Assay—Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics 4.02 according to the following conditions.

(i) Test organism—Bacillus subtilis ATCC 6633
(ii) Culture medium—Use the medium i in 1) under (1) Agar media for seed and base layer, having pH 7.8 – 8.0 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Arbekacin Sulfate RS, previously dried, equivalent to about 20 mg (potency), dissolve in diluted phosphate buffer solution, pH 6.0 (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the stock solution in a refrigerator and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Arbekacin Sulfate, equivalent to about 20 mg (potency), and dissolve in water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 µg (potency) and 5 µg (potency), and use these
solutions as the high concentration sample solution and low concentration sample solution, respectively.

Containers and storage  Containers—Tight containers.

### Arbekacin Sulfate Injection

アルベカシン硫酸塩注射液

Arbekacin Sulfate Injection is an aqueous injection. It contains not less than 90.0% and not more than 110.0% of the labeled amount of arbekacin sulfate (C_{22}H_{44}N_{6}O_{10}: 552.62).

**Method of preparation**  Prepare as directed under Injections, with Arbekacin Sulfate.

**Description**  Arbekacin Sulfate Injection occurs as a clear and colorless liquid.

**Identification**  To 0.2 mL of Arbekacin Sulfate Injection add 1 mL of water, and use this solution as the sample solution. Separately, dissolve 10 mg of Arbekacin Sulfate RS in 1 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 2 μL of each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop with a mixture of ammonia solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop with a mixture of ammonia solution (28), methanol, chloroform and ethanol (95) (7:6:4:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS on the plate, and heat at 80°C for 10 minutes: the principal spot with the sample solution and the spot with the standard solution show a purple-brown color and the same spot with the sample solution and the spot with the standard solution show a violet-blue color. It is gradually decomposed on exposure to light.

**Osmotic pressure ratio**  <2.47> 0.8 – 1.2 (for the preparation intended for intramuscular use).

**pH**  <2.54> 6.0 – 8.0

**Extractable volume**  <6.05> It meets the requirement.

**Foreign insoluble matter**  <6.05> Perform the test according to the Method 1: it meets the requirement.

**Insoluble particulate matter**  <6.07> Perform the test according to the Method 1: it meets the requirement.

**Sterility**  <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay**  Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, Culture medium and Standard solutions: Proceed as directed in the Assay under Arbekacin Sulfate.

(ii) Sample solutions—Take exactly a volume of Arbekacin Sulfate Injection, equivalent to about 20 mg (potency), and add water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

Containers and storage  Containers—Hermetic containers.

### Argatroban Hydrate

アルガトロバン水和物

Argatroban Hydrate occurs as white crystals or crystalline powder. It has a bitter taste. It is freely soluble in acetic acid (100), sparingly soluble in methanol, slightly soluble in ethanol (99.5), and very slightly soluble in water.

Argatroban Hydrate contains not less than 98.5% and not more than 101.0% of argatroban (C_{23}H_{36}N_{6}O_{5}S: 508.63), calculated on the anhydrous basis.

**Description**  Argatroban Hydrate occurs as white crystals or crystalline powder. It has a bitter taste.

**Extractable volume**  <2.47> 6.0 – 8.0

**Related substance 1—Dissolve 50 mg of Arbekacin Sulfate Injection, equivalent to about 20 mg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Assay**  Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, Culture medium and Standard solutions: Proceed as directed in the Assay under Arbekacin Sulfate.

(ii) Sample solutions—Take exactly a volume of Arbekacin Sulfate Injection, equivalent to about 20 mg (potency), and add water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

Containers and storage  Containers—Hermetic containers.

### Arbekacin Sulfate Injection

アルベカシン硫酸塩注射液

Arbekacin Sulfate Injection is an aqueous injection. It contains not less than 90.0% and not more than 110.0% of the labeled amount of arbekacin sulfate (C_{22}H_{44}N_{6}O_{10}: 552.62).

### Argatroban Hydrate

アルガトロバン水和物

Argatroban Hydrate occurs as white crystals or crystalline powder. It has a bitter taste. It is freely soluble in acetic acid (100), sparingly soluble in methanol, slightly soluble in ethanol (99.5), and very slightly soluble in water.

Argatroban Hydrate contains not less than 98.5% and not more than 101.0% of argatroban (C_{23}H_{36}N_{6}O_{5}S: 508.63), calculated on the anhydrous basis.

**Description**  Argatroban Hydrate occurs as white crystals or crystalline powder. It has a bitter taste.

**Extractable volume**  <2.47> 6.0 – 8.0

**Related substance 1—Dissolve 50 mg of Arbekacin Sulfate Injection, equivalent to about 20 mg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Assay**  Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism, Culture medium and Standard solutions: Proceed as directed in the Assay under Arbekacin Sulfate.

(ii) Sample solutions—Take exactly a volume of Arbekacin Sulfate Injection, equivalent to about 20 mg (potency), and add water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

Containers and storage  Containers—Hermetic containers.
Hydrate in 40 mL of methanol, add water to make 100 mL, and use this solution as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography \(\text{<2.07>}\) according to the following conditions. Determine each peak area from the sample solution by the automatic integration method, and calculate the amount of them by the area percentage method: the amount of each peak other than argatroban is not more than 0.1%.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45°C.

Mobile phase A: To 2.5 mL of acetic acid (100) add water to make 1000 mL, and adjust the pH to 5.0 with ammonia TS. To 500 mL of this solution add 500 mL of methanol.

Mobile phase B: To 2.5 mL of acetic acid (100) add water to make 1000 mL, and adjust the pH to 5.0 with ammonia TS. To 200 mL of this solution add 800 mL of methanol.

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 5</td>
<td>100</td>
<td>0</td>
</tr>
<tr>
<td>5 - 35</td>
<td>100 → 5</td>
<td>0 → 95</td>
</tr>
</tbody>
</table>

Flow rate: About 1.0 mL per minute.

Time span of measurement: About 1.5 times as long as the retention time of argatroban beginning after the solvent peak.

**System suitability—**

Test for required detectability: To 1 mL of the sample solution add the mobile phase A to make 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add the mobile phase A to make exactly 10 mL. Confirm that the peak area of argatroban obtained from 10 μL of this solution is equivalent to 7 to 13% of that from 10 μL of the solution for system suitability test.

System performance: Dissolve 5 mg of Argatroban Hydrate and 5 μL of methyl benzoate in 40 mL of methanol, and add water to make 100 mL. To 5 mL of this solution add 40 mL of methanol and water to make 100 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, methyl benzoate and argatroban are eluted in this order with the resolution between these peaks other than argatroban is not more than 0.1.

**Residue on ignition** \(\text{<2.44>}\) No more than 0.1% (1 g).

**Isomer ratio** Dissolve 50 mg of Argatroban Hydrate in 50 mL of methanol, add water to make 100 mL, and use this solution as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography \(\text{<2.07>}\) according to the following conditions. Determine the areas of two adjacent peaks, \(A_a\) and \(A_b\), having the retention times of about 40 minutes, where \(A_a\) is the peak area of shorter retention time and \(A_b\) is the peak area of longer retention time: \(A_b/(A_a + A_b)\) is between 0.30 and 0.40.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 6.0 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: To 500 mL of water add 500 mL of methanol, 13 mL of diluted 40% tetrabutylammonium hydroxide TS (1 in 4) and 0.68 mL of phosphoric acid, and adjust the pH to 6.8 with ammonia TS and diluted ammonia solution (28) (1 in 20).

Flow rate: Adjust the flow rate so that the retention time of the peak having the shorter retention time of the two peaks of argatroban is about 40 minutes.

System performance: When the procedure is run with 10 μL of the sample solution under the above operating conditions, the resolution between the two peaks is not less than 1.2.

System repeatability: When the test is repeated 6 times with 10 μL of the sample solution under the above operating conditions, the relative standard deviation of the total area of the two separate peaks of argatroban is not more than 2.0%.

**Assay** Weigh accurately about 0.5 g of Argatroban Hydrate, dissolve in 20 mL of acetic acid for nonaqueous titration, add 40 mL of acetone for nonaqueous titration, and titrate \(\text{<2.50>}\) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 50.86 mg of \(\text{C}_2\text{H}_4\text{N}_2\text{O}_7\).

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.
L-Arginine

L-アルギニン

\[
\begin{align*}
\text{C}_6\text{H}_{14}\text{N}_4\text{O}_2 & : 174.20 \\
(2S)-2\text{-Amino-5-guanidinopentanoic acid} & [74-79-3]
\end{align*}
\]

L-Arginine, when dried, contains not less than 98.5% and not more than 101.0% of C₆H₁₄N₄O₂.

**Description** L-Arginine occurs as white crystals or crystalline powder. It has a characteristic odor.

- It is freely soluble in water and in formic acid, and practically insoluble in ethanol (95%).
- It dissolves in dilute hydrochloric acid.
- It is hygroscopic.

**Identification** Determine the infrared absorption spectrum of previously dried L-Arginine as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** 2.49 \([\alpha]_D^0: +26.9\) – +27.9° (after drying, 2 g, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**pH** 2.25 – 4.5. The pH of a solution prepared by dissolving 1 g of L-Arginine in 10 mL of water is between 10.5 and 12.0.

**Purity** (1) Clarity and color of solution—A solution obtained by dissolving 1 g of L-Arginine in 10 mL of water is clear and colorless.

- Chloride 1.0%—Perform the test with 0.5 g of L-Arginine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).
- Sulfate 1.10%—Perform the test with 0.6 g of L-Arginine. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.028%).
- Ammonium 1.02%—Perform the test with 0.25 g of L-Arginine. Use the distillation under reduced pressure.
- Heavy metals 1.07%—Dissolve 2.0 g of L-Arginine in 30 mL of water, add 1 drop of phenolphthalein TS, neutralize with dilute hydrochloric acid, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).
- Iron 1.10%—Prepare the test solution with 1.0 g of L-Arginine according to Method 1, and perform the test using Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).
- Related substances—Dissolve 0.10 g of L-Arginine in 10 mL of water, and use this solution as the sample solution.

Purity (2) Dissolve 1.0 g of L-Arginine in 10 mL of water: the pH of this solution is between 4.7 and 6.2.

**Assay** Weigh accurately about 80 mg of L-Arginine, previously dried, dissolve in 3 mL of formic acid, add 50 mL of acetic acid (100), and titrate 2.5° with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 8.710 mg of C₆H₁₄N₄O₂

**Containers and storage** Containers—Tight containers.

L-Arginine Hydrochloride

L-アルギニン塩酸塩

\[
\begin{align*}
\text{C}_6\text{H}_{14}\text{N}_4\text{O}_2\text{·HCl} & : 210.66 \\
(2S)-2\text{-Amino-5-guanidinopentanoic acid monohydrochloride} & [1119-34-2]
\end{align*}
\]

L-Arginine Hydrochloride, when dried, contains not less than 98.5% of C₆H₁₄N₄O₂·HCl.

**Description** L-Arginine Hydrochloride occurs as white crystals or crystalline powder. It is odorless, and has a slight, characteristic taste.

- It is freely soluble in water and in formic acid, and very slightly soluble in ethanol (95%)

**Identification** (1) Determine the infrared absorption spectrum of L-Arginine Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

- A solution of L-Arginine Hydrochloride (1 in 50) responds to the Qualitative Tests 1.0% for chloride.

**Optical rotation** 2.49 \([\alpha]_D^0: +21.5\) – +23.5° (after drying, 2 g, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**pH** 2.54 – 4.5. Dissolve 1.0 g of L-Arginine Hydrochloride in 10 mL of water: the pH of this solution is between 4.7 and 6.2.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of L-Arginine Hydrochloride in 10 mL of water: the solution is clear and colorless.
L-Arginine Hydrochloride Injection

L-アルギニン塩酸塩注射液

L-Arginine Hydrochloride Injection is an aqueous solution for injection. It contains not less than 9.5 w/v% and not more than 10.5 w/v% of L-arginine hydrochloride (C₆H₁₄N₄O₂.HCl: 210.66).

Method of preparation

| L-Arginine Hydrochloride | 100 g |
| Water for Injection or Sterile Water | a sufficient quantity |

Prepare as directed under Injections, with the above ingredients.

No preservative is added.

Description

L-Arginine Hydrochloride Injection is a clear, colorless liquid.

Identification (1)

To 5 mL of a solution of L-Arginine Hydrochloride Injection (1 in 100) add 1 mL of ninhydrin TS, and heat for 3 minutes: a blue-purple color develops.

(2) To 5 mL of a solution of L-Arginine Hydrochloride Injection (1 in 10) add 2 mL of sodium hydroxide TS and 1 to 2 drops of a solution of 1-naphthol in ethanol (95) (1 in 1000), allow to stand for 5 minutes, and add 1 to 2 drops of sodium hypochlorite TS: a red-orange color develops.

pH<2.54> 5.0–6.0

Bacterial endotoxins<4.01> Less than 0.50 EU/mL.

Extractable volume<6.05> It meets the requirement.

Foreign insoluble matter<6.06> Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter<6.07> It meets the requirement.

Sterility<4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay

Pipet 20 mL of L-Arginine Hydrochloride Injection, add 7.5 mol/L hydrochloric acid AS, and heat on a water bath for 30 minutes. After cooling, add 45 mL of acetic acid (100), and titrate<2.50> the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS = 10.53 mg of C₆H₁₄N₄O₂·HCl

Amount (mg) of L-arginine hydrochloride (C₆H₁₄N₄O₂·HCl) = α₀ × 4444

Containers and storage Containers—Hermetic containers.
Arotinolol Hydrochloride

アロチノロール塩酸塩

C₁₅H₂₁N₃O₄S₃·HCl: 408.00
5-[2-[(2RS)-3-(1,1-Dimethylthyl)amino-2-hydroxypropylsulfanyl]-1,3-thiazol-4-yl]thiophene-2-carboxamide monohydrochloride

Arotinolol Hydrochloride, when dried, contains not less than 99.0% of C₁₅H₂₁N₃O₄S₃·HCl.

Description Arotinolol Hydrochloride occurs as a white to light yellow crystalline powder.

It is freely soluble in dimethylsulfoxide, slightly soluble in methanol and in water, very slightly soluble in ethanol (99.5), and practically insoluble in diethyl ether.

A solution of Arotinolol Hydrochloride in methanol (1 in 125) does not show optical rotation.

Identification (1) Determine the absorption spectrum of a solution of Arotinolol Hydrochloride in methanol (1 in 75,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Arotinolol Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectroscopy \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Arotinolol Hydrochloride (1 in 200) responds to the Qualitative Tests \(<1.09\) (2) for chloride.

Purity (1) Heavy metals \(<1.07\rangle—\)Proceed with 1.0 g of Arotinolol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 0.05 g of Arotinolol Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.07\rangle\). Spot 40 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, acetone and ammonia solution (28:30:10:1:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying \(<2.44\rangle—\)Not more than 0.20% (1 g, in vacuum, 105°C, 4 hours).

Residue on ignition \(<2.44\rangle—\)Not more than 0.1% (1 g).

Assay Weigh accurately about 1.5 g of Arotinolol Hydrochloride, previously dried, dissolve in dimethylsulfoxide to make exactly 25 mL. Pipet 5 mL of this solution, add 100 mL of water and 5 mL of sodium hydroxide TS, and extract with three 50-mL portions of dichloromethane. Filter each dichloromethane extract through a pledget of absorbent cotton with anhydrous sodium sulfate on it. Evaporate combined filtrate to dryness in vacuum. Dissolve the residue in 70 mL of acetic acid (100), and titrate \(<2.50\rangle\) with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS = 20.40 mg of C₁₅H₂₁N₃O₄S₃·HCl

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Arsenical Paste

亜ヒ酸パスタ

Arsenical Paste contains not less than 36.0% and not more than 44.0% of arsenic (III) trioxide (As₂O₃: 197.84).

Method of preparation

<table>
<thead>
<tr>
<th>Component</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arsenic Trioxide, finely powdered</td>
<td>40 g</td>
</tr>
<tr>
<td>Procaine Hydrochloride, finely powdered</td>
<td>10 g</td>
</tr>
<tr>
<td>Hydrophilic Cream</td>
<td>30 g</td>
</tr>
<tr>
<td>Clove Oil</td>
<td>a suitable quantity</td>
</tr>
<tr>
<td>Medicinal Carbon</td>
<td>a suitable quantity</td>
</tr>
</tbody>
</table>

To make 100 g

Mix Arsenic Trioxide and Procaine Hydrochloride with Hydrophilic Cream, and add Clove Oil to make a suitably viscous liquid, followed by Medicinal Carbon for coloring.

Description Arsenical Paste is grayish black and has the odor of clove oil.

Identification (1) Place 0.1 g of Arsenical Paste in a small flask, add 5 mL of fuming nitric acid and 5 mL of sulfuric acid, and heat over a flame until the reacting liquid becomes colorless and white fumes begin to evolve. After cooling, add the reacting liquid to 20 mL of water cautiously, and add 10 mL of hydrogen sulfide TS while warming: a yellow precipitate is produced (arsenic (III) trioxide).

(2) Shake thoroughly 0.5 g of Arsenical Paste with 25 mL of diethyl ether, 5 mL of dilute hydrochloric acid and 20 mL of water, separate the water layer, and filter: 5 mL of the filtrate responds to the Qualitative Tests \(<1.09\) for primary aromatic amines (procaine hydrochloride).

(3) Shake thoroughly 0.5 g of Arsenical Paste with 25 mL of diethyl ether and 25 mL of water, separate the water layer, filter, and use the filtrate as the sample solution. Dissolve 0.01 g of procaine hydrochloride in 5 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.07\)\).

Spot 5 μL each of the sample solution and
standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, ethanol (99.5) and ammonia solution (28) (50:5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 mm): the spots from the sample solution and standard solution exhibit the same Rf value.

**Assay**

Weigh accurately about 0.3 g of Arsenical Paste into a 150-mL Kjeldahl flask, add 5 mL of fuming nitric acid and 10 mL of sulfuric acid, and shake thoroughly. Heat cautiously the mixture, gently at first, and then continue strong heating, until red fumes of nitrogen oxide are sparingly evolved. After cooling, add 5 mL of fuming nitric acid, heat again until red fumes of nitrogen oxide are no longer evolved and the reacting liquid becomes clear, and cool. Add 30 mL of a saturated solution of ammonium oxalate monohydrate, heat again until white fumes of sulfuric acid are evolved, and continue the heating for 10 minutes. Decompose completely oxalic acid, cool, transfer cautiously the colorless reacting liquid to a glass-stoppered flask, containing 40 mL of water. Wash thoroughly the Kjeldahl flask with 60 mL of water, add the washings to the content of the glass-stoppered flask, and cool. Dissolve 3 g of potassium iodide in this solution, allow to stand in a dark place at room temperature for 45 minutes, and titrate $< 2.50$ the liberated iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 5 mL of starch TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS = 4.946 mg of As$_2$O$_3$

**Containers and storage** Containers—Tight containers.

### Arsenic Trioxide

 arsenic trioxide

As$_2$O$_3$: 197.84

Arsenic Trioxide, when dried, contains not less than 99.5% of As$_2$O$_3$.

**Description**

Arsenic Trioxide occurs as a white powder. It is odorless. It is practically insoluble in water, in ethanol (95), and in diethyl ether.

It dissolves in sodium hydroxide TS.

**Identification**

Dissolve 0.2 g of Arsenic Trioxide in 40 mL of water by heating on a water bath: the solution responds to the Qualitative Tests $< 1.09$ for arsenite.

**Purity**

Clarity of solution—To 1.0 g of Arsenic Trioxide add 10 mL of ammonia TS, and heat gently: the solution is clear.

**Loss on drying** $< 2.41$ Not more than 0.5% (1 g, 105°C, 3 hours). 

**Assay**

Weigh accurately about 0.15 g of Arsenic Trioxide, previously dried, dissolve in 20 mL of a solution of sodium hydroxide (1 in 25), by warming, if necessary. Add 40 mL of water and 2 drops of methyl orange TS, then add dilute hydrochloric acid until the color of the solution becomes light red. Add 2 g of sodium hydrogen carbonate and 50 mL of water to this solution, and titrate $< 2.50$ with 0.05 mol/L iodine VS (indicator: 3 mL of starch TS).

Each mL of 0.05 mol/L iodine VS = 4.946 mg of As$_2$O$_3$

**Containers and storage** Containers—Tight containers.

### Ascorbic Acid

**Vitamin C**

アスコルビン酸

Ascorbic Acid, when dried, contains not less than 99.0% of L-ascorbic acid (C$_6$H$_8$O$_6$).

**Description**

Ascorbic Acid occurs as white crystals or a white, crystalline powder. It is odorless, and has an acid taste.

It is freely soluble in water, sparingly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 190°C (with decomposition).

**Identification**

(1) To 5 mL each of a solution of Ascorbic Acid (1 in 50) add 1 drop of potassium permanganate TS or 1 drop of a solution of copper (II) sulfate pentahydrate (1 in 1000) and 1 drop of pyrrole, and warm the mixture at 50°C for 5 minutes: a blue color develops.

Optical rotation $< 2.49$ $[\alpha]_D^{20}: +20.5 – +21.5°$ (2.5 g, water, 25 mL, 100 mm).

pH $< 2.50$ Dissolve 1.0 g of Ascorbic Acid in 20 mL of water: the pH of this solution is between 2.2 and 2.5.

**Purity**

Clarity and color of solution—Dissolve 1.0 g of Ascorbic Acid in 20 mL of water: the solution is clear and colorless.

(2) Heavy metals $< 1.07$—Perform the test with 1.0 g of Ascorbic Acid according to Method 1. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

Loss on drying $< 2.41$ Not more than 0.20% (1 g, silica gel, 24 hours).

Residue on ignition $< 2.44$ Not more than 0.1% (1 g).

**Assay**

Weigh accurately about 0.2 g of Ascorbic Acid,
Ascorbic Acid Injection

Vitamin C Injection

Ascorbic Acid Injection is an aqueous solution for injection. It contains not less than 95.0% and not more than 115.0% of the labeled amount of L-ascorbic acid (C₆H₈O₆: 176.12).

Method of preparation  Prepare as directed under injections, with the sodium salt of Ascorbic Acid.

Description  Ascorbic Acid Injection occurs as a clear, colorless liquid.

Identification (1)  Measure a volume of Ascorbic Acid Injection, equivalent to 0.5 g of Ascorbic Acid according to the labeled amount, and add water to make 25 mL. Proceed with 5 mL each of the solution as directed in the Identification (1) under Ascorbic Acid.

(2) Measure a volume of Ascorbic Acid Injection, equivalent to 5 mg of Ascorbic Acid according to the labeled amount. Add a solution of metaphosphoric acid (1 in 50) to make 5 mL, and proceed with this solution as directed in the Identification (2) under Ascorbic Acid.

(3) Ascorbic Acid Injection responds to the Qualitative Tests (1) for sodium salt.

pH  2.54  5.6 – 7.4

Bacterial endotoxins  0.01  Less than 0.15 EU/mg.

Extractable volume  0.05  It meets requirement.

Foreign insoluble matter  0.06  Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter  0.07  It meets the requirement.

Sterility  0.06  Perform the test according to the Membrane filtration method: it meets the requirement.

Assay  Measure exactly a volume of Ascorbic Acid Injection, equivalent to about 0.1 g of L-ascorbic acid (C₆H₈O₆), previously diluted with metaphosphoric acid-acetic acid TS, if necessary, and add metaphosphoric acid-acetic acid TS to make exactly 200 mL. Measure exactly 2 mL of the solution, and shake with 8 mL of metaphosphoric acid-acetic acid TS and 2 mL of hydrogen peroxide TS. Titrate 2.50 with 2,6-dichloroindophenol sodium TS for titration until a light red color persists for 5 seconds. Perform a blank determination, and make any necessary correction.

Each mL of 2, 6-dichlorophenol-indophenol sodium TS for titration:

\[ A \text{ mg} \text{ of } \text{L-ascorbic acid (C}_6\text{H}_8\text{O}_6) \]

A is decided by the following standardization of 2,6-dichloroindophenol sodium TS for titration:

2,6-Dichlorophenol-indophenol sodium TS for titration:

Preparation  —Dissolve 42 mg of sodium hydrogen carbonate in 50 mL of water, add 0.5 g of 2,6-dichloroindophenol sodium dihydrate and water to make 200 mL, and filter. Prepare before use.

Standardization  —Weigh accurately about 50 mg of Ascorbic Acid RS, previously dried in a desiccator (silica gel) for 24 hours, and dissolve in metaphosphoric acid-acetic acid TS to make exactly 100 mL. Pipet 2 mL of this solution, shake with 8 mL of metaphosphoric acid-acetic acid TS and 2 mL of hydrogen peroxide TS, and titrate 2.50 with 2,6-dichloroindophenol sodium TS for titration until a light red color persists for 5 seconds. Perform a blank determination, and make any necessary correction. Calculate the quantity (A mg) of L-ascorbic acid (C₆H₈O₆) equivalent to 1 mL of this test solution.

Containers and storage  Containers—Hermetic containers.

Storage—Under nitrogen atmosphere.

Ascorbic Acid Powder

Vitamin C Powder

Ascorbic Acid Powder contains not less than 95.0% and not more than 120.0% of the labeled amount of L-ascorbic acid (C₆H₈O₆: 176.12).

Method of preparation  Prepare as directed under Granules or Powders, with Ascorbic Acid.

Identification (1)  Weigh a portion of Ascorbic Acid Powder, equivalent to 0.5 g of Ascorbic Acid according to the labeled amount, add 30 mL of water, shake for 1 minute, and filter. Proceed with 5 mL each of the filtrate as directed in the Identification (1) under Ascorbic Acid.

(2) Weigh a portion of Ascorbic Acid Powder, equivalent to about 0.1 g of Ascorbic Acid according to the labeled amount, add 10 mL of a solution of metaphosphoric acid-acetic acid TS, shake for 1 minute, and filter. Proceed with 5 mL of the filtrate as directed in the Identification (2) under Ascorbic Acid.

Purity  Rancidity—Ascorbic Acid Powder is free from any unpleasant or rancid odor and taste.

Assay  Weigh accurately a portion of Ascorbic Acid Powder, equivalent to about 0.1 g of L-ascorbic acid (C₆H₈O₆) according to the labeled amount, extract with several successive portions of metaphosphoric acid-acetic acid TS, combine the extracts, and filter. Wash the residue with metaphosphoric acid-acetic acid TS. Combine the filtrates and washings, and add metaphosphoric acid-acetic acid to make exactly 200 mL. Pipet 2 mL of the solution, and shake with 8 mL of metaphosphoric acid-acetic acid TS and 2 mL of hydrogen peroxide TS. Titrate 2.50 with 2,6-dichloroindophenol sodium TS for titration until a light red color persists for 5 seconds. Perform a blank determination, and make any necessary correction.

Each mL of 2, 6-dichlorophenol-indophenol sodium TS for titration:

\[ A \text{ mg} \text{ of } \text{L-ascorbic acid (C}_6\text{H}_8\text{O}_6) \]

A is decided by the following standardization of 2,6-dichloroindophenol sodium TS for titration:

2,6-Dichlorophenol-indophenol sodium TS for titration:

Preparation  —Dissolve 42 mg of sodium hydrogen carbonate in 50 mL of water, add 0.5 g of 2,6-dichloroindophenol sodium dihydrate and water to make 200 mL, and filter. Prepare before use.

Standardization  —Weigh accurately about 50 mg of Ascorbic Acid RS, previously dried in a desiccator (silica gel) for 24 hours, and dissolve in metaphosphoric acid-acetic acid TS to make exactly 100 mL. Pipet 2 mL of this solution, shake with 8 mL of metaphosphoric acid-acetic acid TS and 2 mL of hydrogen peroxide TS, and titrate 2.50 with 2,6-dichloroindophenol sodium TS for titration until a light red color persists for 5 seconds. Perform a blank determination, and make any necessary correction. Calculate the quantity (A mg) of L-ascorbic acid (C₆H₈O₆) equivalent to 1 mL of this test solution.

Containers and storage  Containers—Hermetic containers.

Storage—Under nitrogen atmosphere.
dichlorophenol sodium TS for titration until a light red color persists for 5 seconds. Perform a blank determination, and make any necessary correction.

Each mL of 2,6-dichlorophenol-indophenol sodium TS for titration = A mg of C₆H₈O₆

A is decided by the following standardization of 2,6-dichlorophenoldisodium TS for titration:

Preparation—Dissolve 42 mg of sodium hydrogen carbonate in 50 mL of water, add 0.05 g of 2,6-dichlorophenoldisodium dihydrate and water to make 200 mL, and filter. Prepare before use.

Standardization—Weigh accurately about 50 mg of Ascorbic Acid RS, previously dried in a desiccator (silica gel) for 24 hours, and dissolve in metaphosphoric acid-acetic acid TS to make exactly 100 mL. Pipet 2 mL of this solution, shake with 8 mL of metaphosphoric acid-acetic acid TS and 2 mL of hydrogen peroxide TS, and titrate with 2,6-dichlorophenoldisodium TS for titration until a light red color persists for 5 seconds. Perform a blank determination, and make any necessary correction. Calculate the quantity (A mg) of L-ascorbic acid (C₆H₈O₆) equivalent to 1 mL of this test solution.

Containers and storage Containers—Tight containers.

L-Aspartic Acid

L-アスパラギン酸

C₆H₇NO₄: 133.10
(2S)-2-Aminobutanedioic acid [56-84-8]

L-Aspartic Acid, when dried, contains not less than 98.5% and not more than 101.0% of C₆H₇NO₄.

Description L-Aspartic Acid occurs as white, crystals or crystalline powder.

It is sparingly soluble in water, and practically insoluble in ethanol (99.5).

It dissolves in dilute hydrochloric acid and in 0.2 mol/L sodium hydroxide TS.

Identification Determine the infrared absorption spectrum of L-Aspartic Acid as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D: +24.0° to +26.0° (2 g, after drying, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

pH <2.54> Dissolve 0.4 g of L-Aspartic Acid in 100 mL of water by warming, and allow to cool: between 2.5 and 3.5.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of L-Aspartic Acid in 20 mL of 1 mol/L hydrochloric acid TS: the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 0.5 g of L-Aspartic Acid in 6 mL of dilute nitric acid and 20 mL of water, add water to make 50 mL, and perform the test with this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Sulfate <1.14>—Dissolve 0.6 g of L-Aspartic Acid in 5 mL of dilute hydrochloric acid and 30 mL of water, add water to make 45 mL, and add 5 mL of barium chloride TS. Perform the test with this solution as the test solution. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS, add 5 mL of dilute hydrochloric acid and water to make 45 mL, and add 5 mL of barium chloride (not more than 0.028%).

(4) Ammonium <1.02>—Perform the test with 0.25 g of L-Aspartic Acid. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(5) Heavy metals <1.07>—Proceed with 1.0 g of L-Aspartic Acid according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(6) Iron <1.10>—Prepare the test solution with 1.0 g of L-Aspartic Acid according to Method 1, and perform the test according to Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(7) Related substances—Dissolve 0.20 g of L-Aspartic Acid in 10 mL of 0.2 mol/L sodium hydroxide TS, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 10 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography, develop with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly a solution of ninhydrin in a mixture of methanol and acetic acid (100) (97:3) (1 in 100),Request rewriting of content here and heat at 80°C for 10 minutes: the spot other than the principal spot is not more intense than the spot obtained with the standard solution.

