area of methanol is not more than 1/2 times the peak area of methanol with the standard solution (1). When calculate the amounts of the volatile impurities by the following equation, the total amount of acetaldehyde and acetal is not more than 10 vol ppm as acetaldehyde, and the amount of benzene is not more than 2 vol ppm. The total area of the peaks other than the peak mentioned above and the peak having the area not more than 3% that of 4-methylpentan-2-ol is not larger than the peak area of 4-methylpentan-2-ol.

$$\text{Total amount (vol ppm) of acetaldehyde and acetal} \\ = \{(10 \times A_E)/(A_T - A_E)\} + \{(30 \times C_E)/(C_T - C_E)\}$$

$$\text{Amount (vol ppm) of benzene} = 2B_E/(B_T - B_E)$$

If necessary, identify the peak of benzene by using a different stationary liquid phase and suitable chromatographic conditions.

**Operating conditions**—

Detector: A hydrogen flame-ionization detector

Column: A fused silica tube 0.32 mm in inside diameter and 30 m in length, coated with 6% cyanopropyl phenyl-94% dimethyl silicone polymer for gas chromatography in 1.8 μm thickness.

Column temperature: Inject at a constant temperature of about 40°C, maintain the temperature for 12 minutes, then rise up to 240°C at the rate of 10°C per minute, and maintain at a constant temperature of about 240°C for 10 minutes.

Carrier gas: Helium

Flow rate: 35 cm/min.

Split ratio: 1: 20

**System suitability**—

System performance: When the procedure is run with 1 μL of the standard solution (2) under the above operating conditions, acetaldehyde and methanol are eluted in this order with the resolution between these peaks being not less than 1.5.

(4) Other impurities (absorbance)—Perform the test with Ethanol as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbances at 240 nm, between 250 nm and 260 nm and between 270 nm and 340 nm are not more than 0.40, 0.30, and 0.10, respectively. The absorption spectrum determined in a 5-cm cell using water as a blank shows a flat absorption curve between 235 nm and 340 nm.

(5) Residue on evaporation—Evaporate 100 mL of Dehydrated Ethanol, exactly measured, in a tared dish on a water bath, and dry for 1 hour at 105°C: the mass of the residue does not exceed 2.5 mg.

**Containers and storage** ♦Containers—Tight containers.◆

Storage—Without exposure to light.

## Ethanol for Disinfection

### Alcohol for Disinfection

消毒用エタノール

Ethanol for Disinfection contains not less than 76.9 vol% and not more than 81.4 vol% (by specific gravity) of ethanol (C<sub>2</sub>H<sub>6</sub>O: 46.07) at 15°C.

#### Method of preparation

Ethanol	830 mL
Purified Water	a sufficient quantity
To make 1000 mL	

Prepare by mixing the above ingredients.

**Description** Ethanol for Disinfection is a colorless, clear liquid.

It is miscible with water.

It burns with a light blue flame on ignition.

It is volatile.

**Identification (1)** To 1 mL of Ethanol for Disinfection add 2 mL of iodine TS and 1 mL of sodium hydroxide TS, and mix: light yellow precipitates appear.

**(2)** To 1 mL of Ethanol for Disinfection add 1 mL of acetic acid (100) and 3 drops of sulfuric acid, and heat: the odor of ethyl acetate is produced.

**Specific gravity** <2.56>  $d_{15}^{15}$ : 0.860 – 0.873

**Purity** Proceed as directed in the Purity under Ethanol.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Ethenzamide

### Ethoxybenzamide

エテンザミド

C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>: 165.19

2-Ethoxybenzamide [938-73-8]

Ethenzamide, when dried, contains not less than 98.0% of C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>.

**Description** Ethenzamide occurs as white crystals or crystalline powder. It is odorless and tasteless.

It is soluble in ethanol (95) and in acetone, slightly soluble in diethyl ether, and practically insoluble in water.

Its saturated solution is neutral.

It begins to sublime slightly at about 105°C.

**Identification (1)** To 0.5 g of Ethenzamide add 5 mL of sodium hydroxide TS, and heat the mixture gently: the gas evolved turns moistened red litmus paper to blue.

**(2)** To 0.2 g of Ethenzamide add 10 mL of hydrobromic acid, and boil the mixture gently for 1 hour under a reflux condenser. Cool in ice water, collect the separated crystalline precipitate, wash with three 5-mL portions of ice water, and dry in a desiccator (in vacuum, silica gel) for 2 hours: the precipitate melts <2.60> between 158°C and 161°C.

**Melting point** <2.60> 131 – 134°C

**Purity (1) Chloride** <1.03>—Dissolve 0.5 g of Ethenzamide in 30 mL of acetone, add 6 mL of dilute nitric acid, and dilute with water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.7 mL of 0.01 mol/L hydrochloric acid VS add 30 mL of acetone and 6 mL of dilute nitric acid, and dilute with water to make 50 mL (not more than 0.050%).

**(2) Sulfate** <1.14>—Dissolve 0.5 g of Ethenzamide in 30 mL of acetone, add 1 mL of dilute hydrochloric acid, and dilute with water to 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.50 mL of 0.005 mol/L sulfuric acid VS add 30 mL of acetone and 1 mL of dilute hydrochloric acid, and dilute with water to 50 mL (not more than 0.048%).

**(3) Heavy metals** <1.07>—Proceed with 2.0 g of Ethenzamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(4) Arsenic** <1.11>—To 0.40 g of Ethenzamide add 0.3 g of potassium nitrate and 0.5 g of anhydrous sodium carbonate, mix thoroughly, ignite the mixture gradually, and cool. Dissolve the residue in 10 mL of dilute sulfuric acid, and heat the solution until white fumes begin to evolve. After cooling, add water carefully to make 5 mL, use this solution as the test solution, and perform the test (not more than 5 ppm).

**(5) Salicylamide**—Dissolve 0.20 g of Ethenzamide in 15 mL of diluted ethanol (95) (2 in 3), and add 2 to 3 drops of dilute iron (III) chloride TS: no purple color develops.

**Loss on drying** <2.41> Not more than 1.0% (1 g, silica gel, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 20 mg each of Ethenzamide and Ethenzamide Reference Standard, previously dried, and dissolve each in 70 mL of ethanol (95) by warming, and after cooling, add ethanol (95) to make exactly 100 mL. Pipet 5 mL each of these solutions, add ethanol (95) to make exactly 50 mL, and use these solutions as the sample solution and standard solution, respectively. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 290 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using ethanol (95) as the blank.

$$\begin{aligned} \text{Amount (mg) of C}_9\text{H}_{11}\text{NO}_2 \\ = W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Ethenzamide Reference Standard

**Containers and storage** Containers—Well-closed containers.

## Ether

エーテル

$\text{C}_4\text{H}_{10}\text{O}$ : 74.12

Diethyl ether [60-29-7]

Ether contains not less than 96% and not more than 98% (by specific gravity) of  $\text{C}_4\text{H}_{10}\text{O}$ .

It contains a small quantity of ethanol and water. It cannot be used for anesthesia.

**Description** Ether is a colorless, clear, mobile liquid, having a characteristic odor.

It is miscible with ethanol (95).

It is soluble in water.

It is highly volatile and flammable.

It is slowly oxidized by the action of air and light, with the formation of peroxides.

Its vapor, when mixed with air and ignited, may explode violently.

Boiling point: 35 – 37°C

**Specific gravity** <2.56>  $d_{20}^{20}$ : 0.718 – 0.721

**Purity (1)** Foreign odor—Place 10 mL of Ether in an evaporating dish, and allow it to evaporate spontaneously to a volume of about 1 mL: no foreign odor is perceptible. Drop this residue onto a piece of clean, odorless filter paper to evaporate the ether: no foreign odor is perceptible.

(2) Acidity—Place 10 mL of diluted ethanol (95) (4 in 5) and 0.5 mL of phenolphthalein TS in a 50-mL glass-stoppered flask, and add 0.2 mol/L sodium hydroxide dropwise to produce a red color which persists after shaking for 30 seconds. Add 25 mL of Ether, stopper the flask, shake gently, and add 0.40 mL of 0.02 mol/L sodium hydroxide VS with shaking: a red color develops.

(3) Aldehyde—Place 10 mL of Ether in a Nessler tube, add 1 mL of potassium hydroxide TS, and allow the mixture to stand for 2 hours, protecting from light, with occasional shaking: no color is produced in the ether layer and the aqueous layer.

(4) Peroxide—Place 10 mL of Ether in a Nessler tube, add 1 mL of a freshly prepared solution of potassium iodide (1 in 10), shake for 1 minute, then add 1 mL of starch TS, and shake well: no color is produced in the ether layer and in the aqueous layer.

(5) Residue on evaporation—Evaporate 140 mL of Ether, and dry the residue at 105°C for 1 hour: the mass of the residue does not more than 1.0 mg.

**Containers and storage** Containers—Tight containers.

Storage—Without fill up, light-resistant, remote from fire, and not exceeding 25°C.

## Anesthetic Ether

麻醉用エーテル

$\text{C}_4\text{H}_{10}\text{O}$ : 74.12

Diethyl ether [60-29-7]

Anesthetic Ether contains not less than 96% and not more than 98% (by specific gravity) of  $\text{C}_4\text{H}_{10}\text{O}$ .

It contains small quantities of ethanol and water. Suitable stabilizers may be added.

It is not to be used for anesthesia if it has been removed from the original container for more than 24 hours.

**Description** Anesthetic Ether occurs as a colorless, clear, mobile liquid, having a characteristic odor.

It is miscible with ethanol (95).

It is soluble in water.

It is highly volatile and flammable.

It is slowly oxidized by the action of air and light, with the formation of peroxides.

Its vapor, when mixed with air and ignited, may explode violently.

Boiling point: 35 – 37°C

**Specific gravity** <2.56>  $d_{20}^{20}$ : 0.718 – 0.721

**Purity (1)** Foreign odor—Place 10 mL of Anesthetic Ether in an evaporating dish, and allow it to evaporate spontaneously to a volume of about 1 mL: no foreign odor is perceptible. Drop this residue onto a piece of clean, odorless filter paper to evaporate the ether: no foreign odor is perceptible.

(2) Acidity—Place 10 mL of diluted ethanol (95) (4 in 5) and 0.5 mL of phenolphthalein TS in a 50-mL glass-stoppered flask, and add 0.2 mol/L sodium hydroxide dropwise to produce a red color which persists after shaking for 30 seconds. Add 25 mL of Anesthetic Ether, stopper the flask, shake gently, and add 0.40 mL of 0.02 mol/L sodium hydroxide VS with shaking: a red color develops.

(3) Aldehyde—To 100 mL of water in a 200-mL glass-stoppered flask add 10 mL of Anesthetic Ether and 1 mL of a solution of sodium hydrogen sulfite (1 in 1000), stopper tightly, shake vigorously for 10 seconds, and allow the mixture to stand in a cool place for 30 minutes, protected from light. Add 2 mL of starch TS, and add dropwise 0.01 mol/L iodine VS until a pale blue color develops. Shake with about 2 g of sodium hydrogen carbonate to decolorize the solution, and add 1 mL of diluted 0.01 mol/L iodine VS (9 in 40): a blue color develops. Keep the temperature of the solution below 18°C during the procedure.

(4) Peroxide—Place 10 mL of Anesthetic Ether in a Nessler tube, add 1 mL of a freshly prepared solution of potassium iodide (1 in 10), shake occasionally for 1 hour, protecting from light, then add 1 mL of starch TS, and shake well: no color is produced and in the aqueous layer and in the ether layer.

(5) Residue on evaporation—Evaporate 50 mL of Anesthetic Ether, and dry the residue at 105°C for 1 hour:

the mass of the residue is not more than 1.0 mg.

**Containers and storage** Containers—Tight containers.

Storage—Without fill up, light-resistant, remote from fire, and not exceeding 25°C.

## Ethinylestradiol

エチニルエストラジオール

$C_{20}H_{24}O_2$ : 296.40

17 $\alpha$ -Ethinylestra-1,3,5(10)-triene-3,17 $\beta$ -diol [57-63-6]

Ethinylestradiol, when dried, contains not less than 98.0% of  $C_{20}H_{24}O_2$ .

**Description** Ethinylestradiol occurs as white to pale yellow crystals or crystalline powder. It is odorless.

It is freely soluble in pyridine and in tetrahydrofuran, soluble in ethanol (95) and in diethyl ether, and practically insoluble in water.

It dissolves in sodium hydroxide TS.

**Identification (1)** Dissolve 2 mg of Ethinylestradiol in 1 mL of a mixture of ethanol (95) and sulfuric acid (1:1): a purplish red color develops with a yellow-green fluorescence. Add carefully 2 mL of water to this solution: the color of the solution changes to red-purple.

(2) Transfer 0.02 g of Ethinylestradiol to a glass-stoppered test tube, dissolve in 10 mL of a solution of potassium hydroxide (1 in 20), add 0.1 g of benzoyl chloride, and shake. Collect the resulting precipitate, recrystallize from methanol, and dry in a desiccator (in vacuum, phosphorus (V) oxide): the precipitate melts <2.60> between 200°C and 202°C.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : -26 - -31° (after drying, 0.1 g, pyridine, 25 mL, 200 mm).

**Melting point** <2.60> 180 - 186°C or 142 - 146°C

**Purity** Estrone—Dissolve 5 mg of Ethinylestradiol in 0.5 mL of ethanol (95), and add 0.05 g of 1,3-dinitrobenzene. Add 0.5 mL of freshly prepared dilute potassium hydroxide-ethanol TS, allow to stand in a dark place for 1 hour, and add 10 mL of ethanol (95): the solution has no more color than the following control solution.

Control solution: Proceed in the same manner as mentioned above, omitting Ethinylestradiol.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 0.2 g of Ethinylestradiol, previously dried, and dissolve in 40 mL of tetrahydrofuran. Add 10 mL of a solution of silver nitrate (1 in 20), and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration).

Each mL of 0.1 mol/L sodium hydroxide VS

= 29.64 mg of  $C_{20}H_{24}O_2$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Ethinylestradiol Tablets

エチニルエストラジオール錠

Ethinylestradiol Tablets contain not less than 90% and not more than 110% of the labeled amount of ethinylestradiol ( $C_{20}H_{24}O_2$ : 296.40).

**Method of preparation** Prepare as directed under Tablets, with Ethinylestradiol.

**Identification (1)** Evaporate to dryness 5 mL of the sample solution obtained in Assay, and add 2 mL of a mixture of sulfuric acid and ethanol (95) (2:1) to the residue: a light red color with a yellow fluorescence develops. To the solution add carefully 4 mL of water: the color of the solution changes to red-purple.

(2) Evaporate to dryness 10 mL of the sample solution obtained in Assay, add 0.2 mL of acetic acid (31) and 2 mL of phosphoric acid to the residue, and heat on a water bath for 5 minutes: a red color with a yellow-green fluorescence develops.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Place 1 tablet of Ethinylestradiol Tablets in a separator, add 10 mL of 2nd fluid for disintegration test, and shake until the tablet is disintegrated. Add 10 mL of dilute sulfuric acid and 20 mL of chloroform, shake vigorously for 5 minutes, and filter the chloroform layer into a conical flask through filter paper on which 5 g of anhydrous sodium sulfate is placed. Extract the aqueous layer with two 20-mL portions of chloroform, proceed with the extracts in the same manner as before, and combine the filtrates with the previous one. Evaporate gently the combined filtrate on a water bath with the aid of a current of nitrogen, dissolve the residue in exactly 100 mL of methanol, and centrifuge, if necessary. Pipet  $x$  mL of the supernatant liquid, add methanol to make exactly  $V$  mL of a solution containing about 0.04  $\mu$ g of ethinylestradiol ( $C_{20}H_{24}O_2$ ) per mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Ethinylestradiol Reference Standard, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 4 hours, dissolve in methanol, dilute to a volume containing about 0.04  $\mu$ g of ethinylestradiol ( $C_{20}H_{24}O_2$ ) per mL, and use this solution as the standard solution. Pipet 4 mL each of sulfuric acid-methanol TS into three glass-stoppered test tubes, T, S and B, cool in ice, to each tube add exactly 1 mL each of the sample solution, the standard solution and methanol, shake immediately, and allow to stand in a water bath at 30°C for 40 minutes, then allow to stand in a water bath at 20°C for 5 minutes. Perform the test with these solutions as directed under Fluorometry <2.22>. Determine the fluorescence intensities,  $F_T$ ,  $F_S$  and  $F_B$ , of these solutions using the fluorophotometer, at about 460 nm of the excitation and at about 493 nm of the fluorescence.

Amount (mg) of ethinylestradiol ( $C_{20}H_{24}O_2$ )

$$= W_S \times \{(F_T - F_B)/(F_S - F_B)\} \times (V/2500) \times (1/x)$$

$W_S$ : Amount (mg) of Ethinylestradiol Reference Standard

**Assay** (i) Chromatographic tube: Pack a pledget of glass wool in the bottom of a tube 25 mm in inside diameter and 300 mm in length, and place 5 g of anhydrous sodium sulfate on the glass wool.

(ii) Chromatographic column: Place 5 g of siliceous earth for chromatography in a 200-mL beaker, soak well in 4 mL of 1 mol/L hydrochloric acid TS, and mix uniformly. Put the siliceous earth into the chromatographic tube in small portions to make 60 to 80 mm in height in proper hardness with a tamping rod.

(iii) Standard solution: Weigh accurately about 10 mg of Ethinylestradiol Reference Standard, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 4 hours, and dissolve in chloroform to make exactly 100 mL. Pipet 5 mL of this solution, and add chloroform to make exactly 100 mL.

(iv) Sample: Weigh accurately not less than 20 Ethinylestradiol Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 0.5 mg of ethinylestradiol ( $C_{20}H_{24}O_2$ ), place in a 50-mL beaker, add 2 mL of water, shake well, add 3 mL of chloroform, and shake well again. Add 4 g of siliceous earth for chromatography, mix well until the contents do not stick to the inner wall of the beaker, and use the substance as the sample.

(v) Procedure: To the chromatographic column add the sample with a funnel, and pack in proper hardness. Mix well the sample sticking to the beaker with 0.5 g of siliceous earth for chromatography, and place in the chromatographic tube. Wipe off the sample solution sticking to the beaker and the tamping rod with glass wool, and place it in the chromatographic tube. Push down the sample, and press lightly on the chromatographic column to make the height of the column 110 mm to 130 mm. Take 70 mL of chloroform, rinse the inner wall of the chromatographic tube with a portion of the chloroform, and transfer the remaining portion to the chromatographic tube. Collect the effluent solution at a flow rate not more than 0.8 mL per minute. After completing the elution, rinse the lower end of the chromatographic tube with a small quantity of chloroform, add chloroform to make exactly 100 mL, and use this solution as the sample solution. Transfer 6 mL each of the sample solution and standard solution to each separator, and add 20 mL each of iso-octane. Add exactly 10 mL of a mixture of sulfuric acid and methanol (7:3), shake vigorously for 5 minutes, allow to stand in a dark place for 15 minutes, and centrifuge. Perform the test with the resulting color solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution, prepared with 6 mL of chloroform in the same manner, as the blank. Determine the absorbances,  $A_T$  and  $A_S$ , of the subsequent solutions obtained from the sample solution and standard solution at 540 nm, respectively.

$$\begin{aligned} &\text{Amount (mg) of ethinylestradiol (C}_{20}\text{H}_{24}\text{O}_2\text{)} \\ &= W_S \times (A_T/A_S) \times (1/20) \end{aligned}$$

$W_S$ : Amount (mg) of Ethinylestradiol Reference Standard

**Containers and storage** Containers—Well-closed containers.

## Ethionamide

エチオナミド

$C_8H_{10}N_2S$ : 166.24

2-Ethylpyridine-4-carbothioamide [536-33-4]

Ethionamide, when dried, contains not less than 98.5% and not more than 101.0% of  $C_8H_{10}N_2S$ .

**Description** Ethionamide occurs as yellow crystals or crystalline powder, having a characteristic odor.

It is soluble in methanol and in acetic acid (100), sparingly soluble in ethanol (99.5) and in acetone, and practically insoluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Ethionamide in methanol (3 in 160,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ethionamide as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 161 – 165°C

**Purity** (1) Acidity—Dissolve 3.0 g of Ethionamide in 30 mL of methanol by warming, add 90 mL of water, allow to stand in ice water for 1 hour, and filter. To 80 mL of the filtrate add 0.8 mL of cresol red TS and 0.20 mL of 0.1 mol/L sodium hydroxide VS: a red color develops.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Ethionamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Ethionamide according to Method 3. Add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 50), then add 1.5 mL of hydrogen peroxide (30), and fire to burn (not more than 2 ppm).

(4) Related substances—Conduct this procedure without exposure to light, using light-resistant vessels. Dissolve 0.20 g of Ethionamide in 10 mL of acetone, and use this solution as the sample solution. Pipet 0.5 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution (1). Separately, pipet exactly 0.2 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography, de-

velop with a mixture of ethyl acetate, hexane and methanol (6:2:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot other than the principal spot obtained with the sample solution is not more intense than the spot with the standard solution (1), and number of the spot other than the principal spot obtained with the sample solution which is more intense than the spot with the standard solution (2) is not more than one.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Ethionamide, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from orange-red to dark orange-brown (indicator: 2 mL of *p*-naphtholbenzein TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 16.62 mg of C<sub>8</sub>H<sub>10</sub>N<sub>2</sub>S

**Containers and storage** Containers—Well-closed containers.

## Ethosuximide

エトスクシミド

C<sub>7</sub>H<sub>11</sub>NO<sub>2</sub>: 141.17  
(2*RS*)-2-Ethyl-2-methylsuccinimide [77-67-8]

Ethosuximide contains not less than 98.5% of C<sub>7</sub>H<sub>11</sub>NO<sub>2</sub> calculated on the anhydrous basis.

**Description** Ethosuximide occurs as a white, paraffin-like solid or powder. It is odorless or has a slight, characteristic odor.

It is very soluble in methanol, in ethanol (95), in diethyl ether, and in *N,N*-dimethylformamide, and freely soluble in water.

Melting point: about 48°C

**Identification** (1) To 0.2 g of Ethosuximide add 10 mL of sodium hydroxide TS, and boil: the gas evolved turns a moistened red litmus paper blue.

(2) Dissolve 0.05 g of Ethosuximide in 1 mL of ethanol (95), add 3 drops of a solution of copper (II) acetate monohydrate (1 in 100), warm slightly, and add 1 to 2 drops of sodium hydroxide TS: a purple color is produced.

(3) Determine the absorption spectrum of a solution of Ethosuximide in ethanol (95) (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of

Ethosuximide in 10 mL of water: the solution is clear and colorless.

(2) Chloride <1.03>—With 1.0 g of Ethosuximide, perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Ethosuximide according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Ethosuximide, according to Method 1, and perform the test (not more than 2 ppm).

(5) Acid anhydride—Dissolve 0.50 g of Ethosuximide in 1 mL of ethanol (95), add 1 mL of hydroxylammonium chloride-iron (III) chloride TS, and allow to stand for 5 minutes. Add 3 mL of water, mix, and allow to stand for 5 minutes: the red to red-purple color of this solution is not more intense than that of the following control solution.

Control solution: Dissolve 0.070 g of succinic anhydride in ethanol (95) to make exactly 100 mL. To 1.0 mL of this solution add 1 mL of hydroxylammonium chloride-iron (III) chloride TS, and proceed in the same manner.

(6) Cyanide—Dissolve 1.0 g of Ethosuximide in 10 mL of ethanol (95), and add 3 drops of iron (II) sulfate TS, 1 mL of sodium hydroxide TS and 2 to 3 drops of iron (III) chloride TS. Warm gently, and acidify with dilute sulfuric acid: not a blue precipitate and a blue color are produced within 15 minutes.

**Water** <2.48> Not more than 0.5% (2 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Ethosuximide, dissolve in 20 mL of *N,N*-dimethylformamide, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration). Perform a blank determination.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS  
= 14.12 mg of C<sub>7</sub>H<sub>11</sub>NO<sub>2</sub>

**Containers and storage** Containers—Tight containers.

## Ethyl Aminobenzoate

Anesthamine

Benzocaine

アミノ安息香酸エチル

C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>: 165.19  
Ethyl 4-aminobenzoate [94-09-7]

Ethyl Aminobenzoate, when dried, contains not less than 99.0% of C<sub>9</sub>H<sub>11</sub>NO<sub>2</sub>.

**Description** Ethyl Aminobenzoate occurs as white crystals or crystalline powder. It is odorless. It has a slightly bitter

taste, numbing the tongue.

It is freely soluble in ethanol (95) and in diethyl ether, and very slightly soluble in water.

It dissolves in dilute hydrochloric acid.

**Identification (1)** Dissolve 0.01 g of Ethyl Aminobenzoate in 1 mL of dilute hydrochloric acid and 4 mL of water. This solution responds to the Qualitative Tests <1.09> for primary aromatic amines.

**(2)** Dissolve 0.1 g of Ethyl Aminobenzoate in 5 mL of water with the aid of dilute hydrochloric acid added dropwise, and add iodine TS dropwise: a brown precipitate is produced.

**(3)** Warm 0.05 g of Ethyl Aminobenzoate with 2 drops of acetic acid (31) and 5 drops of sulfuric acid: the odor of ethyl acetate is perceptible.

**Melting point** <2.60> 89 – 91°C

**Purity (1) Acidity**—Dissolve 1.0 g of Ethyl Aminobenzoate in 10 mL of neutralized ethanol, and add 10 mL of water, 2 drops of phenolphthalein TS and 0.50 mL of 0.01 mol/L sodium hydroxide VS: a red color is produced.

**(2) Chloride**—Dissolve 0.20 g of Ethyl Aminobenzoate in 5 mL of ethanol (95), add 2 to 3 drops each of dilute nitric acid and of silver nitrate TS: no change occurs immediately.

**(3) Heavy metals** <1.07>—Dissolve 2.0 g of Ethyl Aminobenzoate in 20 mL of ethanol (95), add 2 mL of dilute acetic acid and ethanol (95) to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 2 mL of dilute acetic acid and sufficient ethanol (95) to make 50 mL (not more than 10 ppm).

**(4) Readily carbonizable substances** <1.15>—Perform the test with 0.5 g of Ethyl Aminobenzoate: the solution has no more color than Matching Fluid A.

**Loss on drying** <2.41> Not more than 1.0% (1 g, silica gel, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.25 g of Ethyl Aminobenzoate, previously dried, dissolve in 10 mL of hydrochloric acid and 70 mL of water, add 10 mL of a solution of potassium bromide (3 in 10), and cool to a temperature below 15°C. Then titrate <2.50> with 0.1 mol/L sodium nitrite VS by the potentiometric titration or the amperometric titration.

Each mL of 0.1 mol/L sodium nitrite VS  
= 16.52 mg of C<sub>5</sub>H<sub>11</sub>NO<sub>2</sub>

**Containers and storage** Containers—Well-closed containers.

## Ethyl L-Cysteine Hydrochloride

### Ethyl Cysteine Hydrochloride

L-エチルシステイン塩酸塩

C<sub>5</sub>H<sub>11</sub>NO<sub>2</sub>S.HCl: 185.67

Ethyl (2*R*)-2-amino-3-sulfanylpropanoate  
monohydrochloride  
[868-59-7]

Ethyl L-Cysteine Hydrochloride, when dried, contains not less than 98.5% of C<sub>5</sub>H<sub>11</sub>NO<sub>2</sub>S.HCl.

**Description** Ethyl L-Cysteine Hydrochloride occurs as white crystals or crystalline powder. It has a characteristic odor, and has a bitter taste at first with a burning aftertaste.

It is very soluble in water, and freely soluble in ethanol (95).

Melting point: about 126°C (with decomposition).

**Identification (1)** Determine the infrared absorption spectrum of Ethyl L-Cysteine Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(2)** A solution of Ethyl L-Cysteine Hydrochloride (1 in 20) responds to the Qualitative Tests <1.09> (1) for chloride.

**Optical rotation** <2.49> [α]<sub>D</sub><sup>20</sup>: –10.0 – –13.0° (after drying, 2.0 g, 1 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**Purity (1) Sulfate** <1.14>—Perform the test with 0.6 g of Ethyl L-Cysteine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid (not more than 0.028%).

**(2) Heavy metals** <1.07>—Proceed with 1.0 g of Ethyl L-Cysteine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

**(3) Related substances**—Conduct this procedure rapidly. Dissolve 0.05 g each of Ethyl L-Cysteine Hydrochloride and *N*-ethylmaleimide in 5 mL of mobile phase, allow to stand for 30 minutes, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 2 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of these solutions by the automatic integration method: a peak area from the sample solution with the ratio of the retention time to ethyl L-cysteine-*N*-ethylmaleimide complex from the standard solution being about 0.7 is not larger than the peak area of ethyl L-cysteine-*N*-ethylmaleimide complex from the standard solution. Each area of all peaks other than the peaks of ethyl L-cysteine-*N*-ethylmaleimide complex and *N*-ethylmaleimide from the sample solution is not larger than 1/3 of the peak area of ethyl L-cysteine *N*-ethylmaleimide complex from the standard solution.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 250 nm).

**Column:** A stainless steel column about 6 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of 0.02 mol/L monobasic potas-

sium phosphate TS and acetonitrile (2:1).

Flow rate: Adjust the flow rate so that the retention time of ethyl L-cysteine-*N*-ethylmaleimide complex is about 4 minutes.

Selection of column: Dissolve 0.05 g of Ethyl L-Cysteine Hydrochloride, 0.01 g of L-cysteine hydrochloride and 0.05 g of *N*-ethylmaleimide in 25 mL of the mobile phase, and allow to stand for 30 minutes. Proceed with 2  $\mu$ L of this solution under the above conditions, and calculate the resolution. Use a column giving elution of L-cysteine-*N*-ethylmaleimide complex, ethyl L-cysteine-*N*-ethylmaleimide complex and *N*-ethylmaleimide in this order, complete resolution of each component, and the resolution of the peaks of L-cysteine-*N*-ethylmaleimide complex and ethyl L-cysteine-*N*-ethylmaleimide complex being not less than 3.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of ethyl L-cysteine-*N*-ethylmaleimide complex obtained from 2  $\mu$ L of the standard solution is between 10 mm and 20 mm.

Time span of measurement: About 3 times as long as the retention time of ethyl L-cysteine-*N*-ethylmaleimide complex.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, phosphorus oxide (V), 5 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.25 g of Ethyl L-Cysteine Hydrochloride, previously dried, transfer into a glass-stoppered flask, and dissolve in 10 mL of water previously freshly boiled and cooled to a temperature not exceeding 5°C in a stream of nitrogen. Add exactly 20 mL of 0.05 mol/L iodine VS, previously cooled to a temperature not exceeding 5°C, and allow to stand for 30 seconds, then titrate <2.50> with 0.1 mol/L sodium thiosulfate VS, on cooling below 5°C (indicator: 1 mL of starch TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L iodine VS  
= 18.57 mg of C<sub>5</sub>H<sub>11</sub>NO<sub>2</sub>SHCl

**Containers and storage** Containers—Tight containers.

## Ethyl Icosapentate

イコサペント酸エチルエステル

C<sub>22</sub>H<sub>34</sub>O<sub>2</sub>: 330.50

Ethyl (5*Z*,8*Z*,11*Z*,14*Z*,17*Z*)-icosa-5,8,11,14,17-pentaenoate  
[86227-47-6]

Ethyl Icosapentate contains not less than 96.5% and not more than 101.0% of C<sub>22</sub>H<sub>34</sub>O<sub>2</sub>.

It may contain a suitable antioxidant.

**Description** Icosapentate is a colorless or pale yellow, clear liquid. It has a faint, characteristic odor.

It is miscible with ethanol (99.5), with acetic acid (100) and with hexane. It is practically insoluble in water and in ethylene glycol.

**Identification** (1) To 20 mg of Ethyl Icosapentate add 3

mL of a solution of potassium hydroxide in ethylene glycol (21 in 100), stopper tightly while passing a current of nitrogen, and heat at 180°C for 15 minutes. After cooling, add methanol to make 100 mL. To 4 mL of this solution add methanol to make 100 mL, and use this solution as the sample solution. Determine the absorption spectrum of the sample solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution, prepared in the same manner as the sample solution with 3 mL of the solution of potassium hydroxide in ethylene glycol (21 in 100), as a control, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Ethyl Icosapentate Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ethyl Icosapentate as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ethyl Icosapentate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Refractive index** <2.45>  $n_D^{20}$ : 1.481 – 1.491

**Specific gravity** <2.56>  $d_{20}^{20}$ : 0.905 – 0.915

**Acid value** <1.13> Not more than 0.5

**Saponification value** <1.13> 165 – 175

**Iodine value** <1.13> 365 – 395. Perform the test with 20 mg of Ethyl Icosapentate.

**Purity** (1) Heavy metals <1.07>—Mix 1.0 g of Ethyl Icosapentate with ethanol (99.5), and add 2 mL of dilute acetic acid and ethanol (99.5) to make 50 mL. Perform the test with this solution as the test solution. Control solution: To 1.0 mL of Standard Lead Solution add 2 mL of dilute acetic acid and ethanol (99.5) to make 50 mL (not more than 10 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Ethyl Icosapentate according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—To 0.40 g of Ethyl Icosapentate add hexane to make 50 mL, and use this solution as the sample solution. Perform the test with 1.5  $\mu$ L of the sample solution as directed under Gas Chromatography <2.02> according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amounts of these peaks by the area percentage method: the area of the peak, having the relative retention time of about 0.53 with respect to ethyl icosapentate, is not more than 0.5%, the areas of the peaks other than the principal peak and other than the peak mentioned above are not more than 1.0%, and the total amount of these peaks other than the principal peak is not more than 3.5%.

(the rest is omitted)

(4) Peroxide—Weigh accurately about 1 g of Ethyl Icosapentate, put in a 200-mL glass-stoppered conical flask, add 25 mL of a mixture of acetic acid (100) and chloroform (3:2), and dissolve by gentle shaking. Add 1 mL of saturated potassium iodide solution, immediately stopper tightly, shake gently, and allow to stand in a dark place for 10 minutes. Then add 30 mL of water, shake vigorously for 5 to 10 seconds, and titrate <2.50> with 0.01 mol/L sodium thiosulfate VS until the blue color of the solution disappears

after addition of 1 mL of starch TS. Calculate the amount of peroxide by the following equation: not more than 2 meq/kg.

$$\text{Amount (meq/kg) of peroxide} = (V/W) \times 10$$

*V*: Volume (mL) of 0.01 mol/L sodium thiosulfate VS consumed

*W*: Amount (g) of the sample

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Ethyl Icosapentate, and add hexane to make exactly 50 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 80 mg of Ethyl Icosapentate Reference Standard, and add hexane to make exactly 10 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 3  $\mu$ L each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of ethyl icosapentate to that of the internal standard.

$$\begin{aligned} \text{Amount (mg) of ethyl icosapentate (C}_{22}\text{H}_{34}\text{O}_2) \\ = W_S \times (Q_T/Q_S) \times 5 \end{aligned}$$

$W_S$ : Amount (mg) of Ethyl Icosapentate Reference Standard

**Internal standard solution**—A solution of methyl docosanate in hexane (1 in 125).

**Operating conditions**—

Detector: A hydrogen-flame ionization detector

Column: A glass column in 4 mm inside diameter and 1.8 m in length, packed with siliceous earth for gas chromatography (175 to 246  $\mu$ m in particle diameter), coated with diethylene glycol succinate polyester for gas chromatography in the ratio of 25%.

Column temperature: A constant temperature of about 190°C

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of ethyl icosapentate is about 30 minutes.

**System suitability**—

System performance: When the procedure is run with 3  $\mu$ L of the standard solution under the above operating conditions, the internal standard and ethyl icosapentate are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 3  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of ethyl icosapentate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Being fully filled, or replacing the air with Nitrogen.

## Ethyl Parahydroxybenzoate

パラオキシ安息香酸エチル

$\text{C}_9\text{H}_{10}\text{O}_3$ : 166.17

Ethyl 4-hydroxybenzoate [120-47-8]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols (♦ ♦).

Ethyl Parahydroxybenzoate contains not less than 98.0% and not more than 102.0% of  $\text{C}_9\text{H}_{10}\text{O}_3$ .

♦**Description** Ethyl Parahydroxybenzoate occurs as colorless crystals or a white, crystalline powder.

It is freely soluble in ethanol (95) and in acetone, and very slightly soluble in water.♦

**Identification** (1) The melting point <2.60> of Ethyl Parahydroxybenzoate is between 115°C and 118°C.

♦(2) Determine the infrared absorption spectrum of Ethyl Parahydroxybenzoate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.♦

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Ethyl Parahydroxybenzoate in 10 mL of ethanol (95): the solution is clear and not more intensely colored than the following control solution.

Control solution: To 5.0 mL of cobalt (II) chloride colorimetric stock solution, 12.0 mL of iron (III) chloride colorimetric stock solution and 2.0 mL of copper (II) sulfate colorimetric stock solution add water to make 1000 mL.

(2) Acidity—Dissolve 0.20 g of Ethyl Parahydroxybenzoate in 5 mL of ethanol (95), add 5 mL of freshly boiled and cooled water and 0.1 mL of bromocresol green-sodium hydroxide-ethanol TS, then add 0.1 mL of 0.1 mol/L sodium hydroxide VS: the solution shows a blue color.

♦(3) Heavy metals <1.07>—Dissolve 1.0 g of Ethyl Parahydroxybenzoate in 25 mL of acetone, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 25 mL of acetone, 2 mL of dilute acetic acid, and water to make 50 mL (not more than 20 ppm).♦

(4) Related substances—Dissolve 0.10 g of Ethyl Parahydroxybenzoate in 10 mL of acetone, and use this solution as the sample solution. Pipet 0.5 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol, water and acetic acid (100) (70:30:1) to a distance

of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot other than the principal spot is not more intense than the spot obtained with the standard solution.

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 1.0 g of Ethyl Parahydroxybenzoate, add exactly 20 mL of 1 mol/L sodium hydroxide VS, heat at about 70°C for 1 hour, and immediately cool in ice. Titrate <2.50> the excess sodium hydroxide with 0.5 mol/L sulfuric acid VS up to the second equivalent point. (potentiometric titration). Perform a blank determination.

Each mL of 1 mol/L sodium hydroxide VS  
= 166.2 mg of C<sub>9</sub>H<sub>10</sub>O<sub>3</sub>

◆**Containers and storage** Containers—Well-closed containers. ◆

## Ethylenediamine

エチレンジアミン

C<sub>2</sub>H<sub>8</sub>N<sub>2</sub>: 60.10

Ethane-1,2-diamine [107-15-3]

Ethylenediamine contains not less than 97.0% of C<sub>2</sub>H<sub>8</sub>N<sub>2</sub>.

**Description** Ethylenediamine is a clear, colorless to pale yellow liquid. It has an ammonia-like odor.

It is miscible with water, with ethanol (95) and with diethyl ether.

It has a caustic nature and an irritating property.

It is gradually affected by air.

Specific gravity  $d_{20}^{20}$ : about 0.898

**Identification (1)** A solution of Ethylenediamine (1 in 500) is alkaline.

(2) To 2 mL of copper (II) sulfate TS add 2 drops of Ethylenediamine: a blue-purple color develops.

(3) To 0.04 g of Ethylenediamine add 6 drops of benzoyl chloride and 2 mL of a solution of sodium hydroxide (1 in 10), warm for 2 to 3 minutes with occasional shaking, collect the white precipitate formed, and wash with water. Dissolve the precipitate in 8 mL of ethanol (95) by warming, promptly add 8 mL of water, cool, filter the crystals, wash with water, and dry at 105°C for 1 hour: it melts <2.60> between 247°C and 251°C.

**Purity (1)** Heavy metals <1.07>—Place 1.0 g of Ethylenediamine in a porcelain crucible, evaporate to dryness on a water bath, cover loosely, ignite at a low temperature until charred, proceed according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Residue on evaporation—Pipet 5 mL of Ethylenediamine, heat on a water bath to dryness, and dry to constant mass at 105°C: the mass of the residue does not exceed 3.0 mg.

**Distilling range** <2.57> 114 – 119°C, not less than 95 vol%.

**Assay** Weigh accurately about 0.7 g of Ethylenediamine in a glass-stoppered conical flask, add 50 mL of water, and titrate <2.50> with 1 mol/L hydrochloric acid VS (indicator: 3 drops of bromophenol blue TS).

Each mL of 1 mol/L hydrochloric acid VS  
= 30.05 mg of C<sub>2</sub>H<sub>8</sub>N<sub>2</sub>

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant, and almost well-filled.

## Ethylmorphine Hydrochloride Hydrate

Dionin

エチルモルヒネ塩酸塩水和物

C<sub>19</sub>H<sub>23</sub>NO<sub>3</sub>.HCl.2H<sub>2</sub>O: 385.88

(5*R*,6*S*)-4,5-Epoxy-3-ethoxy-17-methyl-

7,8-didehydromorphinan-6-ol monohydrochloride dihydrate [125-30-4, anhydride]

Ethylmorphine Hydrochloride Hydrate contains not less than 98.0% of ethylmorphine hydrochloride (C<sub>19</sub>H<sub>23</sub>NO<sub>3</sub>.HCl: 349.86), calculated on the anhydrous basis.

**Description** Ethylmorphine Hydrochloride Hydrate occurs as white to pale yellow crystals or crystalline powder.

It is very soluble in methanol and in acetic acid (100), freely soluble in water, soluble in ethanol (95), sparingly soluble in acetic anhydride, and practically insoluble in diethyl ether.

It is affected by light.

Melting point: about 123°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Ethylmorphine Hydrochloride Hydrate (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ethylmorphine Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Ethylmorphine Hydrochloride Hydrate (1 in 50) responds to the Qualitative Tests <1.09> (2) for chloride.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : -103 – -106° (0.4 g calculated on the anhydrous basis, water, 20 mL, 100 mm).

**pH** <2.54> Dissolve 0.10 g of Ethylmorphine Hydrochloride

Hydrate in 10 mL of water: the pH of this solution is between 4.0 and 6.0.

**Purity** Related substances—Dissolve 0.20 g of Ethylmorphine Hydrochloride Hydrate in 10 mL of diluted ethanol (95) (1 in 2), and use this solution as the sample solution. Pipet 0.5 mL of the sample solution, add diluted ethanol (95) (1 in 2) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethanol (99.5), toluene, acetone and ammonia solution (28) (14:14:7:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Water** <2.48> 8.0 – 10.0% (0.25 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 0.5 g of Ethylmorphine Hydrochloride Hydrate, and dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 34.99 mg of  $C_{19}H_{23}NO_3 \cdot HCl$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Etidronate Disodium

エチドロン酸二ナトリウム

$C_2H_6Na_2O_7P_2$ : 249.99

Disodium dihydrogen (1-hydroxyethylidene)diphosphate  
[7414-83-7]

Etidronate Disodium, when dried, contains not less than 98.0% and not more than 101.0% of  $C_2H_6Na_2O_7P_2$ .

**Description** Etidronate Disodium occurs as a white powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

The pH of a solution prepared by dissolving 0.10 g of Etidronate Disodium in 10 mL of water is between 4.4 and 5.4.

It is hygroscopic.

**Identification (1)** To 5 mL of a solution of Etidronate Disodium (1 in 100) add 1 mL of copper (II) sulfate TS, and mix for 10 minutes: a blue precipitate is formed.

**(2)** Determine the infrared absorption spectrum of Etidronate Disodium, previously dried, as directed in the potassium bromide disk method under Infrared Spec-

trophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Etidronate Disodium (1 in 100) responds to the Qualitative Tests <1.09> for sodium salt.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Etidronate Disodium according to Method 4, and perform the test using the supernatant liquid obtained by centrifuging after addition of 2 mL of dilute acetic acid. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(2)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Etidronate Disodium according to Method 1, and perform the test (not more than 2 ppm).