Loss on drying <2.41> Not more than 0.30% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.15 g of L-Aspartic Acid, previously dried, dissolve in 50 mL of water by warming. After cooling, titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 13.31 mg of C₆H₇NO₄

Containers and storage Containers—Tight containers.
Aspirin

Acetylsalicylic Acid

**Aspirin**

**Acetylsalicylic Acid**

Aspirin occurs as white crystals, granules or powder. It is odorless, and has a slight acid taste.

It is freely soluble in ethanol (95) and in acetone, soluble in diethyl ether, and slightly soluble in water.

It dissolves in sodium hydroxide TS and in sodium carbonate TS.

In moist air, it gradually hydrolyzes to salicylic acid and acetic acid.

Melting point: about 136°C (bath fluid is heated at 130°C previously).

**Identification** (1) Boil 0.1 g of Aspirin in 5 mL of water for 5 to 6 minutes, cool, and add 1 to 2 drops of iron (III) chloride TS: a red-purple color is produced.

(2) Boil 0.5 g of Aspirin in 10 mL of sodium carbonate TS for 5 minutes, and add 10 mL of dilute sulfuric acid: the odor of acetic acid is perceptible, and a white precipitate is produced. Filter the precipitate, add 3 mL of ethanol (95) and 3 mL of sulfuric acid to the filtrate, and heat: the odor of ethyl acetate is perceptible.

**Purity** (1) Clarity of solution—Dissolve 0.5 g of Aspirin in 10 mL of warm sodium carbonate TS: the solution is clear.

(2) Salicylic acid—Dissolve 2.5 g of Aspirin in 25 mL of ethanol (95), and add 1.0 mL of this solution to a solution which is prepared by transferring 1 mL of a freshly prepared dilute ammonium iron (III) chloride TS to the filtrate: a red-violet color develops.

**Assay**

Weigh accurately about 1.5 g of Aspirin, previously dried, add exactly 50 mL of 0.5 mol/L sodium hydroxide VS, and boil gently for 10 minutes under a reflux condenser with a carbon dioxide-absorbing tube (soda lime). Cool, and titrate 2.50 mL immediately the excess sodium hydroxide with 0.25 mol/L sulfuric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination.

Each mL of 0.5 mol/L sodium hydroxide VS = 45.04 mg of C9H8O4

**Containers and storage** Containers—Well-closed containers.

**Aspirin Tablets**

**Acetylsalicylic Acid Tablets**

Aspirin Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of aspirin (C9H8O4: 180.16).

**Method of preparation** Prepare as directed under Tablets, with Aspirin.

**Identification** (1) Weigh a quantity of powdered Aspirin Tablets, equivalent to 0.1 g of Aspirin according to the labeled amount, add 10 mL of water, and boil for 5 to 6 minutes. After cooling, filter, and add 1 to 2 drops of iron (III) chloride TS to the filtrate: a red-violet color develops.

(2) Weigh a portion of powdered Aspirin Tablets, equivalent to 0.5 g of Aspirin according to the labeled amount, extract with two 10-mL portions of warm ethanol (95), and filter the combined extracts. Evaporate the filtrate to dryness, and boil the residue with 10 mL of sodium carbonate TS for 5 minutes. Proceed as directed in the Identification (2) under Aspirin.

**Purity** Salicylic acid—Take a portion of the powdered Aspirin Tablets, equivalent to 1.0 g of Aspirin according to the labeled amount, shake with 15 mL of ethanol (95) for 5 minutes, filter, discard the first 5 mL of the filtrate, and add 1.0 mL of the subsequent filtrate to a solution which is prepared by transferring 1 mL of freshly prepared dilute am-
Containers and storage  Containers—Well-closed containers.

Assay  Weigh accurately and powder not less than 20 Aspirin Tablets. Weigh accurately a portion of the powder, equivalent to about 1.5 g of aspirin (C9H8O4), add exactly 50 mL of 0.5 mol/L sodium hydroxide VS, and proceed as directed in the Assay under Aspirin.

Each mL of 0.5 mol/L sodium hydroxide VS = 45.04 mg of aspirin (C9H8O4)

Containers and storage  Containers—Well-closed containers.

**Aspirin Aluminum**

**Aluminum Acetylsalicylate**

アルセリンアルミニウム

Aspirin Aluminum contains not less than 83.0% and not more than 90.0% of aspirin (C9H8O4: 180.16), and not less than 6.0% and not more than 7.0% of aluminum (Al: 26.98), calculated on the anhydrous basis.

**Description**  Aspirin Aluminum occurs as a white, crystalline powder. It is odorless or has a slight, acetic odor. It is practically insoluble in water, in methanol, in ethanol (95) and in diethyl ether. It dissolves, with decomposition, in sodium hydroxide TS and in sodium carbonate TS.

**Identification (1)**  Dissolve 0.1 g of Aspirin Aluminum in 10 mL of sodium hydroxide TS by heating, if necessary. Neutralize 2 mL of the solution with hydrochloric acid, and add 1 to 2 drops of iron (III) chloride TS: a red-purple color develops.

(2)  Determine the absorption spectrum of the sample solution obtained in the Assay (1) as directed under Ultraviolet-visible Spectrophotometry <2,24>: it exhibits a maximum between 277 nm and 279 nm.

(3)  Place 2 g of Aspirin Aluminum in a platinum crucible, and ignite until charred. To the residue add 1 g of anhydrous sodium carbonate, and ignite for 20 minutes. After cooling, to the residue add 15 mL of dilute hydrochloric acid, shake, and filter: the filtrate responds to the Qualitative Tests <1,09> for aluminum salt.

**Purity (1)**  Salicylate—Using $A_{T1}$ and $A_{S2}$ obtained in the Assay (1), calculate the amount of salicylate [as salicylic acid (C9H8O4: 180.16)] by the following equation: salicylate content is not more than 7.5%, calculated on the anhydrous basis.

$$\text{Amount (mg) of aspirin (C9H8O4)} = M_S \times \frac{A_{T1} - A_{S2} \times A_{S2}}{A_{S3}} \times \frac{1}{4}$$

$M_S$: Amount (mg) of salicylic acid for assay

(2)  Heavy metals <1.07>—Place 2.0 g of Aspirin Aluminum in a porcelain crucible, cover the crucible loosely, and ignite at a low temperature until charred. After cooling, add 2 mL of nitric acid and 1 mL of sulfuric acid to the content of the crucible, heat gently the crucible until white fumes are evolved, and continue the heating until white fumes are no longer evolved, then ignite between 500°C and 600°C until the carbon is incinerated. When the incineration is not completed, add 2 mL of nitric acid and 1 mL of sulfuric acid, and heat gently in the same manner, then ignite between 500°C and 600°C to incinerate completely. After cooling, add 2 mL of hydrochloric acid, and proceed as directed in Method 2, and perform the test. Prepare the control solution by using the same quantities of the same reagents as directed for the preparation of the test solution, and add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 10 ppm).

(3)  Arsenic <1.11>—Dissolve 1.0 g of Aspirin Aluminum in 15 mL of sodium hydroxide TS. To this solution add 1 drop of phenolphthalein TS, and with stirring, add dropwise hydrochloric acid until the red color of the solution disappears. Then add 2 mL of hydrochloric acid, cool with occasional shaking for 10 minutes, and filter with a glass filter (G3). Wash the residue with two 5 mL portions of 1 mol/L hydrochloric acid TS, and combine the filtrate and the washings. Use this solution as the test solution, and perform the test (not more than 2 ppm).

**Water <2.48>**  Not more than 4.0% (0.15 g, direct titration).

**Assay (1)**  Aspirin—Weigh accurately about 0.1 g of Aspirin Aluminum, add 40 mL of sodium fluoride TS, and shake for 5 minutes. Allow the solution to stand for 10 minutes with frequent shaking. Extract the solution with six 20-mL portions of chloroform. Combine all chloroform extracts, and add chloroform to make exactly 200 mL. Measure exactly 10 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.09 g of salicylic acid for assay, previously dried in a desicator (silica gel) for 3 hours, and dissolve in chloroform to make exactly 200 mL. Measure exactly 5 mL of this solution, add chloroform to make exactly 200 mL, and use this solution as the standard solution (1). Then weigh accurately about 0.09 g of aspirin for assay, previously dried in a desicator (silica gel) for 5 hours, and dissolve in chloroform to make exactly 200 mL. Measure exactly 10 mL of this solution, add chloroform to make exactly 100 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2,24>. Determine the absorbances, $A_{T1}$ and $A_{S1}$, of the sample solution and standard solution (1) at 278 nm, and absorbances, $A_{T2}$ and $A_{S2}$, of these solutions, at 308 nm, respectively. Then determine the absorbance $A_{S3}$ of the standard solution (2) at 278 nm.

$$\text{Amount (mg) of aspirin (C9H8O4)} = M_S \times \left[ \frac{A_{T1}}{A_{S1}} - \frac{A_{T2} \times A_{S1}}{A_{S2}} \times \frac{1}{4} \right]$$
Aspoxicillin Hydrate / Official Monographs

M₅: Amount (mg) of aspirin for assay

(2) Aluminum—Weigh accurately about 0.4 g of Aspirin Aluminum, and dissolve in 10 mL of sodium hydroxide TS. Add dropwise 1 mol/L hydrochloric acid TS to adjust the solution to a pH of about 1, add 20 mL of acetic acid-ammonium acetate buffer solution, pH 3.0, and 0.5 mL of Cu-PAN TS, and heat. While boiling, titrate with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red to yellow and persists for 1 minute. Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 1.349 mg of Al

Containers and storage Containers—Well-closed containers.

Aspoxicillin Hydrate

Aspoxicillin Hydrate occurs as a white, crystalline powder. It is freely soluble in N,N-dimethylformamide, sparingly soluble in water, and practically insoluble in acetonitrile, in methanol and in ethanol (95).

Identification (1) Determine the absorption spectrum of a solution of Aspoxicillin Hydrate (1 in 4000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or spectrum of a solution of Aspoxicillin RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Aspoxicillin Hydrate as directed in the potassium bromide method under Infrared Spectrophotometry <2.55>. Both spectral exhibit similar intensities of absorption at the same wave numbers.

Containers—Well-closed containers.

Optical rotation <2.49> [α] <2.49> C₁₂H₁₇N₅O₇S: +170° – +185° (0.2 g calculated on the anhydrous bases, water, 20 mL, 100 mm).

pH <2.54> Dissolve 1.0 g of Aspoxicillin Hydrate in 50 mL of water: the pH of the solution is between 4.2 and 5.2.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Aspoxicillin Hydrate in 50 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Aspoxicillin Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 2.0 g of Aspoxicillin Hydrate according to Method 5, and perform the test (not more than 1 ppm).

(4) Related substances—Dissolve 0.05 g of Aspoxicillin Hydrate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the areas of each peak by the automatic integration method: the area of each peak other than aspoxicillin from the sample solution is not larger than 3/10 times the peak area of aspoxicillin from the standard solution, and the total of peak areas other than aspoxicillin from the sample solution is not larger than the peak area of aspoxicillin from the standard solution.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 6 times as long as the retention time of aspoxicillin.

System suitability—

Test for required detection: Pipet 2 mL of the standard solution, add the mobile phase to make exactly 10 mL. Confirm that the peak area of aspoxicillin obtained from 10 μL of this solution is equivalent to 15 to 25% of that of aspoxicillin obtained from 10 μL of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution, resist the operating conditions, the relative standard deviation of the peak areas of aspoxicillin is not more than 5%.

Water <2.48> Not less than 95.0% and not more than 13.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately an amount of Aspoxicillin Hydrate and Aspoxicillin RS, equivalent to about 0.1 g (potency), dissolve each in a suitable amount of water, add exactly 10 mL of the internal standard solution, 6.5 mL of acetonitrile and water to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁, and Q₂, of the peak area of aspoxicillin to that of the internal standard of each solution.

C₁₂H₁₇N₅O₇S: 547.58
(2S,5R,6R)-6-[(2R)-2-[2(R)-2-Amino-3-methylcarbamoylpropanoylamino]-2-(4-hydroxyphenyl)acetylamino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid trihydrate [63358-49-6, anhydride]

Aspoxicillin Hydrate contains not less than 950 μg (potency) and not more than 1020 μg (potency) per mg, calculated on the anhydrous basis. The potency of Aspoxicillin Hydrate is expressed as mass (potency) of aspoxicillin (C₁₂H₁₇N₅O₇S: 493.53).

Description Aspoxicillin Hydrate occurs as a white, crystalline powder.

Optical rotation <2.49> [α] <2.49> C₁₂H₁₇N₅O₇S: +170° – +185° (0.2 g calculated on the anhydrous bases, water, 20 mL, 100 mm).

pH <2.54> Dissolve 1.0 g of Aspoxicillin Hydrate in 50 mL of water: the pH of the solution is between 4.2 and 5.2.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Aspoxicillin Hydrate in 50 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Aspoxicillin Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 2.0 g of Aspoxicillin Hydrate according to Method 5, and perform the test (not more than 1 ppm).

(4) Related substances—Dissolve 0.05 g of Aspoxicillin Hydrate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the areas of each peak by the automatic integration method: the area of each peak other than aspoxicillin from the sample solution is not larger than 3/10 times the peak area of aspoxicillin from the standard solution, and the total of peak areas other than aspoxicillin from the sample solution is not larger than the peak area of aspoxicillin from the standard solution.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 6 times as long as the retention time of aspoxicillin.

System suitability—

Test for required detection: Pipet 2 mL of the standard solution, add the mobile phase to make exactly 10 mL. Confirm that the peak area of aspoxicillin obtained from 10 μL of this solution is equivalent to 15 to 25% of that of aspoxicillin obtained from 10 μL of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution, resist the operating conditions, the relative standard deviation of the peak areas of aspoxicillin is not more than 5%.

Water <2.48> Not less than 95.0% and not more than 13.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately an amount of Aspoxicillin Hydrate and Aspoxicillin RS, equivalent to about 0.1 g (potency), dissolve each in a suitable amount of water, add exactly 10 mL of the internal standard solution, 6.5 mL of acetonitrile and water to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁, and Q₂, of the peak area of aspoxicillin to that of the internal standard of each solution.
Amount [µg (potency)] of aspoxicillin (C_{21}H_{27}N_{5}O_{7}S) = M_{S} \times Q_{T} / Q_{S} \times 1000

M_{S}: Amount [µg (potency)] of Aspoxicillin RS

Internal standard solution—A solution of N-(3-hydroxyphenyl)acetamide (1 in 1000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: To 130 mL of acetonitrile add potassium dihydrogen phosphate TS, pH 3.0 to make 1000 mL.
Flow rate: Adjust the flow rate so that the retention time of aspoxicillin is about 3 minutes.

System suitability—
System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, aspoxicillin and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.
System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of aspoxicillin to that of the internal standard is not more than 0.8%.

Containers and storage—Containers—Tight containers.

### Atenolol

Atenolol occurs as a white to pale yellow crystalline powder.

It is freely soluble in methanol and in acetic acid (100), soluble in ethanol (99.5), and slightly soluble in water.

A solution of Atenolol in methanol (1 in 25) shows no optical rotation.

Identification (1) Determine the absorption spectrum of a solution of Atenolol in methanol (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Atenolol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting Point <2.60> 152 – 156°C

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Atenolol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Atenolol in 25 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than atenolol is not larger than 1/2 times the peak area of atenolol obtained with the standard solution, and the total area of the peaks other than atenolol is not larger than the peak area of atenolol with the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 226 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 3.4 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust to pH 3.0 with phosphoric acid. To 40 volume of this solution add 9 volume of methanol and 1 volume of tetrahydrofuran. Dissolve 1 g of sodium 1-octanesulfonate and 0.4 g of tetrabutylammonium hydrogensulfate in 1000 mL of this solution.
Flow rate: Adjust the flow rate so that the retention time of atenolol is about 8 minutes.

Time span of measurement: About 4 times as long as the retention time of atenolol.

System suitability—
Test for required detectability: To exactly 10 mL of the standard solution add the mobile phase to make exactly 50 mL. Confirm that the peak area of atenolol obtained with 10 µL of this solution is equivalent to 14 to 26% of that obtained with 10 µL of the standard solution.
System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of atenolol are not less than 5000 and not more than 1.5, respectively.
System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of atenolol is not more than 1.0%.

Loss on drying <2.4I> Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.2% (1 g).

Assay Weigh accurately about 0.3 g of Atenolol, previously dried, dissolve in 100 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentio-
metric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 26.63 mg of \( \text{Ca}_6\text{H}_{22}\text{N}_4\text{O}_8 \)

Containers and storage Containers—Tight containers.

Atorvastatin Calcium Hydrate

アトルバスタンチカルシウム水和物

\[
\text{C}_{66}\text{H}_{68}\text{CaF}_{2}\text{N}_4\text{O}_{10}\cdot 3\text{H}_2\text{O}: 1209.39 \\
\text{Monocalcium bis}((3R,5R)-7-[2-(4-fluorophenyl]-5-(1-methylpropyl)-3-phenyl-4(phenylcarbamoyl)-1H-pyrrol-1-yl]-3,5-dihydroxyheptanoate trihydrate} \\
[344423-98-9]
\]

Atorvastatin Calcium Hydrate contains not less than 98.0% and not more than 102.0% of atorvastatin calcium (\( \text{C}_{66}\text{H}_{68}\text{CaF}_{2}\text{N}_4\text{O}_{10} \)): 1155.34), calculated on the anhydrous basis.

Description Atorvastatin Calcium Hydrate occurs as a white or pale yellowish white crystalline powder.

It is very soluble in methanol, freely soluble in dimethylsulfoxide, and very slightly soluble in water and in ethanol (99.5).

It gradually turns yellowish white on exposure to light.

Identification (1) Determine the absorption spectrum of a solution of Atorvastatin Calcium Hydrate in methanol (1 in 62,500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Atorvastatin Calcium RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Atorvastatin Calcium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Atorvastatin Calcium RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, recrystallize the sample and the reference standard according to the method otherwise specified, filter, dry the crystals, and perform the test with the crystals.

(3) A gruel-like liquid of Atorvastatin Calcium Hydrate prepared by adding a small amount of dilute hydrochloric acid responds to the Qualitative Tests <1.09> (1) for calcium salt. A solution of Atorvastatin Calcium Hydrate in a mixture of methanol and water (7:3) (1 in 250) is also responds to the Qualitative Tests <1.09> (3) for calcium salt.

Optical rotation \(<2.49> [\alpha]_D^2: -7 - -10^\circ (0.2 \text{g}, \text{calculated on the anhydrous basis}, \text{dimethylsulfoxide}, 20 \text{mL}, 100 \text{mm})

Purity (1) Heavy metals \(<1.07>—\text{Proceed with 1.0 g of Atorvastatin Calcium Hydrate according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).}

(2) Related substances—Dissolve 20 mg of Atorvastatin Calcium Hydrate in 20 mL of a mixture of water and acetonitrile (1:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of water and acetonitrile (1:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.87> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak, having the relative retention time of about 0.8 to atorvastatin, obtained from the sample solution is not larger than 3/10 times the peak area of atorvastatin from the standard solution, the area of the peak other than atorvastatin and peak mentioned above from the sample solution is not larger than 1/10 times the peak area of atorvastatin from the standard solution, and the total area of the peaks other than atorvastatin from the sample solution is not larger than the peak area of atorvastatin from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (5 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase A: Dissolve 10.5 g of citric acid monohydrate in 900 mL of water, adjust to pH 5.0 with ammonia solution (28), and add water to make 1000 mL. To 400 mL of this solution add 100 mL of acetonitrile and 100 mL of tetrahydrofuran.

Mobile phase B: A mixture of acetonitrile and tetrahydrofuran (1:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 40</td>
<td>93</td>
<td>7</td>
</tr>
<tr>
<td>40 – 80</td>
<td>93 → 60</td>
<td>7 → 40</td>
</tr>
</tbody>
</table>

Flow rate: Adjust the flow rate so that the retention time of atorvastatin is about 16 minutes.

Time span of measurement: About 5 times as long as the retention time of atorvastatin, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 5 mL of the standard solution, and add a mixture of water and acetonitrile (1:1) to make exactly 100 mL. Confirm that the peak area of atorvastatin obtained with 20 \( \mu \)L of this solution is equivalent to 3.5 to 6.5% of that with 20 \( \mu \)L of the standard solution.

System performance: When the procedure is run with 20 \( \mu \)L of the standard solution under the above operating con-
ditions, the number of theoretical plates and the symmetry factor of the peak of atorvastatin are not less than 8000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of atorvastatin is not more than 2.0%.

(3) Residual solvents—Being specified separately.

Water ≤2.48  3.5 – 5.5% (50 mg, coulometric titration).

Assay Weigh accurately about 20 mg each of Atorvastatin Calcium Hydrate and Atorvastatin Calcium RS (separately determine the water ≤2.48 in the same manner as Atorvastatin Calcium Hydrate), dissolve each in an adequate amount of a mixture of water and acetonitrile (1:1), add exactly 10 mL of the internal standard solution, then add a mixture of water and acetonitrile (1:1) to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography ≤2.01 according to the following conditions, and calculate the ratios, QT and QS, of the peak area of atorvastatin to that of the internal standard.

Amount (mg) of atorvastatin calcium (C66H68CaF2N4O10) = Mx × Qt/Qt

M5: Amount (mg) of Atorvastatin Calcium RS, calculated on the anhydrous basis

Internal standard solution—A solution of butyl parahydroxybenzoate in a mixture of water and acetonitrile (1:1) (1 in 1500).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 10.5 g of citric acid monohydrate in 900 mL of water, adjust to pH 4.0 with ammonia solution (28), and add water to make 1000 mL. To 530 mL of this solution add 270 mL of acetonitrile and 200 mL of tetrahydrofuran.

Flow rate: Adjust the flow rate so that the retention time of atorvastatin is about 10 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and atorvastatin are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of atorvastatin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Well-closed containers.

Storage—Light-resistant.

Atorvastatin Calcium Tablets

アトルバスタチンカルシウム錠

Atorvastatin Calcium Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of atorvastatin calcium hydrate (C66H68CaF2N4O10·3H2O: 1209.39).

Method of preparation Prepare as directed under Tablets, with Atorvastatin Calcium Hydrate.

Identification To a quantity of powdered Atorvastatin Calcium Tablets, equivalent to 10 mg of Atorvastatin Calcium Hydrate according to the labeled amount, add 50 mL of methanol, shake thoroughly, and centrifuge. To 2.5 mL of the supernatant liquid add methanol to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry ≤2.24: it exhibits a maximum between 244 nm and 248 nm.

Uniformity of dosage units ≤6.02 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Atorvastatin Calcium Tablets add 3/5/5 mL of a mixture of water and methanol (1:1), and disintegrate the tablet by shaking. Add exactly V/10 mL of the internal standard solution, and add a mixture of water and methanol (1:1) to make V mL so that each mL contains about 0.1 mg of atorvastatin calcium hydrate (C66H68CaF2N4O10·3H2O). Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 22 mg of Atorvastatin Calcium RS (separately determine the water ≤2.48 in the same manner as Atorvastatin Calcium Hydrate), and dissolve in a mixture of water and methanol (1:1) to make exactly 20 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, then add a mixture of water and methanol (1:1) to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography ≤2.01 according to the following conditions, and calculate the ratios, QT and QS, of the peak area of atorvastatin to that of the internal standard.

Amount (mg) of atorvastatin calcium hydrate (C66H68CaF2N4O10·3H2O) = M5 × Qt/Qt

M5: Amount (mg) of Atorvastatin Calcium RS, calculated on the anhydrous basis

Internal standard solution—A solution of 1,3-dinitrobenzene in methanol (1 in 2500).

Operating conditions—

Proceed as directed in the operating conditions in the Assay.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and atorvastatin are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times
with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of atorvastatin to that of the internal standard is not more than 1.0%.

**Dissolution** 6.10 When the test is performed at 75 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Atorvastatin Calcium Tablets is not less than 80%.

Start the test with 1 tablet of Atorvastatin Calcium Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 6 µg of atorvastatin calcium hydrate \((\text{C}_{66}\text{H}_{68}\text{CaF}_{2}\text{N}_{4}\text{O}_{10}.3\text{H}_{2}\text{O})\) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 60 mg of Atorvastatin Calcium RS (separately determine the water in the sample solution. Separately, weigh accurately about 44 mg of Atorvastatin Calcium RS (separately determine the water and methanol (1:1) to make 50 mL, and use this solution as the sample solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, \(Q_7\) and \(Q_9\), of the peak area of atorvastatin to that of the internal standard.

\[
\text{Amount (mg) of atorvastatin calcium hydrate (C}_{66}\text{H}_{68}\text{CaF}_{2}\text{N}_{4}\text{O}_{10}.3\text{H}_{2}\text{O})
\]
\[
\text{in 1 tablet of Atorvastatin Calcium Tablets = } M_S \times Q_7/Q_9 \times V/400 \times 1.047
\]

\(M_S\): Amount (mg) of Atorvastatin Calcium RS, calculated on the anhydrous basis

**Internal standard solution**—A solution of 1,3-dinitrobenzene in methanol (1 in 125).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 244 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadeycliclsilanized silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: Dissolve 10.5 g of citric acid monohydrate in 900 mL of water, adjust to pH 4.0 with ammonia solution (28), and add water to make 1000 mL. To 530 mL of this solution add 270 mL of acetonitrile and 200 mL of tetrahydrofuran.
Flow rate: Adjust the flow rate so that the retention time of atorvastatin is about 9 minutes.

**System suitability**—
System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, the internal standard and atorvastatin are eluted in this order with the resolution between these peaks being not less than 10.
System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of atorvastatin to that of the internal standard is not more than 1.0%.

**Containers and storage**—Containers—Tight containers.
Atropine Sulfate Hydrate

Atropine Sulfate Hydrate, when dried, contains not less than 98.0% of atropine sulfate [(C17H23NO3)2.H2SO4.H2O: 676.82].

Description Atropine Sulfate Hydrate occurs as colorless crystals or a white, crystalline powder. It is odorless. It is very soluble in water and in acetic acid (100), freely soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: 188 – 194°C (with decomposition). Introduce a capillary tube charged with dried sample into a bath previously heated to 180°C, and continue to heat at a rate of rise of about 3°C per minute. It is affected by light.

Identification (1) To 1 mg of Atropine Sulfate Hydrate add 3 drops of fuming nitric acid, and evaporate the mixture on a water bath to dryness. Dissolve the residue in 1 mL of N,N-dimethylformamide, and add 5 to 6 drops of tetrachloroethylene (III) hydrate: a red-purple color develops.

(2) To 2 mL of a solution of Atropine Sulfate Hydrate (1 in 50) add 4 to 5 drops of hydrogen tetrachloroaurate (III) TS: a lusterless, yellowish white precipitate is formed.

(3) To 5 mL of a solution of Atropine Sulfate Hydrate (1 in 25) add 2 mL of ammonia TS, and allow to stand for 2 to 3 minutes. Collect the precipitate, wash with water, and dry in a desiccator (in vacuum, silica gel) for 4 hours: it melts <2.60° between 115°C and 118°C.

(4) A solution of Atropine Sulfate Hydrate (1 in 20) responds to the Qualitative Tests <1.09> for sulfate.

Purity (1) Clarity and color of solution—Dissolve 0.5 g of Atropine Sulfate Hydrate in 10 mL of water: the solution is clear and colorless.

(2) Acidity—Dissolve 1.0 g of Atropine Sulfate Hydrate in 20 mL of water, and add 0.30 mL of 0.02 mol/L sodium hydroxide VS and 1 drop of methyl red-methylene blue TS: a green color develops.

(3) Related substances—Dissolve 0.25 g of Atropine Sulfate Hydrate in 1 mL of dilute hydrochloric acid (1 in 10), add water to make 15 mL, and use this solution as the sample solution.

(i) To 5 mL of the sample solution add 2 to 3 drops of hydrogen hexachloroplatinate (IV) TS: no precipitate is formed.

(ii) To 5 mL of the sample solution add 2 mL of ammonia TS, and shake vigorously: the turbidity of the solution is not greater than that of the following control solution.

Control solution: To 0.30 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid and water to make 50 mL. To this solution add 1 mL of silver nitrate TS, and allow 7 mL of the mixture to stand for 5 minutes.

(4) Hyoscyamine—Weigh accurately about 1 g of Atropine Sulfate Hydrate, previously dried, and dissolve in water to make exactly 10 mL: the specific optical rotation [α]D<2.49> of this solution in a 100-mm cell is between −0.60° and +0.10°.

(5) Readily carbonizable substances <1.17>—Take 0.2 g of Atropine Sulfate Hydrate, and perform the test: the solution has no more color than Matching Fluid A.

Loss on drying <2.47> Not more than 4.0% (0.5 g, in vacuum, phosphorus (V) oxide, 110°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (0.5 g).

Assay Dissolve about 0.25 g of Atropine Sulfate Hydrate, previously dried and accurately weighed, in 30 mL of acetic acid (100). If necessary, dissolve it by warming, and cool. Titrate <2.50> with 0.05 mol/L perchloric acid VS until the color of the solution changes from purple through blue to blue-green (indicator: 3 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS = 33.84 mg of atropine sulfate [(C17H23NO3)2.H2SO4].

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Atropine Sulfate Injection

Atropine Sulfate Injection is an aqueous solution for injection. It contains not less than 93.0% and not more than 107.0% of the labeled amount of atropine sulfate hydrate [(C17H23NO3)2.H2SO4.H2O: 676.83].

Method of preparation Prepare as directed under Injections, with Atropine Sulfate Hydrate.

Description Atropine Sulfate Injection is a clear, colorless liquid.

pH: 4.0 – 6.0

Identification (1) Evaporate a volume of Atropine Sulfate Injection, equivalent to 1 mg of Atropine Sulfate Hydrate according to the labeled amount, on a water bath to dryness. Proceed with the residue as directed in the Identification (1) under Atropine Sulfate Hydrate.

(2) Evaporate an exactly measured volume of Atropine Sulfate Injection, equivalent to 5 mg of Atropine Sulfate Hydrate according to the labeled amount, on a water bath to dryness. After cooling, dissolve the residue in 1 mL of ethanol (95), and use this solution as the sample solution. If insoluble substance remains, crush it, allow to stand, and use the supernatant liquid as the sample solution. Separately, dissolve 10 mg of Atropine Sulfate RS in 2 mL of ethanol (95), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer
Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of acetone, water and ammonia water (28:90:7:3) to a distance of about 10 cm, and dry the plate at 80°C for 10 minutes. After cooling, spray evenly Dragendorff’s TS for spraying on the plate; the spots obtained from the sample solution and the standard solution show an orange color and the same Rf value.

(3) Atropine Sulfate Injection responds to the Qualitative Tests <1.09> for sulfate.

Bacterial endotoxins <4.04> Less than 75 EU/mg.

Extractable volume <6.07> It meets the requirements.

Foreign insoluble matter <6.06> Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter <6.07> Perform the test according to Method 1: it meets the requirement.

Sterility <4.06> Perform the test: it meets the requirement.

Assay

To an exactly measured volume of Atropine Sulfate Injection, equivalent to about 5 mg of atropine sulfate hydrate \([\text{C}_{17}\text{H}_{23}\text{NO}_{3}\text{H}_{2}\text{SO}_{4}\text{H}_{2}\text{O}]\), add exactly 3 mL of the internal standard solution and water to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Atropine Sulfate RS, separately determine its loss on drying <2.41> in the same conditions as for Atropine Sulfate Hydrate, and dissolve in water to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 3 mL of the internal standard solution and water to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \(Q_T\) and \(Q_s\), of the peak area of atropine to that of the internal standard.