**(3)** Phosphite—Weigh accurately about 3.5 g of Etidronate Disodium, dissolve in 100 mL of 0.1 mol/L sodium dihydrogen phosphate TS adjusted the pH to 8.0 with sodium hydroxide TS, add exactly 20 mL of 0.05 mol/L iodine VS, and immediately stopper tightly. Allow to stand in a dark place for 30 minutes, add 1 mL of acetic acid (100), and titrate <2.50> the excess of iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank determination in the same manner, and make any necessary correction. The amount of phosphite ( $NaH_2PO_3$ ) is not more than 1.0%.

Each mL of 0.05 mol/L iodine VS = 5.199 mg of  $NaH_2PO_3$

**(4)** Methanol—Weigh accurately about 0.5 g of Etidronate Disodium, dissolve in water to make exactly 5 mL, and use this solution as the sample solution. Separately, pipet 1 mL of methanol, and add water to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 1  $\mu$ L each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, and determine the peak areas of methanol,  $A_T$  and  $A_S$ , and determine the amount of methanol ( $CH_4O$ ) by the following equation: not more than 0.1%.

$$\begin{aligned} \text{Amount (\%)} \text{ of methanol (CH}_4\text{O)} \\ = (1/W) \times (A_T/A_S) \times (1/20) \times 0.79 \end{aligned}$$

$W$ : Amount (g) of sample

0.79: Density (g/mL) of methanol

**Operating conditions—**

Detector: A hydrogen flame-ionization detector.

Column: A glass column 3 mm in inside diameter and 2 m in length, packed with porous copolymer beads for gas chromatography (180 – 250  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 130°C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of methanol is about 2 minutes.

**System suitability—**

System performance: To 1 mL of methanol and 1 mL of ethanol (99.5) add water to make 100 mL. To 1 mL of this solution add water to make 100 mL. When the procedure is run with 1  $\mu$ L of this solution under the above operating conditions, methanol and ethanol are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with

1  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of methanol is not more than 5.0%.

**Loss on drying** <2.41> Not more than 5.0% (0.5 g, 210°C, 2 hours).

**Assay** Weigh accurately about 0.5 g of Etidronate Disodium, previously dried, and dissolve in water to make exactly 50 mL. Transfer exactly 15 mL of this solution to a chromatographic column of 10 mm in internal diameter containing 5 mL of strongly acidic ion exchange resin for column chromatography (H type), allow to flow at a flow rate of about 1.5 mL per minute, and wash the column with two 25-mL portions of water. Combine the eluate and the washings, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 12.50 mg of  $\text{C}_2\text{H}_6\text{Na}_2\text{O}_7\text{P}_2$

**Containers and storage** Containers—Tight containers.

## Etidronate Disodium Tablets

エチドロン酸二ナトリウム錠

Etidronate Disodium Tablets contains not less than 93.0% and not more than 107.0% of the labeled amount of etidronate disodium ( $\text{C}_2\text{H}_6\text{Na}_2\text{O}_7\text{P}_2$ ; 249.99).

**Method of preparation** Prepare as directed under Tablets, with Etidronate Disodium.

**Identification (1)** Shake an amount of pulverized Etidronate Disodium Tablets, equivalent to 0.2 g of Etidronate Disodium according to the labeled amount, with 20 mL of water, and filter. Proceed with the filtrate as directed in the Identification (1) under Etidronate Disodium.

(2) Shake an amount of pulverized Etidronate Disodium Tablets, equivalent to 0.4 g of Etidronate Disodium according to the labeled amount, with 10 mL of water, and filter. Evaporate total amount of the filtrate to dryness under reduced pressure, shake the residue with 15 mL of ethanol (99.5), centrifuge, and dry the precipitate at 150°C for 4 hours. Determine the infrared absorption spectrum of the precipitate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>: it exhibits absorption at the wave numbers of about 1170  $\text{cm}^{-1}$ , 1056  $\text{cm}^{-1}$ , 916  $\text{cm}^{-1}$  and 811  $\text{cm}^{-1}$ .

**Uniformity of dosage unit** <6.02> It meets the requirement of the Mass variation test.

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Etidronate Disodium Tablets at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium. Withdraw not less than 20 mL of the dissolution medium 60 minutes after start of the test, and filter through a membrane filter with pore size of not more than 0.45  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, take exactly  $V$  mL of the subse-

quent filtrate, add water to make exactly  $V'$  mL so that each mL contains about 0.22 mg of etidronate disodium ( $\text{C}_2\text{H}_6\text{Na}_2\text{O}_7\text{P}_2$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of etidronate disodium for assay, previously dried at 210°C for 2 hours, and dissolve in water to make exactly 100 mL. Dilute exactly a suitable amount of this solution with water to make solutions so that each mL contains about 0.12 mg, about 0.21 mg and about 0.24 mg of etidronate disodium ( $\text{C}_2\text{H}_6\text{Na}_2\text{O}_7\text{P}_2$ ), and use these solutions as the standard solutions. Pipet 2 mL each of the sample solution and standard solutions, add exactly 2 mL of a solution of copper (II) sulfate (7 in 10,000) and water to make exactly 10 mL. Determine the absorbances of these solutions at 233 nm as directed under Ultraviolet-visible Spectrophotometry <2.24> using a solution prepared by diluting exactly 2 mL of the solution of copper (II) sulfate (7 in 10,000) with water to make exactly 10 mL as the control. From the calibration curve obtained with the standard solutions determine the concentration of etidronate disodium,  $C_T$ , in the sample solution. The dissolution rate of Etidronate Disodium Tablets in 60 minutes is not less than 85%.

Dissolution rate (%) with respect to the labeled amount of etidronate disodium ( $\text{C}_2\text{H}_6\text{Na}_2\text{O}_7\text{P}_2$ )  
=  $C_T \times (V'/V) \times (1/C) \times 90$

$C_T$ : Concentration ( $\mu\text{g}/\text{mL}$ ) of etidronate disodium ( $\text{C}_2\text{H}_6\text{Na}_2\text{O}_7\text{P}_2$ ) in the sample solution

$C$ : Labeled amount (mg) of etidronate disodium ( $\text{C}_2\text{H}_6\text{Na}_2\text{O}_7\text{P}_2$ ) in 1 tablet

**Assay** Weigh accurately, and powder not less than 20 Etidronate Disodium Tablets. Weigh accurately a portion of the powder, equivalent to about 0.5 g of etidronate disodium ( $\text{C}_2\text{H}_6\text{Na}_2\text{O}_7\text{P}_2$ ), add 30 mL of water, shake vigorously for 10 minutes, add water to make exactly 50 mL, and filter. Proceed with the filtrate as directed in the Assay under Etidronate Disodium.

**Containers and storage** Containers—Tight containers.

## Etilefrine Hydrochloride

エチレフリン塩酸塩

and enantiomer

$\text{C}_{10}\text{H}_{15}\text{NO}_2 \cdot \text{HCl}$ : 217.69  
(1*S*)-2-Ethylamino-1-(3-hydroxyphenyl)ethanol  
monohydrochloride [943-17-9]

Etilefrine Hydrochloride, when dried, contains not less than 98.0% and not more than 101.0% of  $\text{C}_{10}\text{H}_{15}\text{NO}_2 \cdot \text{HCl}$ .

**Description** Etilefrine Hydrochloride occurs as white crystals or crystalline powder.

It is very soluble in water, freely soluble in ethanol (99.5), and sparingly soluble in acetic acid (100).

It is gradually colored to yellow-brown by light.

A solution of Etilefrine Hydrochloride (1 in 20) shows no optical rotation.

**Identification (1)** Dissolve 5 mg of Etilefrine Hydrochloride in 100 mL of diluted hydrochloric acid (1 in 1000). Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Etilefrine Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Etilefrine Hydrochloride (1 in 1000) responds to the Qualitative Tests <1.09> (2) for chloride.

**Melting point** <2.60> 118 – 122°C

**Purity (1)** Acidity or alkalinity—To 10 mL of a solution of Etilefrine Hydrochloride (1 in 50) add 0.1 mL of methyl red TS for acid or alkali test and 0.2 mL of 0.01 mol/L sodium hydroxide VS: a yellow color develops, and the necessary volume of 0.01 mol/L hydrochloric acid VS to change the color to red is not more than 0.4 mL.

(2) Clarity and color of solution—Dissolve 0.5 g of Etilefrine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(3) Sulfate <1.14>—Perform the test with 0.85 g of Etilefrine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.020%).

(4) Heavy metals <1.07>—Dissolve 1.0 g of Etilefrine Hydrochloride in 30 mL of water and 2 mL of acetic acid (100), adjust with sodium hydroxide TS to a pH of 3.3, add water to make 50 mL, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.15 g of Etilefrine Hydrochloride, previously dried, dissolve in 20 mL of acetic acid (100), add 50 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 21.77 mg of C<sub>10</sub>H<sub>15</sub>NO<sub>2</sub>.HCl

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Etilefrine Hydrochloride Tablets

エチレフリン塩酸塩錠

Etilefrine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labeled

amount of etilefrine hydrochloride (C<sub>10</sub>H<sub>15</sub>NO<sub>2</sub>.HCl: 217.69).

**Method of preparation** Prepare as directed under Tablets, with Etilefrine Hydrochloride.

**Identification** To a quantity of powdered Etilefrine Hydrochloride Tablets, equivalent to 5 mg of Etilefrine Hydrochloride according to the labeled amount, add 60 mL of diluted hydrochloric acid (1 in 1000), shake well, add 40 mL of diluted hydrochloric acid (1 in 1000), and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24>, using diluted hydrochloric acid (1 in 1000) as the blank: it exhibits a maximum between 271 nm and 275 nm.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirements of the Content uniformity test.

To 1 tablet of Etilefrine Hydrochloride Tablets add 60 mL of diluted hydrochloric acid (1 in 1000), and proceed as directed in the Assay.

Amount (mg) of etilefrine hydrochloride (C<sub>10</sub>H<sub>15</sub>NO<sub>2</sub>.HCl)  
=  $W_s \times (A_T/A_S) \times (1/10)$

$W_s$ : Amount (mg) of etilefrine hydrochloride for assay

**Assay** Weigh accurately the mass of not less than 20 Etilefrine Hydrochloride Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 5 mg of etilefrine hydrochloride (C<sub>10</sub>H<sub>15</sub>NO<sub>2</sub>.HCl), add 60 mL of diluted hydrochloric acid (1 in 1000), shake for 10 minutes, add diluted hydrochloric acid (1 in 1000) to make exactly 100 mL, and filter. Discard the first 20 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 50 mg of etilefrine hydrochloride for assay, previously dried at 105°C for 4 hours, and dissolve in diluted hydrochloric acid (1 in 1000) to make exactly 100 mL. Pipet 10 mL of this solution, add diluted hydrochloric acid (1 in 1000) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of etilefrine.

Amount (mg) of etilefrine hydrochloride (C<sub>10</sub>H<sub>15</sub>NO<sub>2</sub>.HCl)  
=  $W_s \times (A_T/A_S) \times (1/10)$

$W_s$ : Amount (mg) of etilefrine hydrochloride for assay

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 5 g of sodium lauryl sulfate in 940 mL of water and 500 mL of acetonitrile, and adjust the pH to 2.3 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of etilefrine is about 6 minutes.

**System suitability**—

System performance: Dissolve 4 mg of bamethan sulfate

and 4 mg of etilefrine hydrochloride in the mobile phase to make 50 mL. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, etilefrine and bamethan are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of etilefrine is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Etizolam

エチゾラム

$C_{17}H_{15}ClN_4S$ : 342.85

4-(2-Chlorophenyl)-2-ethyl-9-methyl-6H-thieno[3,2-f][1,2,4]triazolo[4,3-a][1,4]diazepine [40054-69-1]

Etizolam contains not less than 98.5% and not more than 101.0% of etizolam ( $C_{17}H_{15}ClN_4S$ ).

**Description** Etizolam occurs as a white to pale yellowish white crystalline powder.

It is soluble in ethanol (99.5), sparingly soluble in acetonitrile and in acetic anhydride, and practically insoluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Etizolam in ethanol (99.5) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Etizolam as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 146 – 149°C

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Etizolam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 20 mg of Etizolam in 50 mL of acetonitrile, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add acetonitrile to make exactly 20 mL. Pipet 1 mL of this solution, add acetonitrile to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed

under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than etizolam obtained from the sample solution is not more than the peak area of etizolam from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 1.36 g of potassium dihydrogen phosphate in water to make 1000 mL, and adjust the pH to 3.5 with diluted phosphoric acid (1 in 10). To 550 mL of this solution add 450 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of etizolam is about 6 minutes.

Time span of measurement: About 5 times as long as the retention time of etizolam beginning after the solvent peak.

**System suitability**—

Test for required detectability: Measure exactly 2 mL of the standard solution, and add acetonitrile to make exactly 20 mL. Confirm that the peak area of etizolam obtained from 10  $\mu$ L of this solution is equivalent to 8 to 12% of that from 10  $\mu$ L of the standard solution.

System performance: Dissolve 0.02 g each of Etizolam and ethyl parahydroxybenzoate in the mobile phase to make 50 mL. To 1 mL of this solution add the mobile phase to make 50 mL. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, ethyl parahydroxybenzoate and etizolam are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of etizolam is not more than 2%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Etizolam, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). The end point is the second equivalent point. Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 17.14 mg of  $C_{17}H_{15}ClN_4S$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Etodolac

エトドラク

$C_{17}H_{21}NO_3$ : 287.35

2-[(1*R,S*)-1,8-Diethyl-1,3,4,9-tetrahydropyrano[3,4-*b*]indol-1-yl]acetic acid

[41340-25-4]

Etodolac, when dried, contains not less than 98.5% and not more than 101.0% of  $C_{17}H_{21}NO_3$ .

**Description** Etodolac occurs as white to pale yellow, crystals or crystalline powder.

It is freely soluble in methanol and in ethanol (99.5), and practically insoluble in water.

A solution of Etodolac in methanol (1 in 50) shows no optical rotation.

Melting point: about 147°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Etodolac in ethanol (99.5) (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Etodolac as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Etodolac according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 0.5 g of Etodolac in 10 mL of methanol, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution (1). Pipet 4 mL of the standard solution (1), add methanol to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Previously develop a plate of silica gel with fluorescent indicator for thin-layer chromatography in a developing container containing 2 cm depth of a solution of L-ascorbic acid in a mixture of methanol and water (4:1) (1 in 200 mL) to the distance of 3 cm, and air-dry for 30 minutes. Spot 10  $\mu$ L each of the sample solution and standard solutions (1) and (2) on the plate 2.5 cm away from the bottom of the plate, then immediately develop with a mixture of toluene, ethanol (95) and acetic acid (100) (140:60:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): any spot other than the principal spot

obtained with the sample solution is not more intense than the spot with the standard solution (1), and the number of spots which are more intense than the spot with the standard solution (2) is not more than 2.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, 60°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Etodolac, previously dried, dissolve in 50 mL of ethanol (99.5), and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS

= 28.74 mg of  $C_{17}H_{21}NO_3$

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

## Etoposide

エトポシド

$C_{29}H_{32}O_{13}$ : 588.56

(5*R*,5*aR*,8*aR*,9*S*)-9-{[4,6-*O*-(1*R*)-Ethylidene- $\beta$ -D-glucopyranosyl]oxy}-5-(4-hydroxy-3,5-dimethoxyphenyl)-5,8,8*a*,9-tetrahydrofuro[3',4':6,7]naphtho[2,3-*d*]-1,3-dioxol-6(5*aH*)-one [33419-42-0]

Etoposide contains not less than 98.0% and not more than 102.0% of  $C_{29}H_{32}O_{13}$ , calculated on the anhydrous basis.

**Description** Etoposide occurs as white crystals or crystalline powder.

It is sparingly soluble in methanol, slightly soluble in ethanol (99.5), and very slightly soluble in water.

Melting point: about 260°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Etoposide in methanol (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Etoposide Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Etoposide as directed in the potassium bromide disk method

under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Etoposide Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-100 - -105^\circ$  (0.1 g calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Etoposide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Etoposide in 10 mL of methanol, add the mobile phase to make 50 mL, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 50  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than etoposide is not larger than 1/5 times the peak area of etoposide with the standard solution, and the total area of the peaks other than the peak of etoposide with the sample solution is not larger than 1/2 times the peak area of etoposide with the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of etoposide beginning after the solvent peak.

**System suitability**—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of etoposide obtained with 50  $\mu$ L of this solution is equivalent to 7 to 13% of that with 50  $\mu$ L of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 50  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of etoposide is not more than 2.0%.

**Water** <2.48> Not more than 4.0% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 25 mg each of Etoposide and Etoposide Reference Standard (previously determined the water <2.48> in the same manner as Etoposide) dissolve separately in methanol to make exactly 25 mL. Pipet 10 mL each of these solutions, add exactly 5 mL of the internal standard solution and the mobile phase to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 50  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of etoposide to that of the internal standard.

$$\text{Amount (mg) of } C_{29}H_{32}O_{13} = W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of Etoposide Reference Standard,

calculated on the anhydrous basis

**Internal standard solution**—A solution of 2,6-dichlorophenol in methanol (3 in 2500).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 290 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with phenylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 6.44 g of sodium sulfate decahydrate in diluted acetic acid (100) (1 in 100) to make 1000 mL, and add 250 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of etoposide is about 20 minutes.

**System suitability**—

System performance: Dissolve 10 mg of Etoposide in 2 mL of methanol, add 8 mL of the mobile phase, and mix well. Add 0.1 mL of diluted acetic acid (100) (1 in 25) and 0.1 mL of phenolphthalein TS, and add sodium hydroxide TS until the color of the solution changes to faintly red. After allowing to stand for 15 minutes, add 0.1 mL of diluted acetic acid (100) (1 in 25). When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, the resolution between the peak of etoposide and the peak having the relative retention time of about 1.3 with respect to etoposide is not less than 3.

System repeatability: When the test is repeated 6 times with 50  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of etoposide to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Eucalyptus Oil

### *Oleum Eucalypti*

ユーカリ油

Eucalyptus Oil is the essential oil distilled with steam from the leaves of *Eucalyptus globulus* Labillardière or allied plants (*Myrtaceae*).

It contains not less than 70.0% of cineol ( $C_{10}H_{18}O$ : 154.25).

**Description** Eucalyptus Oil is a clear, colorless or pale yellow liquid. It has a characteristic, aromatic odor and a pungent taste.

It is neutral.

**Identification** Shake 1 mL of Eucalyptus Oil vigorously with 1 mL of phosphoric acid, and allow to stand: the solution congeals within 30 minutes.

**Refractive index** <2.45>  $n_D^{20}$ : 1.458 – 1.470

**Specific gravity** <1.13>  $d_{20}^{20}$ : 0.907 – 0.927

**Purity (1)** Clarity of solution—Mix 1.0 mL of Eucalyptus

Oil with 5 mL of diluted ethanol (7 in 10): the solution is clear.

(2) Heavy metals <1.07>—Proceed with 1.0 mL of Eucalyptus Oil according to Method 2, and perform the test. Prepare the control solution with 4.0 mL of Standard Lead Solution (not more than 40 ppm).

**Assay** Weigh accurately about 0.1 g of Eucalyptus Oil, and dissolve in hexane to make exactly 25 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, then add hexane to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of cineol for assay, proceed as directed in the sample solution, and use this solution as the standard solution. Perform the test with 2  $\mu$ L each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions. Calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of cineol to that of the internal standard of each solutions, respectively.

$$\begin{aligned} &\text{Amount (mg) of cineol (C}_{10}\text{H}_{18}\text{O)} \\ &= W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of cineol for assay

**Internal standard solution**—A solution of anisol in hexane (1 in 250).

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A glass column about 3 mm in inside diameter and about 5 m in length, having alkylene glycol phthalate ester for gas chromatography coated at the ratio of 10% on silanized siliceous earth for gas chromatography (150 to 180  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 120°C.

Carrier gas: Nitrogen.

Flow rate: Adjust the flow rate so that the retention time of cineol is about 11 minutes.

Selection of column: Dissolve 0.1 g each of cineol and limonene in 25 mL of hexane. To 1 mL of this solution add hexane to make 20 mL. Proceed with about 2  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of limonene and cineol in this order with the resolution between these peaks being not less than 1.5.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Famotidine

ファミチジン

$\text{C}_8\text{H}_{15}\text{N}_7\text{O}_2\text{S}_3$ : 337.45

*N*-Aminosulfonyl-3-[(2-diaminomethyleneamino)-1,3-thiazol-4-yl]methylsulfanylpropanimidamide  
[76824-35-6]

Famotidine, when dried, contains not less than

98.5% of  $\text{C}_8\text{H}_{15}\text{N}_7\text{O}_2\text{S}_3$ .

**Description** Famotidine occurs as white to yellowish white crystals.

It is freely soluble in acetic acid (100), slightly soluble in ethanol (95), and very slightly soluble in water.

It dissolves in 0.5 mol/L hydrochloric acid TS.

It is gradually colored by light.

Melting point: about 164°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Famotidine in 0.05 mol/L potassium dihydrogenphosphate TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Famotidine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Famotidine in 10 mL of 0.5 mol/L hydrochloric acid TS: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Famotidine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.20 g of Famotidine in 10 mL of acetic acid (100), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add acetic acid (100) to make exactly 100 mL. Pipet 1 mL, 2 mL and 3 mL of this solution, add acetic acid (100) to make exactly 10 mL, respectively, and use these solutions as the standard solution (1), the standard solution (2) and the standard solution (3). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solutions (1), (2) and (3) on a plate of silica gel (5 to 7  $\mu$ m) with fluorescent indicator for thin-layer chromatography, and dry in a stream of nitrogen.

Develop the plate with a mixture of ethyl acetate, methanol, toluene and ammonia solution (28) (40:25:20:2) to a distance of about 8 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot and other than the spot of the starting point from the sample solution are not more intense than the spot from the standard solution (3). Total intensity of the spots other than the principal spot and other than the spot of the starting point from the sample solution is not more than 0.5% calculated on the basis of intensities of the spots from the standard solution (1) and the standard solution (2) (each spot is equivalent to 0.1% and 0.2%, respectively).

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 80°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Famotidine, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 16.87 mg of  $C_8H_{15}N_7O_2S_3$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Famotidine for Injection

注射用ファモチジン

Famotidine for Injection is a preparation for injection which is dissolved before use.

It contains not less than 94.0% and not more than 106.0% of the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ; 337.45).

**Method of preparation** Prepare as directed under Injection, with Famotidine.

**Description** Famotidine for Injection occurs as white porous masses or powder.

**Identification** Dissolve an amount of Famotidine for Injection, equivalent to 0.01 g of Famotidine according to the labeled amount, in 50 mL of 0.05 mol/L potassium dihydrogenphosphate TS. To 5 mL of this solution add 0.05 mol/L potassium dihydrogenphosphate TS to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits a maximum between 263 nm and 267 nm.

**pH** <2.54> Dissolve an amount of Famotidine for Injection, equivalent to 0.02 g of Famotidine according to the labeled amount, in 1 mL of water: the pH of this solution is between 4.9 and 5.5.

**Purity (1)** Clarity and color of solution—Dissolve an amount of Famotidine for Injection, equivalent to 0.02 g of Famotidine according to the labeled amount, in 1 mL of water: the solution is clear and colorless.

**(2)** Related substances—Take a number of Famotidine for Injection, equivalent to about 0.1 g of famotidine ( $C_8H_{15}N_7O_2S_3$ ), dissolve each content in water, wash the inside of the container with water, combine the solutions of the contents with the washings, add water to the combined solution to make exactly 100 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area of these solutions by the automatic integration method: the total area of the peaks other than peak of famotidine from the sample solution is not larger than peak area of famotidine from the standard solution.

**Operating conditions—**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of famotidine beginning after the solvent peak.

**System suitability—**

Test for required detection: To exactly 2 mL of the standard solution add the water to make exactly 20 mL. Confirm that the peak area of famotidine obtained from 5  $\mu$ L of this solution is equivalent to 8 to 12% of that of famotidine obtained from 5  $\mu$ L of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of famotidine is not more than 2.0%.

**Water** <2.48> Not more than 1.5% (0.1 g, coulometric titration).

**Bacterial endotoxins** <4.01> Not more than 15 EU/mg.

**Assay** Take a number of Famotidine for Injection, equivalent to about 0.1 g of famotidine ( $C_8H_{15}N_7O_2S_3$ ), dissolve each content in water, wash the inside of each container with water, combine the solutions of the contents with the washings, add water to the combined solution to make exactly 100 mL, and use this solution as the sample stock solution. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of famotidine for assay, previously dried in vacuum with phosphorus (V) oxide at 80°C for 4 hours, dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add 5 mL of the internal standard solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of famotidine to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of famotidine (C}_8\text{H}_{15}\text{N}_7\text{O}_2\text{S}_3\text{)} \\ & = W_S \times (Q_T/Q_S) \times 2 \end{aligned}$$

$W_S$ : Amount (mg) of famotidine for assay

**Internal standard solution—**To 5 mL of a solution of methyl parahydroxybenzoate in methanol (1 in 500) add water to make 50 mL.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2 g of sodium 1-heptane sulfonate in 900 mL of water, adjust to pH 3.0 with acetic acid (100), and add water to make 1000 mL. To this solution add 240 mL of acetonitrile and 40 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of famotidine is about 6 minutes.

**System suitability—**

System performance: When the procedure is run with 5  $\mu$ L of the standard solution under the above operating condi-

tions, famotidine and the internal standard are eluted in this order with the resolution between these peaks being not less than 11.

System repeatability: When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of famotidine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

## Famotidine Powder

ファミモチジン散

Famotidine Powder contains not less than 94.0% and not more than 106.0% of the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ; 337.45).

**Method of preparation** Prepare as directed under Powder, with Famotidine.

**Identification** Weigh a portion of Famotidine Powder, equivalent to 0.01 g of Famotidine according to the labeled amount, add 50 mL of 0.05 mol/L potassium dihydrogenphosphate TS, shake well, and centrifuge. To 5 mL of the supernatant liquid add 0.05 mol/L potassium dihydrogenphosphate TS to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 263 nm and 267 nm.

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Weigh accurately an amount of Famotidine Powder, equivalent to about 20 mg of famotidine ( $C_8H_{15}N_7O_2S_3$ ) according to the labeled amount, and perform the test at 50 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L acetic acid-sodium acetate buffer solution, pH 4.0 as the dissolution medium. Withdraw not less than 20 mL of the dissolution medium 15 minutes after starting the test, and filter through a membrane filter with pore size of not more than 0.5  $\mu$ m. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 40 mg of famotidine for assay, previously dried in vacuum on phosphorus (V) oxide at 80°C for 4 hours, dissolve in 0.05 mol/L acetic acid-sodium acetate buffer solution, pH 4.0 to make exactly 100 mL. Pipet 5 mL of this solution, add the same buffer solution to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 266 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>. The dissolution rate of a 20-mg/g powder and a 100-mg/g powder in 15 minutes of Famotidine Powder are not less than 80% and not less than 85%, respectively.

Dissolution rate (%) with respect to the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ )

$$= (W_S/W_T) \times (A_T/A_S) \times (1/C) \times 45$$

$W_S$ : Amount (mg) of famotidine for assay

$W_T$ : Amount (mg) of the sample.

C: Labeled amount (mg) of famotidine ( $C_8H_{15}N_7O_2S_3$ ) in

1 g

**Assay** Weigh accurately a portion of Famotidine Powder, equivalent to about 20 mg of famotidine ( $C_8H_{15}N_7O_2S_3$ ), add 20 mL of water, and shake well. Add 20 mL of methanol, then shake well, add methanol to make exactly 50 mL, and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 2 mL of the internal standard solution, add the mobile phase to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of famotidine for assay, previously dried in vacuum with phosphorus (V) oxide at 80°C for 4 hours, dissolve in methanol to make exactly 50 mL. Pipet 10 mL of this solution, and add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 2 mL of the internal standard solution, add the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of famotidine to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of famotidine (} C_8H_{15}N_7O_2S_3 \text{)} \\ &= W_S \times (Q_T/Q_S) \times (1/5) \end{aligned}$$

$W_S$ : Amount (mg) of famotidine for assay

**Internal standard solution**—To 5 mL of a solution of methyl parahydroxybenzoate in methanol (1 in 500) add water to make 50 mL.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2 g of sodium 1-heptane sulfonate in 900 mL of water, adjust to pH 3.0 with acetic acid (100), and add water to make 1000 mL. To this solution add 240 mL of acetonitrile and 40 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of famotidine is about 6 minutes.

**System suitability**—

System performance: When the procedure is run with 5  $\mu$ L of the standard solution under the above operating conditions, famotidine and the internal standard are eluted in this order with the resolution between these peaks being not less than 11.

System repeatability: When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of famotidine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Famotidine Tablets

ファミモチジン錠

Famotidine Tablets contain not less than 94.0% and

not more than 106.0% of the labeled amount of famotidine ( $C_8H_{15}N_7O_2S_3$ ; 337.45).

**Method of preparation** Prepare as directed under Tablets, with Famotidine.

**Identification** Weigh a portion of powdered Famotidine Tablets, equivalent to 0.01 g of Famotidine according to the labeled amount, add 50 mL of 0.05 mol/L potassium dihydrogenphosphate TS, shake well, and centrifuge. To 5 mL of the supernatant liquid add 0.05 mol/L potassium dihydrogenphosphate TS to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 263 nm and 267 nm.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Famotidine Tablets add 2 mL of water, shake to disintegrate, then add a suitable amount of methanol, and shake well. Add methanol to make exactly  $V$  mL of a solution containing about 0.2 mg of famotidine ( $C_8H_{15}N_7O_2S_3$ ) per mL, and centrifuge. Pipet 10 mL of the supernatant liquid, add exactly 2 mL of the internal standard solution, add the mobile phase to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of famotidine for assay, previously dried in vacuum with phosphorus (V) oxide at 80°C for 4 hours, dissolve in methanol to make exactly 100 mL. Pipet 10 mL of this solution, and add methanol to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 2 mL of the internal standard solution, add the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the operating conditions described in the Assay, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of famotidine to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of famotidine (C}_8\text{H}_{15}\text{N}_7\text{O}_2\text{S}_3\text{)} \\ &= W_S \times (Q_T/Q_S) \times (V/500) \end{aligned}$$

$W_S$ : Amount (mg) of famotidine for assay

**Internal standard solution**—To 5 mL of a solution of methyl parahydroxybenzoate in methanol (1 in 500) add water to make 50 mL.

**Dissolution** Being specified separately.

**Assay** Take a number of Famotidine Tablets, equivalent to 0.2 g of famotidine ( $C_8H_{15}N_7O_2S_3$ ), add 50 mL of water, and disintegrate by shaking well. Add 100 mL of methanol, then shake well, add methanol to make exactly 200 mL, and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of famotidine for assay, previously dried in vacuum with phosphorus (V) oxide at 80°C for 4 hours, dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,

$Q_T$  and  $Q_S$ , of the peak area of famotidine to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of famotidine (C}_8\text{H}_{15}\text{N}_7\text{O}_2\text{S}_3\text{)} \\ &= W_S \times (Q_T/Q_S) \times 2 \end{aligned}$$

$W_S$ : Amount (mg) of famotidine for assay

**Internal standard solution**—To 5 mL of a solution of methyl parahydroxybenzoate in methanol (1 in 500) add water to make 50 mL.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 2 g of sodium 1-heptane sulfonate in 900 mL of water, adjust to pH 3.0 with acetic acid (100), and add water to make 1000 mL. To this solution add 240 mL of acetonitrile and 40 mL of methanol.

**Flow rate:** Adjust the flow rate so that the retention time of famotidine is about 6 minutes.

**System suitability**—

**System performance:** When the procedure is run with 5  $\mu$ L of the standard solution under the above operating conditions, famotidine and the internal standard are eluted in this order with the resolution between these peaks being not less than 11.

**System repeatability:** When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of famotidine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Faropenem Sodium Hydrate

ファロペネムナトリウム水和物

$C_{12}H_{14}NNaO_5S \cdot 1\frac{1}{2}H_2O$ : 352.34

Monosodium (5*R*,6*S*)-6-[(1*R*)-1-hydroxyethyl]-7-oxo-3-[(2*R*)-tetrahydrofuran-2-yl]-4-thia-1-azabicyclo[3.2.0]hept-2-ene-2-carboxylate hemipentahydrate [122547-49-3, anhydride]

Faropenem Sodium Hydrate contains not less than 870  $\mu$ g (potency) and not more than 943  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Faropenem Sodium Hydrate is expressed as mass (potency) of faropenem ( $C_{12}H_{15}NO_5S$ ; 285.32).

**Description** Faropenem Sodium Hydrate occurs as white to light yellow, crystals or crystalline powder.

It is freely soluble in water and in methanol, slightly solu-

ble in ethanol (95), and practically insoluble in diethyl ether.

**Identification (1)** Dissolve 5 mg of Faropenem Sodium Hydrate in 1 mL of hydroxylammonium chloride-ethanol TS, allow to stand for 3 minutes, add 1 mL of acidic ammonium iron (III) sulfate TS, and shake: a red-brown to brown color develops.

(2) Determine the absorption spectra of solutions of Faropenem Sodium Hydrate and Faropenem Sodium Reference Standard (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectra: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectra of Faropenem Sodium Hydrate and Faropenem Sodium Reference Standard as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +145 – +150° (0.5 g calculated as the anhydrous basis, water, 50 mL, 100 mm).

**Purity (1)** Clarity and color of solution—Being specified separately.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Faropenem Sodium Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Being specified separately.

**Water** <2.48> Not less than 12.6% and not more than 13.1% (20 mg, coulometric titration).

**Assay** Weigh accurately an amount of Faropenem Sodium Hydrate and Faropenem Sodium Reference Standard, equivalent to about 25 mg (potency), each of these, add exactly 10 mL each of the internal standard solution, add water to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 20  $\mu$ L of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of faropenem to that of the internal standard.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of faropenem (C}_{12}\text{H}_{15}\text{NO}_5\text{S)} \\ &= W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : amount (mg) of Faropenem Sodium Reference Standard

**Internal standard solution**—Dissolve 0.5 g of *m*-hydroxyacetophenone in 20 mL of acetonitrile, and add water to make 200 mL.

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 305 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: Dissolve 4.8 g of potassium dihydrogenphosphate, 5.4 g of disodium hydrogen phosphate dodecahydrate and 1.0 g of tetra *n*-butyl ammonium bromide in water

to make 1000 mL. To 870 mL of this solution add 130 mL of acetonitrile.

**Flow rate**: Adjust the flow rate so that the retention time of faropenem is about 11 minutes.

**System suitability**—

**System performance**: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, the internal standard and faropenem are eluted in this order with the resolution between these peaks being not less than 1.5.

**System repeatability**: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of faropenem to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Faropenem Sodium for Syrup

シロップ用ファロペネムナトリウム

Faropenem Sodium for Syrup is a preparation for syrup, which is dissolved before use. It contains not less than 93.0% and not more than 106.0% of the labeled amount of faropenem (C<sub>12</sub>H<sub>15</sub>NO<sub>5</sub>S: 285.32).

**Method of preparation** Prepare as directed under Syrups, with Faropenem Sodium Hydrate.

**Identification** Dissolve an amount of pulverized Faropenem Sodium for Syrup, equivalent to 25 mg (potency) of Faropenem Sodium Hydrate according to the labeled amount, in 50 mL of water. To 5 mL of this solution add water to make 50 mL, centrifuge, if necessary, and determine the absorption spectrum of the solution so obtained as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 254 nm and 258 nm, and between 304 nm and 308 nm.

**Water** <2.48> Not less than 1.5% and not more than 2.1% (80 mg, coulometric titration).

**Uniformity of dosage units** <6.02> Faropenem Sodium for Syrup in single-unit container meets the requirement of the Mass variation test.

**Assay** Powder, if necessary, and weigh accurately an amount of Faropenem Sodium for Syrup, equivalent to about 25 mg (potency) of faropenem (C<sub>12</sub>H<sub>15</sub>NO<sub>5</sub>S), add exactly 10 mL of the internal standard solution and a suitable amount of water, shake well, and add water to make 50 mL. Filter, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg (potency) of Faropenem Sodium Reference Standard, add exactly 10 mL of the internal standard solution and water to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Faropenem Sodium Hydrate.

$$\begin{aligned} &\text{Amount [mg (potency)] of faropenem (C}_{12}\text{H}_{15}\text{NO}_5\text{S)} \\ &= W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Faropenem Sodium Reference Standard

**Internal standard solution**—Dissolve 0.5 g of *m*-hydroxyacetophenone in 20 mL of acetonitrile, and add water to make 200 mL.

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Faropenem Sodium Tablets

ファロペネムナトリウム錠

Faropenem Sodium Tablets contain not less than 94.0% and not more than 106.0% of the labeled amount of faropenem ( $C_{12}H_{15}NO_5S$ ; 285.32).

**Method of preparation** Prepare as directed under Tablets, with Faropenem Sodium Hydrate.

**Identification** To pulverized Faropenem Sodium Tablets, equivalent to 70 mg (potency) of Faropenem Sodium Hydrate according to the labeled amount, add water to make 100 mL. To 5 mL of this solution add water to make 100 mL, filter, if necessary, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 254 nm and 258 nm and between 304 nm and 308 nm.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Faropenem Sodium Tablets add 180 mL of water, shake vigorously until the tablets are disintegrated, and add water to make exactly  $V$  mL so that each mL contains about 1 mg (potency) of Faropenem Sodium Hydrate. Pipet 5 mL of this solution, add water to make exactly 100 mL, and filter. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg (potency) of Faropenem Sodium Reference Standard, and dissolve in water to make exactly 50 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_{T275}$ ,  $A_{T305}$ ,  $A_{T354}$ ,  $A_{S275}$ ,  $A_{S305}$  and  $A_{S354}$ , of the sample solution and standard solution at 275 nm, 305 nm and 354 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, and calculate  $A_T$  and  $A_S$ , using the following equations.

$$A_T = A_{T305} - (49 \times A_{T275} + 30 \times A_{T354}) / 79$$

$$A_S = A_{S305} - (49 \times A_{S275} + 30 \times A_{S354}) / 79$$

$$\begin{aligned} \text{Amount [mg (potency)] of faropenem (C}_{12}\text{H}_{15}\text{NO}_5\text{S)} \\ = W_S \times (A_T / A_S) \times (V / 25) \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Faropenem Sodium Reference Standard

**Assay** Weigh accurately the mass of not less than 5 Faropenem Sodium Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 25 mg (potency) of faropenem ( $C_{12}H_{15}NO_5S$ ), add exactly 10 mL of the internal standard solution, shake well, and add water to make exactly 50 mL. Filter, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg (potency) of Faropenem Sodium

Hydrate Reference Standard, add exactly 10 mL of the internal standard solution and water to make exactly 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Faropenem Sodium Hydrate.

$$\begin{aligned} \text{Amount [mg (potency)] of faropenem (C}_{12}\text{H}_{15}\text{NO}_5\text{S)} \\ = W_S \times (Q_T / Q_S) \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Faropenem Sodium Hydrate Reference Standard

**Internal standard solution**—Dissolve 0.5 g of *m*-hydroxyacetophenone in 20 mL of acetonitrile, and add water to make 200 mL.

**Containers and storage** Containers—Tight containers.

## Fenbufen

フェンブフェン

$C_{16}H_{14}O_3$ ; 254.28  
4-(Biphenyl-4-yl)-4-oxobutanoic acid [36330-85-5]

Fenbufen, when dried, contains not less than 98.0% of  $C_{16}H_{14}O_3$ .

**Description** Fenbufen occurs as a white crystalline powder. It has a bitter taste.

It is sparingly soluble in acetone, slightly soluble in methanol, in ethanol (95) and in diethyl ether, and practically insoluble in water.

Melting point: about 188°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Fenbufen in ethanol (95) (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Fenbufen, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity** (1) Heavy metals <1.07>—Take 2.0 g of Fenbufen, add 2 mL of sulfuric acid, and carbonize by gentle heating, proceed according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Fenbufen according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.1 g of Fenbufen in 20 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution.

Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, methanol and water (80:20:3) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm); the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.3% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Fenbuten, previously dried, dissolve in 100 mL of ethanol (99.5), and titrate <2.50> with 0.1 mol/L potassium hydroxide-ethanol VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS = 25.43 mg of  $\text{C}_{16}\text{H}_{14}\text{O}_3$

**Containers and storage** Containers—Tight containers.

## Fentanyl Citrate

フェンタニルクエン酸塩

$\text{C}_{22}\text{H}_{28}\text{N}_2\text{O} \cdot \text{C}_6\text{H}_8\text{O}_7$ ; 528.59

*N*-(1-Phenethylpiperidin-4-yl)-*N*-phenylpropanamide monocitrate [990-73-8]

Fentanyl Citrate contains not less than 98.0% of  $\text{C}_{22}\text{H}_{28}\text{N}_2\text{O} \cdot \text{C}_6\text{H}_8\text{O}_7$ , calculated on the dried basis.

**Description** Fentanyl Citrate occurs as white crystals or crystalline powder.

It is freely soluble in methanol and in acetic acid (100), sparingly soluble in water and in ethanol (95), and very slightly soluble in diethyl ether.

**Identification (1)** Dissolve 0.05 g of Fentanyl Citrate in 10 mL of 0.1 mol/L hydrochloric acid TS and ethanol (95) to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Fentanyl Citrate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Fentanyl Citrate (1 in 100) responds to

the Qualitative Tests <1.09> (1) for citrate.

**pH** <2.54> Dissolve 0.10 g of Fentanyl Citrate in 10 mL of water: the pH of this solution is between 3.0 and 5.0.

**Melting point** <2.60> 150 – 154°C

**Purity (1)** Heavy metals <1.07>—Proceed with 0.5 g of Fentanyl Citrate according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 20 ppm).

**(2)** Related substances—Dissolve 0.10 g of Fentanyl Citrate in 5 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff's TS for spraying on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (0.2 g, in vacuum, silica gel, 60°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.2% (0.5 g).

**Assay** Weigh accurately about 0.075 g of Fentanyl Citrate, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.02 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.02 mol/L perchloric acid VS = 10.57 mg of  $\text{C}_{22}\text{H}_{28}\text{N}_2 \cdot \text{C}_6\text{H}_8\text{O}_7$

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

## Ferrous Sulfate Hydrate

硫酸鉄水和物

$\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ ; 278.01

Ferrous Sulfate Hydrate contains not less than 98.0% and not more than 104.0% of  $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ .

**Description** Ferrous Sulfate Hydrate occurs as pale green crystals or crystalline powder. It is odorless, and has an astringent taste.

It is freely soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

It is efflorescent in dry air, and its surface becomes yellowish brown in moist air.

**Identification** A solution of Ferrous Sulfate Hydrate (1 in 10) responds to the Qualitative Tests <1.09> for ferrous salt and for sulfate.

**Purity (1)** Clarity of solution—Dissolve 1.0 g of Ferrous Sulfate Hydrate in 20 mL of water and 1 mL of dilute sulfuric acid: the solution is clear.

(2) Acidity—To 5.0 g of powdered Ferrous Sulfate Hydrate add 50 mL of ethanol (95), shake well for 2 minutes, and filter the mixture. To 25 mL of the filtrate add 50 mL of water, 3 drops of bromothymol blue TS and 0.5 mL of dilute sodium hydroxide TS: a blue color develops.

(3) Heavy metals <1.07>—Take 1.0 g of Ferrous Sulfate Hydrate in a porcelain dish, add 3 mL of aqua regia, and dissolve. Then evaporate on a water bath to dryness. To the residue add 5 mL of 6 mol/L hydrochloric acid TS, and dissolve. Transfer this solution to a separator. Wash the porcelain dish with two 5-mL portions of 6 mol/L hydrochloric acid TS, and combine the washings and the solution in the separator. Pour two 40-mL portions and one 20-mL portion of diethyl ether in the separator, shaking each time to mix. Allow to stand, and discard each separated diethyl ether layer. To the aqueous layer add 0.05 g of hydroxylammonium chloride, dissolve, and heat on a water bath for 10 minutes. Cool, adjust the solution to a pH of 3 to 4 by dropping strong ammonia solution, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: take 2.5 mL of Standard Lead Solution in a porcelain dish, add 3 mL of aqua regia, and proceed as directed for the preparation of the test solution (not more than 25 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Ferrous Sulfate Hydrate according to Method 1, and perform the test (not more than 2 ppm).

**Assay** Dissolve about 0.7 g of Ferrous Sulfate Hydrate, accurately weighed, in a mixture of 20 mL of water and 20 mL of dilute sulfuric acid, add 2 mL of phosphoric acid, and immediately titrate <2.50> with 0.02 mol/L potassium permanganate VS.

Each mL of 0.02 mol/L potassium permanganate VS  
= 27.80 mg of  $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$

**Containers and storage** Containers—Tight containers.

## Flavin Adenine Dinucleotide Sodium

フラビンアデニンジヌクレオチドナトリウム

$\text{C}_{27}\text{H}_{31}\text{N}_9\text{Na}_2\text{O}_{15}\text{P}_2$ : 829.51

Disodium adenosine 5'-[(2*R*,3*S*,4*S*)-5-(7,8-dimethyl-2,4-dioxo-3,4-dihydrobenzo[*g*]pteridin-10(2*H*)-yl)-2,3,4-trihydroxypentyl diphosphate] [84366-81-4]

Flavin Adenine Dinucleotide Sodium contains not less than 93.0% of  $\text{C}_{27}\text{H}_{31}\text{N}_9\text{Na}_2\text{O}_{15}\text{P}_2$ , calculated on

the anhydrous basis.

**Description** Flavin Adenine Dinucleotide Sodium occurs as an orange-yellow to light yellow-brown powder. It is odorless or has a slight, characteristic odor, and has a slightly bitter taste.

It is freely soluble in water, and practically insoluble, in methanol, in ethanol (95), in ethyleneglycol and in diethyl ether.

It is hygroscopic.

It is decomposed by light.

**Identification (1)** A solution of Flavin Adenine Dinucleotide Sodium (1 in 100,000) is light yellow-green in color, and shows a strong yellow-green fluorescence. To 5 mL of the solution add 0.02 g of hydrosulfite sodium: the color and the fluorescence of the solution disappear, and gradually reappear when the solution is shaken in air. Add dilute hydrochloric acid or sodium hydroxide TS dropwise: the fluorescence of the solution disappears.

(2) Determine the infrared absorption spectrum of Flavin Adenine Dinucleotide Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 0.1 g of Flavin Adenine Dinucleotide Sodium add 10 mL of nitric acid, evaporate on a water bath to dryness, and ignite. To the residue add 10 mL of diluted nitric acid (1 in 50), boil for 5 minutes, and after cooling, neutralize with ammonia TS, then filter the solution if necessary: the solution responds to the Qualitative Tests <1.09> for sodium salt and the Qualitative Tests <1.09> (1) and (3) for phosphate.

**Optical rotation** <2.49>  $[\alpha]_{\text{D}}^{20}$ :  $-21.0 - -25.5^\circ$  (0.3 g, calculated on the anhydrous basis, water, 20 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Flavin Adenine Dinucleotide Sodium in 100 mL of water: the pH of this solution is between 5.5 and 6.5.

**Purity (1)** Clarity and color of solution—Dissolve 0.20 g of Flavin Adenine Dinucleotide Sodium in 10 mL of water: the solution is clear and orange-yellow in color.

(2) Free phosphoric acid—Weigh accurately about 0.02 g of Flavin Adenine Dinucleotide Sodium, dissolve in 10 mL of water, and use this solution as the sample solution. Separately, measure exactly 2 mL of Standard Phosphoric Acid Solution, add 10 mL of water, and use this solution as the standard solution. To each of the sample solution and standard solution add 2 mL of diluted perchloric acid (100 in 117), then add 1 mL of hexaammonium heptamolybdate TS and 2 mL of 2,4-diaminophenol hydrochloride TS, respectively, shake, add water to make exactly 25 mL, and allow to stand at  $20 \pm 1^\circ\text{C}$  for 30 minutes. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared in the same manner with 2 mL of water, as the blank, and determine the absorbances,  $A_T$  and  $A_S$ , of the subsequent solutions of the sample solution and standard solution at 730 nm, respectively: the amount of free phosphoric acid is less than 0.25%.

Amount (%) of free phosphoric acid ( $\text{H}_3\text{PO}_4$ )  
=  $(A_T/A_S) \times (1/W) \times 5.16$

$W$ : Amount (mg) of flavin adenine dinucleotide sodium,

calculated on the anhydrous basis.

(3) Heavy metals <1.07>—Proceed with 1.0 g of Flavin Adenine Dinucleotide Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 2.0 g of Flavin Adenine Dinucleotide Sodium according to Method 3, and perform the test (not more than 1 ppm).

(5) Related substances—Dissolve 0.10 g of Flavin Adenine Dinucleotide Sodium in 200 mL of the mobile phase, and use this solution as the sample solution. Perform the test with 20  $\mu$ L of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine the peak area,  $A$ , of flavin adenine dinucleotide and the total area,  $S$ , of peaks other than the peak of flavin adenine dinucleotide by the automatic integration method:  $S/(A + S)$  is not more than 0.10.

*Operating conditions*—

Column, column temperature, mobile phase, flow rate, and time span of measurement: Proceed as directed in the operating conditions in the Procedure (ii) under Assay (1).

Detector: An ultraviolet absorption photometer (wavelength: 260 nm).

*System suitability*—

Test for required detection: To exactly 2 mL of the sample solution add the mobile phase to make exactly 20 mL, and use this solution as the solution for system suitability test. Confirm that the peak area of flavin adenine dinucleotide obtained from 20  $\mu$ L of this solution is equivalent to 8 to 12% of that of flavin adenine dinucleotide obtained from 20  $\mu$ L of the sample solution.

System performance: Proceed as directed in the system suitability in the Procedure (ii) under Assay (1).

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of flavin adenine dinucleotide is not more than 1.0%.

**Water <2.48>** Take 50 mL of a mixture of methanol for Karl Fischer method and ethyleneglycol for Karl Fischer method (1:1) into a dry titration flask, and titrate with Karl Fischer TS until end point. Weigh accurately about 0.1 g of Flavin Adenine Dinucleotide Sodium, transfer quickly to the titration flask, add an excess and constant volume of Karl Fischer TS, dissolve by stirring for 10 minutes, and perform the test: the water content is not more than 10.0%.

**Assay (1) Procedure (i) Total flavin content**—Conduct this procedure without exposure to daylight, using light-resistant vessels. Weigh accurately about 0.1 g of Flavin Adenine Dinucleotide Sodium, and dissolve in water to make exactly 200 mL. Pipet 5 mL of this solution, add 5 mL of zinc chloride TS, and heat in a water bath for 30 minutes. After cooling, add water to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Riboflavin Reference Standard, previously dried at 105°C for 2 hours, dissolve in 200 mL of diluted acetic acid (100) (1 in 100) by warming, cool, add water to make exactly 500 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 450 nm as

directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the blank.

$$\begin{aligned} \text{Total amount (mg) of flavin} \\ = W_S \times (A_T/A_S) \times (4/5) \end{aligned}$$

$W_S$ : Amount (mg) of Riboflavin Reference Standard

(ii) Peak area ratio of flavin adenine dinucleotide—Dissolve 0.1 g of Flavin Adenine Dinucleotide Sodium in 200 mL of water, and use this solution as the sample solution. Perform the test with 5  $\mu$ L of this solution as directed under the Liquid Chromatography <2.01> according to the following conditions. Determine the peak area,  $A$  of flavin adenine dinucleotide, and the total area,  $S$ , of the peaks other than flavin adenine dinucleotide by the automatic integration method.

$$\begin{aligned} \text{Peak area ratio of flavin adenine dinucleotide} \\ = 1.08A/(1.08A + S) \end{aligned}$$

*Operating conditions*—

Detector: A visible spectrophotometer (wavelength: 450 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: A mixture of a solution of potassium dihydrogen phosphate (1 in 500) and methanol (4:1).

Flow rate: Adjust the flow rate so that the retention time of flavin adenine dinucleotide is about 10 minutes.

Time span of measurement: About 4.5 times as long as the retention time of flavin adenine dinucleotide.

*System suitability*—

Test for required detection: To exactly 2 mL of the sample solution add water to make exactly 20 mL, and use this solution as the solution for system suitability test. Pipet 2 mL of the solution, and add water to make exactly 20 mL. Confirm that the peak area of flavin adenine dinucleotide obtained from 5  $\mu$ L of this solution is equivalent to 8 to 12% of that of flavin adenine dinucleotide obtained from 5  $\mu$ L of the solution for system suitability test.

System performance: Dissolve 20 mg each of Flavin Adenine Dinucleotide Sodium and riboflavin sodium phosphate in 100 mL of water. When the procedure is run with 5  $\mu$ L of this solution under the above operating conditions, flavin adenine dinucleotide and riboflavin phosphate are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 5  $\mu$ L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of flavin adenine dinucleotide is not more than 1.0%.

(2) Calculation

$$\begin{aligned} \text{Amount (mg) of } C_{27}H_{31}N_9Na_2O_{15}P_2 \\ = f_T \times f_R \times 2.2040 \end{aligned}$$

$f_T$ : Total amount (mg) of flavin in Flavin Adenine Dinucleotide Sodium obtained from the procedure (i).

$f_R$ : Peak area ratio of flavin adenine dinucleotide in Flavin Adenine Dinucleotide Sodium obtained from the procedure (ii).

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Flavoxate Hydrochloride

フラボキサート塩酸塩

$C_{24}H_{25}NO_4 \cdot HCl$ : 427.92

2-(Piperidin-1-yl)ethyl 3-methyl-4-oxo-2-phenyl-4*H*-chromene-8-carboxylate monohydrochloride  
[3717-88-2]

Flavoxate Hydrochloride, when dried, contains not less than 99.0% of  $C_{24}H_{25}NO_4 \cdot HCl$ .

**Description** Flavoxate Hydrochloride occurs as white crystals or crystalline powder.

It is sparingly soluble in acetic acid (100) and in chloroform, slightly soluble in water and in ethanol (95), and practically insoluble in acetonitrile and in diethyl ether.

**Identification (1)** Determine the absorption spectrum of a solution of Flavoxate Hydrochloride in 0.01 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Flavoxate Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Flavoxate Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> for chloride.

**Purity (1)** Heavy metals <1.07>—Proceed with 2.0 g of Flavoxate Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(2)** Arsenic <1.11>—Prepare the test solution with 2.0 g of Flavoxate Hydrochloride according to Method 4, and perform the test (not more than 1 ppm).

**(3)** Related substances—Dissolve 80 mg of Flavoxate Hydrochloride in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add chloroform to make exactly 20 mL, then pipet 1 mL of this solution, add chloroform to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solu-

tion are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (1 g, reduced pressure, silica gel, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Flavoxate Hydrochloride, previously dried, add 10 mL of acetic acid (100) and 40 mL of acetonitrile to dissolve, add 50 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 42.79 mg of  $C_{24}H_{25}NO_4 \cdot HCl$

**Containers and storage** Containers—Tight containers.

## Flomoxef Sodium

フロモキセフナトリウム

$C_{15}H_{17}F_2N_6NaO_7S_2$ : 518.45

Monosodium (6*R*,7*R*)-7-  
{[(difluoromethylsulfanyl)acetyl]amino}-  
3-[1-(2-hydroxyethyl)-1*H*-tetrazol-5-ylsulfanylmethyl]-  
7-methoxy-8-oxo-5-oxa-1-azabicyclo[4.2.0]oct-2-ene-  
2-carboxylate [92823-03-5]

Flomoxef Sodium contains not less than 870  $\mu$ g (potency) and not more than 985  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Flomoxef Sodium is expressed as mass (potency) of flomoxef ( $C_{15}H_{18}F_2N_6O_7S_2$ : 496.47).

**Description** Flomoxef Sodium occurs as white to light yellowish white, powder or masses.

It is very soluble in water, freely soluble in methanol, and sparingly soluble in ethanol (99.5).

**Identification (1)** Decompose 0.01 g of Flomoxef Sodium as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid. To 2 mL of the test solution so obtained add 1.5 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3 and cerium (III) nitrate TS (1:1:1): blue-purple color develops.

**(2)** Determine the absorption spectrum of a solution of Flomoxef Sodium (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(3)** Determine the infrared absorption spectrum of Flomoxef Sodium as directed in the potassium bromide disk

method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Determine the spectrum of a solution of Flomoxef Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> (<sup>1</sup>H), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around δ3.5 ppm, a single signal or a sharp multiple signal B at around δ3.7 ppm, and a single signal C at around δ5.2 ppm. The ratio of the integrated intensity of these signals, A:B:C, is about 3:2:1.

(5) Flomoxef Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-8 - -13^\circ$  (1 g calculated on the anhydrous basis, a mixture of water and ethanol (99.5) (4:1), 50 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 0.5 g of Flomoxef Sodium in 5 mL of water is between 4.0 and 5.5.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Flomoxef Sodium in 10 mL of water: the solution is clear and pale yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Flomoxef Sodium in a quartz crucible according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—To 1.0 g of Flomoxef Sodium 5 mL of sulfuric acid and 5 mL of nitric acid, heat carefully until the solution changes to colorless to light yellow with occasional addition of 2 mL of nitric acid. After cooling, add 10 mL of ammonium oxalate TS, heat until white fumes evolve, and concentrate to 2 to 3 mL. After cooling, add water to make 10 mL, and perform the test using this solution as the test solution: the color is not darker than that of the control solution.

Control solution: Proceed to prepare a solution in the same manner as the test solution without Flomoxef Sodium, and transfer 10 mL of the solution so obtained to the generator bottle, add exactly 2 mL of Standard Arsenic Solution, and proceed in the same manner as the test solution (not more than 2 ppm).

(4) 1-(2-Hydroxyethyl)-1*H*-tetrazol-5-thiol—Weigh accurately about 20 mg of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 25 mL of the internal standard solution and water to make 50 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the sample solution obtained in the Assay and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol to that of the internal standard: the amount of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol is not more than 1.0% of the amount of Flomoxef Sodium calculated on the anhydrous basis.

Amount (mg) of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol  
(C<sub>3</sub>H<sub>6</sub>N<sub>4</sub>OS)

$$= W_S \times (Q_T/Q_S) \times (1/10)$$

$W_S$ : Amount (mg) of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-

thiol

**Internal standard solution**—A solution of *m*-cresol (3 in 1000)

**Operating conditions**—

Proceed as directed in the operating conditions in the Assay.

**System suitability**—

Proceed as directed in the system suitability in the Assay.

**Water** <2.48> Not more than 1.5% (0.5 g, volumetric titration, back titration).

**Assay** Weigh accurately an amount of Flomoxef Sodium and Flomoxef Triethylammonium Reference Standard, equivalent to about 50 mg (potency), and dissolve each in exactly 50 mL of the internal standard solution, add water to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of flomoxef to that of the internal standard.

$$\begin{aligned} &\text{Amount } [\mu\text{g (potency)}] \text{ of flomoxef (C}_{15}\text{H}_{18}\text{F}_2\text{N}_6\text{O}_7\text{S}_2) \\ &= W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Flomoxef Triethylammonium Reference Standard

**Internal standard solution**—A solution of *m*-cresol (3 in 1000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 246 nm).

Column: A stainless steel column 4 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5–10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 6.94 g of potassium dihydrogen phosphate, 3.22 g of disodium hydrogen phosphate dodecahydrate and 1.60 g of tetra-*n*-butylammonium bromide in water to make 1000 mL. To 750 mL of this solution add 250 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of flomoxef is about 9 minutes.

**System suitability**—

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, flomoxef and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 3 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of flomoxef to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—At 5°C or below.

## Flomoxef Sodium for Injection

注射用フロモキシセフナトリウム

Flomoxef Sodium for Injection is a preparation for injection which is dissolved before use.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of flomoxef ( $C_{15}H_{18}F_2N_6O_7S_2$ : 496.47).

**Method of preparation** Prepare as directed under Injections, with Flomoxef Sodium.

**Description** Flomoxef Sodium for Injection occurs as white to light yellowish white, friable masses or powder.

**Identification** Proceed as directed in the Identification (3) under Flomoxef Sodium.

**pH** <2.54> The pH of a solution obtained by dissolving an amount of Flomoxef Sodium for Injection, equivalent to 0.5 g (potency) of Flomoxef Sodium according to the labeled amount, in 5 mL of water is between 4.0 and 5.5.

**Purity (1)** Clarity and color of solution—Dissolve an amount of Flomoxef Sodium for Injection, equivalent to 1.0 g (potency) of Flomoxef Sodium according to the labeled amount, in 10 mL of water: the solution is clear and colorless or pale yellow.

(2) 1-(2-Hydroxyethyl)-1*H*-tetrazol-5-thiol—Use the sample solution obtained in the Assay as the sample solution. Weigh accurately about 20 mg of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 25 mL of the internal standard solution and water to make 50 mL, and use this solution as the standard solution. Perform the test with 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol to that of the internal standard. Calculate the amount of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol per 1 g (potency) of Flomoxef Sodium for Injection by the following formula: not more than 10 mg.

$$\begin{aligned} & \text{Amount (mg) of 1-(2-hydroxyethyl)-1H-tetrazol-5-thiol} \\ & (C_3H_6N_4OS) \\ & = W_S \times (Q_T/Q_S) \times (1/10) \end{aligned}$$

$W_S$ : Amount (mg) of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol

**Operating conditions**—

Proceed as directed in the Assay.

**System suitability**—

Test for required detectability: Pipet 1 mL of the standard solution, and add water to make exactly 20 mL. Confirm that the peak area of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol obtained from 5  $\mu$ L of this solution is equivalent to 3.5 – 6.5% of that obtained from 5  $\mu$ L of the standard solution.

**System performance**: When the procedure is run with 5  $\mu$ L of the standard solution under the above operating conditions, 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol and the internal standard are eluted in this order with the resolution between these peaks being not less than 20.

**System repeatability**: When the test is repeated 3 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of 1-(2-hydroxyethyl)-1*H*-tetrazol-5-thiol to that of the internal standard is not more than 1.0%.

**Water** <2.48> Not more than 1.5% (0.5 g, volumetric titration, back titration).

**Bacterial endotoxins** <4.01> Less than 0.025 EU/mg (potency).

**Uniformity of dosage units** <6.02> It meets the requirement of the Mass variation test.

**Foreign insoluble matter** <6.06> Perform the test according to Method 2: it meets the requirement.

**Insoluble particulate matter** <6.07> Perform the test according to Method 1: it meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Weigh accurately the mass of the contents of not less than 10 Flomoxef Sodium for Injection, and calculate the average mass of the content. Spread out thinly about 1 g of the content in a petri dish, allow the dish to stand in a desiccator containing a saturated solution of magnesium bromide without light exposure to equilibrate the sample to constant water content. Determine the water content, separately, with about 0.1 g of the sample according to the method described in Water. Weigh accurately an amount of the sample, equivalent to about 50 mg (potency) of Flomoxef Sodium according to the labeled amount, add exactly 50 mL of the internal standard solution to dissolve, add water to make 100 mL, and use this solution as the sample solution. Separately weigh accurately about 50 mg (potency) of Flomoxef Triethylammonium Reference Standard, add exactly 50 mL of the internal standard solution to dissolve, add water to make 100 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Flomoxef Sodium.

$$\begin{aligned} & \text{Amount } [\mu\text{g (potency)}] \text{ of flomoxef } (C_{15}H_{18}F_2N_6O_7S_2) \\ & = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Flomoxef Triethylammonium Reference Standard

**Internal standard solution**—A solution of *m*-cresol (3 in 1000).

**Containers and storage** Containers—Hermetic containers. Polyethylene or polypropylene containers for aqueous injection may be used.

## Flopropione

フロプロピオン

$C_9H_{10}O_4$ : 182.17

1-(2,4,6-Trihydroxyphenyl)propan-1-one [2295-58-1]

Flopropione contains not less than 98.0% of  $C_9H_{10}O_4$ , calculated on the anhydrous basis.

**Description** Flopropione occurs as a white to pale yellow-brown, crystalline powder. It is odorless, and has a bitter taste.

It is very soluble in *N,N*-dimethylformamide, freely soluble in methanol, in ethanol (99.5) and in diethyl ether, and practically insoluble in water.

**Identification (1)** To 1 mL of a solution of Flopropione in ethanol (99.5) (1 in 200) add 4 mL of water and 1 mL of iron (III) nitrate TS: a red-purple color develops.

**(2)** Determine the absorption spectrum of a solution of Flopropione in ethanol (99.5) (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Melting point** <2.60> 177 – 181°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Flopropione in 10 mL of ethanol (99.5): the solution is clear, and has no more color than Matching Fluid H.

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of Flopropione according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Flopropione according to Method 3, and perform the test (not more than 2 ppm).

**(4)** Related substances—Dissolve 0.10 g of Flopropione in 10 mL of ethanol (99.5), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (99.5) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of hexane, ethanol (99.5) and acetic acid (100) (40:20:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly *p*-nitrobenzenediazonium TS for spraying on the plate, and dry in cold wind for about 5 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Water** <2.48> Not more than 4.0% (0.5 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Flopropione, dis-

solve in 30 mL of *N,N*-dimethylformamide, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS  
= 18.22 mg of  $C_9H_{10}O_4$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Flopropione Capsules

フロプロピオンカプセル

Flopropione Capsules contain not less than 93.0% and not more than 107.0% of the labeled amount of flopropione ( $C_9H_{10}O_4$ : 182.17).

**Method of preparation** Prepare as directed under the Capsules, with Flopropione.

**Identification (1)** Powder the contents of Flopropione Capsules. To a portion of the powder, equivalent to 60 mg of Flopropione according to the labeled amount, add 40 mL of water, shake well, and filter. To 5 mL of the filtrate add 1 mL of iron (III) nitrate TS: a red-purple color appears.

**(2)** Powder the contents of Flopropione Capsules. To a portion of the powder, equivalent to 90 mg of Flopropione according to the labeled amount, add 100 mL of ethanol (99.5), shake well, and filter. To 5 mL of the filtrate add ethanol (99.5) to make 50 mL. To 5 mL of this solution add ethanol (99.5) to make 100 mL, and use this solution as the sample solution. Determine the absorption spectrum of the sample solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 283 nm and 287 nm.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 capsule of Flopropione Capsules add 43 mL of a mixture of water and phosphoric acid (86:1), and disintegrate the capsule in a water bath at 50°C. After cooling, add a suitable amount of acetonitrile to make exactly *V* mL of a solution containing about 0.4 mg of flopropione ( $C_9H_{10}O_4$ ) per mL. Stir the solution for 10 minutes, centrifuge a part of the solution at 3000 rpm for 5 minutes, and use the supernatant liquid as the sample solution. Proceed as directed in the Assay.

$$\begin{aligned} &\text{Amount (mg) of flopropione } (C_9H_{10}O_4) \\ &= W_S \times (A_T/A_S) \times (V/100) \end{aligned}$$

$W_S$ : Amount (mg) of flopropione for assay, calculated on the anhydrous basis

**Assay** Take out the contents of not less than 20 Flopropione Capsules, weigh accurately the mass of the contents, and power. Weigh accurately a part of the powder, equivalent to about 40 mg of flopropione ( $C_9H_{10}O_4$ ), and add the mobile phase to make exactly 100 mL. Stir the solution for 10 minutes, centrifuge a part of this solution for 5 minutes at 3000 rpm, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 40 mg of

flopropione for assay (previously determine the water <2.48> in the same manner as Flopropione), add 70 mL of the mobile phase, and dissolve by exposure for 10 minutes to ultrasonic vibration. Add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5  $\mu$ L each of the sample solution and standard solution as directed under Liquid chromatography <2.01> according to the following conditions, and determine the peak areas,  $A_T$  and  $A_S$ , of flopropione.

Amount (mg) of flopropione ( $C_9H_{10}O_4$ ) =  $W_S \times (A_T/A_S)$

$W_S$ : Amount (mg) of flopropione for assay, calculated on the anhydrous basis

#### Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 267 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: A mixture of acetonitrile, water and phosphoric acid (114:86:1)

Flow rate: Adjust the flow rate so that the retention time of flopropione is about 3 minutes.

#### System suitability—

System performance: Dissolve 50 mg of flopropione in 50 mL of the mobile phase. To 20 mL of the solution add 25 mL of a solution prepared by dissolving 25 mg of ethyl parahydroxybenzoate in 30 mL of acetonitrile and add water to make 50 mL, and then add the mobile phase to make 50 mL. When the procedure is run with 5  $\mu$ L of this solution under the above operating conditions, Flopropione and ethyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 5  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of flopropione is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Flucytosine

フルシトシン

$C_4H_4FN_3O$ : 129.09

5-Fluorocytosine [2022-85-7]

Flucytosine, when dried, contains not less than 98.5% of  $C_4H_4FN_3O$ , and not less than 14.0% and not more than 15.5% of fluorine (F: 19.00).

**Description** Flucytosine occurs as a white, crystalline powder.

It is odorless.

It is sparingly soluble in water, slightly soluble in methanol, in ethanol (95), in acetic anhydride and in acetic acid (100), and practically insoluble in diethyl ether.

It dissolves in 0.1 mol/L hydrochloric acid TS.

The pH of a solution of Flucytosine (1 in 100) is between 5.5 and 7.5.

It is slightly hygroscopic.

Melting point: about 295°C (with decomposition).

**Identification (1)** Add 0.2 mL of bromine TS to 5 mL of a solution of Flucytosine (1 in 500): a yellow-brown color of bromine TS is immediately discharged. Further add 2 mL of barium hydroxide TS: a purple precipitate is formed.

(2) Proceed with 0.1 g of Flucytosine as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid. The solution responds to the Qualitative Tests <1.09> (2) for fluoride.

(3) Determine the absorption spectrum of a solution of Flucytosine in 0.1 mol/L hydrochloric acid TS (1 in 125,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Flucytosine in 100 mL of water: the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 1.0 g of Flucytosine in 80 mL of water by heating on a water bath. After cooling, to 40 mL of this solution add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(3) Fluoride—Dissolve 0.10 g of Flucytosine in 10.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20). Transfer 5.0 mL of this solution to a 20-mL volumetric flask, add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3, and cerrous nitrate TS (1:1:1), and add water to make 20 mL. Allow the mixture to stand for 1 hour, and use this solution as the sample solution. Separately, transfer 4.0 mL of Standard Fluorine Solution to a 20-mL volumetric flask, add 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3, and cerrous nitrate TS (1:1:1). Proceed in the same manner as directed in the preparation of the sample solution, and use this solution as the standard solution. Transfer 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) to a 20-mL volumetric flask, proceed in the same manner as directed in the preparation of the standard solution, and use this solution as the blank solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 600 nm, using the blank solution as the control as directed under Ultraviolet-visible Spectrophotometry <2.24>:  $A_T$  is not larger than  $A_S$  (not more than 0.048%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of Flucytosine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(5) Arsenic <1.11>—Prepare the test solution with 1.0 g of Flucytosine according to Method 2, and perform the test (not more than 2 ppm).

(6) Related substances—Dissolve 50 mg of Flucytosine in 5 mL of diluted methanol (1 in 2), and use this solution as the sample solution. Measure accurately 1 mL of this solution, add diluted methanol (1 in 2) to make exactly 25 mL. Measure accurately 1 mL of this solution, add diluted methanol (1 in 2) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the chromatogram with a mixture of ethyl acetate, methanol and water (5:3:2) to a distance of about 12 cm, air-dry the plate, and observe the spots under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** (1) Flucytosine—Weigh accurately about 0.2 g of Flucytosine, previously dried, dissolve in 40 mL of acetic acid (100), add 100 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS  
= 12.91 mg of C<sub>4</sub>H<sub>4</sub>FN<sub>3</sub>O

(2) Fluorine—Weigh accurately about 0.01 g of Flucytosine, previously dried, and proceed as directed in the determination of fluorine under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide VS and 20 mL of water as the absorbing liquid.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Fludiazepam

フルジアゼパム

C<sub>16</sub>H<sub>12</sub>ClFN<sub>2</sub>O: 302.73

7-Chloro-5-(2-fluorophenyl)-1-methyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one [3900-31-0]

Fludiazepam, when dried, contains not less than 99.0% of C<sub>16</sub>H<sub>12</sub>ClFN<sub>2</sub>O.

**Description** Fludiazepam occurs as white to light yellow crystals or crystalline powder.

It is very soluble in chloroform, freely soluble in methanol, in ethanol (95), in acetic acid (100) and in diethyl ether, and practically insoluble in water.

**Identification** (1) Prepare the test solution with 0.01 g of

Fludiazepam as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the test solution responds to the Qualitative Tests <1.09> (2) for fluoride.

(2) Determine the absorption spectrum of a solution of Fludiazepam in methanol (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Fludiazepam in methanol (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Fludiazepam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Perform the test with Fludiazepam as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Melting point** <2.60> 91 – 94°C

**Purity** (1) Chloride <1.03>—Dissolve 1.0 g of Fludiazepam in 50 mL of diethyl ether, add 50 mL of water, and shake. Separate the water layer, wash it with two 20-mL portions of diethyl ether, and filter the water layer. To 20 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Fludiazepam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.10 g of Fludiazepam in 20 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 50 mL. Pipet 2 mL of this solution, add chloroform to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and ethyl acetate (10:7) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.30% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g, platinum crucible).

**Assay** Weigh accurately about 0.5 g of Fludiazepam, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any

necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 30.27 mg of  $C_{16}H_{12}ClFN_2O$

**Containers and storage** Containers—Tight containers.

## Flunitrazepam

フルニトラゼパム

$C_{16}H_{12}FN_3O_3$ : 313.28  
5-(2-Fluorophenyl)-1-methyl-7-nitro-1,3-dihydro-2H-1,4-benzodiazepin-2-one [I622-62-4]

Flunitrazepam, when dried, contains not less than 99.0% of  $C_{16}H_{12}FN_3O_3$ .

**Description** Flunitrazepam occurs as a white to pale yellow crystalline powder.

It is freely soluble in acetic acid (100), soluble in acetic anhydride and in acetone, slightly soluble in ethanol (99.5) and in diethyl ether, and practically insoluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Flunitrazepam in ethanol (99.5) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Flunitrazepam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 168 – 172°C

**Purity (1)** Chloride <1.03>—To 1.0 g of Flunitrazepam add 50 mL of water, allow to stand for 1 hour with occasional stirring, and filter. To 20 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test with this solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.022%).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Flunitrazepam according to Method 4 using a platinum crucible, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 50 mg of Flunitrazepam in 10 mL of acetone, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add acetone to make exactly 20 mL. Pipet 1 mL of this solution, add acetone to make exactly 25 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10

$\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1,2-dichloroethane, diethyl ether and ammonia solution (28) (200:100:3) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): number of the spots other than the principal spot from the sample solution is not more than 2, and they are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g, platinum crucible).

**Assay** Weigh accurately about 0.5 g of Flunitrazepam, previously dried, dissolve in 20 mL of acetic acid (100), add 50 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 31.33 mg of  $C_{16}H_{12}FN_3O_3$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Fluocinolone Acetonide

フルオシノロンアセトニド

$C_{24}H_{30}F_2O_6$ : 452.49  
6 $\alpha$ ,9-Difluoro-11 $\beta$ ,21-dihydroxy-16 $\alpha$ ,17-(1-methylethylidenedioxy)pregna-1,4-diene-3,20-dione [67-73-2]

Fluocinolone Acetonide, when dried, contains not less than 97.0% and not more than 102.0% of  $C_{24}H_{30}F_2O_6$ .

**Description** Fluocinolone Acetonide occurs as white crystals or crystalline powder. It is odorless.

It is freely soluble in acetic acid (100) and in acetone, soluble in ethanol (95) and ethanol (99.5), sparingly soluble in methanol and in chloroform, slightly soluble in acetonitrile, very slightly soluble in diethyl ether, and practically insoluble in water.

Melting point: 266 – 274°C (with decomposition).

**Identification (1)** To 2 mg of Fluocinolone Acetonide add 2 mL of sulfuric acid: a yellow color is produced.

(2) Dissolve 0.01 g of Fluocinolone Acetonide in 1 mL of methanol, add 1 mL of Fehling's TS, and heat: a red precipitate is produced.

(3) Proceed as directed under Oxygen Flask Combustion Method <1.06> with 0.01 g of Fluocinolone Acetonide, using

a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid. When the process is completed, shake well, and force the combustion gas into the absorbing liquid: this liquid responds to the Qualitative Tests <1.09> for fluoride.

(4) Determine the infrared absorption spectrum of Fluocinolone Acetonide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Fluocinolone Acetonide Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Fluocinolone Acetonide and Fluocinolone Acetonide Reference Standard in acetone, respectively, then evaporate the acetone to dryness, and repeat the test on the residues.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +98 – +108° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

**Purity** Related substances—Dissolve 15 mg of Fluocinolone Acetonide in 25 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of each solution by the automatic integration method: the total area of the peaks other than the peak of fluocinolone acetonide from the sample solution is not larger than the peak area of fluocinolone acetonide from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with silica gel (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: A mixture of water-saturated chloroform, methanol and acetic acid (100) (200:3:2).

Flow rate: Adjust the flow rate so that the retention time of fluocinolone acetonide is about 12 minutes.

Time span of measurement: About twice as long as the retention time of fluocinolone acetonide beginning after the solvent peak.

**System suitability**—

Test for required detection: To exactly 5 mL of the standard solution add the mobile phase to make exactly 100 mL. Confirm that the peak area of fluocinolone acetonide obtained from 20  $\mu$ L of this solution is equivalent to 4 to 6% of that of fluocinolone acetonide obtained from 20  $\mu$ L of the standard solution.

System performance: Dissolve 15 mg each of Fluocinolone Acetonide and triamcinolone acetonide in 25 mL of the mobile phase. To 5 mL of this solution add the mobile phase to make 20 mL. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, triamcinolone acetonide and fluocinolone acetonide are eluted in this order with the resolution between these peaks being not less than 1.9.

System repeatability: When the test is repeated 6 times with

20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of fluocinolone acetonide is not more than 1.0%.

**Loss on drying** <2.41> Not more than 1.0% (0.2 g, in vacuum, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.2 g, platinum crucible).

**Assay** Dissolve about 20 mg each of Fluocinolone Acetonide and Fluocinolone Acetonide Reference Standard, previously dried and accurately weighed, in 40 mL each of methanol, add exactly 10 mL each of the internal standard solution, then add water to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 20  $\mu$ L each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of fluocinolone acetonide to that of the internal standard, respectively.

$$\begin{aligned} &\text{Amount (mg) of fluocinolone acetonide (C}_{24}\text{H}_{30}\text{F}_2\text{O}_6) \\ &= W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Fluocinolone Acetonide Reference Standard

**Internal standard solution**—A solution of ethyl parahydroxybenzoate (1 in 2500).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilylated silica gel (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of water and acetonitrile (7:3).

Flow rate: Adjust the flow rate so that the retention time of fluocinolone acetonide is about 20 minutes.

**System suitability**—

System performance: Dissolve 5 mg each of isopropyl parahydroxybenzoate and propyl parahydroxybenzoate in 50 mL of acetonitrile, and add water to make 100 mL. When the procedure is run with 20  $\mu$ L of this solution under the above operating conditions, isopropyl parahydroxybenzoate and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 1.9.

System repeatability: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of fluocinolone acetonide to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Fluocinonide

フルオシノニド

$C_{26}H_{32}F_2O_7$ : 494.52  
 6 $\alpha$ ,9-Difluoro-11 $\beta$ ,21-dihydroxy-16 $\alpha$ ,17-(1-methylethylidenedioxy)pregna-1,4-diene-3,20-dione 21-acetate [356-12-7]

Fluocinonide, when dried, contains not less than 97.0% and not more than 103.0% of  $C_{26}H_{32}F_2O_7$ .

**Description** Fluocinonide occurs as white crystals or crystalline powder.

It is sparingly soluble in chloroform, slightly soluble in acetonitrile, in methanol, in ethanol (95) and in ethyl acetate, very slightly soluble in diethyl ether, and practically insoluble in water.

**Identification** (1) To 0.01 g of Fluocinonide add 4 mL of water and 1 mL of Fehling's TS, and heat: a red precipitate is formed.

(2) Prepare the test solution with 0.01 g of Fluocinonide as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbing liquid: the test solution responds to the Qualitative Tests <1.09> for fluoride.

(3) Determine the absorption spectrum of a solution of Fluocinonide in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Fluocinonide Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectra of Fluocinonide and Fluocinonide Reference Standard, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare both spectra: both the sample and the Reference Standard exhibit similar intensities of absorption at the same wave numbers. If any difference appears in the absorption spectra, dissolve the sample and the Reference Standard in ethyl acetate, respectively, evaporate the ethyl acetate, and perform the test with the residue in the same manner.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +81 – +89° (after drying, 0.2 g, chloroform, 20 mL, 100 mm).

**Purity** Related substances—Dissolve 10 mg of Fluocinonide in 2 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add chloroform to make exactly 100, and use this solution as the standard solution. Perform the test with these solutions as

directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (97:3) to a distance of about 12 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (0.5 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g, platinum crucible).

**Assay** Weigh accurately about 20 mg of Fluocinonide and Fluocinonide Reference Standard, previously dried, dissolve each in 50 mL of acetonitrile, to each add exactly 8 mL of the internal standard solution and water to make 100 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of fluocinonide to that of the internal standard, respectively.

$$\begin{aligned} &\text{Amount (mg) of fluocinonide (C}_{26}\text{H}_{32}\text{F}_2\text{O}_7) \\ &= W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Fluocinonide Reference Standard

**Internal standard solution**—A solution of propyl benzoate in acetonitrile (1 in 100).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: A mixture of acetonitrile and water (1:1).

**Flow rate**: Adjust the flow rate so that the retention time of fluocinonide is about 8 minutes.

**System suitability**—

**System performance**: When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, fluocinonide and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

**System repeatability**: When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of fluocinonide to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

## Fluorescein Sodium

フルオレセインナトリウム

$C_{20}H_{10}Na_2O_5$ : 376.27

Disodium 2-(6-oxido-3-oxo-3*H*-xanthen-9-yl)benzoate  
[518-47-8]

Fluorescein Sodium contains not less than 98.5% of  $C_{20}H_{10}Na_2O_5$ , calculated on the dried basis.

**Description** Fluorescein Sodium occurs as an orange powder. It is odorless, and tasteless.

It is freely soluble in water, in methanol and in ethanol (95), and practically insoluble in diethyl ether.

It is hygroscopic.

**Identification (1)** To a solution of Fluorescein Sodium (1 in 100) having a strong green fluorescence, add a large quantity of water: the fluorescence remains. Acidify the solution with hydrochloric acid: the fluorescence disappears. Then render the solution alkaline with sodium hydroxide TS: the fluorescence reappears.

**(2)** Place 1 drop of a solution of Fluorescein Sodium (1 in 2000) on a piece of filter paper: a yellow spot develops. Expose the spot, while moist, to the vapor of bromine for 1 minute and then to ammonia vapor: the yellow color of the spot changes to red.

**(3)** Char 0.5 g of Fluorescein Sodium by ignition, cool, mix the residue with 20 mL of water, and filter: the filtrate responds to the Qualitative Tests <1.09> for sodium salt.

**Purity (1)** Clarity and color of solution—Dissolve 1 g of Fluorescein Sodium in 10 mL of water: the solution is clear, and shows a red color.

**(2)** Chloride <1.03>—Dissolve 0.15 g of Fluorescein Sodium in 20 mL of water, add 6 mL of dilute nitric acid and water to make 30 mL, and filter. To 20 mL of the filtrate add 2 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.355%).

**(3)** Sulfate <1.14>—Dissolve 0.20 g of Fluorescein Sodium in 30 mL of water, add 2.5 mL of dilute hydrochloric acid and water to make 40 mL, and filter. To 20 mL of the filtrate add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.480%).

**(4)** Zinc—Dissolve 0.10 g of Fluorescein Sodium in 10 mL of water, add 2 mL of hydrochloric acid, and filter. To the filtrate add 0.1 mL of potassium hexacyanoferrate (II) TS: no turbidity is produced immediately.

**(5)** Related substances—Dissolve 0.20 g of Fluorescein Sodium in 10 mL of methanol, and use this solution as the sample solution. Perform the test with this solution as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L of

the sample solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia solution (28) (30:15:1) to a distance of about 10 cm, and air-dry the plate: any colored spot other than the principal spot does not appear.

**Loss on drying** <2.41> Not more than 10.0% (1 g, 105°C, constant mass).

**Assay** Transfer about 0.5 g of Fluorescein Sodium, accurately weighed, to a separator. Dissolve in 20 mL of water, add 5 mL of dilute hydrochloric acid, and extract the solution with four 20-mL portions of a mixture of 2-methyl-1-propanol and chloroform (1:1). Wash each extract successively with the same 10 mL of water. Evaporate the combined extracts on a water bath with the aid of a current of air. Dissolve the residue in 10 mL of ethanol (99.5), evaporate the solution on a water bath to dryness, dry the residue at 105°C for 1 hour, and weigh as fluorescein ( $C_{20}H_{12}O_5$ : 332.31).

Amount (mg) of  $C_{20}H_{10}Na_2O_5$

= amount (mg) of fluorescein ( $C_{20}H_{12}O_5$ )  $\times$  1.1323

**Containers and storage** Containers—Tight containers.

## Fluorometholone

フルオロメトロン

$C_{22}H_{29}FO_4$ : 376.46

9-Fluoro-11 $\beta$ ,17-dihydroxy-6 $\alpha$ -methylpregna-1,4-diene-3,20-dione [426-13-1]

Fluorometholone, when dried, contains not less than 97.0% and not more than 103.0% of  $C_{22}H_{29}FO_4$ .

**Description** Fluorometholone occurs as a white to light yellowish white, odorless, crystalline powder.

It is freely soluble in pyridine, slightly soluble in methanol, in ethanol (99.5) and in tetrahydrofuran, and practically insoluble in water and in diethyl ether.

**Identification (1)** Proceed with 7 mg of Fluorometholone as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbing liquid: the liquid responds to the Qualitative Tests <1.09> (2) for fluoride.

**(2)** Determine the absorption spectrum of a solution of Fluorometholone in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Fluorometholone Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(3)** Determine the infrared absorption spectrum of Fluorometholone, previously dried, as directed in the potassi-

um bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Fluorometholone Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +52 – +60° (after drying, 0.1 g, pyridine, 10 mL, 100 mm).

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Fluorometholone according to Method 3, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 20 mg of Fluorometholone in 10 mL of tetrahydrofuran, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add tetrahydrofuran to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer chromatography <2.03>. Spot 25  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, acetone and methanol (45:5:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (0.2 g, in vacuum, phosphorus (V) oxide, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2 % (0.2 g, platinum crucible).