Amount (mg) of atropine sulfate hydrate
\[
\text{Amount (mg)} = M_S \times \frac{Q_T}{Q_s} \times 1/5 \times 1.027
\]

\(M_S\): Amount (mg) of Atropine Sulfate RS, calculated based on the dried basis

Internal standard solution—A solution of etilefrine hydrochloride (1 in 1000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 210 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: To 0.4 g of sodium lauryl sulfate add 500 mL of diluted phosphoric acid (1 in 1000) to dissolve, and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran, and mix.
Flow rate: Adjust the flow rate so that the retention time of atropine is about 16 minutes.
System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the internal standard and atropine are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of atropine to that of the internal standard is not more than 1.5%.

Containers and storage Containers—Hermetic containers. Storage—Light-resistant.

Azathioprine

\(\text{C}_9\text{H}_7\text{N}_7\text{O}_2\text{S}\) 277.26
6-(1-Methyl-4-nitro-1H-imidazol-5-ylthio)purine [446-86-6]

Azathioprine, when dried, contains not less than 98.5% of \(\text{C}_9\text{H}_7\text{N}_7\text{O}_2\text{S}\).

Description Azathioprine is light yellow crystals or crystalline powder. It is odorless.
It is sparingly soluble in \(N, N\)-dimethylformamide and in pyridine, very slightly soluble in water and in ethanol (99.5), and practically insoluble in chloroform and in diethyyl ether.
It dissolves in sodium hydroxide TS and in ammonia TS. It is gradually colored by light.
Melting point: about 240°C (with decomposition).

Identification (1) Dissolve 0.01 g of Azathioprine in 50 mL of water by warming. To 5 mL of this solution add 1 mL of dilute hydrochloric acid and 0.01 g of zinc powder, and allow to stand for 5 minutes: a yellow color is produced. Filter this solution: the filtrate responds to the Qualitative Tests <1.09> for primary aromatic amines, and a red color is produced.

(2) Dissolve 0.01 g of Azathioprine in 50 mL of water by warming. To 1 mL of this solution add 0.5 mL of phosphotungstic acid TS and 0.5 mL of dilute hydrochloric acid: a white precipitate is formed.

(3) Prepare the test solution by proceeding with 0.03 g of Azathioprine according to the Oxygen Flask Combustion Method <1.06>, using 20 mL of water as the absorbing liquid: the test solution responds to the Qualitative Tests <1.09> (1) for sulfate.

(4) Dissolve 0.01 g of Azathioprine in 2 mol/L hydrochloric acid TS to make 100 mL. Dilute 5 mL of the solution with water to make 50 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.26>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Azathioprine RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.
**Purity** (1) Clarity and color of solution—Dissolve 0.5 g of Azathioprine in 50 mL of N,N-dimethylformamide: the solution is clear and shows a light yellow color.

(2) Acidity or alkalinity—Add 100 mL of water to 2.0 g of Azathioprine, shake well for 15 minutes, centrifuge for 5 minutes at 10,000 revolutions per minute, and filter. Discard the first 20 mL of the filtrate, add 2 drops of methyl red TS to 40 mL of the subsequent filtrate, and use this solution as the sample solution.

(i) Add 0.10 mL of 0.02 mol/L hydrochloric acid VS to 20 mL of the sample solution: a yellow color develops.

(ii) Add 0.10 mL of 0.02 mol/L sodium hydroxide VS to 20 mL of the sample solution: a yellow color develops.

(3) Sulfate \(<1.14^\circ\)—To 25 mL of the filtrate obtained in (2) add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the sample solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.038%).

(4) Heavy metals \(<1.07^\circ\)—Proceed with 2.0 g of Azathioprine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Arsenic \(<1.17^\circ\)—Prepare the test solution with 1.0 g of Azathioprine, according to Method 3, and perform the test (not more than 2 ppm).

(6) Related substances—Dissolve 10 mg of Azathioprine in 80 mL of the mobile phase by warming, cool, add the mobile phase to make 100 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.07^\circ\) according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of the peaks other than that of azathioprine from the sample solution is not larger than 1/2 times the peak area of azathioprine from the standard solution.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 296 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclysilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Adjust to pH 2.5 of a solution of 0.05 mol/L potassium dihydrogenphosphate TS (1 in 2) with diluted phosphoric acid (3 in 2000). To 800 mL of this solution add 200 mL of methanol.
Flow rate: Adjust the flow rate so that the retention time of azathioprine is about 8 minutes.
Time span of measurement: About three times as long as the retention time of azathioprine beginning after the solvent peak.

**System suitability**—
Test for required detection: To exactly 5 mL of the standard solution add water to make exactly 50 mL. Confirm that the peak area of azathioprine obtained from 20 μL of this solution is equivalent to 8 to 12% of that of azathioprine obtained from 20 μL of the standard solution.
System performance: Dissolve 10 mg of Azathioprine in 80 mL of water by warming, cool, and add water to make 100 mL. To 2 mL of this solution add 2 mL of a solution, separately prepared by dissolving 0.06 g of benzoic acid in 3 mL of methanol and diluting with water to make 10 mL, and add the mobile phase to make 25 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, azathioprine and benzoic acid are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of azathioprine is not more than 2.0%.

**Loss on drying** \(<2.4^\circ\) Not more than 0.5% (1 g, 105°C, 5 hours).

**Residue on ignition** \(<2.4^\circ\) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Azathioprine, previously dried, add 80 mL of N,N-dimethylformamide, and warm to dissolve. After cooling, titrate \(<2.5^\circ\) with 0.1 mol/L tetramethylammonium hydroxide VS until the color of the solution changes from yellow through yellow-green to blue-green (indicator: 1 mL of thymol blue-dimethylformamide TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS = 27.73 mg of C9H7O7O2S

**Containers and storage** Containers—Well-closed containers.
Storage—Light-resistant.

### Azathioprine Tablets

アザチオプリン錠

Azathioprine Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of azathioprine (C9H7O7O2S; 277.26).

**Method of preparation** Prepare as directed under Tablets, with Azathioprine.

**Identification** (1) Weigh a quantity of powdered Azathioprine Tablets, equivalent to 0.01 g of Azathioprine according to the labeled amount. Add 50 mL of water, shake well while warming, and filter. Proceed with 5 mL of the filtrate as directed in the Identification (1) under Azathioprine.

(2) Proceed with 1 mL of the filtrate obtained in (1) as directed in the Identification (2) under Azathioprine.

(3) Determine the absorption spectrum of the sample solution in the Assay as directed under Ultraviolet-visible Spectrophotometry \(<2.24^\circ\): it exhibits a maximum between 278 nm and 282 nm.

(4) Weigh a quantity of powdered Azathioprine Tablets, equivalent to 0.1 g of Azathioprine to the labeled amount. Add 10 mL of a solution of ammonia solution (28) in methanol (1 in 10), shake well, filter, and use the filtrate as the sample solution. Separately, dissolve 0.1 g of Azathioprine RS in 10 mL of a solution of ammonia solution (28) in methanol (1 in 10), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.07^\circ\). Spot 5 μL each of the sample
solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, a solution of ammonia solution (28) in methanol (1 in 10), n-butyl formate and 1,2-dichloroethane (15:10:5:2) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots from the sample solution and the standard solution show the same Rf value.

**Uniformity of dosage units**<6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Azathioprine Tablets add 1 mL of dimethylsulfoxide for ultraviolet-visible spectrophotometry per 5 mg of azathioprine (C₉H₇N₇O₂S), shake well, add 0.1 mol/L hydrochloric acid TS to make exactly V mL so that each mL contains about 0.2 mg of azathioprine (C₉H₇N₇O₂S), and filter. Discard the first 20 mL of the filtrate, measure exactly 3 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

\[
\text{Amount (mg) of azathioprine (C₉H₇N₇O₂S)} = M_S \times A_T/A_S \times V/500
\]

\[M_S: \text{Amount (mg) of Azathioprine RS}\]

**Assay** Weigh accurately and powder not less than 20 Azathioprine Tablets. Weigh accurately a portion of the powder, equivalent to about 0.1 g of azathioprine (C₉H₇N₇O₂S), add 20 mL of dimethylsulfoxide for ultraviolet-visible spectrophotometry, shake well, add 0.1 mol/L hydrochloric acid TS to make exactly V mL so that each mL contains about 0.2 mg of azathioprine (C₉H₇N₇O₂S), and filter. Discard the first 20 mL of the filtrate, measure exactly 3 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of Azathioprine RS, previously dried at 105°C for 5 hours, dissolve in 20 mL of dimethylsulfoxide for ultraviolet-visible spectrophotometry, and add 0.1 mol/L hydrochloric acid TS to make exactly 500 mL. Measure exactly 3 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the sample solution and standard solution at 280 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
\text{Amount (mg) of azathioprine (C₉H₇N₇O₂S)} = M_S \times A_T/A_S
\]

\[M_S: \text{Amount (mg) of Azathioprine RS}\]

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Azelastine Hydrochloride**

アゼラスチン塩酸塩

C₂₂H₂₄ClN₃O.HCl: 418.36
4-[(4-Chlorophenyl)methyl]-2-[(4RS)-
(1-methylazepan-4-yl)phthalazin-1(2H)-one
monohydrochloride [79307-93-0]

Azelastine Hydrochloride, when dried, contains not less than 99.0% and not more than 101.0% of C₂₂H₂₄ClN₃O.HCl.

**Description** Azelastine Hydrochloride occurs as a white crystalline powder.

It is freely soluble in formic acid, and slightly soluble in water and in ethanol (99.5).

Melting point: about 225°C (with decomposition).

A solution of Azelastine Hydrochloride (1 in 200) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Azelastine Hydrochloride (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum:

- Both spectra exhibit similar intensities of absorption at the same wavelengths.

**Determination of impurities**

-**Arsenic**<1.17>—Prepare the test solution with 1.0 g of Azelastine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm). 
-**Related substances**—Dissolve 50 mg of Azelastine Hydrochloride in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area of these solutions by the automatic integration method: each peak area other than azelastine obtained from the sam-
ple solution is not larger than 1/10 times the peak area of azelastine from the standard solution, and the total area of the peaks other than the peak of azelastine from the sample solution is not larger than 1/2 times the peak area of azelastine from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: A mixture of water, acetonitrile and perchloric acid (660:340:1).

Flow rate: Adjust the flow rate so that the retention time of azelastine is about 10 minutes.

Time span of measurement: About 2 times as long as the retention time of azelastine, beginning after the solvent peak.

**System suitability**—

Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of azelastine obtained from 20 μL of this solution is equivalent to 7 to 13% of that from 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of azelastine is not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of azelastine is not more than 1.0%.

**Loss on drying** <2.41> Not more than 1.0% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of previously dried Azelastine Hydrochloride, dissolve in 5 mL of formic acid, add 70 mL of acetic anhydride, and titrate according to the following titration procedure. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 41.84 mg of C22H24ClN3O.HCl

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Azelastine Hydrochloride Granules**

アゼラスチン塩酸塩顆粒

Azelastine Hydrochloride Granules contain not less than 93.0% and not more than 107.0% of the labeled amount of azelastine hydrochloride (C22H24ClN3O.HCl: 418.36).

**Method of preparation** Prepare as directed under Granules, with Azelastine Hydrochloride.

**Identification** To a quantity of Azelastine Hydrochloride Granules, equivalent to 2 mg of Azelastine Hydrochloride according to the labeled amount, add 30 mL of 0.1 mol/L hydrochloric acid TS, and treat with ultrasonic waves for 30 minutes. After cooling, add 0.1 mol/L hydrochloric acid TS to make 50 mL, and centrifuge. Determine the absorption spectrum of the supernatant liquid as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 283 nm and 287 nm.

**Dissolution** <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L acetic acid-sodium acetate buffer solution, pH 4.0, as the dissolution medium, the dissolution rate in 45 minutes of Azelastine Hydrochloride Granules is not less than 80%.

Start the test with accurately weighed amount of Azelastine Hydrochloride Granules, equivalent to about 1 mg of azelastine hydrochloride (C22H24ClN3O.HCl) according to the labeled amount, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 50 mg of azelastine hydrochloride for assay, previously dried at 105°C for 2 hours, and dissolve in the dissolution medium to make exactly 250 mL. Pipet 1 mL of this solution, add the dissolution medium to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A1 and A2, of azelastine in each solution.

Dissolution rate (%) with respect to the labeled amount of azelastine hydrochloride (C22H24ClN3O.HCl) = M2/M1 × A1/A2 × 1/C × 9/5

M2: Amount (mg) of azelastine hydrochloride for assay
M1: Amount (g) of Azelastine Hydrochloride Granules
C: Labeled amount (mg) of azelastine hydrochloride (C22H24ClN3O.HCl) in 1 g

**Operating conditions**—

Proceed as directed in the operating conditions in the Assay.

**System suitability**—

System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of azelastine are not less than 2000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of azelastine is not more than 2.0%.

**Assay** Weigh accurately an amount of Azelastine Hydrochloride Granules, equivalent to about 2 mg of azelastine hydrochloride (C22H24ClN3O.HCl), add 50 mL of 0.1 mol/L hydrochloric acid TS, treat with ultrasonic waves for 20 minutes, add 40 mL of ethanol (99.5), add exactly 5 mL of the internal standard solution, and add ethanol (99.5) to
make 100 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of azelastine hydrochloride for assay, previously dried at 105°C for 2 hours, and dissolve in water to make exactly 50 mL. Pipet 10 mL of this solution, and add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Pipet 10 mL of this solution, add 0.1 mol/L hydrochloric acid TS and 40 mL of ethanol (99.5), add exactly 5 mL of the internal standard solution, add ethanol (99.5) to make 100 mL, and use this solution as the standard solution.

Perform the test with 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, $Q_1$ and $Q_0$, of the peak area of azelastine to that of the internal standard.

$$M_S = \frac{M_5 \times Q_1}{Q_0} \times \frac{1}{25}$$

$M_S$: Amount (mg) of azelastine hydrochloride for assay

Internal standard solution—Dissolve 0.2 g of 2-ethylhexyl parahydroxybenzoate in ethanol (99.5) to make 100 mL.

Operating conditions—

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilsanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of acetonitrile and a solution of sodium lauryl sulfate in diluted acetic acid (100) (1 in 250) (1 in 500) (11:9).

Flow rate: Adjust the flow rate so that the retention time of azelastine is about 6 minutes.

System suitability—

System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, azelastine and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of azelastine to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Tight containers.

Azithromycin Hydrate

アジスロマイシン水和物

C$_{38}$H$_{72}$N$_2$O$_{12}$.2H$_2$O: 785.02
(2R,3S,4S,5R,6R,8R,11R,12R,13S,14R)-5-
(3,4,6-Trideoxy-3-dimethylamino-β-D-xylo-
heptamethylhexadecan-14-olide dihydrate
[117772-70-0]

Azithromycin Hydrate is the derivative of erythromycin.

It contains not less than 945 µg (potency) and not more than 1030 µg (potency) per mg, calculated on the anhydrous basis. The potency of Azithromycin Hydrate is expressed as mass (potency) of azithromycin

$\text{C}_{34} \text{H}_{61} \text{N}_{10} \text{O}_{15} \cdot 2 \text{H}_{2} \text{O}$: 748.98.

Description

Azithromycin Hydrate occurs as a white crystalline powder.

It is freely soluble in methanol and in ethanol (99.5), and practically insoluble in water.

Identification

Determine the infrared absorption spectrum of Azithromycin Hydrate as directed in the potassium bromide disk method under the Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Azithromycin RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]$_D^{20}$: −45° to −49° (0.4 g calculated on the anhydrous basis, ethanol (99.5), 20 mL, 100 mm).

Purity

(1) Heavy metals <1.07>—Proceed with 1.0 g of Azithromycin Hydrate according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Being specified separately.

(3) Residual solvent—Being specified separately.

Water <2.45> Not less than 4.0% and not more than 5.0% (0.4 g, volumetric titration, direct titration).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay

Weigh accurately an amount of Azithromycin Hydrate and Azithromycin RS, equivalent to about 50 mg (potency), dissolve each in an adequate amount of a mixture of acetonitrile and water (3:2), add exactly 2 mL of the internal
standard solution and the mixture of acetonitrile and water (3:2) to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 5 μL of each of the sample solution and standard solution as directed under Liquid Chromatography under Nuclear Magnetic Resonance Spectroscopy according to the following conditions, and calculate the ratios, $Q_T$ and $Q_S$, of the peak area of azithromycin to that of the internal standard.

$$M_S = M_S \times \frac{Q_T}{Q_S} \times 1000$$

$M_S$: Amount [mg (potency)] of Azithromycin RS

Internal standard solution—A solution of 4,4'-bis(diethylamino)benzophenone in acetonitrile (3 in 4000).

Operating conditions—
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized polyvinyl alcohol gel polymer for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 6.97 g of dipotassium hydrogen phosphate in about 750 mL of water, adjust the pH to 11.0 with potassium hydroxide TS, and add water to make 1000 mL. To 400 mL of this solution add 600 mL of acetonitrile for liquid chromatography.
Flow rate: Adjust the flow rate so that the retention time of azithromycin is about 10 minutes.
System suitability—
System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, azithromycin and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.0.
System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of azithromycin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Aztreonam

アズトレオナム

C₁₃H₁₁N₅O₈S₂: 435.43
2-[(Z)-(2-Aminothiazol-4-yl)-[25S]-2-methyl-4-oxo-1-sulfoazetidin-3-ylcarbamoyl]methyleneaminoxy]-2-methyl-1-propanoic acid

【78110-38-0】

Aztreonam contains not less than 920 μg (potency) and not more than 1030 μg (potency) per mg, calculated on the anhydrous basis. The potency of Aztreonam is expressed as mass (potency) of aztreonam (C₁₃H₁₁N₅O₈S₂).

Description Aztreonam occurs as a white to yellowish white crystalline powder.
It is freely soluble in dimethylsulfoxide, slightly soluble in water and in methanol, and very slightly soluble in ethanol (95).

Identification (1) Determine the absorption spectrum of a solution of Aztreonam (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum or the spectrum of Aztreonam RS: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the spectrum of a solution of Aztreonam in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 10), using a light hydrogen substance existing in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy as an internal reference compound and 2.50 ppm for its chemical shift, as directed under Nuclear Magnetic Resonance Spectroscopy: it exhibits a multiple signal at around δ 2.49 ppm, and a single signal at around δ 2.15 ppm. The ratio of integrated intensity of each signal is 9:1.

Optical rotation <2.49> [α]D²⁰: −26° – −32° (0.25 g calculated on the anhydrous bases, water, 50 mL, 100 mm).

pH <2.45> Dissolve 0.05 g of Aztreonam in 10 mL of water: the pH of this solution is between 2.2 and 2.8.

Purity (1) Clarity and color of solution—Dissolve 0.1 g of Aztreonam in 20 mL of water: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Aztreonam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 2 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Aztreonam according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.04 g of Aztreonam in 100 mL of water, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add water to make
Aztreenam for Injection

Aztreenam for Injection is a preparation for injection which is dissolved before use. It contains not less than 93.0% and not more than 107.0% of the labeled amount of aztreenam (C₁₃H₁₇N₅O₈S₂: 435.43).

Method of preparation— Prepare as directed under Injections, with Aztreenam.

Description— Aztreenam for Injection is white to yellowish white masses or powder.

Identification—(1) Dissolve an amount of Aztreenam for Injection, equivalent to 6 mg (potency) of Aztreenam according to the labeled amount, in 1 mL of hydroxylammonium chloride-ethanol TS, allow to stand for 3 minutes, add 1 mL of acidic ammonium iron (III) sulfate TS, and mix: a red-brown color develops.

(2) Dissolve an amount of Aztreenam for Injection, equivalent to 3 mg (potency) of Aztreenam according to the labeled amount, in 100 mL of water, and determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 289 nm and 293 nm.

pH— The pH of a solution prepared by dissolving an amount of Aztreenam for Injection, equivalent to 1.0 g (potency) of Aztreenam according to the labeled amount, in 10 mL of water is 4.5 to 7.0.

Purity—Clarity and color of solution—Dissolve an amount of Aztreenam for Injection, equivalent to 1.0 g (potency) of Aztreenam according to the labeled amount, in 10 mL of water: the solution is clear, and its absorbance at 450 nm is not more than 0.06.

System suitability—

System performance: When the procedure is run with 25 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of aztreenam to that of the internal standard is not more than 1.5%.

Operating conditions—

Column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Time span of measurement: About 4 times as long as the retention time of aztreenam beginning after the solvent peak.

System repeatability: When the test is repeated 6 times with 25 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak areas of aztreenam to that of the internal standard is not more than 2.0%.

Water—Not more than 2.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition—Not more than 0.1% (1 g).

Assay—Weigh accurately an amount of Aztreenam and Aztreenam RS, equivalent to about 20 mg (potency), dissolve each in 70 mL of water, add exactly 10 mL of the internal standard solution and water to make 100 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 25 μL each of these solutions as directed under Liquid Chromatography: according to the following conditions, and calculate the areas of each peak by the automatic integration method: the area of each peak is not more than the peak area of aztreenam from the standard solution, and the total area of peaks other than aztreenam from the sample solution is not larger than 2.5 times the peak area of aztreenam from the standard solution.

Operating conditions—

Column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

System repeatability: When the test is repeated 6 times with 25 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak areas of aztreenam to that of the internal standard is not more than 1.5%.

Containers and storage—Containers—Tight containers.

Storage—Light-resistant.

Aztreenam for Injection

注射用アズトレオナム

Aztreenam for Injection is a preparation for injection which is dissolved before use. It contains not less than 93.0% and not more than 107.0% of the labeled amount of aztreenam (C₁₃H₁₇N₅O₈S₂: 435.43).

Storage—Light-resistant.
**Water** <2.40> Not more than 2.0% (0.5 g, volumetric titration, direct titration).

**Bacterial endotoxins** <4.01> Less than 0.10 EU/mg (potency).

**Uniformity of dosage units** <6.02> It meets the requirement of the Mass variation test.

**Foreign insoluble matter** <6.06> Perform the test according to Method 2: it meets the requirement.

**Insoluble particulate matter** <6.07> It meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Take an amount of Aztreonam for Injection, equivalent to about 5 g (potency) of Aztreonam, dissolve the contents with a suitable amount of water, and transfer to a 100-mL volumetric flask. Wash each container with water, combine the washings and the solution, and add water to make exactly 100 mL. Pipet 10 mL of this solution, and add water to make exactly 50 mL. Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution and water to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Aztreonam RS, equivalent to about 20 mg (potency), dissolve in a suitable amount of water, add exactly 10 mL of the internal standard solution and water to make 100 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Aztreonam.

\[
\text{Amount [mg (potency)] of aztreonam (C}_{13}\text{H}_{17}\text{N}_{5}\text{O}_{8}\text{S}_{2}) = M_5 \times \frac{Q_T}{Q_s} \times 250
\]

\(M_5:\) Amount [mg (potency)] of Aztreonam RS

**Internal standard solution**—A solution of 4-aminobenzoic acid (1 in 6250).

**Bacampicillin Hydrochloride**

**Ampicillin Ethoxycarbonyloxyethyl Hydrochloride**

バカンピシリン塩酸塩

\[
\text{C}_{13}\text{H}_{20}\text{N}_{5}\text{O}_{8}\text{S} \cdot \text{HCl:} \ 501.98
\]

1-Ethoxycarbonyloxyethyl (2S,5R,6R)-6-[(2R)-2-amino-2-phenylacetylamino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrochloride [37661-08-8]

Bacampicillin Hydrochloride is a hydrochloride of ampicillin ethoxycarbonyloxyethyl ester.

It contains not less than 626 μg (potency) per mg, calculated on the anhydrous basis. The potency of Bacampicillin Hydrochloride is expressed as mass (potency) of ampicillin (C\(_{16}\)H\(_{19}\)N\(_{3}\)O\(_{4}\)S: 349.40).

**Description** Bacampicillin Hydrochloride occurs as a white to pale yellow crystalline powder. It has a characteristic odor.

It is freely soluble in methanol and in ethanol (95), and soluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Bacampicillin Hydrochloride in methanol (1 in 1000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of Bacampicillin Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bacampicillin Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Bacampicillin Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Bacampicillin Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**Optical rotation** <2.49> [α] = +140° to +170° (0.1 g calculated on the anhydrous basis, ethanol (95), 25 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Bacampicillin Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.17>—Prepare the test solution with 1.0 g of Bacampicillin Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(3) Free ampicillin—Weigh accurately about 0.1 g of Bacampicillin Hydrochloride, transfer into a 100-mL separator, add exactly 15 mL of ice-cold water to dissolve, add and mix with exactly 10 mL of ice-cold 0.05 mol/L phosphate buffer solution, pH 7.0, then add 25 mL of ice-cold chloroform, shake, and abandon the chloroform layer. Repeat the procedure twice with two 25-mL portions of ice-cold chloroform. Centrifuge the water layer, filter the supernatant, and use the filtrate as the sample solution. Separately, weigh accurately an amount of Ampicillin RS, equivalent to about 20 mg, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add 10 mL of 0.05 mol/L phosphate buffer solution, pH 7.0 and water to make exactly 25 mL, and use this solution as the standard solution. To exactly 10 mL of the sample solution and standard solution add exactly 2 mL of sodium hydroxide TS, allow to stand for exactly 15 minutes, add exactly 2 mL of 1 mol/L hydrochloric acid TS, exactly 10 mL of 0.3 mol/L potassium hydrogen phthalate buffer solution, pH 4.6, and exactly 10 mL of 0.005 mol/L iodine VS, allow to stand for exactly 20 minutes without exposure to light. Titrate <2.50> these solutions with 0.01 mol/L sodium thiosulfate VS until the color of the solution changes to colorless. Separately, to exactly 10 mL each of the sample solution and the standard solution add exactly 10 mL of 0.3 mol/L potassium hydrogen phthalate buffer solution, pH 4.6 and exactly 10 mL of 0.005 mol/L iodine VS, and perform a blank determination
with the same manner. Determine the consumed amounts (mL) of 0.005 mol/L iodine VS, $V_1$ and $V_S$, of the sample solution and the standard solution: the amount of ampicillin is not more than 1.0%.

\[
\text{Amount (mg) of ampicillin (C₁₆H₁₉N₃O₄S)} = M_S \times V_1 / V_S \times 1/20
\]

$M_S$: Amount (mg) of Ampicillin RS

**Water** <2.48> Not more than 1.0% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 1.5% (1 g).

**Assay** Weigh accurately an amount of Bacampicillin Hydrochloride and Bacampicillin Hydrochloride RS, equivalent to about 40 mg (potency), dissolve each in water to make exactly 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, $A_T$ and $A_S$, of bacampicillin of these solutions.

\[
\text{Amount [µg (potency)] of ampicillin (C₁₆H₁₉N₃O₄S)} = M_S \times A_T / A_S \times 1000
\]

$M_S$: Amount [mg (potency)] of Bacampicillin Hydrochloride RS

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To 500 mL of diluted 2 mol/L sodium dihydrogen phosphate TS (1 in 100), add dilute 0.05 mol/L disodium hydrogen phosphate TS (2 in 5) to adjust the pH to 6.8. To 500 mL of this solution add 500 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of bacampicillin is about 6.5 minutes.

**System suitability**—

System performance: When the procedure is run with 20 µL of this solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of bacampicillin are not less than 10,000 and not more than 2, respectively.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of peak areas of bacampicillin is not more than 2.0%.

**Containers and storage** Containers—Tight containers.

---

### Bacitracin

バシトラシン

[1405-87-4]

Bacitracin is a mixture of peptide substances having antibacterial activity including bacitracin A as the main component produced by the growth of *Bacillus subtilis* or *Bacillus licheniformis*.

It contains not less than 60 Units per mg. The potency of Bacitracin is expressed as unit calculated from the amount of bacitracin A (C₆₆H₁₀₃N₁₇O₁₆S: 1422.69). One unit of Bacitracin is equivalent to 23.8 µg of bacitracin A (C₆₆H₁₀₃N₁₇O₁₆S).

**Description** Bacitracin occurs as a white to light brown powder. It is freely soluble in water, and slightly soluble in ethanol (99.5).

**Identification** (1) To 3 mL of a solution of Bacitracin (1 in 100) add 3 mL of 4-dimethylaminobenzaldehyde TS, shake until red-rosy to red-purple color appears, then add several drops of a solution of sodium nitrite (1 in 100), and shake: a green to dark green color is produced.

(2) Dissolve 60 mg each of Bacitracin and Bacitracin RS in 10 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>.

**Residue on ignition** <2.44> Not more than 5.0% (1 g, in vacuum, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Micrococcus luteus* ATCC 10240.

(ii) Culture medium—Use the medium iii in 3) under (1) Agar media for seed and base layer.

(iii) Standard solutions—Weigh accurately an amount of Bacitracin RS, equivalent to about 400 units, dissolve in phosphate buffer solution, pH 6.0 to make exactly 20 mL,
and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 10°C and use within 2 days. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 2 units and 0.5 units, and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Bacitracin, equivalent about 400 units, dissolve in phosphate buffer solution, pH 6.0 to make exactly 20 mL. Take exactly a suitable amount of this solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 2 units and 0.5 units, and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

Containers and storage  Containers—Tight containers.

Storage—In a cold place.

**Baclofen**

パクロフェン

C\textsubscript{10}H\textsubscript{12}ClNO\textsubscript{2}: 213.66

(3RS)-4-Amino-3-(4-chlorophenyl)butanoic acid

[B134-47-0]

Baclofen contains not less than 98.5% of C\textsubscript{10}H\textsubscript{12}ClNO\textsubscript{2}, calculated on the anhydrous basis.

Description  Baclofen occurs as a white to pale yellowish white, crystalline powder.

It is freely soluble in acetic acid (100), slightly soluble in water, very slightly soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether.

It dissolves in dilute hydrochloric acid.

Identification  (1) To 5 mL of a solution of Baclofen (1 in 1000) add 1 mL of ninhydrin TS, and heat on a water bath for 3 minutes: a blue-purple color develops.

(2) Determine the absorption spectrum of a solution of Baclofen in 0.1 mol/L hydrochloric acid TS (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Baclofen RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Perform the test with Baclofen as directed under Flame Coloration Test \(<1.04\rangle\) (2); a green color appears.

(4) Assay  Weigh accurately about 0.5 g of Baclofen, dissolve in 80 mL of acetic acid (100), and titrate \(<2.50\rangle\) with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue to greenish blue (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

\[= 21.37 \text{ mg of C}_{10}\text{H}_{12}\text{ClNO}_2\]
Baclofen Tablets

Baclofen Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of baclofen (C\textsubscript{10}H\textsubscript{12}ClNO\textsubscript{2}: 213.66).

**Method of preparation** Prepare as directed under Tablets, with Baclofen.

**Identification (1)** To a portion of powdered Baclofen Tablets, equivalent to 0.01 g of Baclofen according to the labeled amount, add 10 mL of water, shake well, and filter. To 5 mL of the filtrate add 1 mL of ninhydrin TS, and proceed as directed in the Identification (1) under Baclofen.

**Identification (2)** To a portion of powdered Baclofen Tablets, equivalent to 25 mg of Baclofen according to the labeled amount, add 50 mL of 0.1 mol/L hydrochloric acid TS, shake for 15 minutes, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24> 2.24: it exhibits maxima between 257 nm and 261 nm, between 264 nm and 268 nm, and between 272 nm and 276 nm.