**Assay** Weigh accurately about 0.1 g each of Fluorometholone and Fluorometholone Reference Standard, previously dried, and dissolve each in methanol to make exactly 100 mL. Pipet 5 mL each of these solutions, and add diluted methanol (7 in 10) to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 10 mL of the internal standard solution and diluted methanol (7 in 10) to make 100 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 20  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of fluorometholone to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of fluorometholone (C}_{22}\text{H}_{29}\text{FO}_4) \\ &= W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Fluorometholone Reference Standard

**Internal standard solution**—A solution of butyl parahydroxybenzoate in methanol (1 in 10,000).

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column about 4 mm in inside diameter and 25 to 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 35°C.

**Mobile phase:** Diluted methanol (7 in 10).

**Flow rate:** Adjust the flow rate so that the retention time of

fluorometholone is about 8 minutes.

**Selection of column:** Proceed with 20  $\mu$ L of the standard solution under the above operating conditions, and calculate the resolution. Use a column giving elution of fluorometholone and the internal standard in this order with the resolution between these peaks being not less than 4.

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Fluorouracil

フルオロウラシル

$C_4H_3FN_2O_2$ : 130.08  
5-Fluorouracil [51-21-8]

Fluorouracil, when dried, contains not less than 98.5% of  $C_4H_3FN_2O_2$ , and not less than 13.1% and not more than 16.1% of fluorine (F: 19.00).

**Description** Fluorouracil occurs as white crystals or crystalline powder. It is odorless.

It is freely soluble in *N,N*-dimethylformamide, sparingly soluble in water, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 282°C (with decomposition).

**Identification (1)** Add 0.2 mL of bromine TS to 5 mL of a solution of Fluorouracil (1 in 500): the color of bromine TS is discharged. Further add 2 mL of barium hydroxide TS: a purple precipitate is formed.

(2) Determine the absorption spectrum of a solution of Fluorouracil in 0.1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Proceed with 0.01 g of Fluorouracil as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid. After combustion is completed, shake well to absorb the gas evolved: the solution responds to the Qualitative Tests <1.09> for fluoride.

**Purity (1)** Clarity and color of solution—Add 20 mL of water to 0.20 g of Fluorouracil, and dissolve by warming: the solution is clear and colorless.

(2) Fluoride—Dissolve 0.10 g of Fluorouracil in 10.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20). Transfer 5.0 mL of this solution to a 20-mL volumetric flask, add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3, and cerium (III) nitrate TS (1:1:1), and add water to make 20 mL. Allow to stand for 1 hour, and use this solution as the sample solution. Separately, transfer 1.0 mL of Standard Fluorine Solution to a 20-mL volumetric flask, add 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), and add 10 mL of a mixture

of alizarin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3, and cerium (III) nitrate TS (1:1:1). Proceed in the same manner as directed for the preparation of the sample solution, and use this solution as the standard solution. Perform the test as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution, prepared with 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) in the same manner, as the blank: the absorbance of the sample solution at 600 nm is not larger than that of the standard solution (not more than 0.012%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Fluorouracil according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—To 1.0 g of Fluorouracil in a crucible add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10), ignite the ethanol to burn, and incinerate by strong heating at 750°C to 850°C. If a carbonized substance remains in this method, moisten with a small amount of nitric acid, and incinerate by strong heating. Cool, add 10 mL of dilute hydrochloric acid to the residue, dissolve it by warming on a water bath, use this solution as the test solution, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.10 g of Fluorouracil in 10 mL of water, and use this solution as the sample solution. Measure exactly 1 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetone and water (7:4:1) to a distance of about 12 cm, air-dry the plate, and examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, 80°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay (1) Fluorouracil**—Weigh accurately about 0.2 g of Fluorouracil, previously dried, dissolve in 20 mL of *N,N*-dimethylformamide, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide VS until the color of the solution changes from yellow through blue-green to blue (indicator: 3 drops of thymol blue-dimethylformamide TS). Perform a blank determination.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS  
= 13.01 mg of C<sub>4</sub>H<sub>3</sub>FN<sub>2</sub>O<sub>2</sub>

(2) Fluorine—Weigh accurately about 4 mg of Fluorouracil, previously dried, and proceed as directed in the determination of fluorine under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid.

**Containers and storage** Containers—Tight containers.

## Fluoxymesterone

フルオキシメステロン

C<sub>20</sub>H<sub>29</sub>FO<sub>3</sub>; 336.44

9-Fluoro-11 $\beta$ ,17 $\beta$ -dihydroxy-17-methylandrosta-4-en-3-one  
[76-43-7]

Fluoxymesterone, when dried, contains not less than 97.0% and not more than 102.0% of C<sub>20</sub>H<sub>29</sub>FO<sub>3</sub>.

**Description** Fluoxymesterone occurs as white crystals or crystalline powder. It is odorless.

It is sparingly soluble in methanol, slightly soluble in ethanol (95) and in chloroform, very slightly soluble in diethyl ether, and practically insoluble in water.

**Identification (1)** Dissolve 5 mg of Fluoxymesterone in 2 mL of sulfuric acid: a yellow color develops.

(2) Prepare the test solution with 0.01 g of Fluoxymesterone as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbing liquid: the test solution responds to the Qualitative Tests <1.09> (2) for fluoride.

(3) Determine the absorption spectrum of a solution of Fluoxymesterone in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Fluoxymesterone Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Fluoxymesterone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Fluoxymesterone Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Fluoxymesterone and Fluoxymesterone Reference Standard in ethanol (99.5), respectively, then evaporate the ethanol to dryness, and repeat the test on the residues.

**Optical rotation** <2.49> [ $\alpha$ ]<sub>D</sub><sup>20</sup>: +104 – +112° (after drying, 0.1 g, ethanol (95), 10 mL, 100 mm).

**Purity (1) Heavy metals** <1.07>—Proceed with 0.5 g of Fluoxymesterone according to Method 2, and perform the test. Prepare the control solution with 1.5 mL of Standard Lead Solution (not more than 30 ppm).

(2) Related substances—Dissolve 0.03 g of Fluoxymesterone in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed

under Thin-layer Chromatography <2.03>. Spot 10  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene, ethanol (95) and ethyl acetate (3:1:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (0.5 g, platinum crucible).

**Assay** Weigh accurately about 25 mg each of Fluoxymesterone and Fluoxymesterone Reference Standard, previously dried, dissolve each in the internal standard solution to make exactly 100 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of fluoxymesterone to that of the internal standard, respectively.

$$\begin{aligned} & \text{Amount (mg) of } \text{C}_{20}\text{H}_{29}\text{FO}_3 \\ & = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Fluoxymesterone Reference Standard

**Internal standard solution**—A solution of methylprednisolone in a mixture of chloroform and methanol (19:1) (1 in 5000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 30 cm in length, packed with silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature**: A constant temperature of about 25°C.

**Mobile phase**: A mixture of *n*-butyl chloride, water-saturated *n*-butyl chloride, tetrahydrofuran, methanol and acetic acid (100) (95:95:14:7:6).

**Flow rate**: Adjust the flow rate so that the retention time of fluoxymesterone is about 9 minutes.

**System suitability**—

**System performance**: When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, fluoxymesterone and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

**System repeatability**: When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of fluoxymesterone to that of the internal standard is not more than 1.5%.

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Fluphenazine Enanthate

フルフェナジンエナント酸エステル

$\text{C}_{29}\text{H}_{38}\text{F}_3\text{N}_3\text{O}_2\text{S}$ : 549.69

2-(4-{3-[2-(Trifluoromethyl)-10*H*-phenothiazin-10-yl]propyl} piperazin-1-yl)ethyl heptanoate [2746-81-8]

Fluphenazine Enanthate, when dried, contains not less than 98.5% of  $\text{C}_{29}\text{H}_{38}\text{F}_3\text{N}_3\text{O}_2\text{S}$ .

**Description** Fluphenazine Enanthate is a light yellow to yellowish orange viscous liquid. It is generally clear, and can be opaque by producing crystals.

It is freely soluble in methanol and in diethyl ether, soluble in acetic acid (100) and in ethanol (95), and practically insoluble in water.

**Identification** (1) Prepare the test solution with 0.01 g of Fluphenazine Enanthate as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the test solution responds to the Qualitative Tests <1.09> for fluoride.

(2) Dissolve 2 mg of Fluphenazine Enanthate in 200 mL of a solution of hydrochloric acid in methanol (17 in 2000). Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Fluphenazine Enanthate as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Fluphenazine Enanthate according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(2) Related substances—Dissolve 0.25 g of Fluphenazine Enanthate in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetone, hexane and ammonia solution (28) (16:6:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution. Then spray evenly diluted sulfuric acid (1 in 2) on the plate: the spots

other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 1.0% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.5 g of Flurazepam Enanthate, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 27.49 mg of C<sub>29</sub>H<sub>38</sub>F<sub>3</sub>N<sub>3</sub>O<sub>2</sub>S

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Flurazepam

フルラゼパム

C<sub>21</sub>H<sub>23</sub>ClFN<sub>3</sub>O: 387.88

7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one [17617-23-1]

Flurazepam, when dried, contains not less than 99.0% of C<sub>21</sub>H<sub>23</sub>ClFN<sub>3</sub>O.

**Description** Flurazepam occurs as white to light yellow crystals or crystalline powder.

It is very soluble in chloroform, freely soluble in methanol, in ethanol (95), in acetic anhydride and in diethyl ether, and practically insoluble in water.

**Identification** (1) Dissolve 0.01 g of Flurazepam in 3 mL of sulfuric acid: the solution shows a greenish yellow fluorescence under ultraviolet light (main wavelength: 365 nm).

(2) Dissolve 0.01 g of Flurazepam in 3 mL of citric acid-acetic acid TS, and heat in a water bath for 4 minutes: a dark red color develops.

(3) Prepare the test solution with 0.01 g of Flurazepam as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbing liquid: the test solution responds to the Qualitative Tests <1.09> (2) for fluoride.

(4) Determine the absorption spectrum of a solution of Flurazepam in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Flurazepam in methanol (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>,

and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) Perform the test with Flurazepam as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Melting point** <2.60> 79 – 83°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Flurazepam in 10 mL of ethanol (95): the solution is clear and colorless to light yellow.

(2) Chloride <1.03>—Dissolve 1.0 g of Flurazepam in 50 mL of diethyl ether, add 46 mL of water and 4 mL of sodium carbonate TS, shake, separate the water layer, wash with two 20-mL portions of diethyl ether, and filter the water layer. Neutralize 20 mL of the filtrate with dilute nitric acid, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(3) Sulfate <1.14>—Neutralize 20 mL of the filtrate obtained in (2) with dilute hydrochloric acid, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(4) Heavy metals <1.07>—Proceed with 2.0 g of Flurazepam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Arsenic <1.11>—Prepare the test solution with 1.0 g of Flurazepam according to Method 3, and perform the test (not more than 2 ppm).

(6) Related substances—Dissolve 0.20 g of Flurazepam in 20 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 20 mL. Pipet 3 mL of this solution, add chloroform to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of cyclohexane, acetone and ammonia solution (28) (60:40:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.20% (1 g, in vacuum, 60°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g, platinum crucible).

**Assay** Weigh accurately about 0.3 g of Flurazepam, previously dried, dissolve in 50 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS to the second equivalence point (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 19.39 mg of C<sub>21</sub>H<sub>23</sub>ClFN<sub>3</sub>O

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Flurazepam Capsules

フルラゼパムカプセル

Flurazepam Capsules contain not less than 93% and not more than 107% of the labeled amount of flurazepam ( $C_{21}H_{23}ClFN_3O$ : 387.88).

**Method of preparation** Prepare as directed under Capsules, with Flurazepam.

**Identification (1)** Powder the contents of Flurazepam Capsules. To a quantity of the powder, equivalent to 0.1 g of Flurazepam according to the labeled amount, add 100 mL of 0.1 mol/L hydrochloric acid TS, stir, and filter. To 40 mL of the filtrate add 80 mL of a solution of sodium hydroxide (1 in 250) and 100 mL of hexane, extract by shaking well, and use the hexane layer as the sample solution. Evaporate 25 mL of the sample solution on a water bath to dryness. Dissolve the residue in 3 mL of sulfuric acid: the solution shows a greenish yellow fluorescence under ultraviolet light.

(2) Evaporate 25 mL of the sample solution obtained in (1) on a water bath to dryness. Dissolve the residue in 3 mL of citric acid-acetic acid TS, and heat in a water bath for 4 minutes: a dark red color develops.

(3) Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 315 nm and 319 nm, and a minimum between 297 nm and 301 nm.

**Assay** Weigh accurately the contents of not less than 20 Flurazepam Capsules, and powder the combined contents. Weigh accurately a portion of the powder, equivalent to about 0.05 g of flurazepam ( $C_{21}H_{23}ClFN_3O$ ), add 30 mL of methanol, stir well for 10 minutes, and add methanol to make exactly 50 mL. Filter this solution, discard the first 20 mL of the filtrate, pipet 6 mL of the subsequent filtrate, add methanol to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.05 g of flurazepam for assay, previously dried in vacuum at 60°C for 2 hours, and dissolve in methanol to make exactly 50 mL. Pipet 6 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 317 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

$$\begin{aligned} &\text{Amount (mg) of flurazepam (C}_{21}\text{H}_{23}\text{ClFN}_3\text{O)} \\ &= W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of flurazepam for assay

**Containers and storage** Containers—Tight containers.

## Flurazepam Hydrochloride

フルラゼパム塩酸塩

$C_{21}H_{23}ClFN_3O \cdot HCl$ : 424.34  
7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one monohydrochloride [36105-20-1]

Flurazepam Hydrochloride, when dried, contains not less than 99.0% of  $C_{21}H_{23}ClFN_3O \cdot HCl$ .

**Description** Flurazepam Hydrochloride occurs as white to yellowish white crystals or crystalline powder.

It is freely soluble in water, in ethanol (95), in ethanol (99.5) and in acetic acid (100).

Melting point: about 197°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Flurazepam Hydrochloride in sulfuric acid-ethanol TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Flurazepam Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Flurazepam Hydrochloride (1 in 20) responds to the Qualitative Tests <1.09> for chloride.

**pH** <2.54> Dissolve 1.0 g of Flurazepam Hydrochloride in 20 mL of water: the pH of this solution is between 5.0 and 6.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Flurazepam Hydrochloride in 10 mL of water: the solution is clear and colorless to pale yellow.

(2) Sulfate <1.14>—Perform the test with 1.5 g of Flurazepam Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.011%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Flurazepam Hydrochloride in a platinum crucible according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 0.05 g of Flurazepam Hydrochloride in 5 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 50 mL. Pipet 1 mL of this solution, add ethanol (95) to make exactly 10 mL, and use

this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu\text{L}$  each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Place the plate in a chamber filled with ammonia vapor, allow to stand for about 15 minutes, and immediately develop the plate with a mixture of diethyl ether and diethylamine (39:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): not more than 3 spots other than the principal spot and the spot on the starting point from the sample solution appear, and are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Flurbiprofen Hydrochloride, previously dried, dissolve in 10 mL of acetic acid (100), add 40 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 21.22 mg of  $\text{C}_{21}\text{H}_{23}\text{ClFN}_3\text{O}\cdot\text{HCl}$

**Containers and storage** Containers—Tight containers.

## Flurbiprofen

フルルビプロフェン

$\text{C}_{15}\text{H}_{13}\text{FO}_2$ : 244.26  
(2*S*)-2-(2-Fluorobiphenyl-4-yl)propanoic acid  
[5104-49-4]

Flurbiprofen, when dried, contains not less than 98.0% of  $\text{C}_{15}\text{H}_{13}\text{FO}_2$ .

**Description** Flurbiprofen occurs as a white, crystalline powder. It has a slightly irritating odor.

It is freely soluble in methanol, in ethanol (95), in acetone and in diethyl ether, soluble in acetonitrile, and practically insoluble in water.

A solution of Flurbiprofen in ethanol (95) (1 in 50) shows no optical rotation.

**Identification** (1) Determine the absorption spectrum of a solution of Flurbiprofen in methanol (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Flurbiprofen, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry

<2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 114 – 117°C

**Purity** (1) Chloride <1.03>—Dissolve 0.6 g of Flurbiprofen in 40 mL of acetone, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.25 mL of 0.01 mol/L hydrochloric acid VS add 40 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.015%).

(2) Heavy metals <1.07>—Dissolve 2.0 g of Flurbiprofen in 30 mL of acetone, and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 30 mL of acetone, 2 mL of dilute acetic acid and water to make 50 mL (not more than 10 ppm).

(3) Related substances—Dissolve 20 mg of Flurbiprofen in 10 mL of a mixture of water and acetonitrile (11:9), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add a mixture of water and acetonitrile (11:9) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: each area of the peaks other than the peak of flurbiprofen from the sample solution is not larger than the peak area of flurbiprofen from the standard solution, and the total area of these peaks is not larger than twice the peak area of flurbiprofen from the standard solution.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 30°C.

**Mobile phase:** A mixture of water, acetonitrile and acetic acid (100) (12:7:1).

**Flow rate:** Adjust the flow rate so that the retention time of flurbiprofen is about 20 minutes.

**Time span of measurement:** About twice as long as the retention time of flurbiprofen beginning after the solvent peak.

**System suitability**—

**Test for required detection:** To exactly 5 mL of the standard solution add a mixture of water and acetonitrile (11:9) to make exactly 25 mL. Confirm that the peak area of flurbiprofen obtained from 20  $\mu\text{L}$  of this solution is equivalent to 16 to 24% of that of flurbiprofen obtained from 20  $\mu\text{L}$  of the standard solution.

**System performance:** Dissolve 0.04 g of flurbiprofen and 0.02 g of butyl parahydroxybenzoate in 100 mL of a mixture of water and acetonitrile (11:9). To 5 mL of this solution add a mixture of water and acetonitrile (11:9) to make 50 mL. When the procedure is run with 20  $\mu\text{L}$  of this solution under the above operating conditions, butyl parahydroxybenzoate

and flurbiprofen are eluted in this order with the resolution between these peaks being not less than 12.

**System repeatability:** When the test is repeated 6 times with 20  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the peak area of flurbiprofen is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.10% (1 g, in vacuum at a pressure not exceeding 0.67 kPa, silica gel, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g, platinum crucible).

**Assay** Weigh accurately about 0.6 g of Flurbiprofen, previously dried, dissolve in 50 mL of ethanol (95), and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 24.43 mg of  $\text{C}_{15}\text{H}_{13}\text{FO}_2$

**Containers and storage** Containers—Well-closed containers.

## Folic Acid

葉酸

$\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$ ; 441.40  
*N*-[4-[(2-Amino-4-hydroxypteridin-6-ylmethyl)amino]benzoyl]-*L*-glutamic acid [59-30-3]

Folic Acid contains not less than 98.0% and not more than 102.0% of  $\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$ , calculated on the anhydrous basis.

**Description** Folic Acid occurs as a yellow to orange-yellow, crystalline powder. It is odorless.

It is practically insoluble in water, in methanol, in ethanol (95), in pyridine and in diethyl ether.

It dissolves in hydrochloric acid, in sulfuric acid, in dilute sodium hydroxide TS and in a solution of sodium carbonate decahydrate (1 in 100), and these solutions are yellow in color.

It is slowly affected by light.

**Identification** (1) Dissolve 1.5 mg of Folic Acid in dilute sodium hydroxide TS to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Folic Acid Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) To 10 mL of the solution obtained in (1) add 1 drop of potassium permanganate TS, and mix well until the color changes to blue, and immediately observe under ultraviolet light (main wavelength: 365 nm): a blue fluorescence is

produced.

**Purity** (1) Clarity and color of solution—Dissolve 0.10 g of Folic Acid in 10 mL of dilute sodium hydroxide TS: the solution is clear and yellow in color.

(2) Free amines—Pipet 30 mL of the sample solution obtained in the Assay, add 20 mL of dilute hydrochloric acid and water to make exactly 100 mL, and use this solution as the sample solution. Weigh accurately about 50 mg of *p*-Aminobenzoylglutamic Acid Reference Standard, previously dried in a desiccator (in vacuum, silica gel) for 4 hours, dissolve in diluted ethanol (95) (2 in 5) to make exactly 100 mL. Pipet 3 mL of this solution, add water to make exactly 1000 mL, and use this solution as the standard solution. Pipet 4 mL each of the sample solution and the standard solution, proceed as directed in the Assay, and perform the test as directed under Ultraviolet-visible Spectrophotometry <2.24>. Determine the absorbances,  $A_T$  and  $A_S$ , of subsequent solutions of the sample solution and the standard solution at 550 nm: the content of free amines is not more than 1.0%.

Content (%) of free amines =  $(A_T/A_S) \times (W'/W)$

$W$ : Amount (mg) of Folic Acid, calculated on the anhydrous basis

$W'$ : Amount (mg) of *p*-Aminobenzoylglutamic Acid Reference Standard

**Water** <2.48> Not more than 8.5% (10 mg, coulometric titration).

**Residue on ignition** <2.44> Not more than 0.5% (1 g).

**Assay** Weigh accurately about 50 mg each of Folic Acid and Folic Acid Reference Standard. To each add 50 mL of dilute sodium hydroxide TS, mix well to dissolve, add dilute sodium hydroxide TS to make exactly 100 mL, and use these solutions as the sample solution and standard solution. To 30 mL each of these solutions, accurately measured, add 20 mL of dilute hydrochloric acid and water to make exactly 100 mL. To 60 mL each of these solutions add 0.5 g of zinc powder, and allow to stand with frequent shaking for 20 minutes. Filter each mixture through a dry filter paper, and discard the first 10 mL of the filtrate. Pipet 10 mL each of the subsequent filtrate, and add water to make exactly 100 mL. To 4 mL each of solutions, accurately measured, add 1 mL of water, 1 mL of dilute hydrochloric acid and 1 mL of a solution of sodium nitrite (1 in 1000), mix well, and allow to stand for 2 minutes. To each solution add 1 mL of a solution of ammonium amidosulfate (1 in 200), mix thoroughly, and allow to stand for 2 minutes. To each of these solutions, add 1 mL of a solution of *N*-(1-naphthyl)-*N'*-diethylethylenediamine oxalate (1 in 1000), shake, allow to stand for 10 minutes, and add water to make exactly 20 mL. Separately, to 30 mL of the sample solution, accurately measured, add 20 mL of dilute hydrochloric acid and water to make exactly 100 mL. Pipet 10 mL of this solution, add 18 mL of dilute hydrochloric acid and water to make exactly 100 mL. Pipet 4 mL of this solution, and prepare the blank solution in the same manner as the sample solution. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared with 4 mL of water in the same manner as a blank. Determine the absorbances,  $A_T$ ,  $A_S$  and  $A_C$ , of the subsequent solution of the sample solution, the standard solution and the blank solution at 550 nm.

Amount (mg) of  $\text{C}_{19}\text{H}_{19}\text{N}_7\text{O}_6$

$$= W_S \times \{(A_T - A_C)/A_S\}$$

$W_S$ : Amount (mg) of Folic Acid Reference Standard, calculated on the anhydrous basis

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Folic Acid Injection

葉酸注射液

Folic Acid Injection is an aqueous solution for injection.

It contains not less than 95% and not more than 115% of the labeled amount of folic acid ( $C_{19}H_{19}N_7O_6$ : 441.40).

**Method of preparation** Dissolve Folic Acid in water with the aid of Sodium Hydroxide or Sodium Carbonate, and prepare as directed under Injections.

**Description** Folic Acid Injection is a yellow to orange-yellow, clear liquid.

pH: 8.0 – 11.0

**Identification (1)** To a volume of Folic Acid Injection, equivalent to 1.5 mg of Folic Acid according to the labeled amount, add dilute sodium hydroxide TS to make 100 mL. Proceed as directed in the Identification (2) under Folic Acid, using this solution as the sample solution.

(2) Determine the absorption spectrum of the sample solution obtained in (1) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 255 nm and 257 nm, between 281 nm and 285 nm and between 361 nm and 369 nm. Separately, determine the maximal absorbances of the sample solution,  $A_1$  and  $A_2$ , between 255 nm and 257 nm and between 361 nm and 369 nm, respectively: the ratio of  $A_1/A_2$  is between 2.80 and 3.00.

(3) Folic Acid Injection responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Extractable volume** <6.05> It meets the requirement.

**Assay** To an exactly measured volume of Folic Acid Injection, equivalent to about 50 mg of folic acid ( $C_{19}H_{19}N_7O_6$ ) add dilute sodium hydroxide TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Folic Acid Reference Standard, dissolve in dilute sodium hydroxide TS to make exactly 100 mL, and use this solution as the standard solution. Proceed with 30 mL each of the sample solution and standard solution, exactly measured, as directed in the Assay under Folic Acid.

$$\begin{aligned} &\text{Amount (mg) of folic acid (C}_{19}\text{H}_{19}\text{N}_7\text{O}_6) \\ &= W_S \times \{(A_T - A_C)/A_S\} \end{aligned}$$

$W_S$ : Amount (mg) of Folic Acid Reference Standard, calculated on the anhydrous basis

**Containers and storage** Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant.

## Folic Acid Tablets

葉酸錠

Folic Acid Tablets contain not less than 90% and not more than 115% of the labeled amount of folic acid ( $C_{19}H_{19}N_7O_6$ : 441.40).

**Method of preparation** Prepare as directed under Tablets, with Folic Acid.

**Identification (1)** Take a quantity of powdered Folic Acid Tablets, equivalent to 1.5 mg of Folic Acid according to the labeled amount, add 100 mL of dilute sodium hydroxide TS, shake, and filter. Discard the first 10 mL of the filtrate, use the subsequent filtrate as the sample solution, and proceed as directed in the Identification (2) under Folic Acid.

(2) Determine the absorption spectrum of the filtrate obtained in (1) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 255 nm and 257 nm, between 281 nm and 285 nm and between 361 nm and 369 nm. Separately, determine the maximal absorbances of the filtrate,  $A_1$  and  $A_2$ , between 255 nm and 257 nm and between 361 nm and 369 nm, respectively: the ratio of  $A_1/A_2$  is between 2.80 and 3.00.

**Assay** Weigh accurately and powder not less than 20 Folic Acid Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of folic acid ( $C_{19}H_{19}N_7O_6$ ). Add 50 mL of dilute sodium hydroxide TS, shake frequently, then filter into a 100-mL volumetric flask, and wash with dilute sodium hydroxide TS. To the combined filtrate and washings add dilute sodium hydroxide TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Folic Acid Reference Standard, dissolve in dilute sodium hydroxide TS to make exactly 100 mL, and use this solution as the standard solution. Take 30 mL each of the sample solution and standard solution, exactly measured, and proceed as directed in the Assay under Folic Acid.

$$\begin{aligned} &\text{Amount (mg) of folic acid (C}_{19}\text{H}_{19}\text{N}_7\text{O}_6) \\ &= W_S \times \{(A_T - A_C)/A_S\} \end{aligned}$$

$W_S$ : Amount (mg) of Folic Acid Reference Standard, calculated on the anhydrous basis

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Formalin

ホルマリン

Formalin contains not less than 35.0% and not more than 38.0% of formaldehyde ( $CH_2O$ : 30.03.)

It contains 5% to 13% of methanol to prevent polymerization.

**Description** Formalin is a clear, colorless liquid. Its vapor is

irritating to the mucous membrane.

It is miscible with water and with ethanol (95).

When stored for a long time, especially in a cold place, it may become cloudy.

**Identification (1)** Dilute 2 mL of Formalin with 10 mL of water in a test tube, and add 1 mL of silver nitrate-ammonia TS: a gray precipitate is produced, or a silver mirror is formed on the wall of the test tube.

**(2)** To 5 mL of sulfuric acid in which 0.1 g of salicylic acid has been dissolved add 2 drops of Formalin, and warm the solution: a persistent, dark red color develops.

**Purity** Acidity—Dilute 20 mL of Formalin with 20 mL of water, and add 5.0 mL of 0.1 mol/L sodium hydroxide VS and 2 drops of bromothymol blue TS: a blue color develops.

**Residue on ignition** <2.44> Not more than 0.06 w/v% (5 mL, after evaporation).

**Assay** Weigh accurately a weighing bottle containing 5 mL of water, add about 1 g of Formalin, and weigh accurately again. Add water to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 50 mL of 0.05 mol/L iodine VS and 20 mL of potassium hydroxide TS, and allow to stand for 15 minutes at an ordinary temperature. To this mixture add 15 mL of dilute sulfuric acid, and titrate <2.50> the excess iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank determination.

Each mL of 0.05 mol/L iodine VS = 1.501 mg of CH<sub>2</sub>O

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Formalin Water

ホルマリン水

Formalin Water contains not less than 0.9 w/v% and not more than 1.1 w/v% of formaldehyde (CH<sub>2</sub>O: 30.03).

### Method of preparation

Formalin	30 mL
Water or Purified Water	a sufficient quantity
To make 1000 mL	

Prepare by mixing the above ingredients.

**Description** Formalin Water is a clear, colorless liquid. It has a slight odor of formaldehyde.

It is almost neutral.

**Assay** Transfer 20 mL of Formalin Water, measured exactly, to a 100-mL volumetric flask containing 2.5 mL of 1 mol/L sodium hydroxide VS, and add water to make 100 mL. Pipet 10 mL of this solution, and proceed as directed in the Assay under Formalin.

Each mL of 0.05 mol/L iodine VS = 1.501 mg of CH<sub>2</sub>O

**Containers and storage** Containers—Tight containers.

## Formoterol Fumarate Hydrate

ホルモテロール fumarate 水和物

(C<sub>19</sub>H<sub>24</sub>N<sub>2</sub>O<sub>4</sub>)<sub>2</sub>·C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>·2H<sub>2</sub>O: 840.91

*N*-(2-Hydroxy-5-((1*RS*)-1-hydroxy-

2-[(1*RS*)-2-(4-methoxyphenyl)-

1-methylethylamino]ethyl) phenyl)formamide

hemifumarate monohydrate [43229-80-7, anhydride]

Formoterol Fumarate Hydrate contains not less than 98.5% of formoterol fumarate [(C<sub>19</sub>H<sub>24</sub>N<sub>2</sub>O<sub>4</sub>)<sub>2</sub>·C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>: 804.88], calculated on the anhydrous basis.

**Description** Formoterol Fumarate Hydrate occurs as a white to yellowish white, crystalline powder.

It is freely soluble in acetic acid (100), soluble in methanol, very slightly soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

A solution of Formoterol Fumarate in methanol (1 in 100) shows no optical rotation.

Melting point: about 138°C (with decomposition).

**Identification (1)** Dissolve 0.5 g of Formoterol Fumarate Hydrate in 20 mL of 0.5 mol/L sulfuric acid TS, and extract with three 25-mL portions of diethyl ether. Wash the combined diethyl ether extracts with 10 mL of 0.5 mol/L sulfuric acid TS, and evaporate the ether layer under reduced pressure, and dry the residue at 105°C for 3 hours: the residue melts <2.60> at about 290°C (with decomposition, in a sealed tube).

**(2)** Determine the absorption spectrum of a solution of Formoterol Fumarate Hydrate in methanol (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(3)** Determine the infrared absorption spectrum of Formoterol Fumarate Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Formoterol Fumarate Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(2)** Related Substances—Dissolve 0.20 g of Formoterol Fumarate Hydrate in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard

solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, 1,4-dioxane, ethanol (99.5) and ammonia solution (28) (20:20:10:3) to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand for 5 minutes in iodine vapor: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Water** <2.48> 4.0 – 5.0% (0.5 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.7 g of Formoterol Fumarate Hydrate, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 40.24 mg of  $(C_{19}H_{24}N_2O_4)_2 \cdot C_4H_4O_4$

**Containers and storage** Containers—Tight containers.

## Fosfestrol

### Diethylstilbestrol Diphosphate

ホスフェストロール

$C_{18}H_{22}O_8P_2$ : 428.31

(*E*)-4,4'-(Hex-3-ene-3,4-diyl)bis(phenyl dihydrogen phosphate) [522-40-7]

Fosfestrol, when dried, contains not less than 98.5% of  $C_{18}H_{22}O_8P_2$ .

**Description** Fosfestrol occurs as a white, crystalline powder. It is odorless.

It is freely soluble in ethanol (95), soluble in formamide, slightly soluble in water, and practically insoluble in acetonitrile and in diethyl ether.

It dissolves in sodium hydroxide TS.

Melting point: about 234°C (with decomposition).

**Identification (1)** Dissolve 15 mg of Fosfestrol in 1 mL of sulfuric acid: a yellow to orange color develops. To this solution add 10 mL of water: the color of the solution disappears.

(2) Determine the infrared absorption spectrum of Fosfestrol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or with the spectrum of Fosfestrol Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Place 0.4 g of Fosfestrol in a crucible, wet by adding 0.1 mL of sulfuric acid, and heat to carbonize. Add 10 mL of water to the residue, stir well, and filter. Add 0.1 mL of nitric acid to the filtrate, and heat in a water bath for 15 minutes: this solution responds to the Qualitative Tests <1.09> for phosphate.

**pH** <2.54> Dissolve 0.10 g of Fosfestrol in 30 mL of water: the pH of this solution is between 1.0 and 2.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Fosfestrol in 15 mL of sodium hydroxide TS: the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 0.10 g of Fosfestrol in 30 mL of ethanol (95), add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.70 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid, 30 mL of ethanol (95) and water to make 50 mL (not more than 0.248%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Fosfestrol according to Method 4, and perform the test. Use a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 5). Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Fosfestrol according to Method 3, and perform the test. Use a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 5) (not more than 2 ppm).

(5) Free phosphoric acid—Weigh accurately about 0.4 g of Fosfestrol, dissolve in a mixture of water and formamide (1:1) to make exactly 200 mL, and use this solution as the sample solution. Separately, weigh accurately 0.112 g of monobasic potassium phosphate, previously dried in a desiccator (silica gel) to constant mass, dissolve in 10 mL of diluted sulfuric acid (1 in 10) and water to make exactly 1000 mL. Measure exactly 10 mL of this solution, add 100 mL of formamide and water to make exactly 200 mL, and use this solution as the standard solution. Measure exactly 10 mL each of the sample solution and standard solution, and place in a 25-mL volumetric flask, respectively. To each of these solutions add 2.5 mL of hexaammonium heptamolybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, shake, add water to make 25 mL, and allow to stand at  $20 \pm 1^\circ\text{C}$  for 30 minutes. Perform the test with these solutions, using a solution obtained in the same manner with 10 mL of a mixture of water and formamide (1:1) as the blank, as directed under Ultraviolet-visible Spectrophotometry <2.24>. Determine the absorbances,  $A_T$  and  $A_S$ , of the solutions obtained from the sample solution and standard solution at 740 nm: the amount of free phosphoric acid is not more than 0.2%.

Amount (%) of free phosphoric acid ( $H_3PO_4$ )  
=  $(A_T/A_S) \times (1/W) \times 80.65$

$W$ : Amount (mg) of Fosfestrol

(6) Related substances—Dissolve 20 mg of Fosfestrol in 100 mL of the mobile phase, and use this solution as the sample solution. Measure exactly 5 mL of this solution, and add the mobile phase to make exactly 50 mL. Pipet 3 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the total area of the peaks other than the peak of fosfestrol from the sample solution is not larger than the peak area of fosfestrol from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 240 nm).

**Column:** A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu\text{m}$  in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of a solution of potassium dihydrogen phosphate (1 in 500), acetonitrile and tetrabutylammonium hydroxide TS (70:30:1).

**Flow rate:** Adjust the flow rate so that the retention time of fosfestrol is about 8 minutes.

**Selection of column:** Dissolve 0.02 g of Fosfestrol and 8 mg of methyl parahydroxybenzoate in 100 mL of the mobile phase. Proceed with 10  $\mu\text{L}$  of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of methyl parahydroxybenzoate and fosfestrol in this order with the resolution between these peaks being not less than 3.

**Detection sensitivity:** Adjust the detection sensitivity so that the peak height of fosfestrol obtained from 10  $\mu\text{L}$  of the standard solution is between 5 mm and 15 mm.

**Time span of measurement:** Three times as long as the retention time of fosfestrol.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 4 hours).

**Assay** Weigh accurately about 0.2 g of Fosfestrol, previously dried, dissolve in 60 mL of water, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). The end point is the second equivalent point. Perform a blank determination, and make any necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L sodium hydroxide VS} \\ = 10.71 \text{ mg of } \text{C}_{18}\text{H}_{22}\text{O}_8\text{P}_2 \end{aligned}$$

**Containers and storage** Containers—Tight containers.

## Fosfestrol Tablets

### Diethylstilbestrol Diphosphate Tablets

ホスフェストロール錠

Fosfestrol Tablets contain not less than 93% and not more than 107% of the labeled amount of fosfestrol ( $\text{C}_{18}\text{H}_{22}\text{O}_8\text{P}_2$ ; 428.31).

**Method of preparation** Prepare as directed under Tablets, with Fosfestrol.

**Identification (1)** To a quantity of powdered Fosfestrol Tablets, equivalent to 0.5 g of Fosfestrol according to the labeled amount, add 50 mL of 0.1 mol/L hydrochloric acid TS, shake well, and filter. To the filtrate add 100 mL of diethyl ether, extract, and evaporate carefully the diethyl ether extract on a water bath to dryness. Proceed with 0.015 g of the residue as directed in the Identification (1) under Fosfestrol.

(2) Dry 0.01 g of the residue obtained in (1) at 105°C for 4 hours, and determine the infrared absorption spectrum as

directed in the potassium bromide disk method under Infrared Spectrometry <2.25>: it exhibits absorption at the wave numbers of about 2970  $\text{cm}^{-1}$ , 1605  $\text{cm}^{-1}$ , 1505  $\text{cm}^{-1}$ , 1207  $\text{cm}^{-1}$  and 1006  $\text{cm}^{-1}$ .

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Fosfestrol Tablets at 50 revolutions per minute according to the Paddle method, using 900 mL of water. Take 20 mL or more of the dissolved solution 20 minutes after starting the test, and filter through a membrane filter with pore size of not more than 0.8  $\mu\text{m}$ . Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent, add a solution of sodium hydroxide (1 in 250) to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Fosfestrol Reference Standard, previously dried at 105°C for 4 hours, and dissolve in a solution of sodium hydroxide (1 in 250) to make exactly 100 mL. Pipet 2 mL of this solution, add a solution of sodium hydroxide (1 in 250) to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 242 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

The dissolution rate of Fosfestrol Tablets in 20 minutes is not less than 80%.

$$\begin{aligned} \text{Dissolution rate (\%)} \text{ with respect to the labeled amount} \\ \text{of fosfestrol (C}_{18}\text{H}_{22}\text{O}_8\text{P}_2) \\ = W_S \times (A_T/A_S) \times (1/C) \times 180 \end{aligned}$$

$W_S$ : Amount (mg) of Fosfestrol Reference Standard

$C$ : Labeled amount (mg) of fosfestrol ( $\text{C}_{18}\text{H}_{22}\text{O}_8\text{P}_2$ ) in 1 tablet

**Assay** Weigh accurately not less than 20 Fosfestrol Tablets, and powder. Weigh accurately a quantity of the powder, equivalent to about 1 g of fosfestrol ( $\text{C}_{18}\text{H}_{22}\text{O}_8\text{P}_2$ ) according to the labeled amount, add 100 mL of a solution of sodium hydroxide (1 in 125), shake well, add water to make exactly 500 mL. Filter this solution, discard the first 30 mL of the filtrate, pipet the subsequent 2 mL of the filtrate, add 30 mL of a solution of sodium hydroxide (1 in 125) and water to make exactly 250 mL, and use this solution as the sample solution. Separately, weigh accurately about 80 mg of Fosfestrol Reference Standard, previously dried at 105°C for 4 hours, and dissolve in a solution of sodium hydroxide (1 in 125) to make exactly 50 mL. Pipet 1 mL of this solution, add 10 mL of a solution of sodium hydroxide (1 in 125) and water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 242 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

$$\begin{aligned} \text{Amount (mg) of fosfestrol (C}_{18}\text{H}_{22}\text{O}_8\text{P}_2) \\ = W_S \times (A_T/A_S) \times (25/2) \end{aligned}$$

$W_S$ : Amount (mg) of Fosfestrol Reference Standard

**Containers and storage** Containers—Tight containers.

## Fosfomycin Calcium Hydrate

ホスホマイシンカルシウム水和物

$C_3H_5CaO_4P \cdot H_2O$ : 194.14

Monocalcium (2*R*,3*S*)-3-methyloxiran-2-ylphosphonate monohydrate [26016-98-8]

Fosfomycin Calcium Hydrate is the calcium salt of a substance having antibacterial activity produced by the growth of *Streptomyces fradiae* or by the chemical synthesis.

It contains not less than 725  $\mu$ g (potency) and not more than 805  $\mu$ g (potency) per mg, calculated on the anhydrous basis. The potency of Fosfomycin Calcium Hydrate is expressed as mass (potency) of fosfomycin ( $C_3H_7O_4P$ : 138.06).

**Description** Fosfomycin Calcium Hydrate occurs as a white crystalline powder.

It is slightly soluble in water, and practically insoluble in methanol and in ethanol (99.5).

**Identification (1)** Determine the infrared absorption spectrum of Fosfomycin Calcium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Determine the spectrum of a solution of Fosfomycin Calcium Hydrate in heavy water for nuclear magnetic resonance spectroscopy (1 in 300), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> (<sup>1</sup>H): it exhibits a double signal at around  $\delta$  1.5 ppm, a double signal at around  $\delta$  2.9 ppm, a multiple signal at around  $\delta$  3.3 ppm, and no signal at around  $\delta$  1.4 ppm.

(3) A solution of Fosfomycin Calcium Hydrate (1 in 500) responds to the Qualitative Tests <1.09> (3) for calcium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-2.5 - -5.4^\circ$  (0.5 g calculated on the anhydrous bases, 0.4 mol/L disodium dihydrogen ethylenediamine tetraacetate TS, pH 8.5, 10 mL, 100 mm).

**Phosphorus Content** Weigh accurately about 0.1 g of Fosfomycin Calcium Hydrate, add 40 mL of sodium periodate (107 in 10,000) and 2 mL of perchloric acid, and heat in a water bath for 1 hour. After cooling, add water to make exactly 200 mL. Pipet 10 mL of this solution, and add 1 mL of potassium iodide TS. To this solution add sodium thiosulfate TS until the solution is colorless, add water to make exactly 100 mL, and use this solution as the sample stock solution. Separately, weigh accurately about 70 mg of potassium dihydrogenphosphate, proceed with this solution in the same manner as directed for the preparation of the sample stock solution, and use the solution so obtained as the standard stock solution. Proceed and prepare a solution in the same manner for the preparation of the sample stock solution without using Fosfomycin Calcium, and use the solution so

obtained as the blank stock solution. Pipet 5 mL each of the sample stock solution, the standard stock solution, and the blank stock solution, add 2.5 mL of ammonium molybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, mix, and add water to make exactly 25 mL, and use these solutions as the sample solution, the standard solution, and the blank solution, respectively. After allowing these solutions to stand for 30 minutes at  $20 \pm 1^\circ C$ , perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as a blank, and determine the absorbances at 740 nm,  $A_T$ ,  $A_S$  and  $A_B$ , of the sample solution, the standard solution and the blank solution: the content of phosphorus is 15.2 – 16.7%.

$$\begin{aligned} & \text{Amount (mg) of phosphorus (P)} \\ & = W_S \times \{(A_T - A_B)/(A_S - A_B)\} \times 0.22760 \end{aligned}$$

$W_S$ : Amount (mg) of potassium dihydrogenphosphate

**Calcium Content** Weigh accurately about 0.2 g of Fosfomycin Calcium Hydrate, add 4 mL of 1 mol/L Hydrochloric acid TS, and shake well until the sample is completely dissolved. To this solution add 100 mL of water, 9 mL of sodium hydroxide TS and 0.1 g of methylthymol blue-sodium chloride indicator, and titrate <2.50> with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from clear blue to gray or gray-purple: calcium content is 19.6 – 21.7%. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 2.004 mg of Ca

**Purity (1)** Heavy metals <1.07>—To 1.0 g of Fosfomycin Calcium Hydrate add 40 mL of 0.25 mol/L acetic acid TS and water to make 50 mL. Proceed with this solution according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Fosfomycin Calcium Hydrate according to Method 3, and perform the test (not more than 2 ppm).

**Water** <2.48> Not more than 12.0% (0.1 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Proteus* sp. (MB838)

(ii) Culture medium—Dissolve 5.0 g of peptone, 3.0 g of meat extract, 2.0 g of yeast extract, and 15 g of agar in 1000 mL of water, sterilize, and use as the agar media for base layer and seed layer with the pH of between 6.5 and 6.6 after sterilization.

(iii) Seeded agar layer—Incubate the test organism on the slant of the agar medium for transferring test organisms at  $37^\circ C$  for 40 – 48 hours. Subcultures at least three times. Inoculate the grown organisms onto the surface of 300 mL of the agar medium for transferring test organisms in a Roux bottle, incubate at  $37^\circ C$  for 40 – 48 hours, and suspend the grown organisms in about 30 mL of water. To the suspension add water, and use this as the stock suspension of test organ-

ism. The amount of the water to be added is adjust so that the percent transmission at 560 nm of the suspension diluted ten times with water is 17%. Keep the stock suspension at 10°C or below and use within 7 days. Add 1.0–2.0 mL of the stock suspension of test organism to 100 mL of the agar medium for seed layer previously kept at 48°C, mix thoroughly, and use this as the deeded agar layer.

(iv) Standard solutions—Weigh accurately an amount of Fosfomycin Phenethylammonium Reference Standard equivalent to about 20 mg (potency), dissolve in 0.05 mol/L Tris buffer solution, pH 7.0 to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.05 mol/L Tris buffer solution, pH 7.0 to make solutions so that each mL contains 10 µg (potency) and 5 µg (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(v) Sample solutions—Weigh accurately an amount of Fosfomycin Calcium Hydrate equivalent to about 20 mg (potency), and dissolve in 0.05 mol/L Tris buffer solution, pH 7.0 to make exactly 50 mL. To exactly a suitable amount of this solution add 0.05 mol/L Tris buffer solution, pH 7.0 to make solutions so that each mL contains 10 µg (potency) and 5 µg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Fosfomycin Sodium

ホスホマイシンナトリウム

$C_3H_5Na_2O_4P$ : 182.02

Disodium (2*R*,3*S*)-3-methyloxiran-2-ylphosphonate  
[26016-99-9]

Fosfomycin Sodium is the sodium salt of a substance having antibacterial activity produced by the growth of *Streptomyces fradiae* or by the chemical synthesis.

It contains not less than 725 µg (potency) and not more than 770 µg (potency) per mg, calculated on the anhydrous basis. The potency of Fosfomycin Sodium is expressed as mass (potency) of fosfomycin ( $C_3H_7O_4P$ : 138.06).

**Description** Fosfomycin Sodium occurs as a white crystalline powder.

It is very soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol (99.5).

**Identification** (1) Determine the infrared absorption spectrum of Fosfomycin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at

the same wave numbers.

(2) Determine the spectrum of a solution of Fosfomycin Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 300), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> ( $^1H$ ): it exhibits a double signal at around  $\delta$  1.5 ppm, a duple double signal at around  $\delta$  2.8 ppm, a multiple signal at around  $\delta$  3.3 ppm, and no signal at around  $\delta$  1.3 ppm.

(3) A solution of Fosfomycin Sodium (1 in 500) responds to the Quantitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-3.5 - -5.5^\circ$  (0.5 g calculated on the anhydrous bases, water, 10 mL, 100 mm).

**pH** <2.54> Dissolve 0.70 g of Fosfomycin Sodium in 10 mL of water: the pH of the solution is between 8.5 and 10.5.

**Phosphorus Content** Weigh accurately about 0.1 g of Fosfomycin Sodium, add 40 mL of a solution of sodium periodate (107 in 10,000) and 2 mL of perchloric acid, and heat in a water bath for 1 hour. After cooling, add water to make exactly 200 mL. Pipet 10 mL of this solution, and add 1 mL of potassium iodide TS. To this solution add sodium thiosulfate TS until the solution is colorless, add water to make exactly 100 mL, and use this solution as the sample stock solution. Separately, weigh accurately about 70 mg of potassium dihydrogenphosphate, proceed with this solution in the same manner as directed for the preparation of the sample stock solution, and use the solution so obtained as the standard stock solution. Proceed and prepare a solution in the same manner for the preparation of the sample stock solution without using Fosfomycin Sodium, and use the solution so obtained as the blank stock solution. Pipet 5 mL each of the sample stock solution, the standard stock solution, and the blank stock solution, add 2.5 mL of ammonium molybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, mix, and add water to make exactly 25 mL, and use these solutions as the sample solution, the standard solution, and the blank solution, respectively. After allowing these solutions to stand for 30 minutes at  $20 \pm 1^\circ C$ , perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as a blank, and determine the absorbances at 740 nm,  $A_T$ ,  $A_S$  and  $A_B$ , of the sample solution, the standard solution and the blank solution: the content of phosphorus is 16.2–17.9%.

$$\begin{aligned} &\text{Amount (mg) of phosphorus (P)} \\ &= W \times \{(A_T - A_B)/(A_S - A_B)\} \times 0.22760 \end{aligned}$$

$W$ : Amount (mg) of potassium dihydrogenphosphate

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Fosfomycin Sodium in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Fosfomycin Sodium according to Method 1, and perform the test. Prepare the control solution with 2.0 mL Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Fosfomycin Sodium according to Method 3, and perform the test (not more than 2 ppm).

**Water** <2.48> Not more than 3.0% (0.2 g, volumetric titra-

tion, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Proteus* sp. (MB838)

(ii) Culture medium—Mix 5.0 g of peptone, 3.0 g of meat extract, 2.0 g of yeast extract, and 15 g of agar in 1000 mL of water, sterilize, and use as the agar media for base layer and seed layer with the pH of between 6.5 and 6.6 after sterilization.

(iii) Seeded agar layer—Incubate the test organism on the slant of the agar medium for transferring test organisms at 37 °C for 40 – 48 hours. Subcultures at least three times. Inoculate the grown organisms onto the surface of 300 mL of the agar medium for transferring test organisms in a Roux bottle, incubate at 37 °C for 40 – 48 hours, and suspend the grown organisms in about 30 mL of water. To the suspension add water, and use this as the stock suspension of test organism. The amount of the water to be added is adjust so that the percent transmission at 560 nm of the suspension diluted ten times with water is 17%. Keep the stock suspension at 10 °C or below and use within 7 days. Add 1.0 – 2.0 mL of the stock suspension of test organism to 100 mL of the agar medium for seed layer previously kept at 48 °C, mix thoroughly, and use this as the deeded agar layer.

(iv) Standard solutions—Weigh accurately an amount of Fosfomycin Phenethylammonium Reference Standard equivalent to about 20 mg (potency), dissolve in 0.05 mol/L Tris buffer solution, pH 7.0 to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5 °C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.05 mol/L Tris buffer solution, pH 7.0 to make solutions so that each mL contains 10 µg (potency) and 5 µg (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(v) Sample solutions—Weigh accurately an amount of Fosfomycin Sodium equivalent to about 20 mg (potency), and dissolve in 0.05 mol/L Tris buffer solution, pH 7.0 to make exactly 50 mL. To exactly a suitable amount of this solution add 0.05 mol/L Tris buffer solution, pH 7.0 to make solutions so that each mL contains 10 µg (potency) and 5 µg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Hermetic containers.

## Fosfomycin Sodium for Injection

注射用ホスホマイシシナトリウム

Fosfomycin Sodium for Injection is a preparation for injection which is dissolved before use. It contains not less than 90.0% and not more than 110.0% of the labeled amount of fosfomycin (C<sub>3</sub>H<sub>7</sub>O<sub>4</sub>P: 138.06).

**Method of preparation** Prepare as directed under Injections, with Fosfomycin Sodium.

**Description** Fosfomycin Sodium for Injection occurs as a

white crystalline powder.

**Identification (1)** Dissolve about 0.1 g of Fosfomycin Sodium for Injection in 3 mL of a solution of perchloric acid (1 in 4), add 1 mL of 0.1 mol/L sodium periodate solution, and heat in a water bath at 60 °C for 30 minutes. After cooling, add 50 mL of water, neutralize with saturated sodium hydrogen carbonate solution, and add 1 mL of potassium iodide TS; the solution does not reveal a red color, while the blank solution reveals a red color.

(2) To 2 mL of a solution of Fosfomycin Sodium for Injection (1 in 250) add 1 mL of perchloric acid and 2 mL of 0.1 mol/L sodium periodate solution, and heat in a water bath for 10 minutes. After cooling, add 1 mL of ammonium molybdate-sulfuric acid TS and 1 mL of 1-amino-2-naphthol-4-sulfonic acid TS, and allow to stand for 30 minutes: a blue color develops.

(3) Dissolve an amount of Fosfomycin Sodium for Injection, equivalent to 0.1 g (potency) of Fosfomycin Sodium, in 50 mL of water. Perform the test with this solution as directed in the Identification (3) under Fosfomycin Sodium.

**pH <2.54>** The pH of a solution prepared by dissolving an amount of Fosfomycin Sodium for Injection, equivalent to 1.0 g (potency) of Fosfomycin Sodium according to the labeled amount, in 20 mL of water is between 6.5 and 8.5.

**Purity** Clarity and color of solution—Dissolve an amount of Fosfomycin Sodium for Injection, equivalent to 1.0 g (potency) of Fosfomycin Sodium according to the labeled amount, in 10 mL of water: the solution is clear and colorless.

**Water <2.48>** Not more than 4.0% (25 mg, volumetric titration, direct titration).

**Bacterial endotoxins <4.01>** Less than 0.025 EU/mg (potency).

**Uniformity of dosage unit <6.02>** It meets the requirement of the Mass variation test.

**Foreign insoluble matter <6.06>** Perform the test according to the Method 2: it meets the requirement.

**Insoluble particulate matter <6.07>** Perform the test according to the Method 1: it meets the requirement.

**Sterility <4.06>** Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, culture medium, seeded agar layer, and standard solutions—Proceed as directed in the Assay under Fosfomycin Sodium.

(ii) Sample solutions—Weigh accurately the mass of the contents of not less than 10 Fosfomycin Sodium for Injection. Weigh accurately an amount of the content, equivalent to about 20 mg (potency) of Fosfomycin Sodium according to the labeled amount, and dissolve in 0.05 mol/L tris buffer solution, pH 7.0 to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.05 mol/L tris buffer solution, pH 7.0 to make solutions so that each mL contains 10 µg (potency) and 5 µg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Hermetic containers. Polyethylene or polypropylene containers for aqueous injections may be used.

## Fradiomycin Sulfate

### Neomycin Sulfate

フラジオマイシン硫酸塩

C<sub>23</sub>H<sub>46</sub>N<sub>6</sub>O<sub>13</sub>·3H<sub>2</sub>SO<sub>4</sub>: 908.88

Fradiomycin Sulfate B

2,6-Diamino-2,6-dideoxy-α-D-glucopyranosyl-(1→4)-[2,6-diamino-2,6-dideoxy-β-L-idopyranosyl-(1→3)-β-D-ribofuranosyl-(1→5)]-2-deoxy-D-streptomine trisulfate [119-04-0, Neomycin B]

Fradiomycin Sulfate C

2,6-Diamino-2,6-dideoxy-α-D-glucopyranosyl-(1→4)-[2,6-diamino-2,6-dideoxy-β-L-idopyranosyl-(1→3)-β-D-ribofuranosyl-(1→5)]-2-deoxy-D-streptomine trisulfate [66-86-4, Neomycin C] [1405-10-3, Neomycin Sulfate]

Fradiomycin Sulfate is the sulfate of a mixture of aminoglycoside substances having antibacterial activity produced by the growth of *Streptomyces fradiae*.

It, when dried, contains not less than 623 μg (potency) and not more than 740 μg (potency) per mg. The potency of Fradiomycin Sulfate is expressed as mass (potency) of fradiomycin (C<sub>23</sub>H<sub>46</sub>N<sub>6</sub>O<sub>13</sub>: 614.64).

**Description** Fradiomycin Sulfate occurs as a white to light yellow powder.

It is freely soluble in water, and practically insoluble in ethanol (95).

It is hygroscopic.

**Identification (1)** Dissolve 50 mg each of Fradiomycin Sulfate and Fradiomycin Sulfate Reference Standard in 1 mL of water, and use these solutions as the sample solution and the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 2 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the

plate with a mixture of methanol, ammonia solution (28) and dichloromethane (3:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and heat at 110°C for 15 minutes: the R<sub>f</sub> values of the principal spots from the sample solution and the standard solution are not different each other.

(2) A solution of Fradiomycin Sulfate (1 in 20) responds to the Qualitative Tests <1.09> (1) for sulfate.

**Optical rotation** <2.49> [α]<sub>D</sub><sup>20</sup>: +53.5 – +59.0° (1 g calculated on the dried basis, water, 10 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 1.0 g of Fradiomycin Sulfate in 10 mL of water is between 5.0 and 7.5.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Fradiomycin Sulfate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Fradiomycin Sulfate according to Method 1, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.63 g of Fradiomycin Sulfate in 5 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 1 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, ammonia solution (28) and dichloromethane (3:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and heat at 110°C for 15 minutes: the spot at around R<sub>f</sub> 0.4 from the sample solution is not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 8.0% (0.2 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.3% (1 g).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

- |   |         |
|---|---------|
| (i) Test organism— <i>Staphylococcus aureus</i> ATCC 6538 P |         |
| (ii) Agar medium for seed and base layer                    |         |
| Glucose   | 1.0 g   |
| Peptone   | 6.0 g   |
| Meat extract  | 1.5 g   |
| Yeast extract   | 3.0 g   |
| Sodium chloride   | 2.5 g   |
| Agar  | 15.0 g  |
| Water   | 1000 mL |

Mix all the ingredients and sterilize. Adjust the pH after sterilization to 7.8 – 8.0 with sodium hydroxide TS.

(iii) Standard solutions—Weigh accurately an amount of Fradiomycin Sulfate Reference Standard, previously dried, equivalent to about 50 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0 to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 14 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0 to make solutions so

that each mL contains 80  $\mu\text{g}$  (potency) and 20  $\mu\text{g}$  (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Fradiomycin Sulfate, previously dried, equivalent to about 50 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0 to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0 to make solutions so that each mL contains 80  $\mu\text{g}$  (potency) and 20  $\mu\text{g}$  (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Fructose

果糖

$\text{C}_6\text{H}_{12}\text{O}_6$ : 180.16  
 $\beta$ -D-Fructopyranose [57-48-7]

Fructose, when dried, contains not less than 98.0% of  $\text{C}_6\text{H}_{12}\text{O}_6$ .

**Description** Fructose occurs as colorless to white crystals or crystalline powder. It is odorless and has a sweet taste.

It is very soluble in water, sparingly soluble in ethanol (95) and practically insoluble in diethyl ether.

It is hygroscopic.

**Identification (1)** Add 2 to 3 drops of a solution of Fructose (1 in 20) to 5 mL of boiling Fehling's TS: a red precipitate is produced.

(2) Determine the infrared absorption spectrum of Fructose as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**pH** <2.54> Dissolve 4.0 g of Fructose in 20 mL of water: the pH of the solution is between 4.0 and 6.5.

**Purity (1)** Clarity and color of solution—Dissolve 25.0 g of Fructose in 50 mL of water: the solution is clear and has no more color than the following control solution.

Control solution: To a mixture of 1.0 mL of Cobaltous Chloride Stock CS, 3.0 mL of Ferric Chloride Stock CS and 2.0 mL of Cupric Sulfate Stock CS, and add water to make 10.0 mL. To 3.0 mL of the solution add water to make 50 mL.

(2) Acidity—Dissolve 5.0 g of Fructose in 50 mL of freshly boiled and cooled water, and add 3 drops of phenolphthalein TS and 0.60 mL of 0.01 mol/L sodium hydroxide VS: a red color develops.

(3) Chloride <1.03>—Perform the test with 2.0 g of Fructose. Prepare the control solution with 1.0 mL of 0.01 mol/L

hydrochloric acid VS (not more than 0.018%).

(4) Sulfate <1.14>—Perform the test with 2.0 g of Fructose. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(5) Sulfite—Dissolve 0.5 g of Fructose in 5 mL of water, and add 0.25 mL of 0.02 mol/L iodine: the color of the solution is yellow.

(6) Heavy metals <1.07>—Proceed with 5.0 g of Fructose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 4 ppm).

(7) Calcium—Dissolve 0.5 g of Fructose in 5 mL of water, add 2 to 3 drops of ammonia TS and 1 mL of ammonium oxalate TS, and allow to stand for 1 minute: the solution is clear.

(8) Arsenic <1.11>—Dissolve 1.5 g of Fructose in 5 mL of water, heat with 5 mL of dilute sulfuric acid and 1 mL of bromine TS on a water bath for 5 minutes, concentrate to 5 mL, and cool. Perform the test with this solution as the test solution (not more than 1.3 ppm).

(9) 5-Hydroxymethylfurfurals—Dissolve 5.0 g of Fructose in 100 mL of water, and read the absorbance at 284 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbance is not more than 0.32.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, silica gel, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 4 g of Fructose, previously dried, dissolve in 0.2 mL of ammonia TS and 80 mL of water, and after standing for 30 minutes add water to make exactly 100 mL, and determine the optical rotation,  $\alpha_D$ , in a 100-mm cell at  $20 \pm 1^\circ\text{C}$  as directed under Optical Rotation Determination <2.49>.

$$\text{Amount (mg) of } \text{C}_6\text{H}_{12}\text{O}_6 = |\alpha_D| \times 1087.0$$

**Containers and storage** Containers—Tight containers.

## Fructose Injection

果糖注射液

Fructose Injection is an aqueous solution for injection.

It contains not less than 95% and not more than 105% of the labeled amount of fructose ( $\text{C}_6\text{H}_{12}\text{O}_6$ : 180.16).

**Method of preparation** Prepare as directed under Injections, with Fructose. No preservative is added.

**Description** Fructose Injection is a colorless to pale yellow, clear liquid. It has a sweet taste.

**Identification (1)** Take a volume of Fructose Injection, equivalent to 1 g of Fructose according to the labeled amount, dilute with water or concentrate on a water bath to 20 mL, if necessary, and use this solution as the sample solution. Add 2 to 3 drops of the sample solution to 5 mL of boiling Fehling's TS: a red precipitate is produced.

(2) To 10 mL of the sample solution obtained in (1) add 0.1 g of resorcinol and 1 mL of hydrochloric acid, and warm

in a water bath for 3 minutes: a red color develops.

**pH** <2.54> 3.0 – 6.5 In the case where the labeled concentration of the injection exceeds 5%, dilute to 5% with water before the test.

**Purity (1)** Heavy metals <1.07>—Take a volume of Fructose Injection, equivalent to 5.0 g of Fructose, according to the labeled amount, and evaporate on a water bath to dryness. With the residue, proceed according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution.

(2) Arsenic <1.11>—Take a volume of Fructose Injection, equivalent to 1.5 g of Fructose, according to the labeled amount, dilute with water or concentrate on a water bath to 5 mL, if necessary, and add 5 mL of dilute sulfuric acid and 1 mL of bromine TS. Proceed as directed in the purity (8) under Fructose.

**Residue on ignition** <2.44> Measure exactly a volume of Fructose Injection, equivalent to 2 g of Fructose according to the labeled amount, evaporate on a water bath to dryness, and perform the test: the residue weighs not more than 2 mg.

**Extractable volume** <6.05> It meets the requirement.

**Pyrogen** <4.04> Perform the test with Fructose Injection stored in a container in a volume exceeding 10 mL: it meets the requirement.

**Assay** Measure exactly a volume of Fructose Injection equivalent to about 4 g of fructose (C<sub>6</sub>H<sub>12</sub>O<sub>6</sub>), add 0.2 mL of ammonia TS, dilute with water to make exactly 100 mL, shake well, and after allowing to stand for 30 minutes, determine the optical rotation, α<sub>D</sub>, in a 100-mm cell at 20 ± 1°C as directed under Optical Rotation Determination <2.49>.

Amount (mg) of fructose (C<sub>6</sub>H<sub>12</sub>O<sub>6</sub>) = |α<sub>D</sub>| × 1087.0

**Containers and storage** Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

## Furosemide

フロセミド

C<sub>12</sub>H<sub>11</sub>ClN<sub>2</sub>O<sub>5</sub>S: 330.74

4-Chloro-2-[(furan-2-ylmethyl)amino]-5-sulfamoylbenzoic acid [54-31-9]

Furosemide, when dried, contains not less than 98.0% and not more than 101.0% of C<sub>12</sub>H<sub>11</sub>ClN<sub>2</sub>O<sub>5</sub>S.

**Description** Furosemide occurs as white, crystals or crystalline powder.

It is freely soluble in *N,N*-dimethylformamide, soluble in methanol, sparingly soluble in ethanol (99.5), slightly soluble in acetonitrile and in acetic acid (100), and practically insoluble in water.

It dissolves in dilute sodium hydroxide TS.

It is gradually colored by light.

Melting point: about 205°C (with decomposition).

**Identification (1)** Dissolve 25 mg of Furosemide in 10 mL of methanol. To 1 mL of this solution add 10 mL of 2 mol/L hydrochloric acid TS. Heat the solution under a reflux condenser on a water bath for 15 minutes, cool, and add 18 mL of sodium hydroxide TS to make weakly acidic: the solution responds to the Qualitative Tests <1.09> for primary aromatic amines, producing a red to red-purple color.

(2) Determine the absorption spectrum of a solution of Furosemide in dilute sodium hydroxide TS (1 in 125,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Furosemide Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Furosemide as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Furosemide Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Furosemide in 10 mL of a solution of sodium hydroxide (1 in 50): the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 2.6 g of Furosemide in 90 mL of dilute sodium hydroxide TS, add 2 mL of nitric acid, and filter. To 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: To 0.40 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.020%).

(3) Sulfate <1.14>—To 20 mL of the filtrate obtained in (2) add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: To 0.35 mL of 0.005 mol/L sulfuric acid VS add 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.030%).

(4) Heavy metals <1.07>—Proceed with 2.0 g of Furosemide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Related substances—Dissolve 25 mg of Furosemide in 25 mL of the dissolving solution, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the dissolving solution to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of each peak appeared ahead of the peak of furosemide is not more than 2/5 times the peak area of furosemide from the standard solution, the area of each peak appeared behind the peak of furosemide is not more than 1/4 times the peak area of furosemide from the standard solution, and the total area of these peaks is not more than 2 times the peak area of furosemide from the standard solution.

**Dissolving solution**—To 22 mL of acetic acid (100) add a mixture of water and acetonitrile (1:1) to make 1000 mL.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 272 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of water, tetrahydrofuran and acetic acid (100) (70:30:1).

**Flow rate:** Adjust the flow rate so that the retention time of furosemide is about 18 minutes.

**Time span of measurement:** About 2.5 times as long as the retention time of furosemide beginning after the solvent peak.

**System suitability**—

**Test for required detectability:** Measure exactly 2 mL of the standard solution, and add the dissolving solution to make exactly 50 mL. Confirm that the peak area of furosemide obtained from 20  $\mu$ L of this solution is equivalent to 3.2 to 4.8% of that obtained from 20  $\mu$ L of the standard solution.

**System performance:** When the procedure is run with 20  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of furosemide is not less than 7000 and not more than 1.5, respectively.

**System repeatability:** When the test is repeated 6 times with 20  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of furosemide is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Furosemide, previously dried, dissolve in 50 mL of *N,N*-dimethylformamide, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS until the color of the solution changes from yellow to blue (indicator: 3 drops of bromothymol blue TS). Perform a blank determination with a mixture of 50 mL of *N,N*-dimethylformamide and 15 mL of water, and make any necessary correction

$$\begin{aligned} &\text{Each mL of 0.1 mol/L sodium hydroxide VS} \\ &= 33.07 \text{ mg of } C_{12}H_{11}ClN_2O_5S \end{aligned}$$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Furosemide Tablets

フロセミド錠

Furosemide Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of furosemide ( $C_{12}H_{11}ClN_2O_5S$ ; 330.74).

**Method of preparation** Prepare as directed under Tablets,

with Furosemide.

**Identification (1)** Shake well a quantity of powdered Furosemide Tablets, equivalent to 0.2 g of Furosemide according to the labeled amount, with 40 mL of acetone, and filter. To 0.5 mL of the filtrate add 10 mL of 2 mol/L hydrochloric acid TS, and heat under a reflux condenser on a water bath for 15 minutes. After cooling, add 18 mL of sodium hydroxide TS to make the solution slightly acetic: the solution responds to the Qualitative Tests <1.09> for primary aromatic amines, producing a red to red-purple color.

**(2)** Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 227 nm and 231 nm, between 269 nm and 273 nm, and between 330 nm and 336 nm.

**Purity** To a quantity of powdered Furosemide Tablets, equivalent to 40 mg of Furosemide according to the labeled amount, add about 30 mL of acetone, shake well, and add acetone to make exactly 50 mL. Centrifuge the solution, add 3.0 mL of water to 1.0 mL of the supernatant liquid, cool in ice, add 3.0 mL of dilute hydrochloric acid and 0.15 mL of sodium nitrite TS, shake, and allow to stand for 1 minute. Add 1.0 mL of ammonium amidosulfate TS, shake well, allow to stand for 3 minutes, add 1.0 mL of *N,N*-diethyl-*N'*-1-naphthylethylenediamine oxalate TS, shake well, and allow to stand for 5 minutes. Perform the test with this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared in the same manner with 1.0 mL of acetone as the blank: the absorbance at 530 nm is not more than 0.10.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Furosemide Tablets add a suitable amount of 0.05 mol/L sodium hydroxide TS, shake to disintegrate, then add 0.05 mol/L sodium hydroxide TS to make exactly *V* mL so that each mL contains about 0.4 mg of furosemide ( $C_{12}H_{11}ClN_2O_5S$ ). Filter the solution, discard the first 10 mL of the filtrate, pipet the subsequent 2 mL of the filtrate, add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL, and use this solution as the sample solution. Proceed as directed in the Assay.

$$\begin{aligned} &\text{Amount (mg) of furosemide } (C_{12}H_{11}ClN_2O_5S) \\ &= W_S \times (A_T/A_S) \times (V/50) \end{aligned}$$

$W_S$ : Amount (mg) of Furosemide Reference Standard

**Dissolution** <6.10> Perform the test according to the following method: it meets the requirement.

Perform the test with 1 tablet of Furosemide Tablets at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium. Withdraw 20 mL or more of the dissolution medium 15 minutes after starting the test for a 20-mg tablet or 30 minutes after for a 40-mg tablet, and filter through a membrane filter with pore size of not more than 0.45  $\mu$ m. Discard the first 10 mL of the filtrate, pipet *V* mL of the subsequent filtrate, add 2nd fluid for dissolution test to make exactly *V* mL so that each mL contains about 10  $\mu$ g of furosemide ( $C_{12}H_{11}ClN_2O_5S$ ) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Furosemide Reference Standard, previously

dried at 105°C for 4 hours, and dissolve in 5 mL of methanol, and add 2nd fluid for dissolution test to make exactly 100 mL. Pipet 5 mL of this solution, add 2nd fluid for dissolution test to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and the standard solution at 277 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>: the dissolution rates for a 20-mg tablet in 15 minutes and for a 40-mg tablet in 30 minutes are not less than 80%, respectively.

Dissolution rate (%) with respect to the labeled amount of furosemide ( $C_{12}H_{11}ClN_2O_5S$ )

$$= W_S \times (A_T/A_S) \times (V'/V) \times (1/C) \times 45$$

$W_S$ : Amount (mg) of Furosemide Reference Standard

C: Labeled amount (mg) of furosemide ( $C_{12}H_{11}ClN_2O_5S$ ) in 1 tablet

**Assay** Weigh accurately the mass of not less than 20 Furosemide Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 40 mg of furosemide ( $C_{12}H_{11}ClN_2O_5S$ ), add about 70 mL of 0.05 mol/L sodium hydroxide TS, shake well, and add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL. Filter, discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Furosemide Reference Standard, previously dried at 105°C for 4 hours, and dissolve in 0.05 mol/L sodium hydroxide TS to make exactly 50 mL. Pipet 2 mL of this solution, add 0.05 mol/L sodium hydroxide TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 271 nm as directed under the Ultraviolet-visible Spectrophotometry <2.24>.

$$\begin{aligned} &\text{Amount (mg) of furosemide (C}_{12}\text{H}_{11}\text{ClN}_2\text{O}_5\text{S)} \\ &= W_S \times (A_T/A_S) \times 2 \end{aligned}$$

$W_S$ : Amount (mg) of Furosemide Reference Standard

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Fursultiamine Hydrochloride

フルスルチアミン塩酸塩

$C_{17}H_{26}N_4O_3S_2 \cdot HCl$ : 435.00

*N*-(4-Amino-2-methylpyrimidin-5-ylmethyl)-*N*-(1*Z*)-4-hydroxy-1-methyl-2-[(2*RS*)-tetrahydrofuran-2-ylmethyl-disulfanyl]but-1-en-1-yl]formamide monohydrochloride [804-30-8, Fursultiamine]

Fursultiamine Hydrochloride contains not less than

98.5% of  $C_{17}H_{26}N_4O_3S_2 \cdot HCl$ , calculated on the dried basis.

**Description** Fursultiamine Hydrochloride occurs as white crystals or crystalline powder. It is odorless or has a characteristic odor, and has a bitter taste.

It is freely soluble in water, in methanol and in ethanol (95), and practically insoluble in diethyl ether.

**Identification (1)** Dissolve 5 mg of Fursultiamine Hydrochloride in 6 mL of 0.1 mol/L hydrochloric acid TS, add 0.1 g of zinc powder, allow to stand for several minutes, and filter. To 3 mL of the filtrate, add 3 mL of sodium hydroxide TS and 0.5 mL of potassium hexacyanoferrate (III) TS, then add 5 mL of 2-methyl-1-propanol, shake vigorously for 2 minutes, allow to stand to separate the 2-methyl-1-propanol layer, and examine under ultraviolet light (main wavelength: 365 nm): the 2-methyl-1-propanol layer shows a blue-purple fluorescence. The fluorescence disappears by acidifying, and appears again by alkalinizing.

(2) Determine the infrared absorption spectrum of a solution of Fursultiamine Hydrochloride, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 24 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum, or with the spectrum of Fursultiamine Hydrochloride Reference Standard, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 24 hours: both spectra exhibit similar intensities of absorption at the same wave numbers. If any differences appear, dissolve the Fursultiamine Hydrochloride in water, evaporate the water, and dry the residue in a desiccator (in vacuum, phosphorus (V) oxide) for 24 hours, and repeat the test.

(3) A solution of Fursultiamine Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> (2) for chloride.

**Purity (1)** Clarity of solution—Dissolve 1.0 g of Fursultiamine Hydrochloride in 20 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14>—Proceed with 1.5 g of Fursultiamine Hydrochloride, and perform the test. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.011%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Fursultiamine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 0.10 g of Fursultiamine Hydrochloride in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following condition. Determine each peak area of each solution by the automatic integration method: the total area of the peaks other than the peak of fursultiamine from the sample solution is not larger than the peak area of fursultiamine from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, flow rate, and selection of column: Proceed as directed in the operating conditions in the Assay.

Detector sensitivity: Adjust the detection sensitivity so that

the peak height of fursultiamine from 10  $\mu$ L of the standard solution is between 20 mm and 30 mm.

Time span of measurement: About 3 times as long as the retention time of fursultiamine.

**Water** <2.48> Not more than 5.0% (0.3 g, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 55 mg each of Fursultiamine Hydrochloride and Fursultiamine Hydrochloride Reference Standard (previously determined the water <2.48> in the same manner as Fursultiamine Hydrochloride) and dissolve each in 50 mL of water, and add exactly 10 mL each of the internal standard solution, then add water to make exactly 100 mL. To 8 mL each of the solution add water to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of fursultiamine to that of the internal standard, respectively.

$$\begin{aligned} & \text{Amount (mg) of } C_{17}H_{26}N_4O_3S_2 \cdot HCl \\ & = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Fursultiamine Hydrochloride Reference Standard, calculated on the anhydrous basis

**Internal standard solution**—A solution of isopropyl 4-aminobenzoate in ethanol (95) (3 in 400).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Column**: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 50°C.

**Mobile phase**: Dissolve 1.01 g of sodium 1-heptane sulfonate in 1000 mL of diluted acetic acid (100) (1 in 100). To 675 mL of this solution add 325 mL of a mixture of methanol and acetonitrile (3:2).

**Flow rate**: Adjust the flow rate so that the retention time of Fursultiamine is about 9 minutes.

**Selection of column**: Proceed with 10  $\mu$ L of the standard solution under the above operating conditions and calculate the resolution. Use a column giving elution of fursultiamine and the internal standard in this order with the resolution between these peaks being not less than 10.

**Containers and storage** Containers—Tight containers.

## Gabexate Mesilate

ガベキサートメシル酸塩

$C_{16}H_{23}N_3O_4 \cdot CH_4O_3S$ : 417.48

Ethyl 4-(6-guanidinohexanoyloxy)benzoate

monomethanesulfonate [56974-61-9]

Gabexate Mesilate, when dried, contains not less than 98.5% of  $C_{16}H_{23}N_3O_4 \cdot CH_4O_3S$ .

**Description** Gabexate Mesilate occurs as white crystals or crystalline powder.

It is very soluble in water, freely soluble in ethanol (95), and practically insoluble in diethyl ether.

**Identification** (1) To 4 mL of a solution of Gabexate Mesilate (1 in 2000) add 2 mL of 1-naphthol TS and 1 mL of diacetyl TS, and allow to stand for 10 minutes: a red color develops.

(2) Dissolve 1 g of Gabexate Mesilate in 5 mL of water, add 2 mL of sodium hydroxide TS, and heat in a water bath for 5 minutes. After cooling, add 2 mL of dilute nitric acid and 5 mL of ethanol (95), shake, add 5 drops of iron (III) chloride TS, and shake: a purple color develops.

(3) Determine the absorption spectrum of a solution of Gabexate Mesilate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Gabexate Mesilate Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) To 0.1 g of Gabexate Mesilate add 0.2 g of sodium hydroxide, fuse by heating gently, and continue the heating for 20 to 30 seconds. After cooling, add 0.5 mL of water and 3 mL of dilute hydrochloric acid, and warm: the gas evolved changes a potassium iodate-starch paper to blue.

**pH** <2.54> Dissolve 1.0 g of Gabexate Mesilate in 10 mL of water: the pH of the solution is between 4.5 and 5.5.

**Melting point** <2.60> 90 – 93°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Gabexate Mesilate in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Gabexate Mesilate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Dissolve 2.0 g of Gabexate Mesilate in 20 mL of 1 mol/L hydrochloric acid TS by heating in a water bath, and continue the heating for 20 minutes. After cooling, centrifuge, and use 10 mL of the supernatant liquid as the test solution. Perform the test (not more than 2 ppm).

(4) Ethyl parahydroxybenzoate—Weigh 50 mg of Gabexate Mesilate, previously dried, and dissolve in dilute ethanol to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, dissolve 5.0 mg of ethyl parahydroxybenzoate in dilute ethanol to make exactly 100 mL. Pipet 1 mL of this solution, and add dilute ethanol to make exactly 20 mL. To exactly 5 mL of this solution add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 3  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of ethyl parahydroxybenzoate to that of the internal standard:  $Q_T$  is not larger than  $Q_S$ .

**Internal standard solution**—A solution of butyl parahydroxybenzoate in dilute ethanol (1 in 5000).

**Operating conditions**—

Proceed as directed in the operating conditions in the Assay.

**System suitability**—

Proceed as directed in the system suitability in the Assay.

(5) Related substances—Dissolve 0.20 g of Gabexate Mesilate in 5 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and air-dry the plate until it has no acetic odor. Spray evenly a solution of 8-quinolinol in acetone (1 in 1000) on the plate, and after air-drying, spray evenly bromine-sodium hydroxide TS: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.30% (1 g, in vacuum, silica gel, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 50 mg each of Gabexate Mesilate and Gabexate Mesilate Reference Standard, previously dried, and dissolve each in dilute ethanol to make exactly 100 mL. Pipet 5 mL each of these solutions, add exactly 5 mL each of the internal standard solution, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 3  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios,  $Q_T$  and  $Q_S$ , of the peak area of gabexate to that of the internal standard.

$$\begin{aligned} & \text{Amount (mg) of } C_{16}H_{23}N_3O_4 \cdot CH_4O_3S \\ & = W_S \times (Q_T/Q_S) \end{aligned}$$

$W_S$ : Amount (mg) of Gabexate Mesilate Reference Standard

**Internal standard solution**—A solution of butyl parahydroxybenzoate in dilute ethanol (1 in 5000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 245 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol, a solution of sodium lauryl sulfate (1 in 1000), a solution of sodium 1-heptane sulfonate (1 in 200) and acetic acid (100) (540:200:20:1).

Flow rate: Adjust the flow rate so that the retention time of gabexate is about 13 minutes.

**System suitability**—

System performance: When the procedure is run with 3  $\mu$ L of the standard solution under the above operating condi-

tions, the internal standard and gabexate are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 3  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of gabexate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## $\beta$ -Galactosidase (*Aspergillus*)

$\beta$ -ガラクトシダーゼ (アスペルギルス)

[9031-11-2]

$\beta$ -Galactosidase (*Aspergillus*) contains an enzyme produced by *Aspergillus oryzae*. It is an enzyme drug having lactose decomposition activity.

It contains 8000 to 12000 units per g.

Usually, it is diluted with a mixture of Maltose Hydrate and Dextrin, Maltose Hydrate and D-Mannitol, or Maltose Hydrate, Dextrin and D-Mannitol.

**Description**  $\beta$ -Galactosidase (*Aspergillus*) occurs as a white to light yellow powder.

It is slightly soluble in water with a turbidity, and practically insoluble in ethanol (95) and in diethyl ether.

**Identification (1)** Dissolve 25 mg of  $\beta$ -Galactosidase (*Aspergillus*) in 100 mL of water, then to 1 mL of this solution add 9 mL of lactose substrate TS, and stand at 30°C for 10 minutes. To 1 mL of this solution add 6 mL of glucose detection TS, and stand at 30°C for 10 minutes: a red to red-purple color develops.

(2) Dissolve 0.1 g of  $\beta$ -Galactosidase (*Aspergillus*) in 100 mL of water, and filter the solution if necessary. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity (1) Odor**— $\beta$ -Galactosidase (*Aspergillus*) has no any rancid odor.

(2) Heavy metals <1.07>—Proceed with 1.0 g of  $\beta$ -Galactosidase (*Aspergillus*) according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of  $\beta$ -Galactosidase (*Aspergillus*) according to Method 3, and perform the test (not more than 2 ppm).

**Loss on drying** <2.41> Not more than 9.0% (0.5 g, in vacuum, 80°C, 4 hours).

**Residue on ignition** <2.44> Not more than 3% (0.5 g).

**Nitrogen content** Weigh accurately about 70 mg of  $\beta$ -Galactosidase (*Aspergillus*), and perform the test as directed under Nitrogen Determination <1.08>: the amount of nitrogen (N: 14.01) is between 0.5% and 5.0%, calculated on the dried basis.

**Assay** (i) Substrate solution: Dissolve 0.172 g of 2-nitrophenyl- $\beta$ -D-galactopyranoside in disodium hydrogenphosphate-citric acid buffer solution, pH 4.5 to make 100 mL.

(ii) Procedure: Weigh accurately about 25 mg of  $\beta$ -Galactosidase (*Aspergillus*), dissolve in water to make exactly 100 mL, then pipet 2 mL of this solution, add water to make exactly 50 mL, and use this solution as the sample solution. Take exactly 3.5 mL of the substrate solution, stand at  $30 \pm 0.1^\circ\text{C}$  for 5 minutes, add exactly 0.5 mL of the sample solution, immediately mix, and stand at  $30 \pm 0.1^\circ\text{C}$  for exactly 10 minutes, then add exactly 1 mL of sodium carbonate TS and mix immediately. Perform the test as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbance,  $A_1$ , of this solution at 420 nm using water as the control. Separately, take exactly 3.5 mL of the substrate solution, add exactly 1 mL of sodium carbonate TS and mix, then add exactly 0.5 mL of the sample solution and mix. Determine the absorbance,  $A_2$ , of this solution in the same manner as above.

$$\begin{aligned} &\text{Units per g of } \beta\text{-Galactosidase (Aspergillus)} \\ &= (1/W) \times \{(A_1 - A_2)/0.917\} \times (1/0.5) \times (1/10) \end{aligned}$$

0.917: Absorbance of 1  $\mu\text{mol}/5$  mL of *o*-nitrophenol

$W$ : Amount (g) of the sample in the sample solution per mL

Unit: One unit indicates an amount of the enzyme which decomposes 1  $\mu\text{mol}$  of 2-nitrophenyl- $\beta$ -D-galactopyranoside in 1 minute under the above conditions.

**Containers and storage** Containers—Tight containers.

Storage—In a cold place.

## $\beta$ -Galactosidase (Penicillium)

$\beta$ -ガラクトシダーゼ (ペニシリウム)

[9031-11-2]

$\beta$ -Galactosidase (*Penicillium*) contains an enzyme, having lactose decomposition activity, produced by *Penicillium multicolor*.

It contains not less than 8500 units and not more than 11,500 units in each g.

Usually, it is diluted with D-mannitol.

**Description**  $\beta$ -Galactosidase (*Penicillium*) occurs as a white to pale yellowish white, crystalline powder or powder.

It is soluble in water with a turbidity, and practically insoluble in ethanol (95).

It is hygroscopic.

**Identification** (1) Dissolve 0.05 g of  $\beta$ -Galactosidase (*Penicillium*) in 100 mL of water, then to 0.2 mL of this solution add 0.2 mL of lactose substrate TS, and allow to stand at  $30^\circ\text{C}$  for 10 minutes. To this solution add 3 mL of glucose detection TS, and allow to stand at  $30^\circ\text{C}$  for 10 minutes: a red to red-purple color develops.

(2) Dissolve 0.15 g of  $\beta$ -Galactosidase (*Penicillium*) in 100 mL of water, filter if necessary, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maxi-

mum between 278 nm and 282 nm.

**Purity** (1) Odor— $\beta$ -Galactosidase (*Penicillium*) has no any rancid odor.

(2) Heavy metals <1.07>—Proceed with 1.0 g of  $\beta$ -Galactosidase (*Penicillium*) according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of  $\beta$ -Galactosidase (*Penicillium*) according to Method 3, and perform the test (not more than 2 ppm).

(4) Nitrogen—Weigh accurately about 0.1 g of  $\beta$ -Galactosidase (*Penicillium*), and perform the test as directed under Nitrogen Determination <1.08>: not more than 3 mg of nitrogen (N: 14.01) is found for each labeled 1000 Units.

(5) Protein contaminants—Dissolve 0.15 g of  $\beta$ -Galactosidase (*Penicillium*) in 4 mL of water, and use this solution as the sample solution. Perform the test with 15  $\mu\text{L}$  of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than the peak having retention time of about 19 minutes is not more than 75% of the total area of all peaks, and the areas of peaks other than the peaks having retention times of about 3, 16 and 19 minutes are not more than 15% of the total area of all peaks.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column about 7.5 mm in inside diameter and about 75 mm in length, packed with strongly acidic ion-exchange resin for liquid chromatography of sulfopropyl group-binding hydrophilic polymer (10  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about  $20^\circ\text{C}$ .