**Identification (3)** To a portion of powdered Baclofen Tablets, equivalent to 0.1 g of Baclofen according to the labeled amount, add 2 mL of a mixture of methanol and acetic acid (100:1), shake well, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 0.01 g of Baclofen RS in 2 mL of a mixture of methanol and acetic acid (100:1), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 20 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and propanol (1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot from the sample solution and that from the standard solution show the same \(R_f\) value.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Baclofen Tablets add 5 mL of 0.1 mol/L hydrochloric acid TS, disperse the tablet into small particles with the aid of ultrasonic waves, then shake for 10 minutes, and add 0.1 mol/L hydrochloric acid TS to make exactly \(V\) mL so that each mL contains about 0.5 mg of baclofen (C\textsubscript{10}H\textsubscript{12}ClNO\textsubscript{2}). Centrifuge, pipet 5 mL of the supernatant liquid, add 2 drops of phenolphthalein TS, neutralize with dilute sodium hydroxide TS, then add water to make exactly 50 mL, and use this solution as the standard solution. Separately, weigh accurately about 25 mg of Baclofen RS (separately determine the water content <2.48> in the same manner as Baclofen), and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 10 mL of this solution, add 2 drops of phenolphthalein TS, neutralize with dilute sodium hydroxide TS, then add water to make exactly 50 mL, and use this solution as the standard solution. To exactly 2 mL each of the sample solution and standard solution add 4 mL of ninhydrin-tin (II) chloride TS, mix, heat on a water bath for 20 minutes, then immediately shake vigorously for 2 minutes. After cooling, add a mixture of water and 1-propanol (1:1) to make them exactly 25 mL, and determine the absorbances, \(A_T\) and \(A_S\), of them at 570 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution obtained with 2 mL of water by the same procedure as above as the blank.

\[
\text{Amount (mg) of baclofen (C}_{10}\text{H}_{12}\text{ClNO}_{2}) = M_S \times A_T/A_S \times V/50
\]

where:
- \(M_S\): Amount (mg) of Baclofen RS, calculated on the anhydrous basis
- \(A_T\): Absorbance of the sample solution at 570 nm
- \(A_S\): Absorbance of the standard solution at 570 nm
- \(V\): Volume of the standard solution

**Dissolution** <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 500 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Baclofen Tablets is not less than 70%.

Start the test with 1 tablet of Baclofen Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 \(\mu\)m. Discard the first 10 mL of the filtrate, pipet \(V\) mL of the subsequent, add water to make exactly \(V\) mL so that each mL contains about 10 \(\mu\)g of baclofen (C\textsubscript{10}H\textsubscript{12}ClNO\textsubscript{2}) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Baclofen RS (separately determine the water <2.48> in the same manner as Baclofen), dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \(A_T\) and \(A_S\), of the sample solution and the standard solution at 220 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
\text{Dissolution rate (\%)} = (A_T/A_S) \times (1/C \times 50)
\]

where:
- \(C\): Labeled amount (mg) of baclofen (C\textsubscript{10}H\textsubscript{12}ClNO\textsubscript{2}) in 1 tablet

**Assay** Weigh accurately and powder not less than 20 Baclofen Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of baclofen (C\textsubscript{10}H\textsubscript{12}ClNO\textsubscript{2}), add 130 mL of 0.1 mol/L hydrochloric acid TS, shake for 10 minutes, add 0.1 mol/L hydrochloric acid TS to make exactly 200 mL, and centrifuge. Pipet 10 mL of the supernatant liquid, add 2 drops of phenolphthalein TS, neutralize with dilute sodium hydroxide TS, add water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.25 g of Baclofen RS (separately determine the water content <2.48> in the same manner as Baclofen), and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 10 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 10 mL of this solution, add 2 drops of phenolphthalein TS, neutralize with dilute sodium hydroxide TS, add water to make exactly 50 mL, and use this solution as the standard solution. Pipet 2 mL each of the sample solution and the standard solution, to each add 4 mL of ninhydrin-stannous chloride TS, shake, heat on a water bath for
Bamethan Sulfate

Control solution: To 1.5 mL of Matching Fluid O add diluted hydrochloric acid (1 in 40) to make 200 mL.

(2) Chloride $<1.05>$.—Perform the test with 3.5 g of Bamethan Sulfate. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.002%).

(3) Heavy metals $<1.07>$.—Proceed with 2.0 g of Bamethan Sulfate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic $<1.11>$.—Prepare the test solution with 1.0 g of Bamethan Sulfate according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.10 g of Bamethan Sulfate in 2 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $<2.02>$. Spot 2 $\mu$L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (7:2) in a developing vessel saturated with ammonia vapor to a distance of about 12 cm, and air-dry the plate. Spray evenly Dragendorff’s TS for spraying on the plate, air-dry for 15 minutes, spray Dragendorff’s TS for spraying again, then, after 1 minute, spray evenly a solution of sodium nitrite (1 in 20), and immediately put a glass plate on the plate. Examine the plate after 30 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying $<2.41>$. Not more than 0.5% (1 g, 105°C, 4 hours).

Residue on ignition $<2.44>$. Not more than 0.1% (1 g).

Assay Weigh accurately about 0.75 g of Bamethan Sulfate, previously dried, dissolve in 80 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

$= 51.67$ mg of $(C_{12}H_{19}NO_{2})_2.H_2SO_4$.

Barbital

Barbital, when dried, contains not less than 99.0% of $C_8H_{12}N_2O_3$.

Description Barbital occurs as colorless or white crystals or
Barium Sulfate / Official Monographs

420

Barium Sulfate

硫酸バリウム

BaSO₄: 233.39

Description Barium Sulfate occurs as a white powder. It is odorless and tasteless.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It does not dissolve in hydrochloric acid, in nitric acid and in sodium hydroxide TS.

Identification (1) Mix 0.5 g of Barium Sulfate with 2 g each of anhydrous sodium carbonate and potassium carbonate in a crucible, heat the mixture until fusion is complete, treat the cooled mass with hot water, and filter. The filtrate, acidified with hydrochloric acid, responds to the Qualitative Tests <1.09> for sulfate.

(2) Wash the hot water-insoluble residue obtained in (1) with water, dissolve in 2 mL of acetic acid (31), and filter, if necessary: the solution responds to the Qualitative Tests <1.09> for barium salt.

Purity (1) Acidity or alkalinity—Agitate 1.0 g of Barium Sulfate with 20 mL of water for 5 minutes: the solution is neutral.

(2) Phosphate—Boil 1.0 g of Barium Sulfate with 3 mL of nitric acid and 5 mL of water for 5 minutes, cool, and add water to restore the original volume. Filter through a filter paper, previously washed with dilute nitric acid, to the filtrate add an equal volume of hexaammonium heptamolybdic acid TS, and allow to stand between 50°C and 60°C for 1 hour: no yellow precipitate is produced.

(3) Sulfide—Place 10 g of Barium Sulfate in a 250-mL conical flask, add 10 mL of dilute hydrochloric acid and water to make 100 mL, and boil for 10 minutes: the gas evolved does not darken moistened lead (II) acetate paper.

(4) Heavy metals <1.07>—Boil 5.0 g of Barium Sulfate with 2.5 mL of acetic acid (100) and 50 mL of water for 10 minutes, cool, add 0.5 mL of ammonia TS and water to make 100 mL, and filter. Perform the test with a 50-mL portion of this filtrate. Prepare the control solution with 2.5 mL of Standard Lead Solution, 1.25 mL of acetic acid (100), 0.25 mL of ammonia TS and water to make 50 mL (not more than 10 ppm).

(5) Arsenic <1.11>—Proceed the test solution with 2.0 g of Barium Sulfate according to Method 1, and perform the test (not more than 1 ppm).

(6) Hydrochloric acid-soluble substances and soluble barium salts—Cool the solution obtained in (3), add water to
make 100 mL, and filter. Evaporate 50 mL of the filtrate on a water bath to dryness, add 2 drops of hydrochloric acid and 10 mL of warm water, filter through paper for assay, and wash with 10 mL of warm water. Evaporate the combined filtrate and washings on a water bath to dryness, and dry the residue at 105°C for 1 hour: the residue weighs not more than 15 mg. Shake the residue, if any, with 10 mL of water, and filter. To the filtrate add 0.5 mL of dilute sulfuric acid, and allow to stand for 30 minutes: no turbidity is produced.

**Containers and storage** Containers—Well-closed containers.

**Freeze-dried BCG Vaccine**

(オールド BCG ワクチン)

Freeze-dried BCG Vaccine (for Percutaneous Use) is a preparation for injection which is dissolved before use.

It contains live bacteria derived from a culture of the bacillus of Calmette and Guérin.

It conforms to the requirements of Freeze-dried BCG Vaccine (for Percutaneous Use) in the Minimum Requirements for Biological Products.

**Description** Freeze-dried BCG Vaccine (for Percutaneous Use) becomes a white to light yellow, turbid liquid on addition of solvent.

**Beclometasone Dipropionate**

(ベクロメタゾンプロピオン酸エステル)

Beclometasone Dipropionate, when dried, contains not less than 97.0% and not more than 103.0% of \(C_{28}H_{37}ClO_{7}\).

**Description** Beclometasone Dipropionate occurs as a white to pale yellow powder. It is odorless.

It is freely soluble in chloroform, soluble in methanol, sparingly soluble in ethanol (95%) and in 1,4-dioxane, slightly soluble in diethyl ether, and practically insoluble in water.

Melting point: about 208°C (with decomposition).

**Identification** (1) Dissolve 2 mg of Beclometasone Dipropionate in 2 mL of sulfuric acid: initially a yellowish color develops, and gradually changes through orange to dark red-brown. To this solution add carefully 10 mL of water: the color changes to bluish green, and a flocculent precipitate is formed.

(2) Dissolve 0.01 g of Beclometasone Dipropionate in 1 mL of methanol, add 1 mL of Fehling’s TS, and heat: a red to red-brown precipitate is formed.

(3) Prepare the test solution with 0.02 g of Beclometasone Dipropionate as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 1 mL of sodium hydroxide TS and 20 mL of water as an absorbing liquid: the test solution responds to the Qualitative Tests <1.09> for chloride.

(4) Determine the infrared absorption spectrum of Beclometasone Dipropionate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Beclometasone Dipropionate RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Beclometasone Dipropionate and Beclometasone Dipropionate RS in ethanol (95), respectively, then evaporate the ethanol to dryness, and repeat the test on the residues.

**Optical rotation** <2.49> \([\alpha]_D^2 + 88° \pm 94°\) (after drying, 0.1 g, 1,4-dioxane, 10 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Proceed with 0.5 g of Beclometasone Dipropionate according to Method 2, and perform the test. Prepare the control solution with 1.5 mL of Standard Lead Solution (not more than 30 ppm).

(2) Related substances—Dissolve 20 mg of Beclometasone Dipropionate in 5 mL of a mixture of chloroform and methanol (9:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (9:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1,2-dichloroethane, methanol and water (475:25:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 20 mg each of Beclometasone Dipropionate and Beclometasone Dipropionate RS, previously dried, and dissolve each in methanol to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 10 mL of the internal standard solution and methanol to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \(Q_t\) and \(Q_b\), of the peak area of beclometasone dipropionate to that.
Beef Tallow

Sevum Bovinum

牛脂

Beef Tallow is a purified fat obtained by wet steam rendering from the fresh fatty tissues of Bos taurus Linné var. domesticus Gmelin (Bovidae).

Description Beef Tallow occurs as a white, uniform mass. It has a characteristic odor and a mild taste.

It is freely soluble in diethyl ether and in petroleum ether, very slightly soluble in ethanol (95), and practically insoluble in water.

It is breakable at a low temperature, but softens above 9°C.

Acid value <1.13> Not more than 2.0.

Saponification value <1.13> 193 – 200

Iodine value <1.13> 33 – 50 (When the sample is insoluble in 20 mL of cyclohexane, dissolve it by shaking a glass-stoppered flask in warm water. Then, if insoluble, increase the volume of solvent.)

Purity (1) Moisture and coloration—Beef Tallow (5.0 g), melted by heating on a water bath, forms a clear liquid, from which no water separates. In a 10-mm thick layer of the liquid, it is colorless or slightly yellow.

(2) Alkalinity—To 2.0 g of Beef Tallow add 10 mL of water, melt by heating on a water bath, and shake vigorously. After cooling, add 1 drop of phenolphthalein TS to the separated water layer: no color develops.

(3) Chloride—To 1.5 g of Beef Tallow add 30 mL of ethanol (95), boil for 10 minutes under a reflux condenser, and filter after cooling. To 20 mL of the filtrate add 5 drops of a solution of silver nitrate in ethanol (95) (1 in 50): the turbidity of the mixture does not exceed that of the following control solution.

Control solution: To 1.0 mL of 0.01 mol/L hydrochloric acid VS add ethanol (95) to make 20 mL, then add 5 drops of an ethanolic solution of silver nitrate (1 in 50).

Containers and storage Containers—Well-closed containers.

White Beeswax

Cera Alba

サラシミツロウ

White Beeswax is bleached Yellow Beeswax.

Description White Beeswax occurs as white to yellowish white masses. It has a characteristic odor. It is comparatively brittle when cooled, and the fractured surface is granular, and non-crystalline.

It is slightly soluble in diethyl ether, and practically insoluble in water and in ethanol (99.5).

Acid value <1.13> 5 – 9 or 17 – 22 Weigh accurately about 6 g of White Beeswax, place in a glass-stoppered 250-mL flask, and add 50 mL of ethanol (99.5). Warm the mixture to dissolve the wax, add 1 mL of phenolphthalein TS, and proceed as directed in the Acid value. Perform a blank determination using solvent which is not previously neutralized, and make any necessary correction.

Saponification value <1.13> 80 – 100 Weigh accurately about 3 g of White Beeswax, place in a glass-stoppered 250-mL flask, and add exactly 25 mL of 0.5 mol/L potassium hydroxide-ethanol VS and 50 mL of ethanol (95), heat for 4 hours on a water bath under a reflux condenser, and proceed as directed in the Saponification value.

Melting point <1.13> 60 – 67°C.

Purity Paraffin, fat, Japan wax or resin—Melt White Beeswax at the lowest possible temperature, drip the liquid into a vessel containing ethanol (95) to form granules, and allow them to stand in air for 24 hours. Drop the granules into two mixtures of ethanol (95) and water, one adjusted so as to have a specific gravity of 0.95 and the other 0.97: the granules sink or are suspended in the mixture with the specific gravity of 0.95, and float or are suspended in the other mixture.

Containers and storage Containers—Well-closed containers.
Yellow Beeswax

Cera Flava

ミツロウ

Yellow Beeswax is the purified wax obtained from honeycombs such as those of Apis mellifera Linné or Apis cerana Fabricius (Apidae).

**Description** Yellow Beeswax occurs as light yellow to brownish yellow masses. It has a characteristic odor, which is not rancid. It is comparatively brittle when cooled, and the fractured surface is granular, and non-crystalline.

**Acid value**: Weigh accurately about 6 g of Yellow Beeswax, place in a glass-stoppered 250-mL flask, and add 50 mL of ethanol (99.5). Warm the mixture to dissolve the wax, add 1 mL of phenolphthalein TS, and proceed as directed in the Acid value. Perform a blank determination using solvent which is not previously neutralized, and make any necessary correction.

**Saponification value**: Weigh accurately about 3 g of Yellow Beeswax, place in a 250-mL glass-stoppered flask, and add 25 mL of 0.5 mol/L potassium hydroxide-ethanol and 50 mL of ethanol (95), insert a reflux condenser, heat for 4 hours on a water bath, and proceed as directed in the Saponification value.

**Melting point**: Melt Yellow Beeswax at the lowest possible temperature, drip the liquid into a glass vessel containing ethanol (95) to form granules, and allow them to stand in air for 24 hours. Drop the granules into two mixtures of ethanol (95) and water, one adjusted so as to have a specific gravity of 0.95 and the other 0.97: the granules sink or are suspended in the mixture with the specific gravity of 0.95, and float or are suspended in the other mixture.

**Containers and storage**: Well-closed containers.

Bekanamycin Sulfate

ベカナマイシン硫酸塩

C$_{18}$H$_{37}$N$_{5}$O$_{10}$·xH$_{2}$SO$_{4}$

3-Amino-3-deoxy-α-D-glucopyranosyl-(1→6)-[2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl-(1→4)]-2-deoxy-D-streptamine sulfate

[70550-99-1]

Bekanamycin Sulfate is the sulfate of an aminoglycoside substance having antibacterial activity produced by the growth of the mutant of *Streptomycetes kanamyceticus*.

It contains not less than 680 mg (potency) and not more than 770 mg (potency) per mg, calculated on the dried basis. The potency of Bekanamycin Sulfate is expressed as mass (potency) of bekamycin (C$_{18}$H$_{37}$N$_{5}$O$_{10}$: 483.51).

**Description** Bekanamycin Sulfate occurs as a white powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

**Identification**

(1) Dissolve 20 mg of Bekanamycin Sulfate in 2 mL of 1/15 mol/L phosphate buffer solution, pH 5.6, add 1 mL of ninhydrin TS, and boil: a blue-purple color develops.

(2) Dissolve 30 mg each of Bekanamycin Sulfate and Bekanamycin Sulfate RS in 5 mL of water, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography. Spot 5 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a solution of potassium dihydrogen phosphate (3 in 40) to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS, and heat at 100°C for 10 minutes: the principal spots obtained from the sample solution and the standard solution show a purple-brown color and the same Rf value.

(3) To a solution of Bekanamycin Sulfate (1 in 5) add 1 drop of barium chloride TS: a white turbidity is produced.

**Optical rotation**: [α]$_{D}$: +102° to +116° (after drying, 0.25 g, water, 25 mL, 100 mm).

**pH**: The pH of a solution obtained by dissolving 0.50 g of Bekanamycin Sulfate in 10 mL of water is between
distance of about 10 cm, and air-dry the plate. Spray evenly a solution of potassium dihydrogen phosphate (3 in 40) to a gel for thin-layer chromatography. Develop the plate with a solvent. Test the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a solvent.

Perform the test according to the Cylinder-plate Assay method as directed under Microbial Assay for Antibiotics.

(b) Test organism—Bacillus subtilis ATCC 6633

(i) Test organism—Bacillus subtilis ATCC 6633
(ii) Culture medium—Use the medium i in 1) under (1)

(iii) Agar media for seed and base layer having pH 6.0 and 8.5.

(iv) Sample solutions—Weigh accurately an amount of Bekanamycin Sulfate RS, previously dried, equivalent to 2.0 g (potency), dissolve in diluted phosphate buffer solution (pH 8.0) to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 10 µg (potency) and 2.5 µg (potency), and use these solutions as the high concentration sample solution and low concentration standard solution, respectively.

(v) Standard solutions—Weigh accurately an amount of Bekanamycin Sulfate RS, previously dried, equivalent to about 20 mg (potency), dissolve in diluted phosphate buffer solution, pH 6.0 (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5 to 15 °C and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 10 µg (potency) and 2.5 µg (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

Containers and storage—Containers—Tight containers.

Benidipine Hydrochloride

ベニジピン塩酸塩

\[
\text{C}_{28}\text{H}_{31}\text{N}_{3}\text{O}_{6}\cdot\text{HCl}: 542.02
\]

3-[(3RS)-1-Benzylpiperidin-3-yl]-5-methyl (4RS)-2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate monohydrochloride [91599-74-5]

Benidipine Hydrochloride, when dried, contains not less than 99.0% and not more than 101.0% of \(\text{C}_{28}\text{H}_{31}\text{N}_{3}\text{O}_{6}\cdot\text{HCl}\).

Description Benidipine Hydrochloride occurs as a yellow crystalline powder.

It is very soluble in formic acid, soluble in methanol, sparingly soluble in ethanol (99.5), and practically insoluble in water.

A solution of Benidipine Hydrochloride in methanol (1 in 100) shows no optical rotation.

Melting point: about 200°C (with decomposition).

Identification

(1) Determine the absorption spectrum of a solution of Benidipine Hydrochloride in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Benidipine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 5 mL of a solution of Benidipine Hydrochloride (1 in 10) add 5 mL of ammonia TS, heat on a water bath for 5 minutes, cool, and filter. The filtrate, which is acidified with dilute nitric acid, responds to the Qualitative Tests <1.69> (2) for chloride.

Purity

(1) Heavy metals <1.07>—Proceed with 1.0 g of Benidipine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 20 mg of Benidipine Hydrochloride in 100 mL of a mixture of water and methanol (1:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mixture of water and methanol (1:1) to make exactly 500 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of bisbenzyl-
piperidyl ester having the relative retention time of about 0.35 with respect to benidipine, dehydro derivative having the relative retention time of about 0.75 and other related substances are not larger than 1/2 times the peak area of benidipine with the standard solution, and the total area of the peaks other than benidipine is not larger than the peak area of benidipine with the standard solution. For this calculation, use the peak areas of bisbenzylpiperidyl ester and dehydro derivative after multiplying by their response factors, 1.6, respectively.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 237 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS, pH 3.0, methanol and tetrahydrofuran (65:27:8).

Flow rate: Adjust the flow rate so that the retention time of benidipine is about 20 minutes.

Time span of measurement: About 2 times as long as the retention time of benidipine beginning after the solvent peak.

**System suitability—**

Test for required detectability: Measure exactly 5 mL of the standard solution, and add the mixture of water and methanol (1:1) to make exactly 20 mL. Confirm that the peak area of benidipine obtained with 10 μL of this solution is equivalent to 18 to 32% of that with 10 μL of the standard solution.

System performance: Dissolve 6 mg of Benidipine Hydrochloride and 5 mg of benzoin in 200 mL of the mixture of water and methanol (1:1). When the procedure is run with 10 mL of this solution under the above operating conditions, benzoin and benidipine are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of benidipine is not more than 3.5%.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, 105°C, 2 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.7 g of Benidipine Hydrochloride, previously dried, dissolve in 10 mL of formic acid, add 70 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 54.20 mg of C$_2$H$_2$N$_2$O$_6$.HCl

**Containers and storage** Containers—Tight containers.
with 10 \mu L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of benidipine is not more than 2.0%.

**Uniformity of dosage units**

Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Benidipine Hydrochloride Tablets add 40 mL of a mixture of diluted phosphoric acid (1 in 500) and methanol (1:1), shake to disintegrate, and add a suitable amount of the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make exactly V mL of a solution, containing 40 \mu g of benidipine hydrochloride (C_{28}H_{31}N_{3}O_{6}.HCl) per mL. Centrifuge the solution, pipet 20 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make 50 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

\[
\text{Amount (mg) of benidipine hydrochloride (C}_{28}\text{H}_{31}\text{N}_{3}\text{O}_{6}.\text{HCl)} = M_S \times Q_T / Q_S \times V / 1000
\]

\( M_S \): Amount (mg) of benidipine hydrochloride for assay

**Internal standard** solution—A solution of benzoin in a mixture of water and methanol (1:1) (13 in 200,000).

**Dissolution**

Perform the test at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of 1st fluid for dissolution test as the dissolution medium, the dissolution rate of a 2-mg tablet and a 4-mg tablet in 30 minutes is not less than 80%, and that of a 8-mg tablet in 45 minutes is not less than 85%.

Start the test with 1 tablet of Benidipine Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \mu m. Discard the first 10 mL of the filtrate pipet the subsequent V mL, and add the dissolution medium to make exactly V mL so that each mL contains about 2.2 \mu g of benidipine hydrochloride (C_{28}H_{31}N_{3}O_{6}.HCl) according to the labeled amount. Pipet 5 mL of this solution, add exactly 5 mL of the mobile phase, and use this solution as the sample solution. Separately, weigh accurately about 22 mg of benidipine hydrochloride for assay, previously dried at 105°C and cooled, and dissolve in the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, and add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the mobile phase, and use this solution as the standard solution. Perform the test with exactly 50 \mu L of each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of benidipine.

Dissolution rate (%) of benidipine hydrochloride (C_{28}H_{31}N_{3}O_{6}.HCl) with respect to the labeled amount

\[
= M_S \times A_T / A_S \times V' / V \times 1 / C \times 9
\]

\( M_S \): Amount (mg) of benidipine hydrochloride for assay

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 237 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \mu m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS, pH 3.0 and acetonitrile (11:9).

Flow rate: Adjust the flow rate so that the retention time of benidipine is about 5 minutes.

**System suitability—**

System performance: When the procedure is run with 50 \mu L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of benidipine are not less than 3000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 50 \mu L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of benidipine is not more than 1.5%.

**Assay**

Weigh accurately the mass of not less than 20 Benidipine Hydrochloride Tablets, and power using an agate mortar. Weigh accurately a part of the powder, equivalent to about 8 mg of benidipine hydrochloride (C_{28}H_{31}N_{3}O_{6}.HCl), add about 150 mL of a mixture of diluted phosphoric acid (1 in 500) and methanol (1:1), shake, then add the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make exactly 200 mL, and centrifuge. Pipet 20 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 40 mg of benidipine hydrochloride for assay, previously dried at 105°C for 2 hours, and dissolve in the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution and the mixture of diluted phosphoric acid (1 in 500) and methanol (1:1) to make 50 mL, and use this solution as the standard solution. Perform the test with 10 \mu L each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and calculate the ratios, \( Q_T \) and \( Q_S \), of the peak area of benidipine to that of the internal standard.

\[
\text{Amount (mg) of benidipine hydrochloride (C}_{28}\text{H}_{31}\text{N}_{3}\text{O}_{6}.\text{HCl)} = M_S \times Q_T / Q_S \times 1/5
\]

\( M_S \): Amount (mg) of benidipine hydrochloride for assay

**Internal standard** solution—A solution of benzoin in a mixture of water and methanol (1:1) (13 in 200,000).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 237 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 \mu m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS, pH 3.0, methanol and tetrahydrofuran (65:27:8).
Identification (1) Determine the absorption spectrum of a solution of Benserazide Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbance of this solution at 430 nm is not more than 0.10.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Benserazide Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.25 g of Benserazide Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL and 3 mL of the sample solution, add methanol to make exactly 200 mL, and use these solutions as the standard solution (1) and (2), respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.06>. Spot 2 μL each of the sample solution and standard solutions (1) and (2) on a plate of cellulose for thin-layer chromatography. Develop the plate with a solution of formic acid in sodium chloride TS (1 in 1000) to a distance of about 10 cm, and air-dry the plate. Spray evenly sodium carbonate TS, air-dry, and then spray evenly Folin’s TS on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (2), and the number of the spots which intense more than the spot from the standard solution (1) are not more than 2.

Water <2.45> Not more than 2.5% (0.5 g, direct titration). Use a solution of salicylic acid in methanol for Karl Fischer method (3 in 20) instead of methanol for Karl Fischer method.

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Benserazide Hydrochloride, dissolve in 5 mL of formic acid, add 50 mL of acetic acid (100), and titrate <2.50> immediately with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 29.37 mg of C₁₀H₁₅N₃O₅.HCl

Containers and storage Containers—Well-closed containers.

Bentonite

Bentonite is a natural, colloidal, hydrated aluminum silicate.

Description Bentonite occurs as a very fine, white to light yellow-brown powder. It is odorless. It has a slightly earthy taste.

It is practically insoluble in water and in diethyl ether. It swells in water.

Identification (1) Add 0.5 g of Bentonite to 3 mL of diluted sulfuric acid (1 in 3), and heat until white fumes are evolved. Cool, add 20 mL of water, and filter. To 5 mL of the filtrate add 3 mL of ammonia TS: a white, gelatinous
precipitate is produced, which turns red on the addition of 5 drops of alizarin red S TS.

(2) Wash the residue obtained in (1) with water, add 2 mL of a solution of methylene blue trihydrate (1 in 10,000), and wash again with water: the residue is blue in color.

**pH** <2.54> To 1.0 g of Bentonite add 50 mL of water, and shake: the pH of the suspension is between 9.0 and 10.5.

**Purity** (1) Heavy metals <1.07>—To 1.5 g of Bentonite add 80 mL of water and 5 mL of hydrochloric acid, and boil gently for 20 minutes with thorough stirring. Cool, centrifuge, collect the supernatant liquid, wash the residue with two 10-mL portions of water, and centrifuge each. Combine the supernatant liquid and the washings, and add dropwise ammonia solution (28). When a precipitate is produced, add dropwise dilute hydrochloric acid with vigorous stirring, and dissolve. To the solution add 0.45 g of hydroxyaluminium chloride, and heat. Cool, and add 0.45 g of sodium acetate trihydrate, 6 mL of dilute acetic acid and water to make 150 mL. Pipet 50 mL of the solution, and perform the test using this solution as the test solution. Prepare the control solution as follows: mix 2.5 mL of Standard Lead Solution, 0.15 g of hydroxyaluminium chloride, 0.15 g of sodium acetate trihydrate, and 2 mL of dilute acetic acid, and add water to make 50 mL (not more than 50 ppm).

(2) Arsenic <1.17>—To 1.0 g of Bentonite add 5 mL of dilute hydrochloric acid, and gently heat to boil while stirring. Cool immediately, and centrifuge. To the residue add 5 mL of dilute hydrochloric acid, shake well, and centrifuge. To the residue add 10 mL of water, and perform the same operations. Combine all the extracts, and heat on a water bath to concentrate to 5 mL. Perform the test with this solution as the test solution (not more than 2 ppm).

(3) Foreign matter—Place 2.0 g of Bentonite in a mortar, add 20 mL of water to swell, disperse evenly with a pestle, and dilute with water to 100 mL. Pour the suspension through a No. 200 (74 μm) sieve, and wash the sieve thoroughly with water. No grit is felt when the fingers are rubbed over the wire mesh of the sieve.

**Loss on drying** <2.47> 5.0 – 10.0% (2 g, 105°C, 2 hours).

**Gel formation** Mix 6.0 g of Bentonite with 0.30 g of magnesium oxide. Add the mixture, in several portions, to 200 mL of water contained in a glass-stoppered 500-mL cylinder. Agitate for 1 hour, transfer 100 mL of the suspension to a 100-mL graduated cylinder, and allow to stand for 24 hours: not more than 2 mL of supernatant appears on the surface.

**Swelling power** To 100 mL of water in a glass-stoppered 100-mL cylinder add 2.0 g of Bentonite in ten portions, allowing each portion to settle before adding the next, and allow to stand for 24 hours: the apparent volume of the sediment at the bottom is not less than 20 mL.

**Containers and storage** Containers—Well-closed containers.

---

**Benzalkonium Chloride**

Benzalkonium Chloride is represented by the formula \([\text{C}_6\text{H}_5\text{CH}_2\text{N(CH}_3\text{)}_2\text{R}]\text{Cl}\), in which \(R\) extends from C\(_8\)H\(_{17}\) to C\(_{18}\)H\(_{37}\), with C\(_{12}\)H\(_{25}\) and C\(_{14}\)H\(_{29}\) comprising the major portion.

It contains not less than 95.0% and not more than 105.0% of benzalkonium chloride (as \(\text{C}_{22}\text{H}_{40}\text{ClN:} \text{C}_{540.01}\)), calculated on the anhydrous basis.

**Description** Benzalkonium Chloride occurs as a white to yellowish white powder, colorless to light yellow, gelatinous pieces, or jelly-like fluid or mass. It has a characteristic odor.

It is very soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

A solution of Benzalkonium Chloride foams strongly when shaken.

**Identification** (1) Dissolve 0.2 g of Benzalkonium Chloride in 1 mL of sulfuric acid, add 0.1 g of sodium nitrate, and heat for 5 minutes on a water bath. After cooling, add 10 mL of water and 0.5 g of zinc powder, heat for 5 minutes, cool, and filter; the filtrate responds to the Qualitative Tests <1.09> for primary aromatic amines. The color of the solution is red.

(2) To 2 mL of a solution of Benzalkonium Chloride (1 in 1000) add a mixture of 0.2 mL of a solution of bromophenol blue (1 in 2000) and 0.5 mL of sodium hydroxide TS: a blue color develops. Add 4 mL of chloroform to this solution, and shake vigorously: the blue color shifts to the chloroform layer. Collect the chloroform layer, and add dropwise, with stirring, a solution of sodium lauryl sulfate (1 in 1000): the chloroform layer turns colorless.