Mobile phase: A solution obtained by dissolving 2.83 g of sodium acetate in 1000 mL of water, and adjusting to pH 4.5 with acetic acid (100) (mobile phase A), and a solution obtained by dissolving 29.2 g of sodium chloride in 1000 mL of mobile phase A (mobile phase B).

Flow system: Adjust a linear concentration gradient from the mobile phase A to the mobile phase B immediately after injection of the sample so that the retention times of non-retaining protein and the enzyme protein are about 3 minutes and 19 minutes, respectively, when the flow runs 0.8 mL per minute, and then continue the running of the mobile phase B.

Selection of column: Dissolve 15 mg of  $\beta$ -lactoglobulin in 4.5 mL of water, add 0.5 mL of a solution of cytosine (1 in 5000), and use this solution as the column-selecting solution. Proceed with 15  $\mu\text{L}$  of the column-selecting solution under the above operating conditions, and calculate the resolution. Use a column giving elution of cytosine and  $\beta$ -lactoglobulin in this order with the resolution between these peaks being not less than 4.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of  $\beta$ -lactoglobulin from 15  $\mu\text{L}$  of the column-selecting solution is between 5 cm and 14 cm.

Time span of measurement: About 1.4 times as long as the retention time of  $\beta$ -lactoglobulin.

**Loss on drying** <2.41> Not more than 5.0% (0.5 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Residue on ignition** <2.44> Not more than 2% (1 g).

**Assay** (i) Substrate solution—Dissolve 0.603 g of 2-nitrophenyl- $\beta$ -D-galactopyranoside in disodium hydrogen phosphate-citric acid buffer solution, pH 4.5 to make 100 mL.

(ii) Procedure—Weigh accurately about 0.15 g of  $\beta$ -Galactosidase (Penicillium), dissolve in water with thorough shaking to make exactly 100 mL, and allow to stand at room temperature for an hour. Pipet 2 mL of this solution, add disodium hydrogen phosphate-citric acid buffer solution, pH 4.5 to make exactly 100 mL, and use this solution as the sample solution. Transfer exactly 0.5 mL of the sample solution to a test tube, stand at  $30 \pm 0.1^\circ\text{C}$  for 10 minutes, add exactly 0.5 mL of the substrate solution previously kept at  $30 \pm 0.1^\circ\text{C}$ , then mix immediately, and stand at  $30 \pm 0.1^\circ\text{C}$  for exactly 10 minutes. Then add exactly 1 mL of sodium carbonate TS, mix immediately to stop the reaction. To this solution add exactly 8 mL of water, mix, and use as the colored sample solution. Separately, pipet 0.5 mL of disodium hydrogen phosphate-citric acid buffer solution, pH 4.5, then proceed in the same manner as the sample solution, and use the solution so obtained as the colored blank solution. Perform the test with the colored sample solution and the colored blank solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the blank, and determine the absorbances,  $A_T$  and  $A_B$ , at 420 nm.

$$\begin{aligned} &\text{Units per g of } \beta\text{-Galactosidase (Penicillium)} \\ &= (1/W) \times \{(A_T - A_B)/0.459\} \times (1/10) \end{aligned}$$

0.459: Absorbance of 1  $\mu\text{mol}/10$  mL of *o*-nitrophenol

$W$ : Amount (g) of the sample in 0.5 mL of the sample solution

Unit: One unit indicates an amount of the enzyme which decomposes 1  $\mu\text{mol}$  of 2-nitrophenyl- $\beta$ -D-galactopyranoside in 1 minute under the above conditions.

**Containers and storage** Containers—Tight containers.

## Gallium (<sup>67</sup>Ga) Citrate Injection

クエン酸ガリウム (<sup>67</sup>Ga) 注射液

Gallium (<sup>67</sup>Ga) Citrate Injection is an aqueous solution for injection containing gallium-67 (<sup>67</sup>Ga) in the form of gallium citrate.

It conforms to the requirements of Gallium (<sup>67</sup>Ga) Citrate Injection in the Minimum Requirements for Radiopharmaceuticals.

Test for Extractable volume of Parenteral Preparations and Insoluble Particulate Matter Test for Injections are not applied to this injection.

**Description** Gallium (<sup>67</sup>Ga) Citrate Injection is a clear, colorless or light red liquid.

## Gas Gangrene Antitoxin, Equine

ガスエソウマ抗毒素

Gas Gangrene Antitoxin, Equine, is a liquid for in-

jection containing *Clostridium perfringens* (*C. welchii*) Type A antitoxin, *Clostridium septicum* (*Vibrion septique*) antitoxin and *Clostridium oedematiens* (*C. novyi*) antitoxin in immunoglobulin of horse origin.

It may contain also *Clostridium histolyticum* antitoxin.

It conforms to the requirements of Gas Gangrene Antitoxin, Equine, in the Minimum Requirements for Biological Products.

**Description** Gas Gangrene Antitoxin, Equine, is a colorless to light yellow-brown, clear liquid or a slightly whitish turbid liquid.

## Gelatin

ゼラチン

Gelatin is a product prepared from aqueous extract of raw collagen by heating. The raw collagen is obtained by acid or alkali treatment of the bone, skin, ligament or tendon of animals.

**Description** Gelatin occurs as colorless or white to light yellow-brown sheets, shreds, granules or powder. It is odorless and tasteless.

Gelatin is very soluble in hot water, and practically insoluble in ethanol (95) and in diethyl ether.

Gelatin does not dissolve in water, but slowly swells and softens when immersed in it, gradually absorbing water 5 to 10 times its own mass.

Gelatin derived from an acid-treated collagen exhibits an isoelectric point between pH 7.0 and 9.0, and Gelatin derived from an alkali-treated collagen exhibits an isoelectric point between pH 4.5 and 5.0.

**Identification** (1) To 5 mL of a solution of Gelatin (1 in 100) add chromium (VI) oxide TS or 2,4,6-trinitrophenol TS dropwise: a precipitate is formed.

(2) To 5 mL of a solution of Gelatin (1 in 5000) add tannic acid TS dropwise: the solution becomes turbid.

**Purity** (1) Foreign odor and water-insoluble substances—Dissolve 1.0 g of Gelatin in 40 mL of water by heating: the solution has no disagreeable odor. It is clear, or only slightly opalescent. The solution has no more color than Matching Fluid A.

(2) Sulfite—Take 20.0 g of Gelatin in a round-bottomed flask, dissolve in 150 mL of hot water, and add 3 to 5 drops of silicone resin, 5 mL of phosphoric acid and 1 g of sodium hydrogen carbonate. Attach a condenser, immediately distil the solution, immersing the end of the condenser into a receiver containing 50 mL of iodine TS, and continue the distillation until 50 mL of distillate is obtained. Acidify the distillate with 2 to 3 drops of hydrochloric acid, add 2 mL of barium chloride TS, and heat on a water bath until the color of iodine TS is discharged. Collect the precipitates, wash with water, and ignite: the mass of the residue is not more than 4.5 mg, but the mass of the residue obtained from Gelatin for use in the preparation of capsules and tablets is not more than 75 mg. Perform a blank determination, and make any necessary correction.

(3) Heavy metals <1.07>—Proceed with 0.5 g of Gelatin

according to Method 2, and perform the test. Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 50 ppm).

(4) Arsenic <1.11>—Take 15.0 g of Gelatin in a flask, add 60 mL of diluted hydrochloric acid (1 in 5), and heat until solution is effected. Add 15 mL of bromine TS, heat until the excess of bromine is expelled, neutralize with ammonia TS, add 1.5 g of disodium hydrogen phosphate dodecahydrate, and allow to cool. To this solution add 30 mL of magnesia TS, allow to stand for 1 hour, and collect the precipitates. Wash the precipitates with five 10-mL portions of diluted ammonia TS (1 in 4), and dissolve in diluted hydrochloric acid (1 in 4) to make exactly 50 mL. Perform the test with 5 mL of this solution: the solution has no more color than the following standard stain.

Standard stain: Proceed with 15 mL of Standard Arsenic Solution, instead of Gelatin, in the same manner (not more than 1 ppm).

(5) Mercury—Place 2.0 g of Gelatin in a decomposition flask, add 20 mL of diluted sulfuric acid (1 in 2) and 100 mL of a solution of potassium permanganate (3 in 50), heat gently under a reflux condenser, and boil for 2 hours. If the solution becomes clear during boiling, reduce the temperature of the solution to about 60°C, add further 5 mL of a solution of potassium permanganate (3 in 50), boil again, and repeat the above-mentioned procedure until the precipitate of manganese dioxide remains for about 20 minutes. Cool, add a solution of hydroxylammonium chloride (1 in 5) until the precipitate of manganese dioxide disappears, add water to make exactly 150 mL, and use the solution as the sample solution. Perform the test as directed under Atomic Absorption Spectrophotometry <2.23> (Cold vapor type) using the sample solution. Place the sample solution in a sample water bottle of the atomic absorption spectrophotometer, add 10 mL of tin (II) chloride-sulfuric acid TS, connect the bottle immediately to the atomic absorption spectrophotometer, and circulate air. Determine the absorbance  $A_T$  of the sample solution at 253.7 nm when the indication of the recorder has risen rapidly and become constant. On the other hand, place 2.0 mL of Standard Mercury Solution in a decomposition flask, add 20 mL of diluted sulfuric acid (1 in 2) and 100 mL of a solution of potassium permanganate (3 in 50), and proceed in the same manner as for the sample solution. Determine the absorbance  $A_S$  of the standard solution:  $A_T$  is not more than  $A_S$  (not more than 0.1 ppm).

**Loss on drying** Not more than 15.0%. Take about 1 g of Gelatin, accurately weighed, in a tared 200-mL beaker containing 10 g of sea sand (No. 1) previously dried at 110°C for 3 hours. Add 20 mL of water, allow to stand for 30 minutes with occasional shaking, evaporate to dryness on a water bath with occasional shaking, and dry the residue at 110°C for 3 hours.

**Residue on ignition** <2.44> Not more than 2.0% (0.5 g).

**Containers and storage** Containers—Tight containers.

## Purified Gelatin

精製ゼラチン

Purified Gelatin is a product prepared from aqueous

extract of raw collagen by heating. The raw collagen is obtained by acid or alkali treatment of the bone, skin, ligament, or tendon of animals.

**Description** Purified Gelatin occurs as colorless to light yellow sheets, shreds, pellets or powder. It is odorless and tasteless.

It is very soluble in hot water, and practically insoluble in ethanol (95) and in diethyl ether.

Purified Gelatin does not dissolve in water. It slowly swells and softens when immersed in water, and absorbs water 5 to 10 times its own mass.

Purified Gelatin derived from an acid-treated collagen has an isoelectric point at pH 7.0 to 9.0, and Purified Gelatin derived from an alkali-treated collagen has an isoelectric point at pH 4.5 to 5.0.

**Identification** (1) To 5 mL of a solution of Purified Gelatin (1 in 100) add chromium (VI) oxide TS or 2,4,6-trinitrophenol TS dropwise: a precipitate is formed.

(2) To 5 mL of a solution of Purified Gelatin (1 in 5000) add tannic acid TS dropwise: the solution becomes turbid.

**Purity** (1) Foreign odor and water-insoluble substances—Dissolve 1.0 g of Purified Gelatin in 40 mL of water by heating: the solution is clear, colorless and free from any disagreeable odor when the layer of the solution is 20 mm in depth.

(2) Sulfite—Take 20.0 g of Purified Gelatin in a round-bottomed flask, dissolve in 150 mL of hot water, and add 3 to 5 drops of silicone resin, 5 mL of phosphoric acid and 1 g of sodium hydrogen carbonate. Attach a condenser, immediately distill the solution, immersing the end of the condenser into a receiver containing 50 mL of iodine TS, and continue the distillation until 50 mL of distillate is obtained. Acidify the distillate by dropwise addition of hydrochloric acid, add 2 mL of barium chloride TS, and heat on a water bath until the color of iodine TS is discharged. Collect the precipitates, wash with water, and ignite: the mass of the residue is not more than 1.5 mg. Perform a blank determination, and make any necessary correction.

(3) Heavy metals <1.07>—Proceed with 1.0 g of Purified Gelatin according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Place 15.0 g of Purified Gelatin in a flask, add 60 mL of diluted hydrochloric acid (1 in 5), and heat until solution is effected. Add 15 mL of bromine TS, heat until the excess of bromine is expelled, neutralize with ammonia TS, add 1.5 g of disodium hydrogen phosphate dodecahydrate, and allow to cool. To this solution add 30 mL of magnesia TS, allow to stand for 1 hour, and collect the precipitates. Wash the precipitates with five 10-mL portions of diluted ammonia TS (1 in 4), and dissolve in diluted hydrochloric acid (1 in 4) to make exactly 50 mL. Perform the test with 5 mL of this solution: the solution has no more color than the following standard solution.

Standard solution: Proceed with 15 mL of Standard Arsenic Solution, instead of Purified Gelatin, in the same manner (not more than 1 ppm).

(5) Mercury—Place 2.0 g of Purified Gelatin in a decomposition flask, add 20 mL of diluted sulfuric acid (1 in 2) and 100 mL of a solution of potassium permanganate (3 in 50), heat gently under a reflux condenser, and boil for 2 hours. If

the solution becomes clear during boiling, reduce the temperature of the solution to about 60°C, add further 5 mL of a solution of potassium permanganate (3 in 50), boil again, and repeat the above-mentioned procedure until the precipitate of manganese dioxide remains for about 20 minutes. Cool, add a solution of hydroxylammonium chloride (1 in 5) until the precipitate of manganese dioxide disappears, add water to make exactly 150 mL, and use the solution as the sample solution. Perform the test as directed under Atomic Absorption Spectrophotometry <2.23> (Cold vapor type) using the sample solution. Place the sample solution in a sample water bottle of the atomic absorption spectrophotometer, add 10 mL of tin (II) chloride-sulfuric acid TS, connect the bottle immediately to the atomic absorption spectrophotometer, and circulate air. Determine the absorbance  $A_T$  of the sample solution at 253.7 nm when the indication of the recorder has risen rapidly and become constant. On the other hand, place 2.0 mL of Standard Mercury Solution in a decomposition flask, add 20 mL of diluted sulfuric acid (1 in 2) and 100 mL of a solution of potassium permanganate (3 in 50), and proceed in the same manner as for the sample solution. Determine the absorbance  $A_S$  of the standard solution:  $A_T$  is not more than  $A_S$  (not more than 0.1 ppm).

**Loss on drying** Not more than 15.0%. Take about 1 g of Purified Gelatin, accurately weighed, in a tared 200-mL beaker containing 10 g of sea sand (No. 1), previously dried at 110°C for 3 hours. Add 20 mL of water, allow to stand for 30 minutes with occasional shaking, evaporate on a water bath to dryness with occasional shaking, and dry the residue at 110°C for 3 hours.

**Residue on ignition** <2.44> Not more than 2.0% (0.5 g).

**Containers and storage** Containers—Tight containers.

## Gentamicin Sulfate

ゲンタマイシン硫酸塩

Gentamicin Sulfate  $C_1$  :  $R^1 = CH_3$   $R^2 = NHCH_3$

Gentamicin Sulfate  $C_2$  :  $R^1 = CH_3$   $R^2 = NH_2$

Gentamicin Sulfate  $C_{1a}$  :  $R^1 = H$   $R^2 = NH_2$

Gentamicin Sulfate  $C_1$ :

(6*R*)-2-Amino-2,3,4,6-tetradeoxy-6-methylamino-6-methyl- $\alpha$ -D-erythro-hexopyranosyl-(1→4)-[3-deoxy-4-*C*-methyl-3-methylamino- $\beta$ -L-arabinopyranosyl-(1→6)]-2-deoxy-D-streptamine sulfate

Gentamicin Sulfate  $C_2$ :

(6*R*)-2,6-Diamino-2,3,4,6-tetradeoxy-6-methyl- $\alpha$ -D-erythro-hexopyranosyl-(1→4)-[3-deoxy-4-*C*-methyl-3-methylamino- $\beta$ -L-arabinopyranosyl-(1→6)]-2-deoxy-D-streptamine sulfate

Gentamicin Sulfate  $C_{1a}$ :

2,6-Diamino-2,3,4,6-tetradeoxy- $\alpha$ -D-erythro-hexopyranosyl-(1→4)-[3-deoxy-4-*C*-methyl-3-methylamino- $\beta$ -L-arabinopyranosyl-(1→6)]-2-deoxy-D-streptamine sulfate

[1405-41-0, Gentamicin Sulfate]

Gentamicin Sulfate is the sulfate of a mixture of aminoglycoside substances having antibacterial activity produced by the growth of *Micromonospora purpurea* or *Micromonospora echinospora*.

It contains not less than 590  $\mu$ g (potency) and not more than 775  $\mu$ g (potency) per mg, calculated on the dried basis. The potency of Gentamicin Sulfate is expressed as mass (potency) of gentamicin  $C_1$  ( $C_{21}H_{43}N_5O_7$ : 477.60).

**Description** Gentamicin Sulfate occurs as a white to light yellowish white powder.

It is very soluble in water, and practically insoluble in ethanol (99.5).

It is hygroscopic.

**Identification (1)** Dissolve 50 mg of Gentamicin Sulfate in 1 mL of water, and add 2 drops of a solution of 1-naphthol in ethanol (95) (1 in 500). Gently superimpose this solution on 1 mL of sulfuric acid: a blue-purple color develops at the zone of contact.

**(2)** Dissolve 50 mg each of Gentamicin Sulfate and Gentamicin Sulfate Reference Standard in 10 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu$ L of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Separately, shake a mixture of chloroform, ammonia solution (28) and methanol (2:1:1) in a separator, and allow the mixture to stand for more than 1 hour. To 20 mL of the lower layer so obtained add 0.5 mL of methanol, and use this as the developing solvent. Develop the plate with the developing solvent to a distance of about 17 cm in a developing container with a cover, having an opening of about 20 mm<sup>2</sup>, and without putting a filter paper in the container, and air-dry the plate. Allow the plate to stand in iodine vapors: three principal spots obtained from the sample solution are the same with the corresponding spots from the standard solution in color tone and the  $R_f$  value, respectively.

**(3)** Dissolve 50 mg of Gentamicin Sulfate in 5 mL of water, and add 0.5 mL of barium chloride TS: a white precipitate is formed.

**Optical rotation** <2.49>  $[\alpha]_D^{25}$ : +107 – +121° (0.25 g calculated on the dried basis, water, 25 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 0.20 g of Gentamicin Sulfate in 5 mL of water is between 3.5 and 5.5.

**Content ratio of the active principle** Dissolve 50 mg of Gentamicin Sulfate in water to make 10 mL, and use this solution as the sample solution. Perform the test with this solution as directed under Thin-layer Chromatography <2.03>. Spot 20

$\mu\text{L}$  of the sample solution on a plate of silica gel for thin-layer chromatography. Separately, shake a mixture of chloroform, ammonia solution (28) and methanol (2:1:1) in a separator, and allow the mixture to stand for more than 1 hour. To 20 mL of the lower layer so obtained add 0.5 mL of methanol, and use this as the developing solvent. Develop the plate with the developing solvent to a distance of about 17 cm in a developing container with a cover, having an opening of about 20 mm<sup>2</sup>, without putting a filter paper in the container, and air-dry the plate. Allow the plate to stand in iodine vapor. Determine the integral absorbances,  $A_a$ ,  $A_b$  and  $A_c$ , of the colored spots of gentamicin  $C_1$  ( $R_f$  value: about 0.3), gentamicin  $C_2$  ( $R_f$  value: about 0.2) and gentamicin  $C_{1a}$  ( $R_f$  value: about 0.1), respectively, by a densitometer (wavelength: 450 nm) while covering the plate with a glass plate, and calculate these amounts by the following formulae: gentamicin  $C_1$  is between 25% and 55%, gentamicin  $C_2$  is between 25% and 50%, and gentamicin  $C_{1a}$  is between 5% and 30%.

$$\begin{aligned} \text{Amount (\%)} \text{ of gentamicin } C_1 \\ = \{A_a / (A_a + 1.35A_b + A_c)\} \times 100 \end{aligned}$$

$$\begin{aligned} \text{Amount (\%)} \text{ of gentamicin } C_2 \\ = \{1.35A_b / (A_a + 1.35A_b + A_c)\} \times 100 \end{aligned}$$

$$\begin{aligned} \text{Amount (\%)} \text{ of gentamicin } C_{1a} \\ = \{A_c / (A_a + 1.35A_b + A_c)\} \times 100 \end{aligned}$$

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Gentamicin Sulfate in 10 mL of water: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Gentamicin Sulfate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 50 mg of Gentamicin Sulfate in water to make 10 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20  $\mu\text{L}$  of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Separately, shake a mixture of chloroform, ammonia solution (28) and methanol (2:1:1) in a separator, and allow the mixture to stand for more than 1 hour. To 20 mL of the lower layer so obtained add 0.5 mL of methanol, and use this as the developing solvent. Develop the plate with the developing solvent to a distance of about 17 cm in a developing container with a cover, having an opening of about 20 mm<sup>2</sup>, without putting a filter paper in the container, and air-dry the plate. Allow the plate to stand in iodine vapor, and compare the colored spots while covering with a glass plate: the spots other than the spots of gentamicin  $C_1$  ( $R_f$  value: about 0.3), gentamicin  $C_2$  ( $R_f$  value: about 0.2) and gentamicin  $C_{1a}$  ( $R_f$  value: about 0.1) obtained from the sample solution are not more intense than the spot of gentamicin  $C_2$  from the standard solution.

**Loss on drying** <2.41> Not more than 18.0% (0.15 g, reduced pressure not exceeding 0.67 kPa, 110°C, 3 hours). Handle the sample avoiding absorption of moisture.

**Residue on ignition** <2.44> Not more than 1.0% (1 g).

**Assay** Perform the test according to the Cylinder-plate

method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Staphylococcus epidermidis* ATCC 12228

(ii) Agar media for seed and base layer—	
Glucose	1.0 g
Peptone	6.0 g
Meat extract	1.5 g
Yeast extract	3.0 g
Sodium chloride	10.0 g
Agar	15.0 g
Water	1000 mL

Mix all the ingredients, and sterilize. Adjust the pH of the solution so that it will be 7.8 to 8.0 after sterilization.

(iii) Agar medium for transferring test organisms—Use the medium ii in 2) Medium for other organisms under (2) Agar media for transferring test organisms.

(iv) Standard solutions—Weigh accurately an amount of Gentamicin Sulfate Reference Standard, equivalent to about 25 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 25 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 15°C or lower, and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 4  $\mu\text{g}$  (potency) and 1  $\mu\text{g}$  (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(v) Sample solutions—Weigh accurately an amount of Gentamicin Sulfate, equivalent to about 25 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 25 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 4  $\mu\text{g}$  (potency) and 1  $\mu\text{g}$  (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

## Glibenclamide

グリベンクラミド

$C_{23}H_{28}ClN_3O_5S$ : 494.00

4-[2-(5-Chloro-2-methoxybenzoylamino)ethyl]-  
N-(cyclohexylcarbamoyl)benzenesulfonamide [10238-21-8]

Glibenclamide, when dried, contains not less than 98.5% of  $C_{23}H_{28}ClN_3O_5S$ .

**Description** Glibenclamide occurs as white to pale yellowish white crystals or crystalline powder.

It is freely soluble in dimethylformamide, sparingly soluble

in chloroform, slightly soluble in methanol and in ethanol (95), and practically insoluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Glibenclamide in methanol (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Glibenclamide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** Perform the test with Glibenclamide as directed under Flame Coloration Test <1.04> (2): a green color appears.

**Melting point** <2.60> 169 – 174°C

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Glibenclamide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(2)** Related substances—Dissolve 0.20 g of Glibenclamide in 20 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 20 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-propanol, chloroform and diluted ammonia TS (4 in 5) (11:7:2) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Assay** Weigh accurately about 0.9 g of Glibenclamide, previously dried, dissolve in 50 mL of *N,N*-dimethylformamide, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination with a solution prepared by adding 18 mL of water to 50 mL of *N,N*-dimethylformamide, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS  
= 49.40 mg of  $C_{23}H_{28}ClN_3O_5S$

**Containers and storage** Containers—Tight containers.

## Glucose

ブドウ糖

$\alpha$ -D-Glucopyranose : R<sup>1</sup>=H, R<sup>2</sup>=OH  
 $\beta$ -D-Glucopyranose : R<sup>1</sup>=OH, R<sup>2</sup>=H

$C_6H_{12}O_6$ : 180.16

D-Glucopyranose [50-99-7]

Glucose is  $\alpha$ -D-glucopyranose,  $\beta$ -D-glucopyranose, or a mixture of them, and when dried, it contains not less than 99.5% of  $C_6H_{12}O_6$ .

**Description** Glucose occurs as white crystals or crystalline powder. It is odorless, and has a sweet taste.

It is freely soluble in water, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

**Identification** Add 2 to 3 drops of a solution of Glucose (1 in 20) to 5 mL of boiling Fehling's TS: a red precipitate is produced.

**Purity (1)** Clarity and color of solution—Add 25 g of Glucose to 30 mL of water in a Nessler tube, warm at 60°C in a water bath until solution is effected, cool, and add water to make 50 mL: the solution is clear and has no more color than the following control solution.

Control solution: To a mixture of 1.0 mL of Cobaltous Chloride Stock CS, 3.0 mL of Ferric Chloride stock CS, and 2.0 mL of Cupric Sulfate Stock CS, add water to make 10.0 mL. To 3.0 mL of this solution add water to make 50 mL.

**(2)** Acidity—Dissolve 5.0 g of Glucose in 50 mL of freshly boiled and cooled water, and add 3 drops of phenolphthalein TS and 0.60 mL of 0.01 mol/L sodium hydroxide VS: a red color develops.

**(3)** Chloride <1.03>—Perform the test with 2.0 g of Glucose. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.018%).

**(4)** Sulfate <1.14>—Perform the test with 2.0 g of Glucose. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

**(5)** Heavy metals <1.07>—Proceed with 5.0 g of Glucose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 4 ppm).

**(6)** Arsenic <1.11>—Dissolve 1.5 g of Glucose in 5 mL of water, add 5 mL of dilute sulfuric acid and 1 mL of bromine TS, heat on a water bath for 5 minutes, and concentrate to 5 mL. After cooling, perform the test with this solution as the test solution (not more than 1.3 ppm).

**(7)** Dextrin—To 1.0 g of Glucose add 20 mL of ethanol (95), and boil under a reflux condenser: the solution is clear.

**(8)** Soluble starch and sulfite—Dissolve 1.0 g of Glucose in 10 mL of water, and add 1 drop of iodine TS: a yellow color develops.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C,

6 hours).

**Residue on ignition** <2.44> Not more than 0.1% (2 g).

**Assay** Weigh accurately about 10 g of Glucose, previously dried, dissolve in 0.2 mL of ammonia TS and water to make exactly 100 mL, allow to stand for 30 minutes, and determine the optical rotation,  $\alpha_D$ , of this solution at  $20 \pm 1^\circ\text{C}$  in a 100-mm cell as directed under Optical Rotation Determination <2.49>.

$$\text{Amount (mg) of } \text{C}_6\text{H}_{12}\text{O}_6 = \alpha_D \times 1895.4$$

**Containers and storage** Containers—Tight containers.

## Glucose Injection

ブドウ糖注射液

Glucose Injection is an aqueous solution for injection. It contains not less than 95% and not more than 105% of the labeled amount of glucose ( $\text{C}_6\text{H}_{12}\text{O}_6$ ; 180.16).

**Method of preparation** Prepare as directed under Injections, with Glucose. No preservative is added.

**Description** Glucose Injection is a clear, colorless liquid. It has a sweet taste. It occurs as a colorless to pale yellow, clear liquid when its labeled concentration exceeds 40%.

**Identification** Measure a volume of Glucose Injection, equivalent to 0.1 g of Glucose according to the labeled amount, and, if necessary, add water or evaporate on a water bath to a volume of 2 mL. Add 2 to 3 drops of the solution to 5 mL of boiling Fehling's TS: a red precipitate is produced.

**pH** <2.54> 3.5 – 6.5 In the case where the labeled concentration of the injection exceeds 5%, dilute to 5% with water before the test.

**Purity** 5-Hydroxymethylfurfural and related substances—Measure exactly a volume of Glucose Injection, equivalent to 2.5 g of Glucose according to the labeled amount, and add water to make exactly 100 mL. Determine the absorbance of this solution at 284 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>: it is not more than 0.80.

**Bacterial endotoxins** <4.01> Less than 0.50 EU/mL.

**Extractable volume** <6.05> It meets the requirement.

**Assay** Measure accurately a volume of Glucose Injection, equivalent to about 4 g of glucose ( $\text{C}_6\text{H}_{12}\text{O}_6$ ), and add 0.2 mL of ammonia TS and water to make exactly 100 mL. Shake the solution well, allow to stand for 30 minutes, and determine the optical rotation,  $\alpha_D$ , at  $20 \pm 1^\circ\text{C}$  in a 100-mm cell as directed under Optical Rotation Determination <2.49>.

$$\text{Amount (mg) of glucose (C}_6\text{H}_{12}\text{O}_6) = \alpha_D \times 1895.4$$

**Containers and storage** Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

## Glutathione

グルタチオン

$\text{C}_{10}\text{H}_{17}\text{N}_3\text{O}_6\text{S}$ ; 307.32

(2S)-2-Amino-4-[1-(carboxymethyl)carbamoyl-(2R)-2-sulfanylethylcarbamoyl]butanoic acid [70-18-8]

Glutathione, when dried, contains not less than 98.0% and not more than 101.0% of  $\text{C}_{10}\text{H}_{17}\text{N}_3\text{O}_6\text{S}$ .

**Description** Glutathione occurs as a white crystalline powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

Melting point: about  $185^\circ\text{C}$  (with decomposition).

**Identification** Determine the infrared absorption spectrum of Glutathione, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ :  $-15.5 - -17.5^\circ$  (after drying, 2 g, water, 50 mL, 100 mm).

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Glutathione in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Glutathione according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Glutathione according to Method 1, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 50 mg of Glutathione in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly  $10 \mu\text{L}$  each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak having the relative retention time of about 4 with respect to glutathione is not more than 3/4 times the peak area of glutathione from the standard solution, and the total area of the peaks other than the peak of glutathione is not more than the peak area of glutathione from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography ( $5 \mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: Dissolve 6.8 g of potassium dihydrogen phosphate and 2.02 g of sodium 1-heptane sulfonate in 1000 mL of water, and adjust the pH to 3.0 with phosphoric acid. To 970 mL of this solution add 30 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of glutathione is about 5 minutes.

Time span of measurement: About 6 times as long as the retention time of glutathione beginning after the solvent peak.

*System suitability*—

Test for required detectability: Pipet 10 mL of the standard solution, and add the mobile phase to make exactly 100 mL. Confirm that the peak area of glutathione obtained from 10  $\mu$ L of this solution is equivalent to 8 to 12% of that obtained from 10  $\mu$ L of the standard solution.

System performance: Dissolve 50 mg of glutathione, 10 mg of D-phenylglycine and 50 mg of ascorbic acid in 100 mL of water. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, ascorbic acid, glutathione and D-phenylglycine are eluted in this order, and the resolutions between the peaks of ascorbic acid and glutathione and between the peaks of glutathione and D-phenylglycine are not less than 5, respectively.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of glutathione is not more than 1.5%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Glutathione, previously dried, dissolve in 50 mL of a solution of metaphosphoric acid (1 in 50), and titrate <2.50> with 0.05 mol/L iodine VS (indicator: 1 mL of starch TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L iodine VS  
= 30.73 mg of C<sub>10</sub>H<sub>17</sub>N<sub>3</sub>O<sub>6</sub>S

**Containers and storage** Containers—Tight containers.

## Glycerin

### Glycerol

グリセリン

C<sub>3</sub>H<sub>8</sub>O<sub>3</sub>: 92.09

Glycerin contains not less than 84.0% and not more than 87.0% of C<sub>3</sub>H<sub>8</sub>O<sub>3</sub>.

**Description** Glycerin is a clear, colorless, viscous liquid. It has a sweet taste.

It is miscible with water and with ethanol (99.5).

It is hygroscopic.

**Identification** Determine the infrared absorption spectrum

of Glycerin as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Refractive index** <2.45>  $n_D^{20}$ : 1.449 – 1.454

**Specific gravity** <2.56>  $d_{20}^{20}$ : 1.221 – 1.230

**Purity** (1) Color—Place 50 mL of Glycerin in a Nessler tube, and observe downward: the solution has no more color than the following control solution. Control solution: Place 0.40 mL of Ferric Chloride Colorimetric Stock Solution in a Nessler tube, and add water to make 50 mL.

(2) Acidity or alkalinity—To 2 mL of Glycerin add 8 mL of water and mix: the solution is neutral.

(3) Chloride <1.03>—Take 10.0 g of Glycerin, and perform the test: Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.001%).

(4) Sulfate <1.14>—Take 10.0 g of Glycerin, and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.002%).

(5) Ammonium—To 5 mL of Glycerin add 5 mL of a solution of sodium hydroxide (1 in 10), and boil: the gas evolved does not change moistened red litmus paper to blue.

(6) Heavy metals <1.07>—Proceed with 5.0 g of Glycerin according to Method 1, and perform the test: Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 5 ppm).

(7) Calcium—To 5 mL of the solution obtained in (2) add 3 drops of ammonium oxalate TS: the solution remains unchanged.

(8) Arsenic <1.11>—Prepare the test solution with 1.0 g of Glycerin according to Method 1, and perform the test (not more than 2 ppm).

(9) Acrolein, glucose, and other reducing substances—To 1.0 g of Glycerin add 1 mL of ammonia TS, mix, and warm in a water bath at 60°C for 5 minutes: no yellow color is produced. Take the solution out of the water bath, add 3 drops of silver nitrate TS immediately, and allow to stand in a dark place for 5 minutes: the color of the solution does not change, and no turbidity is produced.

(10) Fatty acids and esters—Mix 50 g of Glycerin with 50 mL of freshly boiled and cooled water, add exactly 10 mL of 0.1 mol/L sodium hydroxide VS, boil the mixture for 15 minutes, cool, and titrate the excess sodium hydroxide with 0.1 mol/L hydrochloric acid VS: 0.1 mol/L sodium hydroxide VS consumed is not more than 3.0 mL (indicator: 3 drops of phenolphthalein TS). Perform a blank determination.

(11) Readily carbonizable substances—To 5 mL of Glycerin add carefully 5 mL of sulfuric acid for readily carbonizable substances, mix gently at a temperature between 18°C and 20°C, and allow to stand for 1 hour between 15°C and 25°C: the solution has not more color than Matching Fluid H.

**Water** <2.48> 13 – 17% (0.1 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Weigh accurately about 10 g of Glycerin in a tared crucible, heat to boiling, and fire to burn immediately. After cooling, moisten the residue with 1 to 2 drops of sulfuric acid, and ignite cautiously to constant mass: the mass of the residue is not more than 0.01%.

**Assay** Weigh accurately about 0.2 g of Glycerin, transfer into a glass-stoppered flask, add 50 mL of water, mix, add exactly 50 mL of sodium periodate TS, shake, and allow to stand in a dark place at a room temperature for about 30 minutes. Add 10 mL of a mixture of water and ethylene glycol (1:1), allow to stand for about 20 minutes, add 100 mL of water, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination, and make the necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L sodium hydroxide VS} \\ = 9.209 \text{ mg of } \text{C}_3\text{H}_8\text{O}_3 \end{aligned}$$

**Containers and storage** Containers—Tight containers.

## Concentrated Glycerin

### Concentrated Glycerol

濃グリセリン

$\text{C}_3\text{H}_8\text{O}_3$ : 92.09  
Propane-1,2,3-triol [56-81-5]

Concentrated Glycerin contains not less than 98.0% and not more than 101.0% of glycerin ( $\text{C}_3\text{H}_8\text{O}_3$ ), calculated of the anhydrous basis.

**Description** Concentrated Glycerin is a clear, colorless and viscous liquid. It has a sweet taste.

It is miscible with water and with ethanol (99.5).

It is hygroscopic.

**Identification** Determine the infrared absorption spectrum of Concentrated Glycerin as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Refractive index** <2.45>  $n_D^{20}$ : Not less than 1.470.

**Specific gravity** <2.56>  $d_{20}^{20}$ : Not less than 1.258.

**Purity** (1) Color—Place 50 mL of Concentrated Glycerin in a Nessler tube, and observe downward: the solution has no more color than the following control solution.

Control solution: Pipet 0.40 mL of Ferric Chloride Colorimetric Stock Solution into a Nessler tube, and add water to make 50 mL.

(2) Acidity or alkalinity—To 2 mL of Concentrated Glycerin add 8 mL of water and mix: the solution is neutral.

(3) Chloride <1.03>—Take 10.0 g of Concentrated Glycerin, and perform the test. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.001%).

(4) Sulfate <1.14>—Take 10.0 g of Concentrated Glycerin, and perform the test. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.002%).

(5) Ammonium—To 5 mL of Concentrated Glycerin add 5 mL of a solution of sodium hydroxide (1 in 10), and boil:

the gas evolved does not change moistened red litmus paper to blue.

(6) Heavy metals <1.07>—Proceed with 5.0 g of Concentrated Glycerin according to Method 1, and perform the test. Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 5 ppm).

(7) Calcium—To 5 mL of the solution obtained in (2) add 3 drops of ammonium oxalate TS: the solution remains unchanged.

(8) Arsenic <1.11>—Prepare the test solution with 1.0 g of Concentrated Glycerin according to Method 1, and perform the test (not more than 2 ppm).

(9) Acrolein, glucose, or other reducing substances—To 1.0 g of Concentrated Glycerin add 1 mL of ammonia TS, mix, and warm in a water bath at 60°C for 5 minutes: no yellow color is produced. Take the solution out of the water bath, add 3 drops of silver nitrate TS immediately, and allow to stand in a dark place for 5 minutes: the color of the solution does not change, and no turbidity is produced.

(10) Fatty acids and esters—Mix 50 g of Concentrated Glycerin with 50 mL of freshly boiled and cooled water, add 10 mL of 0.1 mol/L sodium hydroxide VS, accurately measured, boil the mixture for 15 minutes, cool, and titrate the excess sodium hydroxide with 0.1 mol/L hydrochloric acid VS: not more than 3.0 mL of 0.1 mol/L sodium hydroxide VS is consumed (indicator: 3 drops of phenolphthalein TS). Perform a blank determination.

(11) Readily carbonizable substances—To 5 mL of Concentrated Glycerin add carefully 5 mL of sulfuric acid for readily carbonizable substances, mix gently at a temperature between 18°C and 20°C, and allow to stand for 1 hour between 15°C and 25°C: the solution has no more color than Matching Fluid H.

**Water** <2.48> Not more than 2.0% (6 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Weigh accurately about 10 g of Concentrated Glycerin in a tared crucible, heat to boiling, and fire to burn immediately. Cool, moisten the residue with 1 to 2 drops of sulfuric acid, and ignite cautiously to constant mass: the mass of the residue is not more than 0.01%.

**Assay** Weigh accurately about 0.2 g of Concentrated Glycerin, transfer into a glass-stoppered flask, add 50 mL of water, mix, add exactly 50 mL of sodium periodate TS, shake, and allow to stand in a dark place at a room temperature for about 30 minutes. Add 10 mL of a mixture of water and ethylene glycol (1:1), allow to stand for about 20 minutes, add 100 mL of water, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination, and make the necessary correction.

$$\begin{aligned} \text{Each mL of 0.1 mol/L sodium hydroxide VS} \\ = 9.209 \text{ mg of } \text{C}_3\text{H}_8\text{O}_3 \end{aligned}$$

**Containers and storage** Containers—Tight containers.

## Glycerin and Potash Solution

グリセリンカリ液

### Method of preparation

Potassium Hydroxide	3 g
Glycerin	200 mL
Ethanol	250 mL
Aromatic substance	a suitable quantity
Water or Purified Water	a sufficient quantity

To make 1000 mL

Dissolve Potassium Hydroxide in a portion of Water or Purified Water, add Glycerin, Ethanol, a suitable quantity of aromatic substance and another portion of Water or Purified Water to volume, and filter. Concentrated Glycerin may be used in place of Glycerin.

**Description** Glycerin and Potash Solution is a clear, colorless liquid, having an aromatic odor.

The pH of a solution of Glycerin and Potash Solution (1 in 5) is about 12.

Specific gravity  $d_{20}^{20}$ : about 1.02

**Identification (1)** A solution of Glycerin and Potash Solution (1 in 2) is alkaline (potassium hydroxide).

(2) Place 10 mL of a solution of Glycerin and Potash Solution (1 in 10) in a glass-stoppered test tube, add 2 mL of sodium hydroxide TS and 1 mL of copper (II) sulfate TS, and shake: a blue color is produced (glycerin).

(3) Glycerin and Potash Solution responds to the Qualitative Tests <1.09> for potassium salt.

**Containers and storage** Containers—Tight containers.

## Glyceryl Monostearate

モノステアリン酸グリセリン

Glyceryl Monostearate is a mixture of  $\alpha$ - and  $\beta$ -glyceryl monostearate and other fatty acid esters of glycerin.

**Description** Glyceryl Monostearate occurs as white to light yellow, waxy masses, thin flakes, or granules. It has a characteristic odor and taste.

It is very soluble in hot ethanol (95), soluble in chloroform, sparingly soluble in diethyl ether, and practically insoluble in water and in ethanol (95).

It is slowly affected by light.

**Identification (1)** Heat 0.2 g of Glyceryl Monostearate with 0.5 g of potassium hydrogen sulfate until thoroughly charred: the irritative odor of acrolein is perceptible.

(2) Dissolve 0.1 g of Glyceryl Monostearate in 2 mL of ethanol (95) by warming, heat with 5 mL of dilute sulfuric acid in a water bath for 30 minutes, and cool: a white to yellow solid is produced. This separated solid dissolves when shaken with 3 mL of diethyl ether.

**Melting point** <1.13> Not below 55°C.

**Acid value** <1.13> Not more than 15.

**Saponification value** <1.13> 157 – 170

**Iodine value** <1.13> Not more than 3.0. Use chloroform instead of cyclohexane.

**Purity** <1.13> Acidity or alkalinity—To 1.0 g of Glyceryl Monostearate add 20 mL of boiling water, and cool with swirling: the solution is neutral.

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

## Glycine

### Aminoacetic Acid

グリシン

$\text{C}_2\text{H}_5\text{NO}_2$ : 75.07

Aminoacetic acid [56-40-6]

Glycine, when dried, contains not less than 98.5% of  $\text{C}_2\text{H}_5\text{NO}_2$ .

**Description** Glycine occurs as white crystals or crystalline powder. It is odorless. It has a sweet taste.

It is freely soluble in water and in formic acid, and practically insoluble in ethanol (95).

**Identification** Determine the infrared absorption spectrum of Glycine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Glycine in water, evaporate the water to dryness, and repeat the test with the residue.

**pH** <2.54> Dissolve 1.0 g of Glycine in 20 mL of water: the pH of the solution is between 5.6 and 6.6.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Glycine in 10 mL of water: the solution is clear and colorless.

(2) Chloride <1.03>—Perform the test with 0.5 g of Glycine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate <1.14>—Perform the test with 0.6 g of Glycine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).