(3) Determine the absorption spectrum of a solution of Benzalkonium Chloride in 0.1 mol/L hydrochloric acid TS (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) To 1 mL of a solution of Benzalkonium Chloride (1 in 100) add 2 mL of ethanol (95), 0.5 mL of dilute nitric acid and 1 mL of silver nitrate TS: a white precipitate is produced. This precipitate does not dissolve on the addition of dilute nitric acid, but dissolves on the addition of ammonia TS.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Benzalkonium Chloride in 10 mL of water: the solution is clear and colorless to light yellow.

(2) Petroleum ether-soluble substances—To 3.0 g of Benzalkonium Chloride add water to make 50 mL, then add 50 mL of ethanol (99.5) and 5 mL of 0.5 mol/L sodium hydroxide TS, and extract with three 50-mL portions of petroleum ether. Combine the petroleum ether extracts, and wash with three 50-mL portions of dilute ethanol. After shaking well with 10 g of anhydrous sodium sulfate, filter through a dry filter paper, and wash the filter paper with two 10-mL portions of petroleum ether. Evaporate the petroleum ether on a water bath by heating, and dry the residue at 105°C for 1 hour: the residue is not more than 1.0%.
**Benzalkonium Chloride Solution**

Benzalkonium Chloride Solution is an aqueous solution containing not more than 50.0 w/v% of benzalkonium chloride.

It contains not less than 93.0% and not more than 107.0% of the labeled amount of benzalkonium chloride (C\(_{22}\)H\(_{40}\)ClN: 354.01).

**Method of preparation**
Dissolve Benzalkonium Chloride in Water, Purified Water or Purified Water in Containers. It is also prepared by diluting Concentrated Benzalkonium Chloride Solution 50 with Water, Purified Water or Purified Water in Containers.

**Description**
Benzalkonium Chloride Solution is a clear, colorless to light yellow liquid, having a characteristic odor. It foams strongly on shaking.

**Identification (1)**
Evaporate a volume of Benzalkonium Chloride Solution, equivalent to 0.2 g of Benzalkonium Chloride according to the labeled amount, on a water bath to dryness, and proceed with the residue as directed in the Identification (1) under Benzalkonium Chloride.

(2) To a volume of Benzalkonium Chloride Solution, equivalent to 0.01 g of Benzalkonium Chloride according to the labeled amount, add water to make 10 mL. Proceed with 2 mL of this solution as directed in the Identification (2) under Benzalkonium Chloride.

(3) To a volume of Benzalkonium Chloride Solution, equivalent to 1 g of Benzalkonium Chloride according to the labeled amount, add water or concentrate on a water bath, if necessary, to make 10 mL. To 1 mL of this solution add 0.1 mol/L hydrochloric acid VS to make 200 mL, and proceed as directed in the Identification (3) under Benzalkonium Chloride.

(4) To a volume of Benzalkonium Chloride Solution, equivalent to 0.1 g of Benzalkonium Chloride according to the labeled amount, add water or concentrate on a water bath, if necessary, to make 10 mL. Proceed with 1 mL of this solution as directed in the Identification (4) under Benzalkonium Chloride.

**Assay**
Pipet a volume of Benzalkonium Chloride Solution, equivalent to about 0.15 g of benzalkonium chloride (C\(_{22}\)H\(_{40}\)ClN), dilute with water to make 75 mL, if necessary, and proceed as directed in the Assay under Benzalkonium Chloride.

Each mL of 0.02 mol/L sodium tetraphenylboron VS = 7.080 mg of benzalkonium chloride (C\(_{22}\)H\(_{40}\)ClN)
to make 50 mL, then add 50 mL of ethanol (99.5) and 5 mL of 0.5 mol/L sodium hydroxide TS, and extract with three 50-mL portions of petroleum ether. Combine the petroleum ether extracts, and wash with three 50-mL portions of dilute ethanol. After shaking well with 10 g of anhydrous sodium sulfate, filter through a dry filter paper, and wash the filter paper with two 10-mL portions of petroleum ether.

Evaporate the petroleum ether on a water bath by heating, and dry the residue at 105°C for 1 hour: the residue is not more than 1.0%.

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay**

Weigh accurately about 0.3 g of Benzalkonium Chloride Concentrated Solution 50, and dissolve in 75 mL of water. Adjust the pH to between 2.6 and 3.4 by adding dropwise diluted dilute hydrochloric acid (1 in 2), add 1 drop of methyl orange TS, and titrate <2.50> with 0.02 mol/L sodium tetraphenylboron VS until the color of the solution becomes red.

Each mL of 0.02 mol/L sodium tetraphenylborate VS = 7.080 mg of benzalkonium chloride (C₂₂H₄₀ClN)

**Containers and storage** Containers—Tight containers.

### Benzbramarone

ベンズブロマロン

**C₁₇H₁₂Br₂O₃**: 424.08
3,5-Dibromo-4-hydroxyphenyl 2-ethylbenzo[6]furan-3-yl ketone

3562-84-2

Benzbramarone, when dried, contains not less than 98.5% and not more than 101.0% of C₁₇H₁₂Br₂O₃.

**Description**

Benzbramarone occurs as a white to light yellow, crystalline powder.

It is very soluble in N,N-dimethylformamide, freely soluble in acetone, sparingly soluble in ethanol (99.5), and practically insoluble in water.

It dissolves in dilute sodium hydroxide TS.

**Identification**

(1) Determine the absorption spectrum of a solution of Benzbramarone in 0.01 mol/L sodium hydroxide TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Benzbramarone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point**<2.60> 149 – 153°C

**Purity**

(1) Sulfate <1.14>—Dissolve 1.0 g of Benzbramarone in 40 mL of acetone, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.40 mL of 0.005 mol/L sulfuric acid VS add 40 mL of acetone, 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.019%).

(2) Soluble halides—Dissolve 0.5 g of Benzbramarone in 40 mL of acetone, and add 6 mL of dilute nitric acid and water to make 50 mL. Proceed with this solution as directed under Chloride Limit Test <1.05>. Prepare the control solution as follows: to 0.25 mL of 0.01 mol/L hydrochloric acid VS add 40 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL.

(3) Heavy metals <1.07>—Proceed with 2.0 g of Benzbramarone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Iron <1.10>—Prepare the test solution with 1.0 g of Benzbramarone according to Method 3, and perform the test according to Method A. Prepare the control solution with 2.0 mL of Standard Iron Solution (not more than 20 ppm).

(5) Related substances—Dissolve 0.10 g of Benzbramarone in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of cyclohexane, 4-methyl-2-pentanone, ethanol (99.5) and acetic acid (100:20:2:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying**<2.41> Not more than 0.5% (1 g, in vacuum at a pressure not exceeding 0.67 kPa, phosphorus (V) oxide, 50°C, 4 hours).

**Residue on ignition**<2.44> Not more than 0.1% (1 g).

**Assay**

Weigh accurately about 0.6 g of Benzbramarone, previously dried, dissolve in 30 mL of N,N-dimethylformamide, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide VS (indicator: 5 drops of thymol blue-dimethylformamide TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L tetramethylammonium hydroxide VS = 42.41 mg of C₁₇H₁₂Br₂O₃

**Containers and storage** Containers—Light-resistant.

**Storage**—Light-resistant.
Benzethonium Chloride
ベンゼトニウム塩化物

\[
C_{27}H_{42}ClNO_2: 448.08
\]

Benzethonium Chloride, when dried, contains not less than 97.0% of \(C_{27}H_{42}ClNO_2\).

**Description** Benzethonium Chloride occurs as colorless or white crystals. It is odorless.

It is very soluble in ethanol (95), freely soluble in water, and practically insoluble in diethyl ether.

A solution of Benzethonium Chloride foams strongly when shaken.

**Identification (1)** Dissolve 0.2 g of Benzethonium Chloride in 1 mL of sulfuric acid, add 0.1 g of sodium nitrate, and heat for 5 minutes on a water bath. After cooling, add 10 mL of water and 0.5 g of zinc powder, heat for 5 minutes, cool, and filter: the filtrate responds to the Qualitative Tests \(<1.09\) for primary aromatic amines, developing a red color.

(2) To 2 mL of a solution of Benzethonium Chloride (1 in 1000) add a mixture of 0.2 mL of a solution of bromophenol blue (1 in 2000) and 0.5 mL of sodium hydroxide TS: a blue color develops. Add 4 mL of chloroform to this solution, and shake vigorously: the blue color shifts to the chloroform layer. Collect the chloroform layer, and add dropwise a solution of sodium lauryl sulfate (1 in 1000) with stirring: the chloroform layer turns colorless.

(3) Determine the absorption spectrum of a solution of Benzethonium Chloride in 0.1 mol/L hydrochloric acid TS (1 in 5000) as directed in the Identification (4) under Benzethonium Chloride. (4) To 1 mL of a solution of Benzethonium Chloride (1 in 100) add 2 mL of ethanol (95), 0.5 mL of dilute nitric acid and 1 mL of silver nitrate TS: a white precipitate is produced. This precipitate does not dissolve on addition of dilute nitric acid, but dissolves on addition of ammonia TS.

**Melting point** \(<2.60\) 158 – 164°C (after drying).

**Purity** Ammonium—Dissolve 0.10 g of Benzethonium Chloride in 5 mL of water, and boil with 3 mL of sodium hydroxide TS: the evolving gas dose not change moistened red litmus paper to blue.

**Loss on drying** \(<2.41\) Not more than 5.0% (1 g, 105°C, 4 hours).

**Residue on ignition** \(<2.44\) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Benzethonium Chloride, previously dried, dissolve in 75 mL of water, add diluted dilute hydrochloric acid (1 in 2) dropwise to adjust the pH to 2.6–3.4, then add 1 drop of methyl orange TS, and titrate \(<2.50\) with 0.02 mol/L tetrabutylinylboron VS until the solution develops a red.

Each mL of 0.02 mol/L sodium tetrabutylinylboron VS = 8.962 mg of \(C_2H_2ClINO_2\).

**Containers and storage** Containers—Tight containers.

**Storage**—Light-resistant.

Benzethonium Chloride Solution
ベンゼトニウム塩化物液

Benzethonium Chloride Solution contains not less than 93.0% and not more than 107.0% of the labeled amount of benzethonium chloride \((C_{27}H_{42}ClNO_2: 448.08)\).

**Method of preparation** Dissolve Benzethonium Chloride in Water, Purified Water or Purified Water in Containers.

**Description** Benzethonium Chloride Solution is a clear, colorless liquid. It is odorless.

It foams strongly when shaken.

**Identification (1)** Evaporate a volume of Benzethonium Chloride Solution, equivalent to 0.2 g of Benzethonium Chloride according to the labeled amount, on a water bath to dryness, and proceed with the residue as directed in the Identification (1) under Benzethonium Chloride.

(2) To a volume of Benzethonium Chloride Solution, equivalent to 0.01 g of Benzethonium Chloride according to the labeled amount, add water to make 10 mL, proceed with 2 mL of this solution as directed in the Identification (2) under Benzethonium Chloride.

(3) To a volume of Benzethonium Chloride Solution, equivalent to 1 g of Benzethonium Chloride according to the labeled amount, and add water or concentrate on a water bath to make 10 mL. To 1 mL of this solution add 0.1 mol/L hydrochloric acid TS to make 500 mL, and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry \(<2.24\): it exhibits maxima between 262 nm and 264 nm, between 268 nm and 270 nm, and between 274 nm and 276 nm.

(4) To a volume of Benzethonium Chloride Solution, equivalent to 0.1 g of Benzethonium Chloride according to the labeled amount, add water, or concentrate on a water bath, if necessary, to make 10 mL, and proceed with 1 mL of this solution as directed in the Identification (4) under Benzethonium Chloride.

**Purity (1)** Nitrite—Add 1.0 mL of Benzethonium Chloride Solution to a mixture of 1 mL of a solution of glycine (1 in 10) and 0.5 mL of acetic acid (31): no gas is evolved.

(2) Oxidizing substances—To 5 mL of Benzethonium Chloride Solution add 0.5 mL of potassium iodide TS and 2 to 3 drops of dilute hydrochloric acid: no yellow color is produced.

**Assay** Pipet a volume of Benzethonium Chloride Solution, equivalent to about 0.2 g of benzethonium chloride \((C_{27}H_{42}ClNO_2)\), dilute with water to make 75 mL, if necessary, and proceed as directed in the Assay under Benzetho-
Benzoic Acid

**Description**
Benzoic Acid occurs as white crystals or crystalline powder. It is odorless, or has a faint, benzaldehyde-like odor.

It is freely soluble in ethanol (95), in acetone and in diethyl ether, soluble in hot water, and slightly soluble in water.

**Identification**
Dissolve 1 g of Benzoic Acid in 8 mL of sodium hydroxide TS, and add water to make 100 mL. This solution responds to the Qualitative Tests (1.09) (2) for benzoate.

**Melting point**
\(<2.60\) 121 – 124°C

**Purity**
(1) Heavy metals \(<1.07\)—Dissolve 1.0 g of Benzoic Acid in 25 mL of acetone, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 2 mL of dilute acetic acid, 25 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS).

(2) Chlorinated compounds—Take 0.5 g of Benzoic Acid and 0.7 g of calcium carbonate in a crucible, mix with a small amount of water, and dry. Ignite it at about 600°C, dissolve in 20 mL of dilute nitric acid, and filter. Wash the residue with 15 mL of water, combine the filtrate and the washing, add water to make 50 mL, and add 0.5 mL of silver nitrate TS: this solution has not more turbid than the following control solution.

Control solution: Dissolve 0.7 g of calcium carbonate in 20 mL of dilute nitric acid, and filter. Wash the residue with 15 mL of water, combine the filtrate and the washings, add 1.2 mL of 0.01 mol/L hydrochloric acid VS and water to make 50 mL, and add 0.5 mL of silver nitrate TS.

(3) Potassium permanganate-reducing substances—Add 0.02 mol/L potassium permanganate VS dropwise to a boiling mixture of 100 mL of water and 1.5 mL of sulfuric acid, until a red color persists for 30 seconds. Dissolve 1.0 g of Benzoic Acid in this boiling solution, and add 0.50 mL of 0.02 mol/L potassium permanganate VS: a red color persists for at least 15 seconds.

(4) Phthalic acid—To 0.10 g of Benzoic Acid add 1 mL of water and 1 mL of resorcinol-sulfuric acid TS, and heat the mixture in an oil bath heated at a temperature between 120°C and 125°C. After evaporating the water, heat the residue for 90 minutes, cool, and dissolve in 5 mL of water. To 1 mL of the solution add 10 mL of a solution of sodium hydroxide (43 in 500), shake, then examine under light at a wavelength between 470 nm and 490 nm: the green fluorescence of the solution is not more intense than that of the following control solution.

Control solution: Dissolve 61 mg of potassium hydrogen phthalate in water to make exactly 1000 mL. Measure exactly 1 mL of the solution, add 1 mL of resorcinol-sulfuric acid TS, and proceed as directed above.

(5) Readily carbonizable substances \(<1.15\)—Perform the test with 0.5 g of Benzoic Acid. The solution is not more colored than Matching Fluid Q.

**Loss on drying**
\(<2.41\) Not more than 0.5% (1 g, silica gel, 3 hours).

**Residue on ignition**
\(<2.44\) Not more than 0.05% (1 g).

**Assay**
Weigh accurately about 0.5 g of Benzoic Acid, previously dried, dissolve in 25 mL of neutralized ethanol and 25 mL of water, and titrate \(\leq 2.50\) with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS).

Each mL of 0.1 mol/L sodium hydroxide VS = 12.21 mg of C₇H₆O₂

**Containers and storage**
Containers—Well-closed containers. Storage—Light-resistant.

Benzy1 Alcohol

**Description**
Benzy1 Alcohol is a clear, colorless oily liquid.

It is miscible with ethanol (95), with fatty oils and with essential oils.

It is soluble in water.

Specific gravity \(d_{20}^{20}\): 1.043 – 1.049

**Identification**
Determine the infrared absorption spectrum of Benzy1 Alcohol as directed in the liquid film method under Infrared Spectrophotometry \(\leq 2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**RefRACTive index**
\(\leq 2.45\) \(n_{D}^{20}\): 1.538 – 1.541

**Purity**
(1) Clarity and color of solution—Dissolve 2.0
mL of Benzyl Alcohol in 60 mL of water: the solution is clear and colorless.

(2) Acidity—To 10 mL of Benzyl Alcohol add 10 mL of ethanol (95) and 2 drops of phenolphthalein TS, and add dropwise 0.1 mol/L sodium hydroxide VS until the solution acquires a light red color: the amount of 0.1 mol/L sodium hydroxide VS used is not more than 1.0 mL.

(3) Benzaldehyde and other related substances—Use Benzyl Alcohol as the sample solution. Separately, dissolve exactly 0.100 g of ethylbenzene in Benzyl Alcohol to make exactly 10 mL. Pipet 2 mL of this solution, add Benzyl Alcohol to make exactly 20 mL, and use this solution as the ethylbenzene stock solution. Separately, dissolve exactly 2.000 g of dicyclohexyl in Benzyl Alcohol to make exactly 10 mL. Pipet 2 mL of this solution, add exactly 2 mL of ethylbenzene stock solution and exactly 3 mL of dicyclohexyl stock solution, then add Benzyl Alcohol to make exactly 20 mL, and use this solution as the standard solution (1). Perform the test with exactly 0.1 mL of each of the sample solution and standard solution (1) as directed under Gas Chromatography \( <2.02 \) according to the following conditions, and when the peak having the retention time corresponding to ethylbenzene and dicyclohexyl appears on the chromatogram obtained with the sample solution, correct the peak areas of ethylbenzene and dicyclohexyl obtained with the standard solution (1) by deducting the relevant peak area obtained with the sample solution, the peak area of benzaldehyde obtained with the sample solution is not more than the difference between the peak areas of benzaldehyde of the sample solution and the standard solution (2) (0.0%)

relating to benzaldehyde and cyclohexylmethanol obtained with the sample solution is not more than 2 times the peak area or the corrected peak area of ethylbenzene with the standard solution (2) (0.02%). For these calculation the peak areas less than 1/100 times the peak area or the corrected peak area of ethylbenzene with the standard solution (2) are excluded.

Operating conditions—
Detector: A hydrogen flame-ionization detector.
Column: A fused silica column 0.32 mm in inside diameter and 30 m in length, coated inside with polyethylene glycol 20 M for gas chromatography in 0.5 \( \mu \)m thickness.

Column temperature: Inject at a constant temperature of about 50°C, raise the temperature at a rate of 5°C per minute to 220°C, and maintain at 220°C for 35 minutes.

Temperature of injection port: A constant temperature of about 200°C.

Temperature of detector: A constant temperature of about 310°C.

Carrier gas: Helium.
Flow rate: 25 cm/second.
Split ratio: Splitless.
Detection sensitivity: When 0.1 \( \mu \)L of the standard solution (1) is injected, adjust the sensitivity of the detector so that the height of the peak of ethylbenzene is not less than 30% of the full scale of the recorder. For Benzyl Alcohol labeled to use for injection, use the standard solution (2) instead of the standard solution (1).

System suitability—
System performance: When the procedure is run with the standard solution (1) under the above operating conditions, the retention time of benzyl alcohol is about 26 minutes, the relative retention times of ethylbenzene, dicyclohexyl, benzaldehyde and cyclohexylmethanol with respect to benzyl alcohol are about 0.28, about 0.59, about 0.68 and about 0.71, respectively, and the resolution between the peaks of benzaldehyde and cyclohexylmethanol is not less than 3.0. In the case of Benzyl Alcohol labeled to use for injection, proceed with the standard solution (2) instead of the standard solution (1).

(4) Peroxide value—Weigh accurately about 5 g of Benzyl Alcohol, and dissolve in 30 mL of a mixture of acetic acid (100) and chloroform (3:2) in a 250-mL glass-stoppered conical flask. Add 0.5 mL of saturated potassium iodide solution, shake for exactly 1 minute, add 30 mL of water, and titrate \( <2.50 \) with 0.01 mol/L sodium thiosulfate VS, adding the titrant slowly with continuous vigorous shaking, until the
blue color of the solution disappears after addition of 5 mL of starch TS near the end point where the solution is a pale yellow color. Perform a blank determination in the same manner. Calculate the amount of peroxide by the following formula: not more than 5. In the determination, the required amount of 0.01 mol/L sodium thiosulfate VS must not exceed 0.1 mL.

\[
\text{Amount (mEq/kg) of peroxide} = \frac{10 \times (V_1 - V_0)}{M}
\]

\(V_1\): Volume (mL) of 0.01 mol/L sodium thiosulfate VS consumed in the test

\(V_0\): Volume (mL) of 0.01 mol/L sodium thiosulfate VS consumed in the blank determination

\(M\): Amount (g) of the sample

(5) Residue on evaporation—Perform the test after confirmation that the sample meets the requirement of the peroxide value. Transfer 10.0 g of Benzyl Alcohol to a porcelain or quartz crucible or platinum dish, previously weighed accurately, and heat on a hot-plate at not exceeding 200°C, taking care to avoid boiling, to evaporate to dryness. Dry the residue on the hot-plate for 1 hour, and allow to cool in a desiccator: not more than 5 mg.

**Assay** Weigh accurately about 0.9 g of Benzyl Alcohol, add exactly 15 mL of a mixture of pyridine and acetic anhydride (7:1), and heat on a water bath under a reflux condenser with 2.50 mL of neutralized ethanol, and add 0.5 mL of 0.1 mol/L phenolphthalein TS. Perform a blank determination.

Each mL of 1 mol/L sodium hydroxide VS = 108.1 mg of C\(_7\)H\(_8\)O

*•Containers and storage* Containers—Tight containers.

Storage—Light-resistant.

**Benzyl Benzoate**

ベンジルベンゾート

\[\text{C}_{14}\text{H}_{12}\text{O}_2: 212.24}\n
Benzyl benzoate

[120-51-4]

Benzyl Benzoate contains not less than 99.0% of C\(_{14}\)H\(_{12}\)O\(_2\).

**Description** Benzyl Benzoate is a colorless, clear, viscous liquid. It has a faint, aromatic odor and a pungent, burning taste.

It is miscible with ethanol (95) and with diethyl ether. It is practically insoluble in water.

Congealing point: about 17°C

Specific gravity of \(\rho_20\): about 1.123

Boiling point: about 323°C

**Identification (1)** Heat gently 1 mL of Benzyl Benzoate with 5 mL of sodium carbonate TS and 2 mL of potassium permanganate TS: the odor of benzaldehyde is perceptible.

(2) Warm the titrated mixture obtained in the Assay on a water bath to remove ethanol, and add 0.5 mL of iron (III) chloride TS: a light yellow-red precipitate is produced, which turns white on the addition of dilute hydrochloric acid.

**Refractive index** \(\eta_\text{D}: 1.568 – 1.570\)

**Purity** Acidity—Dissolve 5.0 mL of Benzyl Benzoate in 25 mL of neutralized ethanol, and add 0.50 mL of 0.1 mol/L sodium hydroxide VS: a red color develops.

**Residue on ignition** Not more than 0.05% (2 g).

**Assay** Weigh accurately about 2 g of Benzyl Benzoate, add exactly 50 mL of 0.5 mol/L potassium hydroxide-ethanol VS, and boil gently for 1 hour under a reflux condenser with a carbon dioxide-absorbing tube (soda lime). Cool, and titrate 2.50 mL of the excess potassium hydroxide with 0.5 mol/L hydrochloric acid VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination.

Each mL of 0.5 mol/L potassium hydroxide-ethanol VS = 106.1 mg of C\(_7\)H\(_8\)O

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

**Benzylpenicillin Benzathine Hydrate**

ペンジルペニシリンベンザチン水和物

(Benzylpenicillin Benzathine Hydrate)

[C\(_{16}\)H\(_{19}\)N\(_2\)O\(_4\)S\(_2\).C\(_{16}\)H\(_{20}\)N\(_2\).4H\(_2\)O: 981.18](2S,5R,6R)-3,3-Dimethyl-7-oxo-6-[(phenylacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid hemi(N,N'-dibenzylethylenediamine) dihydrate

[41372-02-5]

Benzylpenicillin Benzathine Hydrate is the \(N,N'\)-dibenzylethylenediamine salt of a penicillin compound having antibacterial activity produced by the growth of *Penicillium* species.

It contains not less than 1213 Units and not more than 1333 Units per mg, calculated on the anhydrous basis. The potency of Benzylpenicillin Benzathine Hydrate is expressed as unit calculated from the amount of benzylpenicillin sodium (C\(_{16}\)H\(_{17}\)N\(_2\)NaO\(_4\)S: 356.37). 1 Unit of Benzylpenicillin Benzathine Hydrate is equivalent to 0.6 μg of benzylpenicillin sodium (C\(_{16}\)H\(_{17}\)N\(_2\)NaO\(_4\)S). It contains not less than 24.0% and not more than 27.0% of \(N,N'\)-dibenzylethylenediamine (C\(_{16}\)H\(_{30}\)N\(_2\): 240.34), calculated on the anhydrous basis.

**Description** Benzylpenicillin Benzathine Hydrate occurs as a white crystalline powder.

It is slightly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

**Identification (1)** Determine the absorption spectrum of a
solution of Benzylpenicillin Benzathine Hydrate in methanol (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Benzylpenicillin Benzathine Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> [α]D 20: +217 – +233° (0.1 g calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Benzylpenicillin Benzathine Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Benzylpenicillin Benzathine Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 70 mg of Benzylpenicillin Benzathine Hydrate in 25 mL of methanol, add a solution prepared by dissolving 1.02 g of disodium hydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in water to make 1000 mL to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase A to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak having the relative retention time of about 2.4 with respect to benzylpenicillin is not larger than 2 times the total area of the peaks of benzylpenicillin and N,N'-dibenzylethlenediamine obtained from the standard solution, and the area of the peak other than benzylpenicillin, N,N'-dibenzylethlenediamine and benzylpenicillin are eluted in this order with the resolution between these peaks being not less than 25.

**System suitability**—
Test for required detectability: To exactly 1 mL of the standard solution add the mobile phase A to make exactly 20 mL. Confirm that the peak area of benzylpenicillin obtained from 20 μL of this solution is equivalent to 3.5 to 6.5% of that from the standard solution.

**System performance:** When the procedure is run with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of benzylpenicillin is not more than 2.0%.

**Water** <2.48> 5.0–8.0% (1 g, volumetric titration, direct titration).

**Assay** (1) Benzylpenicillin—Weigh accurately an amount of Benzylpenicillin Benzathine Hydrate, equivalent to about 85,000 Units, dissolve in 25 mL of methanol, and add a solution containing 1.02 g of disodium hydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in 1000 mL of water to make exactly 50 mL. Pipet 5 mL of this solution, add a mixture of the solution containing 1.02 g of disodium hydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in 1000 mL of water and methanol (1:1) to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Benzylpenicillin Potassium RS, equivalent to about 85,000 Units, and about 25 mg of N,N'-dibenzylethlenediamine diacetate, dissolve in 25 mL of methanol, and add the solution containing 1.02 g of disodium hydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in 1000 mL of water to make exactly 50 mL. Pipet 5 mL of this solution, add a mixture of the solution containing 1.02 g of disodium hydrogen phosphate and 6.80 g of potassium dihydrogen phosphate in 1000 mL of water and methanol (1:1) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A1 and A5, of benzylpenicillin.

Amount (unit) of benzylpenicillin sodium (C_{16}H_{17}N_{2}NaO_{4}S) = M_{5} \times A_{1}/A_{5}

M_{5}: Amount (unit) of Benzylpenicillin Potassium RS

**Operating conditions—**
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

<table>
<thead>

Flow rate: 1.0 mL/min
Time span of measurement: About 3 times as long as the retention time of benzylpenicillin beginning after the solvent peak.

**Operating conditions—**
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (5 μm in particle diameter).

Mobile phase: A mixture of water, methanol and 0.25 mol/L potassium dihydrogen phosphate TS, pH 3.5 (11:7:2).

Flow rate: Adjust the flow rate so that the retention time of benzylpenicillin is about 18 minutes.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, N,N'-dibenzylethlenediamine and benzylpenicillin are eluted in this order with the resolution between these peaks being not less than 20.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviations of the peak areas of N,N'-dibenzylethlenediamine and benzylpenicillin are not more than 2.0%, respectively.

(2) N,N'-Dibenzylethlenediamine—Determine the areas, \( A_1 \) and \( A_2 \), of the peak corresponding to N,N'-dibenzylethlenediamine on the chromatograms obtained in (1) with the sample solution and standard solution.

\[
\text{Amount (%)} \text{ of N,N'-dibenzylethlenediamine (C}_{16}\text{H}_{20}\text{N}_{2}\text{N}_{2}) = \frac{M_2}{M_1} \times \frac{A_1}{A_2} \times 100 \times 0.667
\]

\( M_1 \): Amount (mg) of N,N'-dibenzylethlenediamine diacetate

\( M_2 \): Amount (mg) of the sample

0.667: Conversion factor for the molecular mass of N,N'-dibenzylethlenediamine diacetate (C_{16}H_{20}N_{2}2CH_{3}COOH) to that of N,N'-dibenzylethlenediamine (benzathine, C_{16}H_{20}N_{2}N_{2})

Containers and storage—Containers—Tight containers.

Storage—Light-resistant.

**Benzylpenicillin Potassium**

**Penicillin G Potassium**

ベンジルペニシリンカリウム

\[ \text{C}_{16}\text{H}_{17}\text{KN}_{2}\text{O}_{4}\text{S} : 372.48 \]

Monopotassium (2S,5R,6R)-3,3-dimethyl-7-oxo-6-[[phenylacetyl]amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate [113-98-4]

Benzylpenicillin Potassium is the potassium salt of a penicillin substance having antibacterial activity produced by the growth of *Penicillium* species.

It contains not less than 1430 units and not more than 1630 units per mg, calculated on the dried basis. The potency of Benzylpenicillin Potassium is expressed as mass unit of benzylpenicillin potassium (C_{16}H_{17}KN_{2}O_{4}S). One unit of Benzylpenicillin Potassium is equivalent to 0.57 μg of benzylpenicillin potassium.

**Description**

Benzylpenicillin Potassium occurs as white, crystals or crystalline powder.

It is very soluble in water, and slightly soluble in ethanol (99.5).

**Identification**

(1) Determine the absorption spectrum of a solution of Benzylpenicillin Potassium (1 in 1000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Benzylpenicillin Potassium RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Benzylpenicillin Potassium as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum or the spectrum of Benzylpenicillin Potassium RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Benzylpenicillin Potassium responds to the Qualitative Tests \(<1.09\rangle\) (1) for potassium salt.

**Optical rotation** \(<2.49\rangle\ [α]_{D}^{27}: +270 – +300°\ (1.0 g calculated on the dried basis, water, 50 mL, 100 mm).

**pH** \(<2.54\rangle\ The pH of a solution obtained by dissolving 1.0 g of Benzylpenicillin Potassium in 100 mL of water is between 5.0 and 7.5.

**Purity**

(1) Clarity and color of solution—A solution obtained by dissolving 1 g of Benzylpenicillin Potassium in 10 mL of water is clear, and colorless or light yellow.

(2) Heavy metals \(<1.07\rangle\—Proceed with 2.0 g of Benzylpenicillin Potassium according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic \(<1.17\rangle\—Prepare the test solution by incinerating 1.0 g of Benzylpenicillin Potassium according to Method 4, and perform the test. In the incineration, use a crucible of porcelain, and after addition of 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) add 1 mL of hydrogen peroxide (30), then burn the ethanol (not more than 2 ppm).

(4) Related substances—Dissolve 40 mg of Benzylpenicillin Potassium in 20 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\rangle\ according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than benzylpenicillin obtained from the sample solution is not larger than the peak area of benzylpenicillin from the standard solution, and the total area of the peaks other than benzylpenicillin from the sample solution is not larger than 3 times the peak area of benzylpenicillin from the standard solution.

**Operating conditions—**
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of a solution of diammonium hydrogen phosphate (33 in 5000) and acetonitrile (19:6), adjusted the pH to 8.0 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of benzylpenicillin is about 7.5 minutes.

Time span of measurement: About 5 times as long as the retention time of benzylpenicillin.

**System suitability**—

Test for required detection: Pipet 10 mL of the standard solution, and add water to make exactly 100 mL. Confirm that the peak area of benzylpenicillin obtained from 20 μL of this solution is equivalent to 7 to 13% of that from 20 μL of the standard solution.

System performance: Dissolve 40 mg of Benzylpenicillin Potassium in 20 mL of water. Separately, dissolve 10 mg of methyl parahydroxybenzoate in 20 mL of acetonitrile. To 1 mL of this solution add water to make 20 mL. Mix 1 mL of each of these solutions, and add water to make 100 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, benzylpenicillin and methyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 5 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of benzylpenicillin is not more than 2.0%.

**Loss on drying** (2.41) Not more than 1.0% (3 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics (4.02) according to the following conditions.

(i) Test organism—Staphylococcus aureus ATCC 6538 P
(ii) Culture medium—Use the medium iii in 3) under (1) Agar media for seed and base layer.
(iii) Standard solutions—Weigh accurately an amount of Benzylpenicillin Potassium RS, equivalent to about 107.0 Units of Benzylpenicillin Potassium for Injection, equivalent to 1.0 × 10^6 Units of Benzylpenicillin Potassium according to the labeled amount, in 10 mL of water is 5.0 to 7.5.

**Purity** Clarity and color of solution—A solution prepared by dissolving an amount of Benzylpenicillin Potassium for Injection, equivalent to 1.0 × 10^6 Units of Benzylpenicillin Potassium according to the labeled amount, in 10 mL of water is clear. Perform the test with this solution as directed under Ultraviolet-visible Spectrophotometry (2.24): the absorbance at 400 nm is not more than 0.10.

**Bacterial endotoxins** (4.01) Less than 1.25 × 10^-4 EU/Unit.

**Uniformity of dosage units** (6.02) It meets the requirement of the Mass variation test.

**Foreign insoluble matter** (6.06) Perform the test according to Method 2: it meets the requirement.

**Insoluble particulate matter** (6.07) It meets the requirement.

**Sterility** (4.06) Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Weigh accurately the mass of the contents of not less than 10 containers of Benzylpenicillin Potassium for Injection. Weigh accurately an amount of a portion of the contents, equivalent to about 6 × 10^4 Units of Benzylpenicillin Potassium, dissolve in water to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Benzylpenicillin Potassium RS, equivalent to about 6 × 10^4 Units, dissolve in water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions. Determine the peak area of benzylpenicillin, A_1 and A_2, from Benzylpenicillin Potassium for Injection

注射用ベンジルペニシリンカリウム

Benzylpenicillin Potassium for Injection is a preparation for injection which is dissolved before use.

It contains not less than 93.0% and not more than 107.0% of the labeled amount of benzylpenicillin potassium (C_{16}H_{17}KN_2O_4S: 372.48).

**Method of preparation** Prepare as directed under Injections, with Benzylpenicillin Potassium.

**Description** Benzylpenicillin Potassium for Injection occurs as white crystals or crystalline powder.

**Identification** Proceed as directed in the Identification (2) under Benzylpenicillin Potassium.

**Osmotic pressure ratio** Being specified separately.

**pH** (2.54) The pH of a solution prepared by dissolving an amount of Benzylpenicillin Potassium for Injection, equivalent to 1.0 × 10^6 Units of Benzylpenicillin Potassium according to the labeled amount, in 10 mL of water is 5.0 to 7.5.

**Foreign insoluble matter** (6.07) It meets the requirement.

**Insoluble particulate matter** (6.07) It meets the requirement.

**Sterility** (4.06) Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Weigh accurately the mass of the contents of not less than 10 containers of Benzylpenicillin Potassium for Injection. Weigh accurately an amount of a portion of the contents, equivalent to about 6 × 10^4 Units of Benzylpenicillin Potassium, dissolve in water to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Benzylpenicillin Potassium RS, equivalent to about 6 × 10^4 Units, dissolve in water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions. Determine the peak area of benzylpenicillin, A_1 and A_2, from
Beraprost Sodium

ベラプロストナトリウム

- C₂₃H₂₉NaO₅: 420.47
- Monosodium (1RS,2RS,3aSR,8bSR)-2,3,3a,8b-tetrahydro-2-hydroxy-1-[(1E,3SR,4RS)-3-hydroxy-4-methyloct-1-en-6-yn-1-yl]-1H-cyclopenta[b]benzofuran-5-butanoate
- Monosodium (1RS,2RS,3aSR,8bSR)-2,3,3a,8b-tetrahydro-2-hydroxy-1-[(1E,3SR,4RS)-3-hydroxy-4-methyloct-1-en-6-yn-1-yl]-1H-cyclopenta[b]benzofuran-5-butanoate (88475-69-8)

Beraprost Sodium, when dried, contains not less than 98.5% and not more than 101.0% of C₂₃H₂₉NaO₅.

**Description** Beraprost Sodium occurs as a white powder.

It is very soluble in methanol, and freely soluble in water and in ethanol (99.5).

It is hygroscopic.

A solution of Beraprost Sodium (1 in 200) shows no optical rotation.

**Identification** (1) Determine the absorption spectrum of a solution of Beraprost Sodium in methanol (3 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of previously dried Beraprost Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Beraprost Sodium in methanol (1 in 1000) responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Purity** (1) Related substances—Dissolve 20 mg of Beraprost Sodium in 2 mL of methanol, and use this solution as the sample solution. Perform the test with 15 µL of the sample solution as directed under Liquid Chromatography <2.01>, and compare the sample solution with the Reference Solution: the amount of the peak, other than the two peaks of beraprost and the peaks mentioned above, is not exceeding 0.1%, and the total amount of the peaks, other than the two peaks of beraprost, is not more than 1.5%.

**Operating conditions**—

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 µm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase A: A mixture of methanol and acetic acid (100) (640:330:30:1).

Mobile phase B: A mixture of acetonitrile, water and acetic acid (100) (900:100:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Flow rate: Adjust the flow rate so that the retention time of the second peak of beraprost is about 23 minutes.

Each solution.

Amount (unit) of Benzylpenicillin Potassium (C₁₆H₁₇KN₂O₄S) = Mₛ × A₁/ₐₛ

Mₛ: Amount (unit) of Benzylpenicillin Potassium RS

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To a mixture of diammonium hydrogen phosphate solution (33 in 5000) and acetonitril (19:6), add phosphoric acid to adjust the pH of this solution to 8.0.

Flow rate: Adjust the flow rate so that the retention time of benzylpenicillin is about 7.5 minutes.

System suitability—

System performance: When the procedure is run with 5 theoretical plates and the symmetry factor of the peak of benzylpenicillin are not less than 6000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 5 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of benzylpenicillin is not more than 1.0%.

**Containers and storage** Containers—Hermetic containers.

**Purity (2)** Related substances—Dissolve 20 mg of Beraprost Sodium in 2 mL of methanol, and use this solution as the sample solution. Perform the test with 15 µL of the sample solution as directed under Liquid Chromatography <2.01>, and compare the sample solution with the Reference Solution: the amount of the peak, other than the two peaks of beraprost and the adjacent two peaks having the relative retention time of about 2.0 are not more than 0.3%, respectively, the amount of the peak having the relative retention time of about 1.7 and another adjacent two peaks having the relative retention time of about 2.0 are not more than 0.2%, respectively, the amount of the peak having the relative retention time of about 1.2 is not more than 0.3%, the amount of the peak, other than the two peaks of beraprost and the peaks mentioned above, is not exceeding 0.1%, and the total amount of the peaks, other than the two peaks of beraprost, is not more than 1.5%.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To a mixture of diammonium hydrogen phosphate solution (33 in 5000) and acetonitril (19:6), add phosphoric acid to adjust the pH of this solution to 8.0.

Flow rate: Adjust the flow rate so that the retention time of benzylpenicillin is about 7.5 minutes.
Time span of measurement: For 80 minutes after injection, beginning after the solvent peak.

**System suitability**—
Test for required detectability: To 1 mL of the sample solution add methanol to make 20 mL. To 1 mL of this solution add methanol to make 20 mL, and use this solution as the solution for system suitability test. Pipet 2 mL of the solution for system suitability test, and add methanol to make exactly 10 mL. Confirm that the total area of the two peaks of beraprost obtained with 15 µL of this solution is equivalent to 14 to 26% of that with 15 µL of the solution for system suitability test.

System performance: When the procedure is run with 15 µL of the solution for system suitability test under the above operating conditions, the resolution between the two peaks of beraprost is not less than 1.5.

System repeatability: When the test is repeated 6 times with 15 µL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the total area of the two peaks of beraprost is not more than 2.0%.

(2) Residual solvent—Being specified separately.

**Loss on drying** <2.41> Not more than 3.0% (0.5 g, reduced pressure not exceeding 0.67 kPa, silica gel, 60°C, 5 hours).

**Isomer ratio** Dissolve 10 mg of Beraprost Sodium in 5 mL of methanol, and use this solution as the sample solution. Perform the test with 15 µL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the areas, A1 of the peak which appears at the retention time about 25 minutes, and A2 of the peak which appears at about 27 minutes: A1/A2 is between 0.90 and 1.10.

**Operating conditions**—
Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: A mixture of methanol, water and acetic acid (100:600:400:1).
Flow rate: Adjust the flow rate so that the retention time of the second eluting peak of beraprost is about 27 minutes.

**System suitability**—
System performance: When the procedure is run with 15 µL of the sample solution under the above operating conditions, the resolution between the two peaks of beraprost is not less than 1.2.
System repeatability: When the test is repeated 6 times with 15 µL of the sample solution under the above operating conditions, the relative standard deviation of the total area of the two peaks of beraprost is not more than 2.0%.

**Assay** Weigh accurately about 0.1 g of Beraprost Sodium, previously dried, dissolve in 30 mL of diluted ethanol with freshly boiled and cooled water (7 in 10), add exactly 2 mL of 0.2 mol/L hydrochloric acid TS, and titrate <2.50> with 0.025 mol/L sodium hydroxide-ethanol VS from the first equivalence point to the second equivalence point (potentiometric titration). Each mL of 0.025 mol/L sodium hydroxide-ethanol VS = 10.51 mg of C24H29NaO5.

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

### Beraprost Sodium Tablets

Beraprost Sodium Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of beraprost sodium (C24H29NaO5: 420.47).

**Method of preparation** Prepare as directed under Tablets, with Beraprost Sodium.

**Identification** Powder Beraprost Sodium Tablets. To a portion of the powder, equivalent to 0.2 mg of Beraprost Sodium according to the labeled amount, add 10 mL of water, shake, and filter through a membrane filter with a pore size not exceeding 0.45 µm. To the filtrate add 1 mL of 0.1 mol/L hydrochloric acid TS, extract with two 50-mL portions of ethyl acetate, combine the extracts, and evaporate in reduced pressure at 40°C. Dissolve the residue in 1 mL of methanol, use this solution as the sample solution. Separately, dissolve 1 mg of beraprost sodium in 5 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 10 µL of each sample solution and standard solution on a plate of silica gel for thin-layer chromatography, develop the plate with the upper layer of a mixture of 11 volumes of ethyl acetate, 10 volumes of water, 4 volumes of isooctane and 2 volumes of acetic acid (100) to a distance of about 10 cm, air-dry the plate, and heat at 120°C for 30 minutes. After cooling, spray evenly a mixture of ethanol (99.5), water, sulfuric acid and 4-methoxybenzaldehyde (17:2:1:1) on the plate, and heat at 120°C for 3 minutes: the principal spot obtained from the sample solution and the spot from the standard solution show the same RF value.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Beraprost Sodium Tablets add exactly V mL of the internal standard solution so that each mL contains about 2 µg of beraprost sodium (C24H29NaO5), shake at 30°C for 30 minutes, filter through a membrane filter with a pore size not exceeding 0.45 µm, and use the filtrate as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of beraprost sodium (C24H29NaO5) = M3 × Q2/Q1 × V/10,000

M3: Amount (mg) of beraprost sodium for assay

**Internal standard solution**—A mixture of water and 4-isopropylphenol in methanol (1 in 250,000) (1:1).

**Dissolution** <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Beraprost Sodium Tablets is not less than 85%.
Start the test with 1 tablet of Beraprost Sodium Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V' mL so that each mL contains about 22 ng of beraprost sodium (C₂₄H₂₉NaO₅) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of beraprost sodium for assay, previously dried in reduced pressure not exceeding 0.67 kPa at 60°C for 5 hours using silica gel as a desiccant, and dissolve in methanol to make exactly 100 mL. Pipet 2 mL of this solution, and add water to make exactly 200 mL. Pipet 2 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 200 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the total areas, A₁ and A₃, of the two peaks of beraprost of both solutions.

Dissolution rate (%) with respect to the labeled amount of beraprost sodium (C₂₄H₂₉NaO₅)  
\[ \text{Dissolution rate} = \frac{M_S}{M_i} \times \frac{A_t}{A_s} \times \frac{V'}{V} \times \frac{1}{C} \times 9/100 \]

Where:
- \( M_S \): Amount (mg) of beraprost sodium for assay
- \( M_i \): Labeled amount (mg) of beraprost sodium (C₂₄H₂₉NaO₅) in 1 tablet

**Operating conditions**
- Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
- Column temperature: A constant temperature of about 40°C.
- Mobile phase: A mixture of methanol, water and acetic acid (100) (650:350:1).
- Flow rate: Adjust the flow rate so that the retention time of the first eluting peak of beraprost is about 15 minutes.

**System suitability**
- System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the internal standard and beraprost are eluted in this order and the resolution between the internal standard peak and the first eluting peak of beraprost is not less than 11, and the resolution between the two peaks of beraprost is not less than 1.5.
- System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the total area of the two peaks of beraprost to the peak area of the internal standard is not more than 2.0%.

**Containers and storage** Containers—Well-closed containers.

**Berberine Chloride Hydrate**

ベルベリン塩化物水和物

\[ \text{C}_9\text{H}_8\text{ClNO}_4\cdot\text{xH}_2\text{O} \]

9,10-Dimethoxy-5,6-dihydro[1,3]dioxolo[4,5-g]isoquinol[3,2-a]isoquinolin-7-ium chloride hydrate [633-65-8, anhydride]

Berberine Chloride Hydrate contains not less than 95.0% and not more than 102.0% of berberine chloride (C₉H₈ClNO₄ 371.81), calculated on the anhydrous basis.

**Description** Berberine Chloride Hydrate occurs as yellow crystals or crystalline powder. It is odorless or has a faint,
characteristic odor. It has a very bitter taste.

It is sparingly soluble in methanol, slightly soluble in ethanol (95), and very slightly soluble in water.

Identification (1) Determine the absorption spectrum of a solution of Berberine Chloride Hydrate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Berberine Chloride RS prepared in the same manner as the sample solution; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Berberine Chloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Berberine Chloride RS; both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 0.1 g of Berberine Chloride Hydrate in 20 mL of water by warming, add 0.5 mL of nitric acid, cool, and filter after allowing to stand for 10 minutes. To 3 mL of the filtrate add 1 mL of silver nitrate TS, and collect the produced precipitate: the precipitate does not dissolve in dilute nitric acid, but it dissolves in an excess amount of ammonia TS.

Purity (1) Acidity—Shake thoroughly 0.10 g of Berberine Chloride Hydrate with 30 mL of water, and filter. To the filtrate add 2 drops of phenolphthalein TS and 0.10 mL of 0.1 mol/L sodium hydroxide VS: the yellow color changes to an orange to red color.

(2) Sulfate <1.14>—Shake 1.0 g of Berberine Chloride Hydrate with 48 mL of water and 2 mL of dilute hydrochloric acid for 1 minute, and filter. Discard the first 5 mL of the filtrate, take the subsequent 25 mL of the filtrate, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS, 1 mL of dilute hydrochloric acid, 5 to 10 drops of bromophenol blue TS and water to make 50 mL (not more than 0.04%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Berberine Chloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(4) Related substances—Dissolve 10 mg of Berberine Chloride Hydrate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 4 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total of the peak of the areas other than berberine of the sample solution is not larger than the peak area of berberine of the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 345 nm).
Column: A stainless steel column about 4 mm in inside diameter and about 25 cm in length, packed with octadecyl-silanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 3.4 g of monobasic potassium phosphate and 1.7 g of sodium lauryl sulfate in 1000 mL of a mixture of water and acetonitrile (1:1).
Flow rate: Adjust the flow rate so that the retention time of berberine is about 10 minutes.
Selection of column: Dissolve each 1 mg of berberine chloride and palmatin chloride in the mobile phase to make 10 mL. Proceed with 10 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of palmatin and berberine in this order with the resolution between these peaks being not less than 1.5.
System repeatability: When the test is repeated 5 times with the standard solution under the above operating conditions, the relative standard deviation of the peak areas of berberine is not more than 1.5%.

Containers and storage—Containers—Tight containers.
Storage—Light-resistant.

**Berberine Tannate**

**タンニン酸ベルベリン**

Berberine Tannate is a compound of berberine and tannic acid.

It contains not less than 27.0% and not more than 33.0% of berberine (C_{20}H_{19}NO_{5}: 353.37), calculated on the anhydrous basis.

**Description** Berberine Tannate occurs as a yellow to light...
yellow-brown powder. It is odorless or has a faint, characteristic odor, and is tasteless.

It is practically insoluble in water, in acetonitrile, in methanol and in ethanol (95).

**Identification (1)** To 0.1 g of Berberine Tannate add 10 mL of ethanol (95), and heat in a water bath for 3 minutes with shaking. Cool, filter, and to 5 mL of the filtrate add 1 drop of iron (III) chloride TS: a blue-green color is produced, and on allowing to stand, a bluish black precipitate is formed.

(2) Dissolve 0.01 g of Berberine Tannate in 10 mL of methanol and 0.4 mL of 1 mol/L hydrochloric acid TS, and add water to make 200 mL. To 8 mL of the solution add water to make 25 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.4>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Berberine Tannate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity (1)** Acidity—To 0.10 g of Berberine Tannate add 30 mL of water, and filter after shaking well. To the filtrate add 2 drops of phenolphthalein TS and 0.10 mL of 0.1 mol/L sodium hydroxide VS: the color of the solution changes from yellow to orange to red.

(2) Chloride <1.03>—Shake 1.0 g of Berberine Tannate with 38 mL of water and 12 mL of dilute nitric acid for 5 minutes, and filter. Discard the first 5 mL of the filtrate, to 25 mL of the subsequent filtrate add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.01 mol/L hydrochloric acid VS by adding 6 mL of dilute nitric acid, 10 to 15 drops of bromophenol blue TS and water to make 50 mL (not more than 0.035%).

(3) Sulfate <1.14>—Shake 1.0 g of Berberine Tannate with 48 mL of water and 2 mL of dilute hydrochloric acid for 1 minute, and filter. Discard the first 5 mL of the filtrate, take the subsequent 25 mL of the filtrate, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS, 1 mL of dilute hydrochloric acid, 5 to 10 drops of bromophenol blue TS and water to make 50 mL (not more than 0.048%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of Berberine Tannate according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(5) Related substances—Dissolve 10 mg of Berberine Tannate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 4 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total of the peak areas other than berberine of the sample solution is not larger than the peak area of berberine of the standard solution.

**Operating conditions—**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of berberine beginning after the solvent peak.

**System suitability—**

Test for required detectability: To exactly 2 mL of the standard solution add the mobile phase to make exactly 20 mL. Confirm that the peak area of berberine obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of berberine is not more than 3.0%.

**Water <2.48>** Not more than 6.0% (0.7 g, direct titration).

**Residue on ignition <2.44>** Not more than 1.0% (1 g).

**Assay** Weigh accurately about 30 mg of Berberine Tannate, dissolve in the mobile phase to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Berberine Chloride RS (separately, determine the water content <2.48> in the same manner as Berberine Chloride Hydrate), dissolve in the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine the peak areas, A₁ and A₂, of berberine in each solution.

\[
\text{Amount (mg) of berberine} (C_{20}H_{18}NO_3) = M_s \times \frac{A_1}{A_2} \times 0.950
\]

M₅: Amount (mg) of Berberine Chloride RS, calculated on the dehydrated basis.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 345 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 3.4 g of potassium dihydrogen phosphate and 1.7 g of sodium lauryl sulfate in 1000 mL of a mixture of water and acetonitrile (1:1).

Flow rate: Adjust the flow rate so that the retention time of berberine is about 10 minutes.

**System suitability—**

System performance: Dissolve 1 mg each of berberine chloride and palmatin chloride in the mobile phase to make 10 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, palmatin and berberine are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak
area of berberine is not more than 1.5%.

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Betahistine Mesilate**

ベタヒスチンメシル酸塩

\[
\text{C}_8\text{H}_{12}\text{N}_2\cdot 2\text{C}_2\text{H}_4\text{O}_3\text{S} : 328.41
\]

\[\text{N-Methyl-2-pyridin-2-ylethylamine dimethanesulfonate} \]

[5638-76-6, Betahistine]

Betahistine Mesilate, when dried, contains not less than 98.0% and not more than 101.0% of \( \text{C}_8\text{H}_{12}\text{N}_2\cdot 2\text{C}_2\text{H}_4\text{O}_3\text{S} \).

**Description** Betahistine Mesilate occurs as white crystals or crystalline powder.

- It is very soluble in water, freely soluble in acetic acid (100), and sparingly soluble in ethanol (99.5).
- It dissolves in dilute hydrochloric acid.
- It is hygroscopic.

**Identification (1)** Determine the absorption spectrum of a solution of Betahistine Mesilate in 0.1 mol/L hydrochloric acid (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**(2)** Determine the infrared absorption spectrum of Betahistine Mesilate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** (2.60) 110–114°C (after drying).

**Purity (1)** Heavy metals (1.07)—Proceed with 1.0 g of Betahistine Mesilate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**(2)** Related substances—Dissolve 50 mg of Betahistine Mesilate in 10 mL of a mixture of water and acetonitrile (63:37), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mixture of water and acetonitrile (63:37) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography (2.07) according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than betahistine with the sample solution is not larger than 1/10 times the peak area of betahistine with the standard solution, and the total area of the peaks other than the peak of betahistine with the sample solution is not larger than 1/2 times the peak area of betahistine with the standard solution.

**Operating conditions**—

- Detector: An ultraviolet absorption photometer (wavelength: 261 nm).
- Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (5 μm in particle diameter).
- Column temperature: A constant temperature of about 35°C.
- Mobile phase: To 5 mL of diethyl amine and 20 mL of acetic acid (100) add water to make 1000 mL. Dissolve 2.3 g of sodium lauryl sulfate in 630 mL of this solution, and add 370 mL of acetonitrile.
- Flow rate: Adjust the flow rate so that the retention time of betahistine is about 5 minutes.
- Time span of measurement: About 3 times as long as the retention time of betahistine, beginning after the solvent peak.

**System suitability**—

Test for required detectability: To exactly 5 mL of the standard solution add the mixture of water and acetonitrile (63:37) to make exactly 50 mL. Confirm that the peak area of betahistine obtained with 20 \( \mu \)L of this solution is equivalent to 7 to 13% of that with 20 \( \mu \)L of the standard solution.

System performance: Dissolve 10 mg of betahistine mesilate and 10 mg of 2-vinylpyridine in 50 mL of the mixture of water and acetonitrile (63:37). To 2 mL of this solution add the mixture of water and acetonitrile (63:37) to make 50 mL. When the procedure is run with 20 \( \mu \)L of this solution under the above operating conditions, 2-vinylpyridine and betahistine are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 20 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betahistine is not more than 1.0%.

**Loss on drying** (2.41) Not more than 1.0% (1 g, in vacuum, phosphorus (V) oxide, 70°C, 24 hours).

**Residue on ignition** (2.42) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Betahistine Mesilate, previously dried, dissolve in 1 mL of acetic acid (100), add 50 mL of acetic anhydride, and titrate (2.50) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 16.42 mg of \( \text{C}_8\text{H}_{12}\text{N}_2\cdot 2\text{C}_2\text{H}_4\text{O}_3\text{S} \).

**Containers and storage** Containers—Tight containers.

**Betahistine Mesilate Tablets**

ベタヒスチンメシル酸塩錠

Betahistine Mesilate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of betahistine mesilate (\( \text{C}_8\text{H}_{12}\text{N}_2\cdot 2\text{C}_2\text{H}_4\text{O}_3\text{S} : 328.41 \)).

**Method of preparation** Prepare as directed under Tablets, with Betahistine Mesilate.
Uniformity of dosage units

Content uniformity test.

To perform the test according to the following method: it meets the requirement of the official monograph regardless of the labeled amount, and use this solution as the sample solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry. With a detector and reference cell, measure the absorbance at the specified wavelength within the specified range, and determine the peak areas. When the procedure is run with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betahistine obtained with 20 μL of the standard solution and the total area of the peaks other than betahistine is not larger than 3/5 times the peak area of betahistine from the standard solution.

System suitability

- Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the Assay.
- Time span of measurement: About 8 times as long as the retention time of betahistine beginning after the solvent peak.
- System performance: Dissolve 10 mg of betahistine mesilate and 10 mg of 2-vinylpyridine in 50 mL of the mixture of water and acetonitrile (63:37). To 2 mL of this solution add the mixture of water and acetonitrile (63:37) to make exactly 50 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, 2-vinylpyridine and betahistine are eluted in this order with the resolution between these peaks being not less than 5.
- System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betahistine is not more than 1.0%.

Uniformity of dosage units (6.02) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Betahistine Mesilate Tablets add exactly V mL of 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Confirm that the peak area of betahistine obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.

Dissolution (6.10) When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Betahistine Mesilate Tablets is not less than 85%.

Start the test with 1 tablet of Betahistine Mesilate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 6.7 μg of betahistine mesilate (C8H12N2.2CH4O3S) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 17 mg of betahistine mesilate for assay, previously dried under reduced pressure with phosphorous (V) oxide at 70°C for 24 hours, and dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography. With a detector and reference cell, measure the absorbance at the specified wavelength within the specified range, and determine the peak areas, A1 and A3, of betahistine.

Dissolution rate (%) with respect to the labeled amount of betahistine mesilate (C8H12N2.2CH4O3S) = M5 × A1/A3 × V/V × 1/C × 36

M5: Amount (mg) of betahistine mesilate for assay

C: Labeled amount (mg) of betahistine mesilate (C8H12N2.2CH4O3S) in 1 tablet

Operating conditions—

Proceed as directed in the Assay.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of betahistine are not less than 2000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betahistine is not more than 2.0%.

Assay Weigh accurately the mass of not less than 20 Beta-histine Mesilate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 20 mg of betahistine mesilate (C8H12N2.2CH4O3S), add 40 mL of 0.1 mol/L hydrochloric acid TS, agitate for 10 minutes with the aid of ultrasonic waves, and add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 0.1 g of betahistine mesilate for assay, previously dried under reduced pressure with phosphorous (V) oxide at 70°C for 24 hours, and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Pipet 10 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography, according to the following conditions, and determine the peak areas, A1 and A3, of betahistine.
Amount (mg) of betahistine mesilate \((C_{22}H_{29}FO_5\)S) = \(M_s \times A_1/A_s \times 1/5\)

\(M_s\): Amount (mg) of betahistine mesilate for assay

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 261 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: To 5 mL of diethylamine and 20 mL of acetic acid (100) add water to make 1000 mL. In 630 mL of this solution dissolve 2.3 g of sodium lauryl sulfate, and add 370 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the detention time of betahistine is about 5 minutes.

System suitability—

System performance: When the procedure is run with 5 \(\mu\)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of betahistine are not less than 2000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 5 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betahistine is not more than 1.0%.

Containers and storage Containers—Tight containers.

Betamethasone

ベタメタゾン

\(C_{22}H_{29}FO_5: 392.46\)

9-Fluoro-11\(\beta\),17,21-trihydroxy-16\(\beta\)-methylpregna-1,4-diene-3,20-dione

\([378-44-9]\)

Betamethasone, when dried, contains not less than 96.0% and not more than 103.0% of \(C_{22}H_{29}FO_5\).

Description Betamethasone occurs as a white to pale yellowish white, crystalline powder.

It is sparingly soluble in methanol, in ethanol (95) and in acetone, and practically insoluble in water.

Melting point: about 240°C (with decomposition).

Identification (1) Proceed 10 mg of Betamethasone as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbing liquid, and prepare the test solution: the test solution so obtained responds to the Qualitative Tests <1.09> for fluoride.

(2) Dissolve 1.0 mg of Betamethasone in 10 mL of ethanol (95). Mix 2.0 mL of the solution with 10 mL of phenylhydrazinium hydrochloride TS, heat in a water bath at 60°C for 20 minutes, and cool the solution. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using as the blank the solution prepared with 2.0 mL of ethanol (95) in the same manner as the former solution, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Betamethasone RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Betamethasone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Betamethasone RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Betamethasone and Betamethasone RS in acetone, respectively, then evaporate the acetone to dryness, and repeat the test on the residues.

Optical rotation <2.49> \([\alpha]_D^{20}: +118 +/ - 126°\) (after drying, 0.1 g, methanol, 20 mL, 100 mm).

Purity (1) Heavy metals <1.07>—Proceed with 0.5 g of Betamethasone according to Method 2, and perform the test. Prepare the control solution with 1.5 mL of Standard Lead Solution (not more than 30 ppm).

(2) Related substances—Dissolve 10 mg of Betamethasone in 5 mL of a mixture of chloroform and methanol (9:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (9:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, diethyl ether, methanol and water (385:75:40:6) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 4 hours).

Residue on ignition <2.44> Not more than 0.5% (0.1 g, platinum crucible).

Assay Dissolve about 20 mg each of Betamethasone and Betamethasone RS, previously dried and accurately weighed, in methanol to make exactly 50 mL. Pipet 5 mL each of these solutions, add exactly 5 mL each of the internal standard solution, then add methanol to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10 \(\mu\)L each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \(Q_t\) and \(Q_s\), of the peak area of betamethasone to that of the internal standard, respectively.

Amount (mg) of \(C_{22}H_{29}FO_5\) = \(M_s \times Q_t/Q_s\)

\(M_s\): Amount (mg) of Betamethasone RS
Betamethasone Tablets

**Internal standard solution**—A solution of butyl parahydroxybenzoate in methanol (2 in 3500).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 240 nm).
Column: A stainless steel column about 4.0 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of water and acetonitrile (3:2).
Flow rate: Adjust the flow rate so that the retention time of betamethasone is about 4 minutes.

**System suitability**—
- System performance: When the test with 10 µL of the standard solution under the above operating conditions, betamethasone and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.
- System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone to that of the internal standard is not more than 1.0%.

**Containers and storage**—Containers—Tight containers.
Storage—Light-resistant.

**Betamethasone Tablets**

ベタメタゾン錠

Betamethasone Tablets contain not less than 90.0% and not more than 107.0% of the labeled amount of betamethasone (C₂₂H₂₉FO₅: 392.46).