(4) Ammonium <1.02>—Perform the test using 0.25 g of Glycine. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(5) Heavy metals <1.07>—Proceed with 1.0 g of Glycine according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(6) Arsenic <1.11>—Prepare the test solution with 1.0 g of Glycine according to Method 1, and perform the test (not more than 2 ppm).

(7) Related substances—Dissolve 0.10 g of Glycine in 25

mL of water and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly a solution of ninhydrin in acetone (1 in 50), and heat at 80°C for 5 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.30% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 80 mg of Glycine, previously dried, dissolve in 3 mL of formic acid, add 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 7.507 mg of C<sub>2</sub>H<sub>5</sub>NO<sub>2</sub>

**Containers and storage** Containers—Well-closed containers.

## Gonadorelin Acetate

ゴナドレリン酢酸塩

C<sub>55</sub>H<sub>75</sub>N<sub>17</sub>O<sub>13</sub>·2C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>: 1302.39

5-Oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-glycyl-L-leucyl-L-arginyl-L-prolyl-glycinamide diacetate [34973-08-5]

Gonadorelin Acetate contains not less than 96.0% and not more than 102.0% of C<sub>55</sub>H<sub>75</sub>N<sub>17</sub>O<sub>13</sub>·2C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>, calculated on the anhydrous basis.

**Description** Gonadorelin Acetate occurs as a white to pale yellow powder. It is odorless or has a slight, acetic odor.

It is freely soluble in water, in methanol and in acetic acid (100), and sparingly soluble in ethanol (95).

It is hygroscopic.

**Identification** (1) Determine the absorption spectrum of a solution of Gonadorelin Acetate in methanol (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Gonadorelin Acetate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the

spectrum of Gonadorelin Acetate Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 20 mg of Gonadorelin Acetate in 0.5 mL of ethanol (99.5), add 1 mL of sulfuric acid, and heat: the odor of ethyl acetate is perceptible.

**Optical rotation** <2.49>:  $[\alpha]_D^{20}$ : -53.0 - -57.0° (0.10 g calculated on the anhydrous basis, diluted acetic acid (100) (1 in 100), 10 mL, 100 mm).

**pH** <2.54> Dissolve 0.10 g of Gonadorelin Acetate in 10 mL of water: the pH of this solution is between 4.8 and 5.8.

**Constituent amino acids** Put 10 mg of Gonadorelin Acetate in a test tube for hydrolysis, add 0.5 mL of hydrochloric acid and 0.5 mL of a solution of mercaptoacetic acid (2 in 25), seal the tube under reduced pressure, and heat at 110°C for 5 hours. After cooling, open the tube, transfer the hydrolyzate into a beaker, and evaporate to dryness on a water bath. Add exactly 100 mL of 0.02 mol/L hydrochloric acid TS to dissolve the residue, and use this solution as the sample solution. Separately, weigh exactly 0.105 g of L-serine, 0.147 g of L-glutamic acid, 0.115 g of L-proline, 75 mg of glycine, 0.131 g of L-leucine, 0.181 g of L-tyrosine, 0.210 g of L-histidine hydrochloride monohydrate, 0.204 g of L-tryptophan and 0.211 g of L-arginine hydrochloride, which are all previously dried at 105°C for 3 hours, add 50 mL of 1 mol/L hydrochloric acid TS to dissolve them, and add water to make exactly 1000 mL. Pipet 10 mL of this solution, add 0.02 mol/L hydrochloric acid TS to make exactly 200 mL, and use this solution as the standard solution. Perform the test with 50  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions: the peaks of nine constituent amino acids are observed on the chromatogram, and their respective molar ratios with respect to arginine are 0.7 - 1.0 for serine and tryptophan, 0.8 - 1.2 for proline, 0.9 - 1.1 for glutamic acid, leucine, tyrosine and histidine, respectively, and 1.8 - 2.2 for glycine.

**Operating conditions**—

Detector: A visible spectrophotometer (wavelength: 440 nm for proline and 570 nm for others).

Column: A stainless steel column 4 mm in inside diameter and 8 cm in length, packed with strongly acidic ion-exchange resin for liquid chromatography composed with a sulfonated polystyrene copolymer (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 57°C.

Chemical reaction bath temperature: A constant temperature of about 130°C.

Mobile phase: Prepare the mobile phases A, B, C and D according to the following table.

Mobile phase	A	B	C	D
Trisodium citrate dihydrate	6.19 g	7.74 g	26.67 g	—
Sodium hydroxide	—	—	—	8.00 g
Sodium chloride	5.66 g	7.07 g	54.35 g	—
Citric acid monohydrate	19.80 g	22.00 g	6.10 g	—
Ethanol (99.5)	130 mL	20 mL	—	100 mL
Benzyl alcohol	—	—	5 mL	—
Thiodiglycol	5 mL	5 mL	—	—
Lauromacrogol solution in diethyl ether (1 in 4)	4 mL	4 mL	4 mL	4 mL
Caprylic acid	0.1 mL	0.1 mL	0.1 mL	0.1 mL
Water	a sufficient amount	a sufficient amount	a sufficient amount	a sufficient amount
Total volume	1000 mL	1000 mL	1000 mL	1000 mL

Flowing of mobile phase: Control the gradient by mixing the mobile phases A, B, C and D as directed in the following table.

Time after injection of sample (min)	Mobile phase A (vol%)	Mobile phase B (vol%)	Mobile phase C (vol%)	Mobile phase D (vol%)
0~9	100	0	0	0
9~25	0	100	0	0
25~61	0	100→0	0→100	0
61~76	0	0	100	0
76~96	0	0	0	100

Reaction reagent: Dissolve 204 g of lithium acetate dihydrate in 336 mL of water, add 123 mL of acetic acid (100) and 401 mL of 1-methoxy-2-propanol, and use as Solution A. Separately, dissolve 39 g of ninhydrin and 81 mg of sodium borohydride in 979 mL of 1-methoxy-2-propanol, and use as Solution B. Mix the same volume of Solution A and Solution B before use.

Flow rate of mobile phase: 0.25 mL per minute.

Flow rate of reaction reagent: 0.3 mL per minute.

#### System suitability—

System performance: When the procedure is run with 50  $\mu$ L of the standard solution under the above operating conditions, serine, glutamic acid, proline, glycine, leucine, tyrosine, histidine, tryptophan and arginine are eluted in this order with enough separation between these peaks.

**Purity (1)** Clarity and color of solution—A solution obtained by dissolving 0.10 g of Gonadorelin Acetate in 10 mL of water is clear, and the absorbance of this solution at 350 nm determined as directed under Ultraviolet-visible Spectrophotometry <2.24> is not more than 0.10.

**(2)** Related substances—Dissolve 50 mg of Gonadorelin Acetate in 100 mL of the mobile phase A, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than gonadorelin from the sample solution is not more than 1/5 times the peak area of gonadorelin from the standard solution, and the total area of the peaks other than the peak of gonadorelin is not more than 3/5 of the peak area of

gonadorelin from the standard solution.

#### Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2.5 times as long as the retention time of gonadorelin beginning after the solvent peak.

#### System suitability—

Test for required detectability: To exactly 2 mL of the standard solution add the mobile phase to make exactly 100 mL. Confirm that the peak area of gonadorelin obtained from 10  $\mu$ L of this solution is equivalent to 1 to 3% of that obtained from 10  $\mu$ L of the standard solution.

System performance: Dissolve 4 mg of Gonadorelin Acetate in a suitable amount of the mobile phase, add 5 mL of a solution of phenacetin in acetonitrile (1 in 1000) and the mobile phase to make 50 mL. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, gonadorelin and phenacetin are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of gonadorelin is not more than 5%.

**Water <2.48>** Not more than 8.0% (0.15 g, volumetric titration, direct titration).

**Residue on ignition <2.44>** Not more than 0.2% (0.1 g).

**Assay** Weigh accurately about 40 mg of Gonadorelin Acetate and Gonadorelin Acetate Reference Standard (separately determine the water <2.48> in the same manner as Gonadorelin Acetate) and dissolve in diluted acetic acid (100) (1 in 1000) to make exactly 25 mL each. Pipet 5 mL each of these solutions, add exactly 5 mL of the internal standard solution and water to make 25 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of gonadorelin to that of the internal standard.

$$\text{Amount (mg) of } C_{55}H_{75}N_{17}O_{13} \cdot 2C_2H_4O_2 = W_S \times (Q_T/Q_S)$$

$W_S$ : Amount (mg) of Gonadorelin Acetate Reference Standard, calculated on the anhydrous basis

**Internal standard solution**—A solution of phenacetin in a mixture of water and acetonitrile (3:2) (1 in 1000).

#### Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS, pH 3.0 and acetonitrile (90:17).

Flow rate: Adjust the flow rate so that the retention time of gonadorelin is about 13 minutes.

#### System suitability—

**System performance:** When the procedure is run with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, gonadorelin and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

**System repeatability:** When the test is repeated 6 times with 10  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of gonadorelin to that of the internal standard is not more than 1.5%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Human Chorionic Gonadotrophin

### Chorionic Gonadotrophin

ヒト絨毛性性腺刺激ホルモン

Human Chorionic Gonadotrophin is a dried preparation of gonad-stimulating hormone obtained from the urine of healthy pregnant women after the manufacturing process to remove or inactivate the virus.

It contains not less than 2500 human chorionic gonadotrophin Units per mg, and contains not less than 3000 chorionic gonadotrophin Units per mg protein.

It contains not less than 80% and not more than 125% of the labeled human chorionic gonadotrophin Units.

**Description** Human Chorionic Gonadotrophin occurs as a white to light yellow-brown powder.

It is freely soluble in water.

**Identification** Calculate  $b$  by the following equation, using  $Y_3$  and  $Y_4$  obtained in the Assay:  $b$  is not less than 120.

$$b = (E/I)$$

$$E = (Y_3 - Y_4)/f$$

$f$ : Number of test animals per group.

$$I = \log (T_H/T_L)$$

**Purity** (1) Clarity and color of solution—Dissolve 0.05 g of Human Chorionic Gonadotrophin in 5 mL of isotonic sodium chloride solution: the solution is clear and colorless or light yellow.

(2) Estrogen—Inject subcutaneously into each of three female albino rats or albino mice ovariectomized at least two weeks before the test, single dose of 100 units according to the labeled Units dissolved in 0.5 mL of isotonic sodium chloride solution. Take vaginal smear twice daily, on the third, fourth and fifth day. Place the smear thinly on a slide glass, dry, stain with Giemsa's TS, wash with water, and again dry: no estrus figure is shown microscopically <5.01>.

**Loss on drying** <2.41> Not more than 5.0% (0.1 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Bacterial endotoxins** <4.01> Less than 0.03 EU/unit.

**Abnormal toxicity** Dilute Human Chorionic Gonadotrophin with isotonic sodium chloride solution so that each mL of the solution contains 120 Units, and use this solution as the sample solution. Inject 5.0 mL of the sample solution

into the peritoneal cavity of each of 2 or more of well-nourished, healthy guinea pigs weighing about 350 g, and observe the conditions of the animals for more than 7 days: all the animals exhibit no abnormalities.

**Specific activity** When calculate from the results obtained by the Assay and the following test, the specific activity is not less than 3000 human chorionic gonadotrophin Units per mg protein.

(i) Sample solution—To an exactly amount of Chorionic Gonadotrophin add water to make a solution so that each mL contains about 500 Units of human chorionic gonadotrophin according to the labeled amount.

(ii) Standard solution—Weigh accurately about 10 mg of bovine serum albumin, and dissolve in water to make exactly 20 mL. To a suitable volume of this solution add water to make four solutions containing exactly 300, 200, 100 and 50  $\mu\text{g}$  of the albumin per mL, respectively.

(iii) Procedure—Pipet 0.5 mL each of the sample solution and the standard solutions, put them in glass test tubes about 18 mm in inside diameter and about 130 mm in length, add exactly 5 mL of alkaline copper TS, mix, and allow the tubes to stand in a water bath at 30°C for 10 minutes. Then add exactly 0.5 mL of diluted Folin's TS (1 in 2), mix, and warm in a water bath at 30°C for 20 minutes. Determine the absorbances of these solutions at 750 nm as directed under Ultraviolet-visible Spectrophotometry <2.24> using a solution obtained in the same manner with 0.5 mL of water as the blank.

Plot the absorbances of the standard solutions on the vertical axis and their protein concentrations on the horizontal axis to prepare a calibration curve, and determine the protein content of the sample solution from its absorbance by using this curve. Then calculate the amount of the protein in the sample.

**Assay** (i) Test animals—Select healthy female albino rats weighing about 45 to 65 g.

(ii) Standard solution—Dissolve a quantity of Human Chorionic Gonadotrophin Reference Standard in bovine serum albumin-isotonic sodium chloride solution to prepare four kinds of solutions, having 7.5, 15, 30 and 60 Units per 2.5 mL, respectively. Inject these solutions into four groups consisting of five test animals each, and weigh their ovaries, as directed in procedure of (iv). Inject bovine serum albumin-isotonic sodium chloride solution to another group, and use this group as the control group. According to the result of this test, designate the concentration of the reference standard which will increase the masses of the ovaries about 2.5 times the mass of the ovaries of the control group as a low-dose concentration of the standard solution, and the concentration 1.5 to 2.0 times the low-dose concentration as a high-dose concentration. Dissolve a quantity of Human Chorionic Gonadotrophin Reference Standard, in bovine serum albumin-isotonic sodium chloride solution, and prepare a high-dose standard solution  $S_H$  and a low-dose standard solution  $S_L$  whose concentrations are equal to those determined by the above test.

(iii) Sample solution—According to the labeled units, weigh accurately a suitable quantity of Human Chorionic Gonadotrophin, dissolve in bovine serum albumin-isotonic sodium chloride solution, and prepare a high-dose sample solution  $T_H$  and a low-dose sample solution  $T_L$  having Units equal to the standard solutions in equal volumes, respectively.

(iv) Procedure—Divide the test animals at random into 4 groups, A, B, C and D, with not less than 10 animals and equal numbers in each group. Inject subcutaneously 0.5 mL of  $S_H$ ,  $S_L$ ,  $T_H$  and  $T_L$  in each group for 5 days. On the sixth day, excise the ovaries, remove the fat and other unwanted tissues attached to the ovaries, and remove the adhering water by lightly pressing between filter paper, and immediately weigh the ovaries.

(v) Calculation—Designate the mass of ovaries by  $S_H$ ,  $S_L$ ,  $T_H$  and  $T_L$  as  $y_1$ ,  $y_2$ ,  $y_3$  and  $y_4$ , respectively. Sum up  $y_1$ ,  $y_2$ ,  $y_3$  and  $y_4$  on each set to obtain  $Y_1$ ,  $Y_2$ ,  $Y_3$  and  $Y_4$ .

Units per mg of Human Chorionic Gonadotrophin  
= antilog  $M \times (\text{units per mL of } S_H) \times (b/a)$

$$M = Y_a / Y_b$$

$$I = \log (S_H/S_L) = \log (T_H/T_L)$$

$$Y_a = -Y_1 - Y_2 + Y_3 + Y_4$$

$$Y_b = Y_1 - Y_2 + Y_3 - Y_4$$

$a$ : Mass (mg) of sample.

$b$ : Total volume (mL) of the high dose of the test solution prepared by diluting with bovine serum albumin-isotonic sodium chloride solution.

$F'$  computed by the following equation should be smaller than  $F_1$  against  $n$  when  $s^2$  is calculated. And compute  $L$  ( $P = 0.95$ ) by the following equation:  $L$  should be not more than 0.3. If  $F'$  exceeds  $F_1$ , or if  $L$  exceeds 0.3, repeat the test increasing the number of the test animals or arranging the assay method in a better way until  $F'$  is smaller than  $F_1$  or  $L$  is not more than 0.3.

$$F' = (Y_1 - Y_2 - Y_3 + Y_4)^2 / 4fs^2$$

$f$ : Number of test animals per group.

$$s^2 = \{\Sigma y^2 - (Y/f)\} / n$$

$\Sigma y^2$ : The sum of the squares of each  $y_1$ ,  $y_2$ ,  $y_3$  and  $y_4$ .

$$Y = Y_1^2 + Y_2^2 + Y_3^2 + Y_4^2$$

$$n = 4(f - 1)$$

$$L = 2\sqrt{(C-1)(CM^2 + I^2)}$$

$$C = Y_b^2 / (Y_b^2 - 4fs^2I^2)$$

$I^2$ : Value shown in the following table against  $n$  used to calculate  $s^2$ .

$n$	$I^2 = F_1$	$n$	$I^2 = F_1$	$n$	$I^2 = F_1$
1	161.45	13	4.667	25	4.242
2	18.51	14	4.600	26	4.225
3	10.129	15	4.543	27	4.210
4	7.709	16	4.494	28	4.196
5	6.608	17	4.451	29	4.183
6	5.987	18	4.414	30	4.171
7	5.591	19	4.381	40	4.085
8	5.318	20	4.351	60	4.001
9	5.117	21	4.325	120	3.920
10	4.965	22	4.301	$\infty$	3.841
11	4.844	23	4.279		
12	4.747	24	4.260		

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant, and in a cold place.

## Human Chorionic Gonadotrophin for Injection

### Chorionic Gonadotrophin for Injection

注射用ヒト絨毛性性腺刺激ホルモン

Human Chorionic Gonadotrophin for Injection is a preparation for injection which is dissolved before use.

It contains not less than 80% and not more than 125% of the labeled human chorionic gonadotrophin Units.

**Method of preparation** Prepare as directed under Injections with Human Chorionic Gonadotrophin.

**Description** Human Chorionic Gonadotrophin for Injection occurs as a white to light yellow-brown powder or masses.

**Identification** Proceed as directed in the Identification under Human Chorionic Gonadotrophin.

**pH** <2.54> Prepare a solution so that each mL of isotonic sodium chloride solution contains 2 mg of Human Chorionic Gonadotrophin for Injection: the pH of this solution is between 5.0 and 7.0.

**Loss on drying** <2.41> Not more than 5.0% (0.1 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Bacterial endotoxins** <4.01> Less than 0.03 EU/unit.

**Uniformity of dosage units** <6.02> When calculate the acceptance value using the mean of estimated contents of the units tested as M, it meets the requirements of the Mass variation test.

**Foreign insoluble matter** <6.06> Perform the test according to the Method 2: it meets the requirement.

**Insoluble particulate matter** <6.07> Perform the test according to the Method 1: it meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Proceed as directed in the Assay under Human Chorionic Gonadotrophin. The ratio of the assayed Units to the labeled Units should be calculated by the following equation.

$$\begin{aligned} &\text{The ratio of the assayed Units to the labeled Units} \\ &= \text{antilog } M \end{aligned}$$

**Containers and storage** Containers—Hermetic containers.  
Storage—Light-resistant, and in a cold place.

## Human Menopausal Gonadotrophin

ヒト下垂体性性腺刺激ホルモン

Human Menopausal Gonadotrophin is a dried preparation of gonad-stimulating hormone obtained

from the urine of postmenopausal healthy women, after processing for virus removal or inactivation. It has follicle-stimulating hormonal action and luteinizing hormonal action.

It contains not less than 40 follicle-stimulating hormone Units per mg.

**Description** Human Menopausal Gonadotrophin occurs as a white to pale yellow powder.

It is soluble in water.

**Purity** Interstitial cell-stimulating hormone—Perform the test according to the following method: the ratio of the unit of interstitial cell-stimulating hormone (luteinizing hormone) to that of follicle-stimulating hormone is not more than 1.

(i) Test animals—Select healthy male albino rats weighing about 45 to 65 g.

(ii) Standard solutions—Weigh accurately a suitable amount of Human Menopausal Gonadotrophin Reference Standard, and dissolve in bovine serum albumin-sodium chloride-phosphate buffer solution, pH 7.2, to prepare three kinds of solutions, containing 10, 20 and 40 interstitial cell-stimulating hormone (luteinizing hormone) units per 1.0 mL, respectively. Inject these solutions into three groups consisting of five test animals each, and weigh their seminal vesicles as directed in (iv). According to the result of the test, designate the concentration of the reference standard, which will make the mass of the seminal vesicle 20 to 35 mg, as the high-dose standard solution,  $S_H$ . Dilute the  $S_H$  to 1.5 to 2.0 times the initial volume with the bovine serum albumin-sodium chloride-phosphate buffer solution, pH 7.2, and designate this solution as the low-dose standard solution,  $S_L$ . Store these solutions at 2 – 8°C.

(iii) Sample solution—According to the labeled units, weigh accurately a suitable amount of Human Menopausal Gonadotrophin, and dissolve in the bovine serum albumin-sodium chloride-phosphate buffer solution, pH 7.2, to prepare the high-dose sample solution,  $T_H$  and the low-dose sample solution,  $T_L$ , so that their concentrations are similar to those of the corresponding standard solutions, respectively. Store these solutions at 2 – 8°C.

(iv) Procedure—Divide the test animals at random into 4 groups, A, B, C and D, with not less than 10 animals and equal numbers in each group. Inject subcutaneously once every day 0.2 mL each of  $S_H$ ,  $S_L$ ,  $T_H$  and  $T_L$  into the animals in each group. On the sixth day, excise the seminal vesicles, remove extraneous tissue, remove fluid adhering to the vesicles and the contents of the vesicles by lightly pressing between filter papers, and weigh the vesicles.

(v) Calculation—Proceed as directed in (v) in the Assay.

**Bacterial endotoxins** <4.01> Dissolve Human Menopausal Gonadotrophin in water for bacterial endotoxins test to prepare a solution containing 75 follicle-stimulating hormone Units per mL, and perform the test: less than 0.66 EU/ follicle-stimulating hormone Unit.

**Water** <2.48> Not more than 5.0% (0.2 g, volumetric titration, direct titration).

**Specific activity** Perform the test with Human Menopausal Gonadotrophin according to the following method, and calculate the specific activity using the amount (Unit) obtained in the Assay: it is not less than 50 follicle-stimulating hormone Units per 1 mg of protein.

(i) Sample solution—Weigh accurately about 10 mg of Human Menopausal Gonadotrophin, dissolve in water so that each mL contains exactly 200  $\mu$ g, and use this solution as the sample solution.

(ii) Standard solutions—Weigh accurately about 10 mg of bovine serum albumin, and dissolve in water to make exactly 20 mL. To this solution add water to make four solutions containing exactly 300  $\mu$ g, 200  $\mu$ g, 100  $\mu$ g and 50  $\mu$ g of the albumin per mL, respectively, and use these solutions as the standard solutions.

(iii) Procedure—To glass test tubes, about 18 mm in inside diameter and about 130 mm in height, add separately exactly 0.5 mL each of the sample solution and the standard solutions. To these tubes add exactly 5 mL of alkaline copper TS, warm in a water bath at 30°C for 10 minutes, then add exactly 0.5 mL of diluted Folin's TS (1 in 2), and warm in a water bath at 30°C for 20 minutes. Perform the test with these solutions as directed under Ultraviolet-visible Spectrometry <2.24>, and determine the absorbances at 750 nm, using a liquid obtained with 0.5 mL of water in the same manner as above as a blank. Prepare a calibration curve from the absorbances of the standard solutions, with absorbance on the vertical axis and concentration on the horizontal axis. Determine the amount of protein in the sample solution from the absorbance of the sample solution using the curve, and calculate the protein content of the sample.

#### Assay

(i) Test animals—Select healthy female albino rats weighing about 45 to 65 g.

(ii) Standard solutions—Weigh accurately a suitable amount of Human Menopausal Gonadotrophin Reference Standard, dissolve in human chorionic gonadotrophin TS to make three solutions which contain 0.75, 1.5 and 3.0 follicle-stimulating hormone Units per 1.0 mL, respectively. Inject these solutions into three groups consisting of five test animals each, and weigh their ovaries, as directed in (iv). According to the result of the test, designate the concentration of the reference standard, which will make the mass of the ovary about 120 to 160 mg, as the high-dose standard solution,  $S_H$ . Dilute the  $S_H$  to 1.5 to 2.0 times the initial volume with the human chorionic gonadotrophin TS, and designate the solution as the low-dose standard solution,  $S_L$ .

(iii) Sample solutions—According to the labeled units, weigh accurately a suitable amount of Human Menopausal Gonadotrophin, dissolve in human chorionic gonadotrophin TS, and prepare the high-dose sample solution,  $T_H$ , and the low-dose sample solution,  $T_L$ , which have similar numbers of units to those of corresponding standard solutions in equal volume, respectively.

(iv) Procedure—Divide the test animals at random into 4 groups, A, B, C and D, with not less than 10 animals and equal numbers in each group. Inject subcutaneously 0.2 mL each of  $S_H$ ,  $S_L$ ,  $T_H$  and  $T_L$  into the animals in each group, once in the afternoon on the first day, three times in the morning, noon and afternoon on the second day, and two times in the morning and afternoon on the third day. On the fifth day, excise the ovaries, remove the fat and extraneous tissue, remove fluid adhering to the ovaries by lightly pressing between filter papers, and immediately weigh the ovaries.

(v) Calculation—Designate the mass of ovaries by  $S_H$ ,  $S_L$ ,  $T_H$  and  $T_L$  as  $y_1$ ,  $y_2$ ,  $y_3$  and  $y_4$ , respectively. Sum up  $y_1$ ,  $y_2$ ,  $y_3$  and  $y_4$  on each set to obtain  $Y_1$ ,  $Y_2$ ,  $Y_3$  and  $Y_4$ .

Units per mg of Human Menopausal Gonadotrophin  
= antilog  $M \times (\text{units per mL of } S_H) \times (b/a)$

$M = IY_a/Y_b$

$$I = \log (S_H/S_L) = \log (T_H/T_L)$$

$$Y_a = -Y_1 - Y_2 + Y_3 + Y_4$$

$$Y_b = Y_1 - Y_2 + Y_3 - Y_4$$

$a$ : Mass (mg) of sample.

$b$ : Total volume (mL) of the high dose of the test solution prepared by diluting with bovine serum albumin-isotonic sodium chloride solution.

$F'$  computed by the following equation should be smaller than  $F_1$  against  $n$  when  $s^2$  is calculated. And compute  $L$  ( $P = 0.95$ ) by the following equation:  $L$  should be not more than 0.3. If  $F'$  exceeds  $F_1$ , or if  $L$  exceeds 0.3, repeat the test increasing the number of the test animals or arranging the assay method in a better way until  $F'$  is smaller than  $F_1$  or  $L$  is not more than 0.3.

$$F' = (Y_1 - Y_2 - Y_3 - Y_4)^2 / (4fs^2)$$

$f$ : Number of test animals per group.

$$s^2 = \{ \sum y^2 - (Y/f) \} / n$$

$\sum y^2$ : The sum of the squares of each  $y_1, y_2, y_3$  and  $y_4$ .

$$Y = -Y_{12} - Y_{22} + Y_{32} + Y_{42}$$

$$n = 4(f - 1)$$

$$L = 2\sqrt{(C-1)(CM^2 + I^2)}$$

$$C = Y_b^2 / (Y_a^2 - 4fs^2t^2)$$

$t^2$ : Value shown in the following table against  $n$  used to calculate  $s^2$ .

$n$	$t^2 = F_1$	$n$	$t^2 = F_1$	$n$	$t^2 = F_1$
1	161.45	13	4.667	25	4.242
2	18.51	14	4.600	26	4.225
3	10.129	15	4.543	27	4.210
4	7.709	16	4.494	28	4.196
5	6.608	17	4.451	29	4.183
6	5.987	18	4.414	30	4.171
7	5.591	19	4.381	40	4.085
8	5.318	20	4.351	60	4.001
9	5.117	21	4.325	120	3.920
10	4.965	22	4.301	$\infty$	3.841
11	4.844	23	4.279		
12	4.747	24	4.260		

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and in a cold place.

## Serum Gonadotrophin

血清性腺刺激ホルモン

Serum Gonadotrophin is a dried preparation of gonad-stimulating hormone, obtained from pregnant mares' serum which has adequately inspected viruses, and subjected to a suitable process for removal or inac-

tivation of viruses.

It contains not less than 2000 serum gonadotrophin Units per mg.

It contains not less than 80% and not more than 125% of the labeled serum gonadotrophin Units.

**Description** Serum Gonadotrophin occurs as a white powder.

It is freely soluble in water.

**Identification** Calculate  $b$  by the following equation, using  $Y_3$  and  $Y_4$  obtained in the Assay:  $b$  is not less than 120.

$$b = E/I$$

$$E = (Y_3 - Y_4)/f$$

$f$ : Number of test animals per group.

$$I = \log (T_H/T_L)$$

**Purity** Clarity and color of solution—Dissolve Serum Gonadotrophin in isotonic sodium chloride solution to prepare a solution containing 9000 units per mL according to the labeled Units: the solution is clear and colorless.

**Loss on drying** <2.4I> Not more than 8.0% (0.1 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Bacterial endotoxins** <4.0I> Less than 0.1 EU/unit.

**Specific activity** When calculated from the results obtained by the Assay and the following test, Serum Gonadotrophin contains not less than 3000 serum gonadotrophin Units per mg of protein.

(i) Standard solutions—Dissolve about 3 mg of bovine serum albumin in water to make a solution containing 500  $\mu$ g of the albumin in each mL. To this solution add water to make four standard solutions so that each mL contains exactly 200  $\mu$ g, 150  $\mu$ g, 100  $\mu$ g and 50  $\mu$ g of the albumin, respectively.

(ii) Sample solution—Dissolve about 1 mg of Serum Gonadotrophin in water to make a solution containing exactly 180  $\mu$ g in each mL.

(iii) Sodium carbonate solution—Dissolve 2 g of sodium carbonate (standard reagent) in 0.1 mol/L sodium hydroxide TS to make 100 mL.

(iv) Sodium tartrate solution—Dissolve about 1 g of sodium tartrate dihydrate in water to make 100 mL.

(v) Copper (II) sulfate solution—Dissolve 0.5 g of copper (II) sulfate pentahydrate in the sodium tartrate solution to make 100 mL.

(vi) Alkaline copper solution—Mix 50 mL of the sodium carbonate solution and 1 mL of the copper (II) sulfate solution. Prepare before use. Use within the day of preparation.

(vii) Procedure—Pipet 0.5 mL each of the standard solutions and the sample solution in small test tubes, add 3 mL of the alkaline copper solution to them, and mix. Allow them to stand at the room temperature for not less than 10 minutes, add 0.3 mL of diluted Folin's TS (1 in 2), mix immediately, and allow to stand for not less than 30 minutes. Determine the absorbances of these solutions so obtained at 750 nm as directed under Ultraviolet-visible Spectrophotometry <2.24> using a solution, prepared in the same manner with 0.5 mL of water, as the blank. Plot the calibration curve from the absorbances obtained with the standard solutions, and determine the amount of protein in the sample solution from

this curve.

$$\begin{aligned} &\text{Specific activity (unit/mg protein)} \\ &= [(\text{units per mg, obtained in the Assay}) / \\ &\quad (\text{amount (\%) of protein in the sample})] \times 100 \end{aligned}$$

**Abnormal toxicity** Dissolve Serum Gonadotrophin in isotonic sodium chloride solution so that each 5 mL of the solution contains 4000 Units, and use this solution as the sample solution. Inject 5.0 mL of the sample solution into the peritoneal cavity of each of 2 or more of well-nourished, healthy guinea pigs weighing about 350 g, and inject 0.5 mL of the sample solution into the peritoneal cavity of each of 2 or more of well-nourished, healthy mice aged about 5 weeks. Observe the conditions of the animals for more than 7 days: all the animals exhibit no abnormalities.

#### Assay

(i) Test animals—Select healthy female albino rats weighing about 45 g.

(ii) Standard solution—Dissolve a quantity of Serum Gonadotrophin Reference Standard in bovine serum albumin-isotonic sodium chloride solution to prepare four kinds of solutions, containing 10, 20, 40 and 80 Units per 0.5 mL, respectively. Inject these solutions into four groups consisting of five test animals each, and weigh their ovaries, as directed in procedure of (iv). Inject bovine serum albumin-isotonic sodium chloride solution to another group, and use this group as the control group. According to the result of this test, designate the concentration of the reference standard which will increase the masses of the ovaries about 3 times the mass of the ovaries of the control group as a low-dose concentration of the standard solution, and the concentration 1.5 to 2.0 times the low-dose concentration as a high-dose concentration. Weigh accurately a suitable quantity of Serum Gonadotrophin Reference Standard, dissolve in bovine serum albumin-isotonic sodium chloride solution, and prepare a high-dose standard solution  $S_H$  and a low-dose standard solution  $S_L$  whose concentrations are equal to those determined by the above test.

(iii) Sample solution—According to the labeled units, weigh accurately a suitable quantity of Serum Gonadotrophin, dissolve in bovine serum albumin-isotonic sodium chloride solution, and prepare a high-dose sample solution  $T_H$  and a low-dose sample solution  $T_L$  having Units equal to the standard solutions in equal volumes, respectively.

(iv) Procedure—Divide the test animals at random into 4 groups, A, B, C and D, with not less than 10 animals and equal numbers in each group. Inject once subcutaneously 0.5 mL of  $S_H$ ,  $S_L$ ,  $T_H$  and  $T_L$  in each group. On the sixth day, excise the ovaries, remove the fat and other unwonted tissues attached to the ovaries, and remove the adhering water by lightly pressing between filter paper, and immediately weigh the ovaries.

(v) Calculation—Designate the mass of ovaries by  $S_H$ ,  $S_L$ ,  $T_H$  and  $T_L$  as  $y_1$ ,  $y_2$ ,  $y_3$  and  $y_4$ , respectively. Sum up  $y_1$ ,  $y_2$ ,  $y_3$  and  $y_4$  on each set to obtain  $Y_1$ ,  $Y_2$ ,  $Y_3$  and  $Y_4$ .

$$\begin{aligned} &\text{Units per mg of Serum Gonadotrophin} \\ &= \text{antilog } M \times (\text{units per mL of SH}) \times (b/a) \end{aligned}$$

$$M = IY_a/Y_b$$

$$I = \log (S_H/S_L) = \log (T_H/T_L)$$

$$Y_a = -Y_1 - Y_2 + Y_3 + Y_4$$

$$Y_b = Y_1 - Y_2 + Y_3 - Y_4$$

$a$ : Mass (mg) of sample.

$b$ : Total volume (mL) of the high dose of the test solution prepared by diluting with bovine serum albumin-isotonic sodium chloride solution.

$F'$  computed by the following equation should be smaller than  $F_1$  against  $n$  when  $s^2$  is calculated. And compute  $L$  ( $P = 0.95$ ) by the following equation:  $L$  should be not more than 0.3. If  $F'$  exceeds  $F_1$ , or if  $L$  exceeds 0.3, repeat the test increasing the number of the test animals or arranging the assay method in a better way until  $F'$  is smaller than  $F_1$  or  $L$  is not more than 0.3.

$$F' = (Y_1 - Y_2 - Y_3 + Y_4)^2 / 4fs^2$$

$f$ : Number of test animals per group.

$$s^2 = \{\Sigma y^2 - (Y/f)\} / n$$

$\Sigma y^2$ : The sum of the squares of each  $y_1$ ,  $y_2$ ,  $y_3$  and  $y_4$ .

$$Y = Y_1^2 + Y_2^2 + Y_3^2 + Y_4^2$$

$$n = 4(f - 1)$$

$$L = 2\sqrt{(C-1)(CM^2 + I^2)}$$

$$C = Y_b^2 / (Y_b^2 - 4fs^2t^2)$$

$t^2$ : Value shown in the following table against  $n$  used to calculate  $s^2$ .

$n$	$t^2 = F_1$	$n$	$t^2 = F_1$	$n$	$t^2 = F_1$
1	161.45	13	4.667	25	4.242
2	18.51	14	4.600	26	4.225
3	10.129	15	4.543	27	4.210

12	4.747	24	4.260		

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and in a cold place.

## Serum Gonadotrophin for Injection

注射用血清性腺刺激ホルモン

Serum Gonadotrophin for Injection is a preparation for injection which is dissolved before use.

It contains not less than 80% and not more than 125% of the labeled Serum Gonadotrophin Units.

**Method of preparation** Prepare as directed under Injections with Serum Gonadotrophin.

**Description** Serum Gonadotrophin for Injection occurs as white powder or masses.

**Identification** Proceed as directed in the Identification under Serum Gonadotrophin.

**pH** <2.54> Dissolve 30 mg of Serum Gonadotrophin for In-

jection in 20 mL of isotonic sodium chloride solution: the pH of this solution is between 5.0 and 7.0.

**Loss on drying** <2.41> Not more than 5.0% (0.1 g, in vacuum, phosphorus (V) oxide, 4 hours).

**Bacterial endotoxins** <4.01> Less than 0.1 EU/unit.

**Assay** Proceed as directed in the Assay under Serum Gonadotrophin. The ratio of the Units assayed to the labeled Units should be calculated by the following equation.

$$\frac{\text{The ratio of the assayed Units to the labeled Units}}{= \text{antilog } M}$$

**Containers and storage** Containers—Hermetic containers. Storage—Light-resistant, and in a cold place.

## Gramicidin

グラミシジン

[1405-97-6]

Gramicidin is a mixture of peptide substances having antibacterial activity produced by the growth of *Bacillus brevis* Dubos.

It contains not less than 900 µg (potency) per mg, calculated on the dried basis. The potency of Gramicidin is expressed as mass (potency) of gramicidin.

**Description** Gramicidin occurs as a white to light yellowish white crystalline powder.

It is freely soluble in methanol, soluble in ethanol (99.5), and practically insoluble in water.

**Identification** (1) To 10 mg of Gramicidin add 2 mL of 6 mol/L hydrochloric acid TS, and heat in a water bath for 30 minutes with occasional stirring. After cooling, neutralize with 6 mol/L sodium hydroxide TS, add 1 mL of ninhydrin TS and 0.5 mL of pyridine, and heat for 2 minutes: a blue-purple to red-purple color develops.

(2) Determine the absorption spectrum of a solution of Gramicidin in ethanol (95) (1 in 20,000), as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Gramicidin Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Loss on drying** <2.41> Not more than 3.0% (0.1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 1.0% (1 g).

**Assay** Perform the test according to the Turbidimetric method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

- (i) Test organism—*Enterococcus hirae* ATCC 10541
- (ii) Agar medium for transferring test organism

Glucose	10.0 g
Casein peptone	5.0 g
Yeast extract	20.0 g
Potassium dihydrogen phosphate	2.0 g
Polysorbate 80	0.1 g

Agar	15.0 g
Water	1000 mL

Mix all the ingredients, and sterilize. Adjust the pH of the solution so that it will be 6.7 to 6.8 after sterilization.

(iii) Liquid medium for suspending test organism—Use the culture medium (2).

(iv) Preparation of the test organism suspension—Puncture the test organism in the medium, prepared by dispensing 10 mL of the agar medium for transferring test organism in a test tube about 16 mm in inside diameter, incubate at 36.5 to 37.5°C for 20 to 24 hours. After sub-culturing at least three times, keep between 1 to 5°C. Transfer the organism so obtained in 10 mL of the liquid medium for suspending test organism, incubate at 36.5 to 37.5°C for 20 to 24 hours, and use this medium as the test organism stock suspension. Before use, add the test organism stock suspension to the liquid medium for suspending test organism so that the transmittance at 580 nm is 50 to 60%. Mix one volume of this suspension and 200 volume of the liquid medium for suspending test organism, and use this as the test organism suspension.

(v) Standard solution—Weigh accurately an amount of Gramicidin Reference Standard, previously dried under reduced pressure not exceeding 0.67 kPa at 60°C for 3 hours, equivalent to about 10 mg (potency), dissolve in ethanol (99.5) to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 5°C and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add the following diluting solution to make a solution so that each mL contains 0.02 µg (potency), and use this solution as the standard solution.

Diluting solution: To 390 mL of propylene glycol add 210 mL of a mixture of ethanol (99.5) and acetone (9:1) and Sterile Purified Water to make 1000 mL.

(vi) Sample solution—Weigh accurately an amount of Gramicidin, equivalent to about 10 mg (potency), and dissolve in ethanol (99.5) to make exactly 100 mL. Take exactly a suitable amount of this solution, add the diluting solution obtained in (v) to make a solution so that each mL contains 0.02 µg (potency), and use this solution as the sample solution.

(vii) Procedure—Transfer 0.155 mL, 0.125 mL, 0.100 mL, 0.080 mL and 0.065 mL each of the standard solution, 0.100 mL of the sample solution and 0.100 mL of the diluting solution, separately, in test tubes about 14 mm in inside diameter and about 15 cm in length, and make three sets for each. To each of the test tube add 10 mL of the test organism suspension, stopper the tube, incubate in a water bath at 36.5 to 37.5°C for 180 to 270 minutes, add 0.5 mL of a solution of formaldehyde (1 in 3), and determine their transmittances at 580 nm.

**Containers and storage** Containers—Tight containers.

## Griseofulvin

グリセオフルビン

$C_{17}H_{17}ClO_6$ : 352.77

(2*S*,6'*R*)-7-Chloro-2',4,6-trimethoxy-6'-methylspiro[benzo[*b*]furan-2(3*H*),1'-(cyclohex-2'-ene)]-3,4'-dione [126-07-8]

Griseofulvin is a substance having antifungal activity produced by the growth of *Penicillium griseofulvum* or *Penicillium janczewskii*.

It contains not less than 960  $\mu\text{g}$  (potency) and not more than 1020  $\mu\text{g}$  (potency) per mg, calculated on the dried basis. The potency of Griseofulvin is expressed as mass (potency) of griseofulvin ( $C_{17}H_{17}ClO_6$ ).

**Description** Griseofulvin occurs as white, crystals or crystalline powder.

It is soluble in *N,N*-dimethylformamide, sparingly soluble in acetone, slightly soluble in methanol and in ethanol (95), and practically insoluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Griseofulvin in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Griseofulvin Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Griseofulvin as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Griseofulvin Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  $[\alpha]_D^{20}$ : +350 – +364° (0.25 g calculated on the dried basis, *N,N*-dimethylformamide, 25 mL, 100 mm).

**Melting point** <2.60> 218 – 222°C

**Purity** (1) Acidity—Dissolve 0.25 g of Griseofulvin in 20 mL of neutralized ethanol, and add 2 drops of phenolphthalein TS and 1.0 mL of 0.02 mol/L sodium hydroxide VS: the color of the solution is red.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Griseofulvin according to Method 2, and perform the test. Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 25 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Griseofulvin according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—To 0.10 g of Griseofulvin add exactly 1 mL of the internal standard solution and acetone to make 10 mL, and use this solution as the sample solution. Separately, to 5.0 mg of Griseofulvin Reference Standard add exactly 1 mL of the internal standard solution and acetone to make 10 mL, and use this solution as the standard solution. Perform the test with 2  $\mu\text{L}$  each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, determine each peak area by the automatic integration method, and calculate the ratio,  $Q_1$ , of the peak area of dechlorogriseofulvin, having the relative retention time of about 0.6 with respect to griseofulvin, to that of the internal standard obtained from the sample solution, the ratio,  $Q_2$ , of the peak area of dehydrogriseofulvin, having the relative retention time of about 1.2 with respect to griseofulvin, to that of the internal standard obtained from the sample solution and the ratio,  $Q_S$ , of the peak area of griseofulvin to that of the internal standard obtained from the standard solution:  $Q_1/Q_S$  is not more than 0.6, and  $Q_2/Q_S$  is not more than 0.15. **Internal standard solution**—A solution of 9,10-diphenylanthracene in acetone (1 in 500).

**Operating conditions**—

Detector: An hydrogen flame-ionization detector.

Column: A glass column 4 mm in inside diameter and 1 m in length, packed with siliceous earth for gas chromatography coated with 25% phenyl-25% cyanopropyl-methylsilicone polymer for gas chromatography in the ratio of 1% (150 – 180  $\mu\text{m}$  in particle diameter).