**Method of preparation**—Prepare as directed under Tablets, with Betamethasone.

**Identification**—Pulverize Betamethasone Tablets. To a portion of the powder, equivalent to 2 mg of Betamethasone according to the labeled amount, add 20 mL of methanol, shake for 5 minutes, and filter. Evaporate the filtrate on a water bath to dryness, dissolve the residue after cooling in 2 mL of methanol, filter if necessary, and use this as the sample solution. Separately, dissolve 2 mg of Betamethasone RS in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.05). Spot 5 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop with a mixture of 1-butanol, water and acetic anhydride (3:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained with the sample solution and the spot with the standard solution show the same *Rf* value.

**Uniformity of dosage units**—Perform the test according to the following method: it meets the requirement of the Content uniformity test.
To 1 tablet of Betamethasone Tablets add *V* mL of water so that each mL contains about 50 µg of betamethasone (C₂₂H₂₉FO₅). Add exactly 2 *V* mL of the internal standard solution, shake vigorously for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 20 mg of Betamethasone RS, previously dried for 4 hours in a desiccator (in vacuum, phosphorus (V) oxide), dissolve in acetonitrile to make exactly 200 mL. Pipet 5 mL of this solution, add exactly 20 mL of the internal standard solution, add 5 mL of water, and use this solution as the standard solution. Perform the test with 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and calculate the ratios, *Q₁* and *Q₂*, of the peak area of betamethasone to that of the internal standard.

Amount (mg) of betamethasone (C₂₂H₂₉FO₅) = *M₃* × *Q₁*/*Q₂* × *V*/400

*M₃*: Amount (mg) of Betamethasone RS

**Internal standard solution**—A solution of butyl parahydroxybenzoate in acetonitrile (1 in 40,000).

**Operating conditions**—
Proceed as directed in the operating conditions in the Assay.

**System suitability**—
- System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, betamethasone and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.
- System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone to that of the internal standard is not more than 1.0%.

**Dissolution**—When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Betamethasone Tablets is not less than 85%.
Start the test with 1 tablet of Betamethasone Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard the first 10 mL of the filtrate, pipet the subsequent *V* mL of the filtrate, add water to make exactly *V* mL so that each mL contains about 0.56 µg of betamethasone (C₂₂H₂₉FO₅). Add 5 mL of this solution, and add water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 100 µL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and determine the peak areas, *A₁* and *A₃*, of betamethasone.
Dissolution rate (%) with respect to the labeled amount of betamethasone (C<sub>21</sub>H<sub>33</sub>FO<sub>7</sub>)

\[
M_S = \frac{M_S}{A_T / A_S} \times \frac{V'}{V} \times \frac{1}{C} \times \frac{9}{5}
\]

- **M<sub>S</sub>:** Amount (mg) of Betamethasone RS
- **C:** Labeled amount (mg) of betamethasone (C<sub>21</sub>H<sub>33</sub>FO<sub>7</sub>) in 1 tablet

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 241 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of water and acetonitrile (3:2).

**Flow rate:** Adjust the flow rate so that the retention time of betamethasone is about 7 minutes.

**System suitability—**

- **System performance:** When the procedure is run with 100 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of betamethasone are not less than 3000 and not more than 2.0, respectively.

- **System repeatability:** When the test is repeated 6 times with 100 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betamethasone is not more than 2.0%.

**Assay** Weigh accurately the mass of not less than 20 Betamethasone Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 5 mg of betamethasone (C<sub>21</sub>H<sub>33</sub>FO<sub>7</sub>), add 25 ml of water, then add exactly 50 ml of the internal standard solution, and shake vigorously for 10 minutes. Filter through a membrane filter with pore size of not more than 0.5 μm, discard the first 5 ml of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg of Betamethasone RS, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 4 hours, and dissolve in acetonitrile to make exactly 50 ml. Pipet 5 ml of this solution, add exactly 20 ml of the internal standard solution and 5 ml of water, and use this solution as the standard solution. Perform the test with 20 μl each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q1 and Q8, of the peak area of betamethasone to that of the internal standard.

- **Amount (mg) of betamethasone (C<sub>21</sub>H<sub>33</sub>FO<sub>7</sub>):**

\[
M_S = \frac{M_S \times Q_1}{Q_8} \times \frac{1}{4}
\]

- **M<sub>S</sub>:** Amount (mg) of Betamethasone RS

**Internal standard solution—** A solution of butyl parahydroxybenzoate in acetonitrile (1 in 10,000).

**Operating conditions—**

**Detector:** An ultraviolet absorption photometer (wavelength: 241 nm).

**Column:** A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

**Column temperature:** A constant temperature of about 25°C.

**Mobile phase:** A mixture of water and acetonitrile (3:2).

Flow rate: Adjust the flow rate so that the retention time of betamethasone is about 4 minutes.

**System suitability—**

- **System performance:** When the procedure is run with 20 μL of the standard solution under the above operating conditions, betamethasone and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

- **System repeatability:** When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Betamethasone Dipropionate**

ベタメタゾンジプロピオン酸エステル

C<sub>29</sub>H<sub>37</sub>FO<sub>7</sub>: 504.59

9-Fluoro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17,21-dipropanoate [5593-20-4]

Betamethasone Dipropionate, when dried, contains not less than 97.0% and not more than 103.0% of C<sub>29</sub>H<sub>37</sub>FO<sub>7</sub>, and not less than 3.4% and not more than 4.1% of fluorine (F:19.00).

**Description** Betamethasone Dipropionate occurs as a white to pale yellowish white, crystalline powder. It is odorless.

It is freely soluble in acetone, in 1,4-dioxane and in chloroform, soluble in methanol, sparingly soluble in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water and in hexane.

It is affected gradually by light.

**Identification**

1. To 1 mL of a solution of Betamethasone Dipropionate in methanol (1 in 10,000) add 4 mL of isoniazid TS, and heat on a water bath for 2 minutes: a yellow color develops.

2. Proceed with 0.01 g of Betamethasone Dipropionate as directed under Oxygen Flask Combustion Method <1.067>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the test solution so obtained responds to the Qualitative Tests <1.099> for fluorine.

3. Determine the absorption spectrum of a solution of Betamethasone Dipropionate in methanol (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.
(4) Determine the infrared absorption spectrum of Betamethasone Dipropionate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** 2.60> 176 – 180°C

**Optical rotation** 2.49: αD: +63 ± 70° (after drying, 50 mg, 1,4-dioxane, 10 mL, 100 mm).

**Purity** (1) Fluoride—To 0.10 g of Betamethasone Dipropionate add 10.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), shake for 10 minutes, and filter through a membrane filter (0.4-µm pore size). Place 5.0 mL of the filtrate in a 20-mL volumetric flask, and add 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3, and cerium (III) nitrate TS (1:1:1), add water to make 20 mL, allow to stand for 1 hour, and use this solution as the sample solution. Separately, place 1.0 mL of Standard Fluorine Solution in a 20-mL volumetric flask, add 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20), then 10 mL of a mixture of alizarin complexone TS, acetic acid-potassium acetate buffer solution, pH 4.3, and cerium (III) nitrate TS (1:1:1), proceed in the same manner as the preparation of the sample solution, and use this solution as the standard solution. Place 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) in a 20-mL volumetric flask, and proceed in the same manner as the preparation of the sample solution. Using this solution as the blank, determine the absorbances of the sample solution and standard solution at 600 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbance of the sample solution is not greater than that of the standard solution (not more than 0.012%).

(2) Heavy metals <1.07>—Proced with 1.0 g of Betamethasone Dipropionate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.010 g of Betamethasone Dipropionate in 10 mL of chloroform, and use this solution as the sample solution. Pipet 0.010 g of Betamethasone Dipropionate in 10 mL of chloroform, and use this solution as the standard solution. Place 0.01 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) in a 20-mL volumetric flask, and proceed in the same manner as the preparation of the sample solution. Using this solution as the blank, determine the absorbances of the sample solution and standard solution at 600 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbance of the sample solution is not greater than that of the standard solution (not more than 0.012%).

**Assay** (1) Betamethasone dipropionate—Weigh accurately about 15 mg of Betamethasone Dipropionate, previously dried, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, and dilute with methanol to exactly 50 mL. Determine the absorbance A of this solution at the wavelength of maximum absorption at about 239 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>:

\[ \text{Amount (mg) of C}_2\text{H}_{19}\text{FNa}_2\text{O}_8\text{P} = A/312 \times 10,000 \]

(2) Fluorine—Weigh accurately about 10 mg of Betamethasone Dipropionate, previously dried, and proceed as directed in the procedure of determination for fluorine under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid.

**Containers and storage** Containers—Light-resistant.

**Betamethasone Sodium Phosphate**

![Chemical Structure](image)

Betamethasone Sodium Phosphate contains not less than 97.0% and not more than 103.0% of C22H28FNa2O8P, calculated on the anhydrous basis.

**Description** Betamethasone Sodium Phosphate occurs as white to pale yellowish white, crystalline powder or masses. It is odorless.

It is freely soluble in water, sparingly soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

It is hygroscopic.

**Melting point** about 213°C (with decomposition).

**Identification** (1) Dissolve 2 mg of Betamethasone Sodium Phosphate in 2 mL of sulfuric acid: a brown color develops, and gradually changes to blackish brown.

(2) Prepare the test solution with 0.01 g of Betamethasone Sodium Phosphate as directed under Oxygen Flask Combustion Method <1.06>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as an absorbing liquid: the test solution responds to the Qualitative Tests <1.09> (2) for fluorine.

(3) Take 40 mg of Betamethasone Sodium Phosphate in a platinum crucible, and carbonize by heating. After cooling, add 5 drops of nitric acid, and incinerate by heating. To the residue add 10 mL of diluted nitric acid (1 in 50), and boil for several minutes. After cooling, filter if necessary, and use this solution as the sample solution. The sample solution responds to the Qualitative Tests <1.09> for sodium salt, and
to the Qualitative Tests <1.0> (1) and (3) for phosphate.

(4) Determine the infrared absorption spectrum of Betamethasone Sodium Phosphate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Betamethasone Sodium Phosphate RS; both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.40> \[\alpha]^n_D + 99° to +105° (0.1 g, calculated on the anhydrous basis, water, 10 mL, 100 mm).

**pH** <2.54> Dissolve 0.10 g of Betamethasone Sodium Phosphate in 20 mL of water: the pH of this solution is between 7.5 and 9.0.

**Purity** (1) Clarity and color of solution—Dissolve 0.25 g of Betamethasone Sodium Phosphate in 10 mL of water: the solution is clear and colorless.

(2) Free phosphoric acid—Weigh accurately about 20 mg of Betamethasone Sodium Phosphate, dissolve in 20 mL of water, and use this solution as the sample solution. Separately, pipet 4 mL of Standard Phosphoric Acid Solution, add 20 mL of water, and use this solution as the standard solution. To each of the sample solution and the standard solution add exactly 7 mL of dilute sulfuric acid, exactly 2 mL of hexaammonium heptamolybdate-sulfuric acid TS and exactly 2 mL of methylaminophenol sulfate TS, shake well, and allow to stand at 20 ± 1°C for 15 minutes. To each add water to make exactly 50 mL, and allow to stand at 20 ± 1°C for 15 minutes. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.34>, using a solution prepared with 20 mL of water in the same manner as the blank. Determine the absorbances, \(A_1\) and \(A_2\), of each solution from the sample solution and standard solution at 730 nm: the amount of free phosphoric acid is not more than 0.5%.

\[
\text{Amount (mg) of free phosphoric acid (H}_3\text{PO}_4) = A_1/A_2 \times 1/M \times 10.32
\]

\(M\): Amount (mg) of Betamethasone Sodium Phosphate, calculated on the anhydrous basis.

(3) Betamethasone—Dissolve 20 mg of Betamethasone Sodium Phosphate in exactly 2 mL of methanol, and use this solution as the sample solution. Separately, dissolve 20 mg of Betamethasone RS in exactly 10 mL of methanol. Pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 \(\mu\)L of each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a freshly prepared mixture of 1-butanol, water and acetic anhydride (3:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot from the sample solution corresponding to the spot from the standard solution is not more intense than the spot from the standard solution.

**Water** <2.48> Not more than 10.0% (0.2 g, back titration).

**Assay** Weigh accurately about 20 mg each of Betamethasone Sodium Phosphate and Betamethasone Sodium Phosphate RS (determine the water <2.48> before using in the same manner as Betamethasone Sodium Phosphate), and dissolve each in methanol to make exactly 20 mL. Pipet 5 mL each of these solutions, and exactly 5 mL of the internal standard solution, then add methanol to make 50 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \(Q_T\) and \(Q_S\), of the peak area of betamethasone phosphate to that of the internal standard, respectively.

\[
\text{Amount (mg) of C}_{22}\text{H}_{28}\text{FNa}_2\text{O}_8\text{P} = M \times Q_T/Q_S
\]

\(M\): Amount (mg) of Betamethasone Sodium Phosphate RS, calculated on the anhydrous basis

**Internal standard solution**—A solution of butyl parahydroxybenzoate in methanol (1 in 5000).

**Operating conditions**—
- **Detector:** An ultraviolet absorption photometer (wavelength: 254 nm).
- **Column:** A stainless steel column 4.0 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 \(\mu\)m in particle diameter).
- **Column temperature:** A constant temperature of about 25°C.

Mobile phase: Dissolve 1.6 g of tetra-n-butylammonium bromide, 3.2 g of disodium hydrogen phosphate dodecahydrate and 6.9 g of potassium dihydrogen phosphate in 1000 mL of water, and add 1500 mL of methanol.

**Flow rate:** Adjust the flow rate so that the retention time of betamethasone phosphate is about 5 minutes.

**System suitability**—
- **System performance:** When the procedure is run with 10 \(\mu\)L of the standard solution under the above operating conditions, betamethasone phosphate and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.
- **System repeatability:** When the test is repeated 6 times with 10 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of betamethasone phosphate to that of the internal standard is not more than 1.0%.

**Containers and storage**—Containers—Tight containers.

---

**Betamethasone Valerate**

ベタメタゾン吉草酸エステル

\(\text{C}_{27}\text{H}_{37}\text{FO}_6\): 476.58

9-Fluoro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17-pentanoate

[2152-44-5]

Betamethasone Valerate, when dried, contains not less than 97.0% and not more than 103.0% of
Betamethasone Valerate and Gentamicin Sulfate Cream

**Betamethasone Valerate** occurs as a white, crystalline powder. It is odorless. It is freely soluble in chloroform, soluble in ethanol (95), sparingly soluble in methanol, slightly soluble in diethyl ether, and practically insoluble in water. Melting point: about 190°C (with decomposition).

**Description**

Betamethasone Valerate can be dissolved in 0.1 g methanol, 20 mL 100 mm) methanol (9:1) to make exactly 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (9:1), and use this solution as the sample solution. Pipet 1 mL of ethyl acetate, mix, and use as the sample solution.

**Purity** Related substances—Conduct this procedure without exposure to daylight. Dissolve 0.02 g of Betamethasone Valerate as directed under Oxygen Flask Combustion Method <1.00>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide solution and 20 mL of water as the absorbing liquid, and prepare the test solution: the test solution so obtained responds to the Qualitative Tests <1.00> for fluoride.

(2) Determine the infrared absorption spectrum of Betamethasone Valerate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Betamethasone Valerate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** 

\[\beta_{D}^{2.49}\] [α]D9: +77 – +83° (after drying, 0.1 g, methanol, 20 mL, 100 mm).

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (0.5 g, platinum crucible).

**Assay** Dissolve about 10 mg each of Betamethasone Valerate and Betamethasone Valerate RS, previously dried and accurately weighed, in methanol to make exactly 100 mL. Pipet 10 mL each of these solutions, add 10 mL each of the internal standard solution, and use these solutions as the sample solution and standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \(Q_t\) and \(Q_S\), of the peak area of betamethasone valerate to that of the internal standard, respectively.

\[\text{Amount (mg) of } C_{27}H_{37}FO_{6} = M_S \times Q_t/Q_S \]

\[M_S: \text{Amount (mg) of Betamethasone Valerate RS} \]

**Internal standard solution—**A solution of isoamyl benzoate in methanol (1 in 1000).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.0 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol and water (7:3).

Flow rate: Adjust the flow rate so that the retention time of betamethasone valerate is about 10 minutes.

**System suitability—**

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, betamethasone valerate and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone valerate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

**Betamethasone Valerate and Gentamicin Sulfate Cream**

Betamethasone Valerate and Gentamicin Sulfate Cream contains not less than 90.0% and not more than 110.0% of the labeled amount of betamethasone valerate \((C_{27}H_{37}FO_6; 476.58)\) and not less than 90.0% and not more than 115.0% of the labeled amount of gentamicin \(C_1(C_{21}H_{43}N_5O_7; 477.60)\).

**Method of preparation** Prepare as directed under Creams, with Betamethasone Valerate and Gentamicin Sulfate.

**Identification** (1) To a quantity of Betamethasone Valerate and Gentamicin Sulfate Cream, equivalent to about 1.2 mg of Betamethasone Valerate according to the labeled amount, add 20 mL of methanol and 20 mL of hexane, shake vigorously for 10 minutes, and allow to stand. Take 15 mL of the lower layer, evaporate the layer to dryness on a water bath under a current of nitrogen. To the residue add 1 mL of ethyl acetate, mix, and use as the sample solution. Separately, dissolve about 18 mg of Betamethasone Valerate RS in 20 mL of ethyl acetate, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (9:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly alkaline blue tetrazolium TS on the plate; the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

\[\text{Amount (mg) of } C_{27}H_{37}FO_{6} = M_S \times Q_t/Q_S \]

\[M_S: \text{Amount (mg) of Betamethasone Valerate RS} \]

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.0 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol and water (7:3).

Flow rate: Adjust the flow rate so that the retention time of betamethasone valerate is about 10 minutes.

**System suitability—**

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, betamethasone valerate and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone valerate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
Purity Related substances—Weigh accurately an amount of Betamethasone Valerate and Gentamicin Sulfate Cream, equivalent to about 1 mg of Betamethasone Valerate according to the labeled amount, add 15 mL of water, and mix while warming on a water bath to make a milky liquid: the pH of the cooled liquid is between 4.0 and 6.0.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 240 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 45°C.
Mobile phase: A mixture of water, acetonitrile and methanol (12:7:1) in the ratios, Q1, Q2, Q3.
Flow rate: Adjust the flow rate so that the retention time of betamethasone valerate is about 16 minutes.
Time span of measurement: About 2.5 times as long as the retention time of betamethasone valerate beginning after the solvent peak. The peaks of the compounding ingredients are not determined.

System suitability—
Test for required detectability: Dissolve 20 mg of Betamethasone Valerate in 100 mL of a mixture of methanol and water (7:3). To exactly 1 mL of this solution add the mixture of methanol and water (7:3) to make exactly 100 mL, and use this solution as the solution for system suitability test. To exactly 2.5 mL of this solution add the mixture of methanol and water (7:3) to make exactly 25 mL. Pipet 5 mL of this solution, and add the mixture of methanol and water (7:3) to make exactly 50 mL. Pipet 10 mL of this solution, and add the mixture of methanol and water (7:3) to make exactly 100 mL. Perform the test with 3 μL each of the sample solution and standard solution as directed under Liquid Chromatography to determine the number of theoretical plates and the symmetry factor of the peak of betamethasone valerate.

System performance: When the procedure is run with 3 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betamethasone valerate is not more than 2.0%.

System repeatability: When the procedure is run with 3 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betamethasone valerate is not more than 2.0%.

Assay (1) Betamethasone valerate—Weigh accurately an amount of Betamethasone Valerate and Gentamicin Sulfate Cream, equivalent to about 1 mg of betamethasone valerate (C27H37FO6), add 10 mL of a mixture of methanol and water (7:3), and add exactly 10 mL of the internal standard solution. After warming in a water bath at 60°C for 5 minutes, shake vigorously for 20 minutes. Repeat this procedure twice, cool with ice for 15 minutes, centrifuge for 5 minutes, then filter the supernatant liquid, discard the first 5 mL of filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg of Betamethasone Valerate RS, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 25 mL. Pipet 5 mL of this solution, and add the mixture of methanol and water (7:3) to make exactly 50 mL. Pipet 10 mL of this solution, and add the mixture of methanol and water (7:3) to make exactly 100 mL. Perform the test with 3 μL each of the sample solution and standard solution as directed under Liquid Chromatography to determine the ratios, Q1 and Q2, of the peak area of betamethasone valerate to that of the internal standard.

Amount (mg) of betamethasone valerate (C27H37FO6) = M5 × Q1/Q2 × 1/25

M5: Amount (mg) of Betamethasone Valerate RS

Internal standard solution—Dissolve 20 mg of beclometasone dipropionate in 10 mL of methanol, and add the mixture of methanol and water (7:3) to make 200 mL.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 2.1 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3.5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of methanol and water (13:7).
Flow rate: Adjust the flow rate so that the retention time of betamethasone valerate is about 16 minutes.

System suitability—
System performance: When the procedure is run with 3 μL of the standard solution under the above operating conditions, betamethasone valerate and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 3 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone valerate to that of the internal standard is not more than 1.0%.

(2) Gentamicin sulfate—Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics. Use Lactobacillus fermentum L-20 as test organism, agar media for base layer and seed layer, agar medium for transferring test organisms, and standard solutions—Follow the directions as directed in the Assay under Gentamicin Sulfate.
(ii) Sample solutions—Weigh accurately an amount of Betamethasone Valerate and Gentamicin Sulfate Cream, equivalent to about 1 mg (potency) of Gentamicin Sulfate, add 100 mL of 0.1 mol/L phosphate buffer solution, pH 8.0, previously warmed to about 85°C, and shake well to dissolve. After cooling, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 250 mL to make the high concentration sample solution, which contains 4 μg (potency) per mL. Pipet a suitable amount of the high concentration sample solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 so that each mL contains 1 μg (potency), and use this solution as the low concentration sample solution.

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Betamethasone Valerate and Gentamicin Sulfate Ointment ベタメタゾン吉草酸エステル・ゲンタマイシン硫酸塩軟膏

Betamethasone Valerate and Gentamicin Sulfate Ointment contains not less than 95.0% and not more than 110.0% of the labeled amount of betamethasone valerate (C_{27}H_{37}FO_{6} : 476.58) and not less than 90.0% and not more than 115.0% of the labeled potency of gentamicin C_{1} (C_{27}H_{37}NO_{7} : 477.60).

Method of preparation Prepare as directed under Ointment, with Betamethasone Valerate and Gentamicin Sulfate.

Identification (1) To a quantity of Betamethasone Valerate and Gentamicin Sulfate Ointment, equivalent to 1.2 mg of Betamethasone Valerate according to the labeled amount, add 20 mL of methanol and 20 mL of hexane, and disperse the ointment with the aid of ultrasonic. Shake vigorously for 5 minutes, centrifuge for 5 minutes, cool for 15 minutes with ice, and take 15 mL of the lower layer. Evaporate the layer to dryness on a water bath under a current of nitrogen. To the residue add 1 mL of ethyl acetate, apply ultrasonic waves, filter, if necessary, and use the filtrate as the sample solution. Separately, dissolve 18 mg of Betamethasone Valerate RS in 20 mL of ethyl acetate, and use this solution as the sample solution. After warming in a water bath at 75°C for 5 minutes, shake vigorously for 10 minutes. Repeat this procedure once more, cool with ice for 15 minutes, filter, discard the first 5 mL of filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg of Betamethasone Valerate RS, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 25 mL. Pipet 5 mL of this solution, and add the mixture of methanol and water (7:3) to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, mix, and use this solution as the standard solution. Perform the test with 3 μL of each of the sample solution and standard solution as directed under Liquid Chromatography 2.02 according to the following conditions, and calculate the ratios, Q_{1} and Q_{6}, of the peak area of betamethasone valerate to that of the internal standard.

\[ M_5 = M_2 \times Q_1/Q_6 \times 1/25 \]

M_{5}: Amount (mg) of Betamethasone Valerate RS

Internal standard solution—Dissolve 20 mg of beclometasone dipropionate in 10 mL of methanol, and add the mixture of methanol and water (7:3) to make 200 mL.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 2.1 mm in inside diameter and 10 cm in length, packed with octadeceansilanized silica gel for liquid chromatography (3.5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of methanol and water (13:7).
Flow rate: Adjust the flow rate so that the retention time of betamethasone valerate is about 16 minutes.

System suitability—
System performance: When the procedure is run with 3 μL of the standard solution under the above operating conditions, betamethasone valerate and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.
System repeatability: When the test is repeated 6 times with 3 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of betamethasone valerate to that of the internal standard is not more than 1.0%.

(2) Gentamicin sulfate—Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics 4.02 according to the following conditions.

(i) Test organism, agar media for base layer and seed layer, agar medium for transferring test organisms, and standard solutions—Proced as directed in the Assay under Gentamicin Sulfate.
(ii) Sample solutions—Weigh accurately an amount of Betamethasone Valerate and Gentamicin Sulfate Ointment, equivalent to about 1 mg (potency) of Gentamicin Sulfate, transfer to a separator, add 50 mL of petroleum ether and exactly 100 mL of 0.1 mol/L phosphate buffer solution, pH 8.0, shake for 10 minutes, and allow to stand. Pipet a suitable amount of the water layer, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 4 μg (potency) and 1 μg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Betamipron

ベタミプロン

![Chemical Structure of Betamipron]

C_{10}H_{11}NO_3: 193.20
3-Benzoylaminopropionic acid

[3440-28-6]

Betamipron contains not less than 99.0% and not more than 101.0% of C_{10}H_{11}NO_3, calculated on the anhydrous basis.

Description Betamipron occurs as white crystals or crystalline powder.
It is freely soluble in methanol, soluble in ethanol (95.5), and slightly soluble in water.
It dissolves in sodium hydroxide TS.

Identification (1) Determine the absorption spectrum of a solution of Betamipron in ethanol (99.5) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Betamipron as directed in the potassium bromide disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

pH <2.54> Dissolve 0.25 g of Betamipron in 100 mL of water by warming, and cool: the pH of this solution is 3.0 to 3.4.

Melting point <2.60> 132 ~ 135°C

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Betamipron in 10 mL of sodium hydroxide TS: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Betamipron according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) β-Alanine—Dissolve 0.25 g of Betamipron in 10 mL of methanol, and use this solution as the sample solution. Separately, dissolve 50 mg of β-alanine in methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.06>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography, develop the plate with a mixture of methanol, ethyl acetate, ammonia solution (28) and water (200:200:63:37) to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin-butanol TS on the plate, and heat at 105°C for 5 minutes: the spot obtained from the sample solution corresponding to the spot from the standard solution is not more intense than the spot from the standard solution.

System suitability—
Test for required detectability: To exactly 1 mL of the standard solution add the mobile phase to make exactly 10 mL. Confirm that the peak area of betamipron obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: Dissolve 5 mg of Betamipron and 5 mg of benzoic acid in 200 mL of the mobile phase. When the procedure is run with 10 μL of this solution under the above operating conditions, benzoic acid and betamipron are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of betamipron is not more than 2.0%.

Water <2.48> Not more than 0.5% (1 g, volumetric titration, direct titration).
Residue on ignition Not more than 0.1% (1 g).

Assay Weigh accurately about 0.25 g of Betamipron, dissolve in 25 mL of ethanol (99.5), add 25 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform the blank determination in the same manner, and make any necessary correction. Each mL of 0.1 mol/L sodium hydroxide VS = 19.32 mg of C_{10}H_{11}NO_3

Containers and storage Containers—Tight containers.

Betaxolol Hydrochloride

ベタキソロール塩酸塩

C_{18}H_{29}NO_3.HCl: 343.89

Betaxolol Hydrochloride, when dried, contains not less than 99.0% and not more than 101.0% of C_{18}H_{29}NO_3.HCl.

Description Betaxolol Hydrochloride occurs as white crystals or crystalline powder.

It is very soluble in water, and freely soluble in methanol, in ethanol (99.5) and in acetic acid (100).

Dissolve 1.0 g of Betaxolol Hydrochloride in 50 mL of water: the pH of the solution is between 4.5 and 6.5.

A solution of Betaxolol Hydrochloride (1 in 100) shows no optical rotation.

Identification (1) Determine the absorption spectrum of a solution of Betaxolol Hydrochloride in ethanol (99.5) (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry 2.2.4, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Betaxolol Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry 2.2.5, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Betaxolol Hydrochloride (1 in 100) responds to the Qualitative Tests 1.09 (2) for chloride.

Melting point 2.60 114 – 117°C.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Betaxolol Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals 1.07—Proceed with 2.0 g of Betaxolol Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic 1.11—Prepare the test solution with 2.0 g of Betaxolol Hydrochloride according to Method 3, and perform the test (not more than 1 ppm).

(4) Related substance I—Dissolve 0.10 g of Betaxolol Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 3 mL of the sample solution, and add methanol to make exactly 50 mL. Pipet 1 mL of this solution, add methanol to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.07. Spot 10 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, water and acetic acid (100:10:3) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 1 hour: the number of the spots other than the principal spot obtained from the sample solution is not more than 3, and they are not more intense than the spot from the standard solution.

(5) Related substance II—Dissolve 0.10 g of Betaxolol Hydrochloride in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography 2.07 according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak other than betaxolol obtained from the sample solution is not larger than the peak area of betaxolol from the standard solution, and the total area of the peaks other than the peak of betaxolol is not larger than 2 times the peak area of betaxolol from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 273 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octysilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of diluted 0.05 mol/L potassium dihydrogen phosphate TS (1 in 2) with the pH adjusted to 3.0 with 1 mol/L hydrochloric acid TS, acetonitrile and methanol (26:7:7).

Flow rate: Adjust the flow rate so that the retention time of betaxolol is about 9 minutes.

Time span of measurement: About 2 times as long as the retention time of betaxolol beginning after the solvent peak.

System suitability—
Test for required detectability: Pipet 4 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of betaxolol obtained from 10 µL of this solution is equivalent to 14 to 26% of that from 10 µL of the standard solution.

System performance: Dissolve 50 mg of Betaxolol Hydrochloride and 5 mg of 2-naphthol in 200 mL of the mobile phase. When the procedure is run with 10 µL of this solution under the above operating conditions, betaxolol and 2-naphthol are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak...
area of betaxolol is not more than 2.0%.

(6) Residual solvent—Being specified separately.

Loss on drying <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of Betaxolol Hydrochloride, previously dried, dissolve in 30 mL of acetic acid (100), add 30 mL of acetic anhydride, and titrate 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 34.39 mg of C₇H₁₇ClN₂O₂·HCl

Containers and storage Containers—Tight containers.

Bethanechol Chloride

ベタネコール塩化物

![Chemical Structure of Bethanechol Chloride](image)

C₇H₁₇ClN₂O₂: 196.68
(2RS)-2-Carbamoyloxy-\(N,\,N,\,N-\)trimethylpropylaminium chloride [590-63-6]

Bethanechol Chloride, when dried, contains not less than 98.0% and not more than 101.0% of C₇H₁₇ClN₂O₂.

Description Bethanechol Chloride occurs as colorless or white crystals or a white, crystalline powder. It is very soluble in water, freely soluble in acetic acid (100), and sparingly soluble in ethanol (99.5).

A solution of Bethanechol Chloride (1 in 10) shows no optical rotation.

It is hygroscopic.