Column temperature: A constant temperature of about 250°C.

Temperature of injection port: A constant temperature of about 270°C.

Temperature of detector: A constant temperature of about 300°C.

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of griseofulvin is about 10 minutes.

**System suitability**—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the internal standard solution diluted with acetone (1 in 10) to make exactly 10 mL. Confirm that the ratio of the peak area of griseofulvin to that of the internal standard obtained from 2  $\mu\text{L}$  of this solution is equivalent to 7 to 13% of that obtained from 2  $\mu\text{L}$  of the standard solution.

System performance: When the procedure is run with 2  $\mu\text{L}$  of the standard solution under the above operating conditions, the internal standard and griseofulvin are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 2  $\mu\text{L}$  of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of griseofulvin to that of the internal standard is not more than 5.0%.

(5) Petroleum ether soluble substances—To 1.0 g of Griseofulvin add 20 mL of petroleum ether, shake, and boil for 10 minutes under a reflux condenser. After cooling, filter through a dried filter paper, wash the filter paper with two 15-mL portions of petroleum ether, combine the washings to the filtrate, evaporate the petroleum ether on a water bath, and dry the residue at 105°C for 1 hour: the amount of the

residue is not more than 0.2%.

**Loss on drying** <2.41> Not more than 1.0% (1 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately an amount of Griseofulvin and Griseofulvin Reference Standard, equivalent to about 50 mg (potency), dissolve each in 50 mL of *N,N*-dimethylformamide, add exactly 20 mL of the internal standard solution and water to make 250 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of griseofulvin to that of the internal standard.

$$\begin{aligned} & \text{Amount } [\mu\text{g (potency)}] \text{ of } \text{C}_{17}\text{H}_{17}\text{ClO}_6 \\ & = W_S \times (Q_T/Q_S) \times 1000 \end{aligned}$$

$W_S$ : Amount [mg (potency)] of Griseofulvin Reference Standard

**Internal standard solution**—A solution of butyl parahydroxybenzoate in acetonitrile (1 in 400).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 25°C.

**Mobile phase**: A mixture of water and acetonitrile (3:2).

**Flow rate**: Adjust the flow rate so that the retention time of griseofulvin is about 6 minutes.

**System suitability**—

**System performance**: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, griseofulvin and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability**: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of griseofulvin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

## Guaifenesin

### Guaiacol Glyceryl Ether

グアイフェネシン

$\text{C}_{10}\text{H}_{14}\text{O}_4$ : 198.22

(2*RS*)-3-(2-Methoxyphenoxy)propane-1,2-diol [93-14-1]

Guaifenesin, when dried, contains not less than 98.0% and not more than 102.0% of  $\text{C}_{10}\text{H}_{14}\text{O}_4$ .

**Description** Guaifenesin occurs as a white crystals or crystalline powder.

It is freely soluble in ethanol (95), and sparingly soluble in water.

A solution of ethanol (95) (1 in 20) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Guaifenesin (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Guaifenesin Reference Standard prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Guaifenesin, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Guaifenesin Reference Standard: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 80 – 83°C

**pH** <2.54> Dissolve 1.0 g of Guaifenesin in 100 mL of water: the pH of the solution is between 5.0 and 7.0.

**Purity (1)** Clarity and color of solution—Dissolve 0.20 g of Guaifenesin in 10 mL of water: the solution is clear and colorless.

**(2)** Chloride <1.03>—Dissolve 0.7 g of Guaifenesin in 25 mL of water by warming. Cool, add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.020%).

**(3)** Heavy metals <1.07>—Dissolve 2.0 g of Guaifenesin in 25 mL of water by warming. Cool, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**(4)** Arsenic <1.11>—Prepare the test solution with 1.0 g of Guaifenesin according to Method 3, and perform the test (not more than 2 ppm).

**(5)** Free guaiacol—To 1.0 g of Guaifenesin add exactly 25 mL of water, dissolve by warming, cool, and use this solu-

tion as the sample solution. Separately, dissolve 0.100 g of guaiacol in water to make exactly 1000 mL. Pipet 3 mL of this solution, add exactly 22 mL of water, and use this solution as the standard solution. To each of the sample solution and the standard solution add 1.0 mL of potassium hexacyanoferrate (III) TS and 5.0 mL of a solution of 4-aminoantipyrine (1 in 200), and immediately after shaking for exactly 5 seconds add a solution of sodium hydrogen carbonate (1 in 1200) to make exactly 100 mL. Determine the absorbances of these solutions at 500 nm exactly 15 minutes after the addition of the 4-aminoantipyrine solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution, prepared in the same manner with 25 mL of water, as the blank: the absorbance of the solution obtained from the sample solution is not greater than that from the standard solution.

(6) Related substances—Dissolve 1.0 g of Guaifenesin in 100 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10  $\mu$ L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of diethyl ether, ethanol (95), and ammonia solution (28) (40:10:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS for spraying on the plate, and heat at 110°C for 10 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 60 mg of Guaifenesin and Guaifenesin Reference Standard, previously dried, and dissolve each then in water to make exactly 100 mL. Pipet 5 mL of these solutions, and add water to make exactly 100 mL, and use these solutions as the sample solution and standard solution. Determine the absorbances,  $A_T$  and  $A_S$ , of the sample solution and standard solution at 273 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

$$\begin{aligned} & \text{Amount (mg) of } C_{10}H_{14}O_4 \\ & = W_S \times (A_T/A_S) \end{aligned}$$

$W_S$ : Amount (mg) of Guaifenesin Reference Standard

**Containers and storage** Containers—Tight containers.

## Guanabenz Acetate

グアナベンズ酢酸塩

$C_8H_8Cl_2N_4 \cdot C_2H_4O_2$ : 291.13  
(*E*)-1-(2,6-Dichlorobenzylideneamino)guanidine monoacetate [23256-50-0]

Guanabenz Acetate, when dried, contains not less than 98.5% of  $C_8H_8Cl_2N_4 \cdot C_2H_4O_2$ .

**Description** Guanabenz Acetate occurs as white crystals or crystalline powder.

It is freely soluble in acetic acid (100), soluble in methanol and in ethanol (95), slightly soluble in water, and practically insoluble in diethyl ether.

It is gradually affected by light.

Melting point: about 190°C (with decomposition).

**Identification** (1) To 5 mL of a solution of Guanabenz Acetate (1 in 1000) add 0.5 mL of a diluted ethanol (95) (5 in 6) which contains 16 g of urea and 0.2 g of 1-naphthol in 100 mL, and add 1 mL of *N*-bromosuccinimide TS: a purple color develops.

(2) Determine the absorption spectrum of a solution of Guanabenz Acetate in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Guanabenz Acetate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) To 0.1 g of Guanabenz Acetate add 5 mL of water and 1 mL of ammonia TS, shake, filter, and neutralize the filtrate with dilute hydrochloric acid: the solution responds to the Qualitative Tests <1.09> (3) for acetate.

**Purity** (1) Heavy metals <1.07>—Proceed with 2.0 g of Guanabenz Acetate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.05 g of Guanabenz Acetate in 5 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 10 mL, then pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5  $\mu$ L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia solution (28) (80:20:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution. Place the plate in a chamber filled with iodine vapor for 10 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 50°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.25 g of Guanabenz Acetate, previously dried, dissolve in 50 mL of acetic acid

(100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 29.11 mg of  $C_8H_8Cl_2N_4 \cdot C_2H_4O_2$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Guanethidine Sulfate

グアネチジン硫酸塩

$C_{10}H_{22}N_4 \cdot H_2SO_4$ : 296.39  
1-[2-(Hexahydroazocin-1(2H)-yl)ethyl]guanidine  
monosulfate [645-43-2]

Guanethidine Sulfate, when dried, contains not less than 98.5% of  $C_{10}H_{22}N_4 \cdot H_2SO_4$ .

**Description** Guanethidine Sulfate occurs as white crystals or crystalline powder. It is odorless or has a slight, characteristic odor and a bitter taste.

It is very soluble in formic acid, freely soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

Melting point: 251 – 256°C (an evacuated sealed capillary tube, with decomposition).

**Identification (1)** To 4 mL of a solution of Guanethidine Sulfate (1 in 4000) add 2 mL of 1-naphthol TS, 1 mL of diacetyl TS and 15 mL of water, and allow to stand for 30 minutes: a red color develops.

**(2)** Determine the infrared absorption spectrum of Guanethidine Sulfate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**(3)** A solution of Guanethidine Sulfate (1 in 10) responds to the Qualitative Tests <1.09> for sulfate.

**pH <2.54>** Dissolve 1.0 g of Guanethidine Sulfate in 50 mL of water: the pH of the solution is between 4.7 and 5.7.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Guanethidine Sulfate in 50 mL of water: the solution is clear and colorless.

**(2)** Methylisothiourea sulfate—Dissolve 2.0 g of Guanethidine Sulfate in 80 mL of sodium hydroxide TS, and allow to stand for 10 minutes. Add 60 mL of hydrochloric acid, 2 g of sodium bromide and water to make 200 mL. Then, to this solution add 0.70 mL of 1/60 mol/L potassium bromate VS and 2 mL of zinc iodide-starch paste TS: a blue color develops.

**(3)** Heavy metals <1.07>—Proceed with 2.0 g of Guanethidine Sulfate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Loss on drying <2.41>** Not more than 0.5% (1 g, 105°C,

4 hours).

**Residue on ignition <2.44>** Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.5 g of Guanethidine Sulfate, previously dried, dissolve in 2 mL of formic acid, add 70 mL of a mixture of acetic anhydride and acetic acid (100) (6:1), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 29.64 mg of  $C_{10}H_{22}N_4 \cdot H_2SO_4$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Adsorbed Habu-venom Toxoid

沈降はぶトキソイド

Adsorbed Habu-venom Toxoid is a liquid for injection containing habu toxoid prepared by treating toxic substances produced by habu (*Trimeresurus flavoviridis*) with formaldehyde by a method involving no appreciable loss of the immunogenicity and rendered insoluble by the addition of aluminum salt.

It conforms to the requirements of Adsorbed Habu-venom Toxoid in the Minimum Requirements for Biological Products.

**Description** Adsorbed Habu-venom Toxoid becomes a uniform whitish turbid liquid on shaking.

## Freeze-dried Habu Antivenom, Equine

乾燥はぶウマ抗毒素

Freeze-dried Habu Antivenom, Equine, is a preparation for injection which is dissolved before use.

It contains *Trimeresurus flavoviridis* antivenom in immunoglobulin of horse origin.

It conforms to the requirements of Freeze-dried Habu Anti-venom, Equine, in the Minimum Requirements for Biological Products.

**Description** Freeze-dried Habu Antivenom, Equine, becomes colorless or light yellow-brown, clear liquid or a slightly whitish turbid liquid on addition of solvent.

## Adsorbed Hepatitis B Vaccine

沈降 B 型肝炎ワクチン

Adsorbed Hepatitis B Vaccine is a liquid for injection prepared by adding an aluminum salt to a liquid containing a surface antigen of hepatitis B virus to make the HBs antigen insoluble.

It conforms to the requirements of Adsorbed Hepatitis B Vaccine in the Minimum Requirements for Biological Products.

**Description** Adsorbed Hepatitis B Vaccine becomes a homogeneous, whitish turbid liquid on shaking.

## Haloperidol

ハロペリドール

$C_{21}H_{23}ClFNO_2$ : 375.86

4-[4-(4-Chlorophenyl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one [52-86-8]

Haloperidol, when dried, contains not less than 99.0% and not more than 101.0% of  $C_{21}H_{23}ClFNO_2$ .

**Description** Haloperidol occurs as white to pale yellow crystals or powder.

It is freely soluble in acetic acid (100), sparingly soluble in methanol, slightly soluble in 2-propanol and in ethanol (99.5), and practically insoluble in water.

**Identification (1)** Dissolve 30 mg of Haloperidol in 100 mL of 2-propanol. To 5 mL of the solution add 10 mL of 0.1 mol/L hydrochloric acid TS and 2-propanol to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Haloperidol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 149 – 153°C

**Purity (1)** Sulfate <1.14>—To 1.0 g of Haloperidol add 50 mL of water, shake, and filter. To 25 mL of the filtrate add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

**(2)** Heavy metals <1.07>—Proceed with 1.0 g of Haloperidol according to method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(3)** Related substances—Dissolve 25 mg of Haloperidol in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the fol-

lowing conditions, and determine each peak area by the automatic integration method: the area of the peak other than haloperidol is not larger than the peak area of haloperidol from the standard solution, and the total area of these peaks is not larger than 2 times the peak area of haloperidol from the standard solution. For this calculation, use the peak areas for the related substances, having the relative retention time of about 0.5, about 1.2 and about 2.6 with respect to haloperidol, after multiplying by their relative response factors, 0.75, 1.47 and 0.76, respectively.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 220 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** Dissolve 2.95 g of trisodium citrate dihydrate in 900 mL of water, adjust to pH 3.5 with dilute hydrochloric acid, and add water to make 1000 mL. To 300 mL of this solution add 700 mL of methanol and 1.0 g of sodium lauryl sulfate.

**Flow rate:** Adjust the flow rate so that the retention time of haloperidol is about 9 minutes.

**Time span of measurement:** About 2 times as long as the retention time of haloperidol beginning after the solvent peak.

**System suitability—**

**Test for required detectability:** To exactly 5 mL of the standard solution add the mobile phase to make exactly 25 mL. Confirm that the peak area of haloperidol obtained with 10  $\mu$ L of this solution is equivalent to 15 to 25% of that with 10  $\mu$ L of the standard solution.

**System performance:** When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of haloperidol are not less than 4000 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of haloperidol is not more than 2.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, in vacuum, 60°C, phosphorus (V) oxide, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of haloperidol, previously dried, and dissolve in 40 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (indicator: 1 drop of crystal violet TS). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS  
= 37.59 mg of  $C_{21}H_{23}ClFNO_2$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Haloperidol Tablets

ハロペリドール錠

Haloperidol Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of haloperidol ( $C_{21}H_{23}ClFNO_2$ ; 375.86).

**Method of preparation** Prepare as directed under Tablets, with Haloperidol.

**Identification** To pulverized Haloperidol Tablets, equivalent to 6 mg of Haloperidol according to the labeled amount, add 70 mL of 2-propanol, and heat on a water bath until to boiling while shaking. After cooling, add 2-propanol to make 100 mL, and centrifuge. To 5 mL of the supernatant liquid add 2 mL of 0.1 mol/L hydrochloric acid TS and 2-propanol to make 20 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 219 nm and 223 nm and between 243 nm and 247 nm.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Haloperidol Tablets add 5 mL of the mobile phase, disperse the particle with the aid of ultrasonic waves, add 30 mL of the mobile phase, and extract for 30 minutes with the aid of ultrasonic waves with occasional shaking. Shake for more 30 minutes, and add the mobile phase to make exactly 50 mL. Centrifuge the solution, pipet  $V$  mL of the supernatant liquid, equivalent to about 0.3 mg of haloperidol ( $C_{21}H_{23}ClFNO_2$ ), add exactly 2 mL of the internal standard solution and the mobile phase to make 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of haloperidol for assay, previously dried in vacuum at 60°C for 3 hours on phosphorus (V) oxide, and dissolve in the mobile phase to make exactly 100 mL. Pipet 15 mL of this solution, and add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 2 mL of the internal standard solution and the mobile phase to make 25 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of haloperidol to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of haloperidol (C}_{21}\text{H}_{23}\text{ClFNO}_2\text{)} \\ &= W_S \times (Q_T/Q_S) \times (1/V) \times (3/4) \end{aligned}$$

$W_S$ : Amount (mg) of haloperidol for assay

**Internal standard solution**—A solution of diphenyl in the mobile phase (1 in 6700).

**Operating conditions**—

Proceed as detected in the operating condition in the Assay.

**System suitability**—

**System performance**: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, haloperidol and diphenyl are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability**: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of haloperidol to that of the internal standard is not more than 1.0%.

**Dissolution** Being specified separately.

**Assay** Weigh accurately, and powder not less than 20 Haloperidol Tablets. Weigh accurately a portion of the powder, equivalent to about 10 mg of haloperidol ( $C_{21}H_{23}ClFNO_2$ ), add 10 mL of water, disperse the particle with the aid of ultrasonic waves, add exactly 20 mL of the internal standard solution, extract for 30 minutes with the aid of ultrasonic waves with occasional shaking, and add the mobile phase to make 100 mL. Centrifuge after shaking for more 30 minutes, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 25 mg of haloperidol for assay, previously dried in vacuum at 60°C for 3 hours on phosphorus (V) oxide, and dissolve in methanol to make exactly 25 mL. Pipet 10 mL of this solution, add exactly 20 mL of the internal standard solution and the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios,  $Q_T$  and  $Q_S$ , of the peak area of haloperidol to that of the internal standard.

$$\begin{aligned} &\text{Amount (mg) of haloperidol (C}_{21}\text{H}_{23}\text{ClFNO}_2\text{)} \\ &= W_S \times (Q_T/Q_S) \times (2/5) \end{aligned}$$

$W_S$ : Amount (mg) of haloperidol for assay

**Internal standard solution**—A solution of diphenyl in methanol (1 in 2000).

**Operating conditions**—

**Detector**: An ultraviolet absorption photometer (wavelength: 220 nm).

**Column**: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature**: A constant temperature of about 40°C.

**Mobile phase**: Dissolve 2.95 g of trisodium citrate dihydrate in 900 mL of water, adjust to pH 3.5 with dilute hydrochloric acid, and add water to make 1000 mL. To 250 mL of this solution add 750 mL of methanol and 1.0 g of sodium lauryl sulfate, and mix to dissolve.

**Flow rate**: Adjust the flow rate so that the retention time of haloperidol is about 9 minutes.

**System suitability**—

**System performance**: When the procedure is run with 10  $\mu$ L of the standard solution under the above operating conditions, haloperidol and diphenyl are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability**: When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of haloperidol to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant for the tablets without coating.

## Halothane

ハロタン

C<sub>2</sub>HBrClF<sub>3</sub>: 197.38(2*RS*)-2-Bromo-2-chloro-1,1,1-trifluoroethane [151-67-7]

Halothane contains not less than 0.008% and not more than 0.012% of Thymol as a stabilizer.

**Description** Halothane is a clear, colorless, and mobile liquid.

It is miscible with ethanol (95), with diethyl ether and with isooctane.

It is slightly soluble in water.

It is a volatile, nonflammable liquid, and setting fire to its heated vapor does not support combustion.

It is affected by light.

Refractive index  $n_D^{20}$ : 1.369 – 1.371

**Identification** Transfer about 3  $\mu$ L of Halothane to a gas cell having light path 10 cm in length, and determine the infrared absorption spectrum as directed in the gas sampling method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Specific gravity** <2.56>  $d_{20}^{20}$ : 1.872 – 1.877

**Purity (1)** Acidity or alkalinity—Shake 60 mL of Halothane with 60 mL of freshly boiled and cooled water vigorously for 3 minutes. Separate the water layer, and use this as the sample solution. To 20 mL of the sample solution add 1 drop of bromocresol purple TS and 0.10 mL of 0.01 mol/L sodium hydroxide VS: a red-purple color develops. To 20 mL of the sample solution add 1 drop of bromocresol purple TS and 0.6 mL of 0.01 mol/L hydrochloric acid VS: a yellow color is produced.

**(2)** Halide and halogen—To 5 mL of the sample solution obtained in (1) add 1 drop of nitric acid and 0.20 mL of silver nitrate TS: no turbidity is produced. To 10 mL of the sample solution obtained in (1) add 1 mL of potassium iodide TS and 2 drops of starch TS, and allow to stand for 5 minutes: no blue color develops.

**(3)** Phosgene—Transfer 50 mL of Halothane to a dried 300-mL conical flask, suspend a strip of phosgene test paper vertically inside the flask with the lower end about 10 mm above the surface of the liquid, insert the stopper, and allow to stand at a dark place for 20 to 24 hours: the test paper shows no yellow color.

**(4)** Residue on evaporation—Pipet 50 mL of Halothane, evaporate on a water bath, and dry the residue at 105°C for 2 hours: the mass of the residue is not more than 1.0 mg.

**(5)** Volatile related substances—To 100 mL of Halothane add exactly 5.0  $\mu$ L of the internal standard, and use this solution as the sample solution. Perform the test with 5  $\mu$ L of the sample solution as directed under Gas Chromatography <2.02>, and determine each peak area by the automatic integration method: the total area of the peaks other than those

of halothane and the internal standard is not larger than the peak area of the internal standard.

**Internal standard**—1,1,2-Trichloro-1,2,2-trifluoroethane.

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A column about 3 mm in inside diameter and 3 m in length, at the first 2 m from the injection port, having macrogol 400 coated in the ratio of 30% on siliceous earth for gas chromatography (180 to 250  $\mu$ m in particle diameter), and at the remaining 1 m, having dinonyl phthalate coated in the ratio of 30% on siliceous earth for gas chromatography (180 to 250  $\mu$ m in particle diameter).

Column temperature: A constant temperature of about 50°C

Carrier gas: Nitrogen

Flow rate: Adjust the flow rate so that the retention time of the internal standard is 2 to 3 minutes.

Selection of column: Mix 3 mL of Halothane and 1 mL of the internal standard. Proceed with 1  $\mu$ L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of the internal standard and halothane in this order with the resolution between these peaks being not less than 10.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of the internal standard obtained from 5  $\mu$ L of the sample solution composes 30 to 70% of the full scale.

Time span of measurement: About 3 times as long as the retention time of halothane.

**Distilling range** <2.57> Not less than 95 vol distills within a 1°C range between 49°C and 51°C.

**Thymol** To 0.50 mL of Halothane add 5.0 mL of isooctane and 5.0 mL of titanium (IV) oxide TS, shake vigorously for 30 seconds, and allow to stand: the separated upper layer has more color than the following control solution A, and has no more color than the following control solution B.

Control solution: Dissolve 0.225 g of thymol for assay in isooctane to make exactly 100 mL. To 10 mL each of this solution, accurately measured, add isooctane to make exactly 150 mL and 100 mL, respectively. Proceed with 0.50 mL each of these solutions in the same manner as Halothane, and use the separated upper layers so obtained as the control solution A and B, respectively.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and not exceeding 30°C.

## Haloxazolam

ハロキサゾラム

C<sub>17</sub>H<sub>14</sub>BrFN<sub>2</sub>O<sub>2</sub>: 377.21(11*bRS*)-10-Bromo-11*b*-(2-fluorophenyl)-2,3,7,11*b*-tetrahydro[1,3]oxazolo[3,2-*d*][1,4]benzodiazepin-6(5*H*)-one [59128-97-1]

Haloxazolam, when dried, contains not less than 99.0% of  $C_{17}H_{14}BrFN_2O_2$ .

**Description** Haloxazolam occurs as white crystals or crystalline powder. It is odorless and tasteless.

It is freely soluble in acetic acid (100), sparingly soluble in acetonitrile, in methanol and in ethanol (99.5), slightly soluble in diethyl ether, and practically insoluble in water.

Melting point: about 183°C (with decomposition).

**Identification (1)** Dissolve 0.01 g of Haloxazolam in 10 mL of methanol, add 1 drop of hydrochloric acid: the solution shows a yellow-green fluorescence under ultraviolet light (main wavelength: 365 nm). To this solution add 1 mL of sodium hydroxide TS: the fluorescence disappears immediately.

**(2)** Prepare the test solution with 0.05 g of Haloxazolam as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 20 mL of dilute sodium hydroxide TS and 1 mL of hydrogen peroxide (30) as an absorbing liquid: the test solution responds to the Qualitative Tests <1.09> for bromide and for fluoride.

**(3)** Determine the absorption spectrum of a solution of Haloxazolam in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(4)** Determine the infrared absorption spectrum of Haloxazolam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Absorbance** <2.24>  $E_{1cm}^{1\%}$  (247 nm): 390 – 410 (10 mg, methanol, 1000 mL).

**Purity (1)** Clarity and color of solution—Dissolve 0.10 g of Haloxazolam in 20 mL of ethanol (99.5): the solution is clear and colorless.

**(2)** Soluble halides—To 1.0 g of Haloxazolam add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. To 25 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test with this solution as directed under Chloride Limit Test <1.03>. Prepare the control solution with 0.10 mL of 0.01 mol/L hydrochloric acid VS.

**(3)** Heavy metals <1.07>—Proceed with 1.0 g of Haloxazolam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(4)** Arsenic <1.11>—To 1.0 g of Haloxazolam in a decomposition flask add 5 mL of nitric acid and 2 mL of sulfuric acid, place a small funnel on the mouth of the flask, and heat carefully until white fumes are evolved. After cooling, add 2 mL of nitric acid, heat, repeat this procedure twice, add several 2-mL portions of hydrogen peroxide (30), and heat until the solution is colorless to pale yellow. After cooling, add 2 mL of a saturated solution of ammonium oxalate monohydrate, and heat until white fumes are evolved. After cooling, add water to make 5 mL, and perform the test with this solution: the solution has no more color than the following control solution (not more than 2 ppm).

Control solution: Proceed in the same manner as above

without using Haloxazolam, add 2.0 mL of Standard Arsenic Solution and water to make 5 mL, and proceed in the same manner as the test solution.

**(5)** Related substances—Dissolve 0.10 g of Haloxazolam in 100 mL of acetonitrile, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10  $\mu$ L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of all peaks other than the area of the haloxazolam from the sample solution is not larger than the peak area of the haloxazolam from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 250 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5  $\mu$ m in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** Dissolve 6.2 g of boric acid and 7.5 g of potassium chloride in 900 mL of water, adjust the pH with triethylamine to 8.5, and add water to make 1000 mL. To 300 mL of this solution add 200 mL of acetonitrile.

**Flow rate:** Adjust the flow rate so that the retention time of haloxazolam is about 10 minutes.

**Time span of measurement:** About 3 times as long as the retention time of haloxazolam beginning after the solvent peak.

**System suitability—**

**Test for required detection:** To exactly 5 mL of the standard solution add acetonitrile to make exactly 50 mL. Confirm that the peak area of haloxazolam obtained from 10  $\mu$ L of this solution is equivalent to 8 to 12% of that of haloxazolam obtained from 10  $\mu$ L of the standard solution.

**System performance:** Dissolve 10 mg each of Haloxazolam and cloxazolam in 200 mL of acetonitrile. When the procedure is run with 10  $\mu$ L of this solution under the above operating conditions, haloxazolam and cloxazolam are eluted in this order with the resolution between these peaks being not less than 1.5.

**System repeatability:** When the test is repeated 6 times with 10  $\mu$ L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of haloxazolam is not more than 1.0%.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g, platinum crucible).

**Assay** Weigh accurately about 0.5 g of Haloxazolam, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS  
= 37.72 mg of  $C_{17}H_{14}BrFN_2O_2$

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

## Heparin Sodium

ヘパリンナトリウム

Heparin Sodium is obtained from the livers, the lungs and the intestinal mucosa of healthy edible animals, and prolongs the clotting time of blood. Heparin Sodium obtained from the livers and the lungs contains not less than 110 Heparin Units per mg, and that obtained from the intestinal mucosa contains not less than 130 Heparin Units per mg.

Heparin Sodium, calculated on the dried basis, contains not less than 90% and not more than 110% of the labeled Units.

Label the name of the organ used as the starting material.

**Description** Heparin Sodium occurs as a white to grayish brown powder or grains. It is odorless.

It is soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

It is hygroscopic.

**pH** <2.54> The pH of a solution of 1.0 g of Heparin Sodium in 100 mL of water is between 6.0 and 8.0.

**Purity** (1) Clarity and color of solution—Dissolve 0.5 g of Heparin Sodium in 20 mL of water: the solution is clear and colorless to light yellow.

(2) Barium—Dissolve 0.03 g of Heparin Sodium in 3.0 mL of water, and use this solution as the sample solution. To 1.0 mL of the sample solution add 3 drops of dilute sulfuric acid, and allow to stand for 10 minutes: no turbidity is produced.

(3) Total nitrogen—Weigh accurately about 0.1 g of Heparin Sodium, previously dried at 60°C for 3 hours under reduced pressure, and perform the test as directed under Nitrogen Determination <1.08>: the amount of nitrogen (N: 14.01) is not more than 3.0%.

(4) Protein—To 1.0 mL of the sample solution obtained in (2) add 5 drops of a solution of trichloroacetic acid (1 in 5): neither a precipitate nor turbidity is produced.

**Loss on drying** <2.41> Not more than 10% (20 mg, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 40% (after drying, 20 mg).

**Pyrogen** <4.04> Dissolve Heparin Sodium in isotonic sodium chloride solution so as to contain 1000 Units per mL according to the labeled Units. Inject into rabbits 2 mL of this solution per kg: it meets the requirement.

**Assay** (i) Substrate solution: Dissolve 15 mg of *N*-benzoyl-L-isoleucyl-L-glutamyl( $\gamma$ -OR)-glycyl-L-arginyl-*p*-nitroanilide hydrochloride in 20 mL of water.

(ii) Antithrombin III solution: Dissolve human antithrombin III in water to make a solution containing 1 Unit per mL.

(iii) Activated blood coagulation factor X solution: Dissolve bovine activated blood coagulation factor X in water to

make a solution containing 0.426 Units per mL.

(iv) Buffer solution: Dissolve 6.06 g of 2-amino-2-hydroxymethyl-1,3-propanediol in 750 mL of water, adjust the pH to 8.4 with 1 mol/L hydrochloric acid TS, and add water to make 1000 mL.

(v) Reaction stop solution: To 20 mL of acetic acid (100) add water to make 40 mL.

(vi) Heparin standard solutions: Dissolve Heparin Sodium Reference Standard in isotonic sodium chloride solution to make a solution containing 10 Units per mL, and use as the standard stock solution. To 100  $\mu$ L of the standard stock solution add the buffer solution to make exactly 5 mL, and use this solution as the standard solution. Prepare the heparin standard solutions (1), (2), (3), (4) and (5) by addition of antithrombin III solution, human normal plasma and the buffer solution to the standard solution as directed in the following table.

Heparin standard solution		Buffer solution ( $\mu$ L)	Antithrombin III solution ( $\mu$ L)	Human normal plasma ( $\mu$ L)	Standard solution ( $\mu$ L)
No.	Heparin concentration (Unit/mL)				
(1)	0	800	100	100	0
(2)	0.02	700	100	100	100
(3)	0.04	600	100	100	200
(4)	0.06	500	100	100	300
(5)	0.08	400	100	100	400

(vii) Sample solution: Weigh accurately an adequate amount of Heparin Sodium, dissolve in isotonic sodium chloride solution so that each mL contains about 0.5 Units according to the labeled amount. To 100  $\mu$ L of this solution add 100  $\mu$ L of antithrombin III solution, 100  $\mu$ L of human normal plasma and 700  $\mu$ L of the buffer solution, and use this solution as the sample solution.

(viii) Procedure: Transfer 400  $\mu$ L of the sample solution to a test tube, and warm at 37°C for 4 minutes. Add 200  $\mu$ L of the activated blood coagulation factor X solution, mix well, warm at 37°C for exactly 30 seconds, add 400  $\mu$ L of the substrate solution, previously warmed at 37°C, and mix well. Allow the tube to stand at 37°C for exactly 3 minutes, add 600  $\mu$ L of the reaction stop solution, mix immediately, and determine the absorbance at 405 nm, using the blank solution prepared by addition of 600  $\mu$ L of the reaction stop solution and 600  $\mu$ L of water to 400  $\mu$ L of the sample solution. Proceed the same way with the heparin standard solution (1), the heparin standard solution (2), the heparin standard solution (3), the heparin standard solution (4) and the heparin standard solution (5), and determine their absorbances.

(ix) Calculation: Plot the absorbances of the standard solutions on the vertical axis and their heparin concentrations on the horizontal axis to prepare a calibration curve. Determine the heparin concentration, *C*, of the sample solution from its absorbance by using the curve, and calculate heparin Units per mg of Heparin Sodium from the following formula.

$$\text{Units per mg of Heparin Sodium} = C \times 10 \times (b/a)$$

- a*: Amount of sample (mg)  
*b*: Total volume (mL) of isotonic sodium chloride solution used to dissolve the sample to make the solution containing about 0.5 Units per mL

**Containers and storage** Containers—Tight containers.

## Heparin Sodium Injection

ヘパリンナトリウム注射液

Heparin Sodium Injection is an aqueous solution for injection. It contains not less than 90% and not more than 110% of the labeled heparin Units.

Label the name of organ used as the starting material of Heparin Sodium supplied for preparing Heparin Sodium Injection.

**Method of preparation** Dissolve Heparin Sodium in Isotonic Sodium Chloride Solution and prepare as directed under Injections.

**Description** Heparin Sodium Injection is a clear, colorless to light yellow liquid.

**pH** <2.54> 5.5 – 8.0

**Purity (1)** Barium—Measure exactly a portion of Heparin Sodium Injection, equivalent to 3000 Units of Heparin Sodium according to the labeled Unit. Add water to make 3.0 mL and use this solution as the sample solution. To 1.0 mL of the sample solution add 3 drops of dilute sulfuric acid, and allow to stand for 10 minutes: no turbidity is produced.

(2) Protein—Proceed as directed in the Purity (4) under Heparin Sodium.

**Bacterial endotoxins** <4.01> Less than 0.0030 EU/unit.

**Extractable volume** <6.05> It meets the requirement.

**Foreign insoluble matter** Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** Perform the test according to Method 1: it meets the requirement.

**Sterility** Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Proceed as directed in the Assay under Heparin Sodium, replacing the sample solution indicated in (vii) and the calculation in (ix) with the following.

Sample solution: Measure exactly an adequate portion of Heparin Sodium Injection according to the labeled Units, dilute it with isotonic sodium chloride solution so that each mL contains about 0.5 Units. To 100  $\mu$ L of this solution add 100  $\mu$ L of antithrombin III solution, 100  $\mu$ L of human normal plasma and 700  $\mu$ L of the buffer solution, and use this solution as the sample solution.

Calculation: Plot the absorbances of the standard solutions on the vertical axis and their heparin concentrations on the horizontal axis to prepare a calibration curve. Determine the heparin concentration, *C*, of the sample solution from its absorbance by using the curve, and calculate heparin Units per mL of Heparin Sodium Injection from the following formula.

$$\begin{aligned} &\text{Units per mL of Heparin Sodium Injection} \\ &= C \times 10 \times (b/a) \end{aligned}$$

- a*: Amount of sample (mL)  
*b*: Total volume (mL) of isotonic sodium chloride solution used to dilute the sample to make the solution containing about 0.5 Units per mL

**Containers and storage** Containers—Hermetic containers.  
 Storage—Light-resistant.

## Homatropine Hydrobromide

ホマトロピン臭化水素酸塩

$C_{16}H_{21}NO_3 \cdot HBr$ : 356.25

(1*R*,3*r*,5*S*)-8-Methyl-8-azabicyclo[3.2.1]oct-3-yl [(2*RS*)-2-hydroxy-2-phenyl]acetate monohydrobromide [51-56-9]

Homatropine Hydrobromide contains not less than 99.0% of  $C_{16}H_{21}NO_3 \cdot HBr$ , calculated on the dried basis.

**Description** Homatropine Hydrobromide occurs as white crystals or crystalline powder. It is odorless.

It is freely soluble in water, sparingly soluble in ethanol (95), slightly soluble in acetic acid (100), very slightly soluble in acetic anhydride, and practically insoluble in diethyl ether. It is affected by light.

Melting point: about 214°C (with decomposition).

**Identification (1)** To 5 mL of a solution of Homatropine Hydrobromide (1 in 20) add 2 to 3 drops of iodine TS: a brown precipitate is produced.

(2) Dissolve 0.05 g of Homatropine Hydrobromide in 5 mL of water, and add 3 mL of 2,4,6-trinitrophenol TS: a yellow precipitate is produced. Filter the precipitate, wash with five 10-mL portions of water, and dry at 105°C for 2 hours: it melts <2.60> between 184°C and 187°C.

(3) A solution of Homatropine Hydrobromide (1 in 20) responds to the Qualitative Tests <1.09> for bromide.

**Purity (1)** Acidity—Dissolve 1.0 g of Homatropine Hydrobromide in 20 mL of water, and add 0.40 mL of 0.01 mol/L sodium hydroxide VS and 1 drop of methyl red-methylene blue TS: a green color develops.

(2) Atropine, hyoscyamine and scopolamine—To 10 mg of Homatropine Hydrobromide add 5 drops of nitric acid, evaporate on a water bath to dryness, and cool. Dissolve the residue in 1 mL of *N,N*-dimethylformamide, and add 5 to 6 drops of tetraethylammonium hydroxide TS: no red-purple color is produced.

(3) Related substances—Dissolve 0.15 g of Homatropine Hydrobromide in 3 mL of water, and use this solution as the sample solution.

(i) To 1 mL of the sample solution add 2 to 3 drops of tannic acid TS: no precipitate is produced.

(ii) To 1 mL of the sample solution add 2 to 3 drops each

of dilute hydrochloric acid and platinic chloride TS: no precipitate is produced.

**Loss on drying** <2.41> Not more than 1.5% (0.5 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.2% (0.2 g).

**Assay** Dissolve by warming about 0.4 g of Homatropine Hydrobromide in 60 mL of a mixture of acetic anhydride and acetic acid (100) (7:3). Cool, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS  
= 35.63 mg of C<sub>19</sub>H<sub>21</sub>NO<sub>3</sub>·HBr

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Homochlorcyclizine Hydrochloride

ホモクロルシクリジン塩酸塩

C<sub>19</sub>H<sub>23</sub>ClN<sub>2</sub>·2HCl: 387.77

1-[(*RS*)-(4-Chlorophenyl)(phenyl)methyl]-  
4-methylhexahydro-1*H*-1,4-diazepine dihydrochloride  
[1982-36-1]

Homochlorcyclizine Hydrochloride, when dried, contains not less than 98.0% of C<sub>19</sub>H<sub>23</sub>ClN<sub>2</sub>·2HCl.

**Description** Homochlorcyclizine Hydrochloride occurs as white to pale brown, crystals or powder.

It is very soluble in water, freely soluble in acetic acid (100), slightly soluble in ethanol (99.5), and very slightly soluble in acetonitrile and in acetic anhydride.

It dissolves in 0.1 mol/L hydrochloric acid TS.

It is hygroscopic.

It is colored slightly by light.

A solution of Homochlorcyclizine Hydrochloride (1 in 10) shows no optical rotation.

Melting point: about 227°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Homochlorcyclizine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Homochlorcyclizine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Homochlorcyclizine Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> for chloride.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of

Homochlorcyclizine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.10 g of Homochlorcyclizine Hydrochloride in 100 mL of the mobile phase, and use this solution as the sample solution. Measure exactly 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas by the automatic integration method: the areas of the peaks other than homochlorcyclizine obtained from the sample solution are not more than 1/2 times the peak area of homochlorcyclizine from the standard solution, and the total area of the peaks other than homochlorcyclizine from the sample solution is not more than the peak area of homochlorcyclizine from the standard solution.

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 223 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

**Column temperature:** A constant temperature of about 40°C.

**Mobile phase:** A mixture of water, acetonitrile and perchloric acid (134:66:1).

**Flow rate:** Adjust the flow rate so that the retention time of homochlorcyclizine is about 10 minutes.

**Time span of measurement:** About 2 times as long as the retention time of homochlorcyclizine.

**System suitability—**

**Test for required detection:** To exactly 5 mL of the standard solution add the mobile phase to make exactly 50 mL. Confirm that the peak area of homochlorcyclizine obtained from 10 μL of this solution is equivalent to 7 to 13% of that of homochlorcyclizine obtained from 10 μL of the standard solution.

**System performance:** Dissolve 5 mg each of Homochlorcyclizine Hydrochloride and methyl parahydroxybenzoic acid in 100 mL of the mobile phase. When the procedure is run with 10 μL of this solution under the above operating conditions, methyl parahydroxybenzoic acid and homochlorcyclizine are eluted in this order with the resolution between these peaks being not less than 5.

**System repeatability:** When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of homochlorcyclizine is not more than 1.0%.

**Loss on drying** <2.41> Not more than 2.0% (1 g, 110°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.3 g of Homochlorcyclizine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS

= 19.39 mg of  $C_{19}H_{23}ClN_2 \cdot 2HCl$

**Containers and storage** Containers—Tight containers.  
Storage—Light-resistant.

## Human Normal Immunoglobulin

人免疫グロブリン

Human Normal Immunoglobulin is a liquid for injection containing immunoglobulin G in serum globulins of humans.

It conforms to the requirements of Human Normal Immunoglobulin in the Minimum Requirements for Biological Products.

**Description** Human Normal Immunoglobulin is a clear, colorless or yellow-brown liquid.

## Hydralazine Hydrochloride

ヒドララジン塩酸塩

$C_8H_8N_4 \cdot HCl$ : 196.64

Phthalazin-1-ylhydrazine monohydrochloride [304-20-1]

Hydralazine Hydrochloride, when dried, contains not less than 98.0% of  $C_8H_8N_4 \cdot HCl$ .

**Description** Hydralazine Hydrochloride occurs as a white, crystalline powder. It is odorless, and has a bitter taste.

It is soluble in water, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 275°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Hydralazine Hydrochloride (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Hydralazine Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Hydralazine Hydrochloride (1 in 4000) responds to the Qualitative Tests <1.09> for chloride.

**pH** <2.54> Dissolve 1.0 g of Hydralazine Hydrochloride in 50 mL of water: the pH of the solution is between 3.5 and 4.5.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Hydralazine Hydrochloride in 50 mL of water: the solution is clear, and colorless or pale yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Hydrala-

zine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 8 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.15 g of Hydralazine Hydrochloride, previously dried, transfer it to a glass-stoppered flask, dissolve in 25 mL of water, add 25 mL of hydrochloric acid, cool to room temperature, add 5 mL of chloroform, and titrate <2.50> with 0.05 mol/L potassium iodate VS while shaking until the purple color of the chloroform layer disappears. The end point is reached when the red-purple color no more reappears in the chloroform layer within 5 minutes after the layer has been decolorized.

Each mL of 0.05 mol/L potassium iodate VS  
= 9.832 mg of  $C_8H_8N_4 \cdot HCl$

**Containers and storage** Containers—Tight containers.

## Hydralazine Hydrochloride for Injection

注射用ヒドララジン塩酸塩

Hydralazine Hydrochloride for Injection is a preparation for injection which is dissolved before use. It contains not less than 99% and not more than 113% of the labeled amount of hydralazine hydrochloride ( $C_8H_8N_4 \cdot HCl$ : 196.64).

**Method of preparation** Prepare as directed under Injections, with Hydralazine Hydrochloride.

**Description** Hydralazine Hydrochloride for Injection occurs as a white to pale yellow powder or mass. It is odorless, and has a bitter taste.

**Identification** Determine the absorption spectrum of a solution of Hydralazine Hydrochloride for Injection (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 238 nm and 242 nm, between 258 nm and 262 nm, between 301 nm and 305 nm, and between 313 nm and 317 nm.

**pH** <2.54> Dissolve 1.0 g of Hydralazine Hydrochloride for Injection in 50 mL of water: the pH of this solution is between 3.5 and 4.5.

**Assay** Weigh accurately the contents of not less than 10 samples of Hydralazine Hydrochloride for Injection. Weigh accurately about 0.15 g of the contents, transfer it to a glass-stoppered flask, dissolve in 25 mL of water, add 25 mL of hydrochloric acid, cool to room temperature, and proceed as directed in the Assay under Hydralazine Hydrochloride.

Each mL of 0.05 mol/L potassium iodate VS  
= 9.832 mg of  $C_8H_8N_4 \cdot HCl$

**Containers and storage** Containers—Hermetic containers.