Identification (1) To 2 mL of a solution of Bethanechol Chloride (1 in 40) add 0.1 mL of a solution of cobalt (II) chloride hexahydrate (1 in 100), then add 0.1 mL of potassium hexacyanoferrate (II) TS: A green color is produced, and almost entirely fades within 10 minutes.

(2) To 1 mL of a solution of Bethanechol Chloride (1 in 100) add 0.1 mL of iodine TS: a brown precipitate is produced, and the solution shows a brown color.

(3) Determine the infrared absorption spectrum of Bethanechol Chloride as directed in the paste method under Infrared Spectrophotometry <2.23>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Bethanechol Chloride (1 in 100) responds to the Qualitative Tests <1.09> for chlorides.

Melting point <2.60> 217 – 221°C (after drying).

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Bethanechol Chloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 1.0 g of Bethanechol Chloride in 2.5 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 1 μL each of the sample solution and standard solution on a plate of cellulose for thin-layer chromatography. Develop the plate with a mixture of a solution of ammonium acetate (1 in 100), acetone, 1-butanol and formic acid (20:20:20:1) to a distance of about 10 cm, and dry the plate at 105°C for 15 minutes. Spray evenly hydrogen hexachloroplatinate (IV)-potassium iodide TS on the plate, and allow to stand for 30 minutes: the spot other than the principal spot from the sample solution is not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 1.0% (1 g, 105°C, 2 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Bethanechol Chloride, previously dried, dissolve in 2 mL of acetic acid (100), add 40 mL of acetic anhydride, and titrate 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 19.67 mg of C₇H₁₇ClN₂O₂

Containers and storage Containers—Tight containers.

Bezafibrate

ベザフィブラート

![Chemical Structure of Bezafibrate](image)

C₁₉H₂₀ClNO₄: 361.82
2-(4-{[4-Chlorobenzoyl]amino}ethyl)phenoxy)-2-methylpropanoic acid [41859-67-0]

Bezafibrate, when dried, contains not less than 98.5% and not more than 101.0% of C₁₉H₂₀ClNO₄.

Description Bezafibrate occurs as a white crystalline powder.

It is freely soluble in N,N-dimethylformamide, soluble in methanol, slightly soluble in ethanol (99.5), and practically insoluble in water.

Identification (1) Determine the absorption spectrum of a solution of Bezafibrate in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of
Bezafibrate as directed in the potassium bromide disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Bezafibrate as directed under Flame Coloration Test: a green color appears.

**Melting point**

$\text{181 – 186^\circ C}$

**Purity**

(1) Chloride: Dissolve 3.0 g of Bezafibrate in 15 mL of $N, N$-dimethylformamide, add water to make 60 mL, shake well, allow to stand for more than 12 hours, and filter. To 40 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: To 0.70 mL of 0.01 mol/L hydrochloric acid VS add 40 mL of $N, N$-dimethylformamide, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.01%).

(2) Heavy metals: Proceed with 2.0 g of Bezafibrate according to Method $4$, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances: Dissolve 0.10 g of Bezafibrate in 35 mL of methanol, add diluted 0.5 mol/L ammonium acetate TS (1 in 50) to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add 70 mL of methanol and diluted 0.5 mol/L ammonium acetate TS (1 in 50) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography, according to the following conditions, and determine each peak area by the automatic integration method: the areas of the peaks having retention times of about 0.65 and 1.86 with respect to bezafibrate obtained from the sample solution are not larger than 1/2 times the peak area of bezafibrate from the standard solution, the area of the peak other than those and other than bezafibrate from the sample solution is not larger than 1/5 times the peak area of bezafibrate from the standard solution, and the total area of the peaks other than the peak of bezafibrate from the sample solution is not larger than 3/4 times the peak area of bezafibrate from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wave-length: 230 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 $\mu$m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol and diluted acetic acid (100) (1 in 100) (9:4).

Flow rate: Adjust the flow rate so that the retention time of bezafibrate is about 6 minutes.

Time span of measurement: About 2.5 times as long as the retention time of bezafibrate beginning after the solvent peak.

**System suitability—**

Test for required detectability: Measure exactly 5 mL of the standard solution, and add a mixture of methanol and diluted 0.5 mol/L ammonium acetate TS (1 in 50) (7:3) to make exactly 50 mL. Confirm that the peak area of bezafibrate obtained with 5 $\mu$L of this solution is equivalent to 7 to 13% of that with 5 $\mu$L of the standard solution.

System performance: Dissolve 20 mg of Bezafibrate and 10 mg of 4-chlorobenzoate in 70 mL of methanol, and add diluted 0.5 mol/L ammonium acetate TS (1 in 50) to make 100 mL. When the procedure is run with 5 $\mu$L of this solution under the above operating conditions, 4-chlorobenzoate and bezafibrate are eluted in order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 5 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of bezafibrate is not more than 2.0%.

**Loss on drying**

Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition**

Not more than 0.1% (1 g).

**Assay**

Weigh accurately about 0.7 g of Bezafibrate, previously dried, dissolve in 50 mL of ethanol (99.5), and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS is equivalent to $36.18$ mg of $C_{19}H_{20}ClNO_4$.

**Containers and storage**

Tight containers.

**Bezafibrate Sustained Release Tablets**

ベースフィプラート徐放錠

Bezafibrate Sustained Release Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of bezafibrate ($C_{19}H_{20}ClNO_4$: 361.82).

**Method of preparation**

Prepare as directed under Tablets, with Bezafibrate.

**Identification**

Mix well an amount of powdered Bezafibrate Sustained Release Tablets, equivalent to 0.1 g of Bezafibrate according to the labeled amount, with 100 mL of methanol, and filter. To 1 mL of the filtrate and add methanol to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry, and it exhibits a maximum between 227 nm and 231 nm.

**Uniformity of dosage units**

It meets the requirement of the Mass variation test.

**Dissolution**

When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of disodium hydrogen phosphate-citric acid buffer solution, pH 7.2 as the dissolution medium, the dissolution rates of a 100-mg tablet in 1.5 hours, in 2.5 hours and in 8 hours are 15 – 45%, 35 – 65% and not less than 80%, respectively, and those of a 200-mg tablet in 1.5 hours, in 2.5 hours and in 8 hours are 15 – 45%, 30 – 60% and not less than 75%, respectively.

Start the test with 1 tablet of Bezafibrate Sustained Release Tablets, withdraw not less than 20 mL of the medi-
um at the specified minutes after starting the test, and immediately fill up the dissolution medium each time with exactly 20 mL of fresh dissolution medium, previously warmed to 37 ± 0.5°C. Filter these media through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet the subsequent V mL, add the dissolution medium to make exactly V mL, so that each mL contains about 13 μg of bezafibrate (C₁₉H₂₀ClNO₄) according to the labeled amount, and use these solutions as the sample solutions. Separately, weigh accurately about 66 mg of bezafibrate for assay, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution, add the dissolution medium to make exactly 200 mL, and use this solution as the standard solution. Determine the absorbances, \( A_{T00} \) (n = 1, 2, 3) and \( A_S \), of the sample solutions and standard solution at 228 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
M_S = \frac{M_S}{\sum_{i=1}^{n-1} \frac{A_{T00} \times 1}{A_S} + \frac{A_{T00} \times 1}{A_S} \times \frac{V}{V}} \times \frac{1}{C} \times 18
\]

\( M_S \): Amount (mg) of bezafibrate for assay
\( C \): Labeled amount (mg) of bezafibrate (C₁₉H₂₀ClNO₄) in 1 tablet

**Assay** Weigh accurately, and powder not less than 20 Bezafibrate Sustained Release Tablets. Weigh accurately a Assay Weigh accurately, and powder not less than 20 bezafibrate for assay, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution, add the dissolution medium to make exactly 200 mL, and use this solution as the standard solution. Determine the absorbances, \( A_{T00} \) (n = 1, 2, 3) and \( A_S \), of the sample solutions and standard solution at 228 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Dissolution rate (%) in each case of n with respect to the labeled amount of bezafibrate (C₁₉H₂₀ClNO₄)

\[
\frac{M_S}{\sum_{i=1}^{n-1} \frac{A_{T00} \times 1}{A_S} + \frac{A_{T00} \times 1}{A_S} \times \frac{V}{V}} \times \frac{1}{C} \times 18
\]

**Internal standard solution—**A solution of 4-nitrophenol in methanol (1 in 500).

**Operating conditions—**
- Detector: An ultraviolet absorption photometer (wavelength: 230 nm).
- Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeckysilanized silica gel for liquid chromatography (5 μm in particle diameter).
- Column temperature: A constant temperature of about 25°C.
- Mobile phase: A mixture of methanol and diluted acetic acid (100 mL) in 1000 mL exactly V mL so that each mL contains about 13 μg of bezafibrate (C₁₉H₂₀ClNO₄) according to the labeled amount, and use these solutions as the sample solutions. Separately, weigh accurately about 66 mg of bezafibrate for assay, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution, add the dissolution medium to make exactly 200 mL, and use this solution as the standard solution. Determine the absorbances, \( A_{T00} \) (n = 1, 2, 3) and \( A_S \), of the sample solutions and standard solution at 228 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Dissolution rate (%) in each case of n with respect to the labeled amount of bezafibrate (C₁₉H₂₀ClNO₄)

\[
M_S = \frac{M_S}{\sum_{i=1}^{n-1} \frac{A_{T00} \times 1}{A_S} + \frac{A_{T00} \times 1}{A_S} \times \frac{V}{V}} \times \frac{1}{C} \times 18
\]

**Bifonazole**

![Bifonazole Structure](image)

Bifonazole, when dried, contains not less than 98.5% of C₂₂H₁₈N₂. 1-(4RS)-(Biphenyl-4-yl)(phenyl)methyl]-1H-imidazole [60629-96-8]

**Description** Bifonazole occurs as a white to pale yellow powder. It is odorless and tasteless.

It is freely soluble in dichloromethane, soluble in methanol, sparingly soluble in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water.

A solution of Bifonazole in methanol (1 in 100) does not show optical rotation.

**Identification** (1) Determine the absorption spectrum of a solution of Bifonazole in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bifonazole, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** 147 – 151°C

**Purity** (1) Chloride <1.03>—To 2.0 g of Bifonazole add 40 mL of water, warm for 5 minutes, and after cooling, filter. To 10 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(2) Sulfate <1.14>—To 10 mL of the filtrate obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L of the standard solution under the above operating conditions, the internal standard and bezafibrate are eluted in this order with the resolution between these peaks being not less than 4.

**System repeatability:** When the test is repeated 6 times with 2 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of bezafibrate to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
mol/L sulfuric acid VS (0.048%).

(3) Heavy metals

Proceed with 2.0 g of Bifonazole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.10 g of Bifonazole in 10 mL of methanol, and use this solution as the sample solution. Pipet 3 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 25 mL and 5 mL of this solution, add methanol to make exactly 50 mL each, and use these solutions as the standard solutions (1) and (2), respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>.

Spot 10 µL of each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and ammonia solution (28) (49:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot with Rf value of about 0.20 from the sample solution is not more intense than the spot from the standard solution (1). And the spots other than the spot mentioned above and the principal spot from the sample solution are not more intense than the spot from the standard solution (2).

Loss on drying <2.47> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 2 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.15 g of Bifonazole, previously dried, and dissolve in dichloromethane to make exactly 50 mL. Pipet 5 mL of this solution in a glass-stoppered conical flask, add 10 mL of water, 5 mL of dilute sulfuric acid and 25 mL of dichloromethane, and add 2 to 3 drops of a solution of methyl yellow in dichloromethane (1 in 500) as indicator, and titrate <2.30>, while shaking vigorously, with 0.01 mol/L sodium lauryl sulfate VS by a buret with 0.02-mL minimum graduation. The end point is reached when the color of the dichloromethane layer changes from yellow to orange-red after dropwise addition of 0.01 mol/L sodium lauryl sulfate VS, strong shaking, and standing for a while.

Each mL of 0.01 mol/L sodium lauryl sulfate VS = 3.104 mg of C22H18N2O3S.

Containers and storage Containers—Tight containers. Storage—Light-resistant.

### Biotin

ビオチン

Biotin occurs as white crystals or a white crystalline powder.

It is very slightly soluble in water and in ethanol (99.5).

It dissolves in dilute sodium hydroxide TS.

Melting point: about 231°C (with decomposition).

Identification Determine the infrared absorption spectrum of Biotin as directed in the potassium bromide disc method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D: +89 – +93° (after drying, 0.4 g, dilute sodium hydroxide TS, 20 mL, 100 mm).

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Biotin in 10 mL of 0.5 mol/L sodium hydroxide TS: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Biotin according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Place 0.7 g of Biotin in a Kjeldahl flask, add 5 mL of nitric acid and 2 mL of sulfuric acid, place a small funnel on the mouth of the flask, and carefully heat until white fumes are evolved. After cooling, add 2 mL of nitric acid twice, heat, add 2 mL of hydrogen peroxide (30) several times, and heat until the color of the solution becomes colorless or pale yellow. After cooling, add 2 mL of saturated ammonium oxalate solution, and heat to concentrate until white fumes are evolved again. After cooling, add water to make 5 mL, and perform the test using this solution as the test solution (not more than 2.8 ppm).

(4) Related substances—Dissolve 0.10 g of Biotin in 10 mL of diluted ammonia solution (28) (7 in 100), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add diluted ammonia solution (28) (7 in 100) to make exactly 100 mL. Pipet 10 mL of this solution, add diluted ammonia solution (28) (7 in 100) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>.

Spot 5 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water, and acetic acid (100) (5:2:1) to a distance of about 10 cm, air-dry the plate, and then dry for 30 minutes at 105°C. Spray the plate evenly with a mixture of a
solution of 4-dimethylaminocinnamaldehyde in ethanol (99.5) (1 in 500) and a solution of sulfuric acid in ethanol (99.5) (1 in 50) (1:1); the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** 2.44 Not more than 0.5% (0.5 g, 105°C, 4 hours).

**Residue on ignition** 2.44 Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.25 g of Biotin, previously dried, dissolve by adding exactly 20 mL of 0.1 mol/L sodium hydroxide VS, and titrate 2.50 the excess sodium hydroxide with 0.1 mol/L hydrochloric acid VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination in the same manner.

Each mL of 0.1 mol/L sodium hydroxide VS = 24.43 mg of C_{10}H_{16}N_{2}O_{3}S

**Containers and storage** Containers—Tight containers.

**Biperiden Hydrochloride**

ビペリデン塩酸塩

C_{21}H_{29}NO.HCl: 347.92
1-(Bicyclo[2.2.1]hept-5-en-2-yl)-1-phenyl-3-(piperidin-1-yl)propan-1-ol monohydrochloride
[1235-82-1]

Biperiden Hydrochloride, when dried, contains not less than 99.0% of C_{21}H_{29}NO.HCl.

**Description** Biperiden Hydrochloride occurs as a white to brownish and yellowish white, crystalline powder.

It is freely soluble in formic acid, slightly soluble in water, in methanol and in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 270°C (with decomposition).

**Identification** (1) Dissolve 0.02 g of Biperiden Hydrochloride in 5 mL of phosphoric acid: a green color develops.
(2) Dissolve 0.01 g of Biperiden Hydrochloride in 5 mL of water by heating, cool, and add 5 to 6 drops of bromine TS: a green color develops.
(3) Determine the absorption spectrum of a solution of Biperiden Hydrochloride (1 in 2000) as directed under Ultra-violet-visible Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.
(4) Determine the infrared absorption spectrum of Biperiden Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.
(5) Dissolve 0.02 g of Biperiden Hydrochloride in 10 mL of water by heating, and cool: the solution responds to the Qualitative Tests 1.09 for chloride.

**Purity** (1) Acidity or alkalinity—To 1.0 g of Biperiden Hydrochloride add 50 mL of water, shake vigorously, filter, and to 20 mL of the filtrate add 1 drop of methyl red TS: no red to yellow color develops.
(2) Heavy metals 1.07—Proceed with 1.0 g of Biperiden Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).
(3) Arsenic 1.11—Prepare the test solution with 1.0 g of Biperiden Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).
(4) Related substances—Dissolve 0.10 g of Biperiden Hydrochloride in 20 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.05. Spot 50 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia solution (28:80:15:2) to a distance of about 15 cm, and air-dry the plate. Spray evenly Dragendorff’s TS for spraying on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** 2.44 Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** 2.44 Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Biperiden Hydrochloride, previously dried, dissolve in 5 mL of formic acid, add 60 mL of acetic anhydride, and titrate 2.50 with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 34.79 mg of C_{21}H_{29}NO.HCl

**Containers and storage** Containers—Tight containers.

**Storage**—Light-resistant.

**Bisacodyl**

ピサコジル

C_{22}H_{19}NO_{4}: 361.39
4,4′-(Pyridin-2-ylmethylene)bis(phenyl acetate)
[603-50-9]

Bisacodyl, when dried, contains not less than 98.5% of C_{22}H_{19}NO_{4}.
**Bisacodyl Suppositories**

Bisacodyl Suppositories contain not less than 90.0% and not more than 110.0% of the labeled amount of bisacodyl (C\(_{22}\)H\(_{19}\)NO\(_4\)) as C\(_{22}\)H\(_{19}\)NO\(_4\); 361.39.

**Method of preparation** Prepare as directed under Suppositories, with Bisacodyl.

**Identification (1)** To a quantity of Bisacodyl Suppositories, equivalent to 6 mg of Bisacodyl according to the labeled amount, add 20 mL of ethanol (95), warm on a water bath for 10 minutes, shake vigorously for 10 minutes, and allow to stand in ice water for 1 hour. Centrifuge the solution, filter the supernatant liquid, and to 2 mL of the filtrate add ethanol (95) to make 20 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry \(\lambda_{	ext{max}}\): it exhibits a maximum between 261 nm and 265 nm.

**2. Use** the filtrate obtained in (1) as the sample solution. Separately, dissolve 6 mg of Bisacodyl RS in 20 mL of ethanol (95), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(\lambda_{	ext{max}}\). Spot 20 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 2-butane, chloroform, and xylene (1:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot from the sample solution and that from the standard solution show the same \(Rf\) value.

**Uniformity of dosage units** \(\lambda_{0.02}\) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 suppository of Bisacodyl Suppositories add tetrahydrofuran to make a solution containing about 0.2 mg of bisacodyl (C\(_{22}\)H\(_{19}\)NO\(_4\)) in each mL, warm to 40°C, and shake to dissolve. After cooling, add tetrahydrofuran to make exactly \(V\) mL so that each mL contains about 10 \(\mu\)g of bisacodyl (C\(_{22}\)H\(_{19}\)NO\(_4\)). Pipet 5 mL of this solution, and proceed as directed in the Assay.

\[
\text{Amount (mg) of bisacodyl (C}_{22}\text{H}_{19}\text{NO}_{4}) = M_s \times Q_r = V/50
\]

\(M_s\): Amount (mg) of Bisacodyl RS

**Internal standard solution**—A solution of ethyl parahydroxybenzoate in acetonitrile (3 in 100,000).

**Assay** Weigh accurately not less than 20 Bisacodyl Suppositories, make them fine fragments carefully, and mix uniformly. Weigh accurately a portion of the fragments, equivalent to about 10 mg of bisacodyl (C\(_{22}\)H\(_{19}\)NO\(_4\)), add 40 mL of tetrahydrofuran, warm to 40°C, dissolve by shaking, cool, and add tetrahydrofuran to make exactly 50 mL. Pipet
5 mL of this solution, add exactly 5 mL of the internal standard solution, and add the mobile phase to make 100 mL. Cool this solution in ice for 30 minutes, centrifuge, filter the supernatant liquid through a membrane filter with pore size of 0.5 μm, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 10 mg of Bisacodyl RS, previously dried at 105°C for 2 hours, and dissolve in tetrahydrofuran to make exactly 50 mL. Pipet 5 mL of this solution, proceed in the same manner as the sample solution, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, QT and QS, of the peak area of bisacodyl to that of the internal standard, respectively.

Amount (mg) of bisacodyl (C₂₂H₁₉NO₄) = M₅ × Q₅/Q₅
M₅: Amount (mg) of Bisacodyl RS

Internal standard solution—A solution of ethyl parahydroxybenzoate in acetonitrile (3 in 100,000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel (10 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of 0.01 mol/L citric acid TS, acetonitrile and methanol (2:1:1).
Flow rate: Adjust the flow rate so that the retention time of bisacodyl is about 8 minutes.

System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the internal standard and bisacodyl are eluted in this order with the resolution between these peaks being not less than 2.0.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of bisacodyl to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Tight containers.

**Bismuth Subgallate**

**Dermatol**

次没食子酸ビスマス

Bismuth Subgallate, when dried, contains not less than 47.0% and not more than 51.0% of bismuth (Bi: 208.98).

**Description**
Bismuth Subgallate occurs as a yellow powder. It is odorless and tasteless. It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It dissolves in dilute hydrochloric acid, in dilute nitric acid and in dilute sulfuric acid on warming. It dissolves in sodium hydroxide TS, forming a clear, yellow solution, which turns red immediately.

It is affected by light.

**Identification (1)**
Ignite 0.5 g of Bismuth Subgallate: it chars at first, and leaves finally a yellow residue. The residue responds to the Qualitative Tests <1.09> for bismuth salt.

(2) To 0.5 g of Bismuth Subgallate add 25 mL of water and 20 mL of hydrogen sulfide TS, and shake well. Filter off the blackish brown precipitate, and add 1 drop of iron (III) chloride TS to the filtrate: a blue-black color is produced.

**Purity (1)**
Clarity of solution—Dissolve 1.0 g of Bismuth Subgallate in 40 mL of diluted sodium hydroxide TS (1 in 8): the solution is clear.

(2) Sulfate—Ignite 3.0 g of Bismuth Subgallate in a porcelain crucible, and cautiously dissolve the residue in 2.5 mL of nitric acid by warming. Pour the solution into 100 mL of water, shake, and filter. Evaporate 50 mL of the filtrate on a water bath to 15 mL. Add water to make 20 mL, filter again, and use the filtrate as the sample solution. To 5 mL of the sample solution add 2 to 3 drops of barium nitrate TS: no turbidity is produced.

(3) Nitrate—To 0.5 g of Bismuth Subgallate add 5 mL of dilute sulfuric acid and 25 mL of iron (II) sulfate TS, shake well, and filter. Superimpose carefully 5 mL of the filtrate on sulfuric acid: no red-brown color develops at the zone of contact.

(4) Ammonium—Dissolve 1.0 g of Bismuth Subgallate in 5 mL of sodium hydroxide TS, and heat: the gas evolved does not change moistened red litmus paper to blue.

(5) Copper—To 5 mL of the sample solution obtained in (2) add 1 mL of ammonia TS, and filter: no blue color develops in the filtrate.

(6) Lead—Ignite 1.0 g of Bismuth Subgallate at about 500°C in a porcelain crucible, dissolve the residue in a smallest possible amount of nitric acid added dropwise, evaporate over a low flame to dryness, and cool. Add 5 mL of a solution of potassium hydroxide (1 in 6) to the residue, boil carefully for 2 minutes, cool, and centrifuge. Take the supernatant liquid in a test tube, add 10 drops of potassium chromate TS, and acidify the solution by adding acetic acid (100 dropwise): neither turbidity nor a yellow precipitate is produced.

(7) Silver—To 5 mL of the sample solution obtained in (2) add 0.5 mL of nitric acid and 2 to 3 drops of dilute hydrochloric acid: no turbidity is produced.

(8) Alkaline earth metals and alkali metals—Boil 1.0 g of Bismuth Subgallate with 40 mL of dilute acetic acid (31) (1 in 2) for 2 minutes, cool, add water to make 40 mL, and filter. To 20 mL of the filtrate add 2 mL of dilute hydrochloric acid, boil, immediately pass hydrogen sulfide thoroughly through the solution, filter the precipitate produced, and wash with water. Combine the filtrate and the washings, add 5 drops of sulfuric acid, and evaporate to dryness. Ignite as directed under Residue on Ignition <2.44>: the mass of the residue does not more than 5.0 mg.

(9) Arsenic <1.11>—Mix well 0.20 g of Bismuth Subgallate with 0.20 g of calcium hydroxide, and ignite the mixture. Dissolve the residue in 5 mL of dilute hydrochloric acid, use this solution as the test solution, and perform the test (not more than 10 ppm).

(10) Gallic acid—To 1.0 g of Bismuth Subgallate add

---

**Official Monographs / Bismuth Subgallate** 461

JP XVI
20 mL of ethanol (95), shake for 1 minute, and filter. Evaporate the filtrate on a water bath to dryness: the mass of the residue does not more than 5.0 mg.

**Loss on drying** <2.41> Not more than 6.0% (1 g, 105°C, 3 hours).

**Assay** Weigh accurately about 0.5 g of Bismuth Subgallate, previously dried, ignite at about 500°C for 30 minutes, and cool. Dissolve the residue in 5 mL of dilute nitric acid (2 in 5) by warming, and add water to make exactly 100 mL. Measure exactly 30 mL of this solution, add 200 mL of water, and titrate <2.50> with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to yellow (indicator: 2 to 3 drops of xylene orange TS).

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 4.180 mg of Bi

**Containers and storage** Containers—Well-closed containers.

**Description** Bismuth Subnitrate occurs as a white powder. It is practically insoluble in water, in ethanol (95) and in diethyl ether.

It readily dissolves in hydrochloric acid and in nitric acid without effervescence.

It is slightly hygroscopic, and changes moistened blue litmus paper to red.

**Identification** Bismuth Subnitrate responds to the Qualitative Tests <1.09> for bismuth salt and nitrate.

**Purity (1)** Chloride <1.03>—Dissolve 0.7 g of Bismuth Subnitrate in 2 mL of water and 2 mL of nitric acid, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: evaporate 2 mL of nitric acid on a water bath to dryness, add 0.70 mL of 0.01 mol/L hydrochloric acid VS, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.035%).

(2) Sulfate—Dissolve 3.0 g of Bismuth Subnitrate in 3.0 mL of warm nitric acid, pour this solution into 100 mL of water, shake, and filter. Concentrate the filtrate on a water bath to 30 mL, filter, and use this filtrate as the sample solution. To 5 mL of the sample solution add 2 to 3 drops of barium nitrate TS: no turbidity is produced.

(3) Ammonium—Boil 0.10 g of bismuth Subnitrate with 5 mL of sodium hydroxide TS: the gas evolved does not change moistened red litmus paper to blue.

(4) Copper—To 5 mL of the sample solution obtained in (2) add 2 mL of ammonia TS, and filter: no blue color develops.

(5) Lead—To 1.0 g of Bismuth Subnitrate add 5 mL of a solution of sodium hydroxide (1 in 6), boil carefully for 2 minutes, cool and centrifuge. Transfer the supernatant liquid to a test tube, add 10 drops of potassium chromate TS, and add dropwise acetic acid (31) to render the solution acid: no turbidity or yellow precipitate is produced.

(6) Silver—To 5 mL of the sample solution obtained in (2) add 0.5 mL of nitric acid and 2 to 3 drops of dilute hydrochloric acid: no turbidity is produced.

(7) Alkaline earth metals and alkali metals—Boil 2.0 g of Bismuth Subnitrate with 40 mL of diluted acetic acid (31) (1 in 2) for 2 minutes, cool, add water to make 40 mL, and filter. To 20 mL of the filtrate add 2 mL of dilute hydrochloric acid, boil, immediately pass hydrogen sulfide thoroughly through the solution, filter, and wash the residue with water. Combine the filtrate and the washings, add 5 drops of sulfuric acid, evaporate to dryness, and ignite as directed under Residue on Ignition <2.44>: the residue does not exceed 5.0 mg.

(8) Arsenic <1.17>—To 0.20 g of Bismuth Subnitrate add 2 mL of sulfuric acid, heat until white fumes evolve, dilute cautiously with water to 5 mL, use this solution as the test solution, and perform the test (not more than 10 ppm).

**Loss on drying** <2.41> Not more than 3.0% (2 g, 105°C, 2 hours).

**Assay** Weigh accurately about 0.4 g of Bismuth Subnitrate, previously dried, dissolve in 5 mL of diluted nitric acid (2 in 5) by warming, and add water to make exactly 100 mL. Pipet 25 mL of the solution, add 200 mL of water and titrate <2.50> with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to yellow (indicator: 5 drops of xylene orange TS).

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 4.180 mg of Bi

**Containers and storage** Containers—Well-closed containers.

**Bisoprolol Fumarate**

**Description** Bisoprolol Fumarate occurs as white crystals

\[(C_{18}H_{31}NO_{4})_2\cdot C_4H_4O_4 \cdot 766.96\]

\[
\text{(2S,RS)-1-[(4-[2-(1-Methylethoxy)ethoxy]methyl)phenoxy]-3-[(1-methylethyl)amino]propan-2-ol fumarate [104344-23-2]}
\]

Bisoprolol Fumarate, when dried, contains not less than 98.5% and not more than 101.0% of \((C_{18}H_{31}NO_{4})_2\cdot C_4H_4O_4\).

**Description** Bisoprolol Fumarate occurs as white crystals
or a white crystalline powder.

It is very soluble in water and in methanol, and freely soluble in ethanol (99.5) and in acetic acid (100).

A solution of Bisoprolol Fumarate (1 in 10) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Bisoprolol Fumarate in methanol (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry \( < 2.24 \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bisoprolol Fumarate as directed in the potassium bromide disc method under Infrared Spectrophotometry \( < 2.25 \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** \( < 2.60 \) 101 - 105°C

**Purity (1)** Heavy metals \( < 1.07 \)—Proceed with 2.0 g of Bisoprolol Fumarate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Bisoprolol Fumarate in 100 mL of a mixture of water and acetonitrile (4:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mixture of water and acetonitrile (4:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu \)L of each of the sample solution and standard solution as directed under Liquid Chromatography \( < 2.01 \) according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peaks other than bisoprolol obtained from the sample solution is not larger than 1/2 times the peak area of bisoprolol from the standard solution. Furthermore, the total of the areas of all peaks other than bisoprolol from the sample solution is not larger than the peak area of bisoprolol from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 4.08 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust to pH 2.5 with phosphoric acid. To 800 mL of this solution add 200 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of bisoprolol is about 8 minutes.

Time span of measurement: About 2 times as long as the retention time of bisoprolol, beginning after the fumaric acid peak.

**System suitability**—

Test for required detectability: Pipet 2 mL of the standard solution, and add a mixture of water and acetonitrile (4:1) to make exactly 20 mL. Confirm that the peak area of bisoprolol obtained from 20 \( \mu \)L of this solution is equivalent to 7 to 13% of that from 20 \( \mu \)L of the standard solution.

System performance: When the procedure is run with 20 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of bisoprolol are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of bisoprolol is not more than 1.5%.

**Loss on drying** \( < 2.41 \) Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 80°C, 5 hours).

**Residue on ignition** \( < 2.44 \) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Bisoprolol Fumarate, previously dried, dissolve in 70 mL of acetic acid (100), and titrate \( < 2.50 \) with 0.1 mol/L perchloric acid VS (indicator: 2 drops of crystal violet TS). The endpoint of titration is when the purple color of the solution turns blue and then blue-green. Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 38.35 mg of \((C_{18}H_{31}NO_4)_2C_4H_4O_4\)

**Containers** Containers—Tight containers.

---

**Bisoprolol Fumarate Tablets**

ビソプロロールフマル酸塩錠

Bisoprolol Fumarate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of bisoprolol fumarate \([C_{18}H_{31}NO_4]_2C_4H_4O_4: 766.96\).

**Method of preparation** Prepare as directed under Tablets, with Bisoprolol Fumarate.

**Identification** To a quantity of powdered Bisoprolol Fumarate Tablets, equivalent to 10 mg of Bisoprolol Fumarate according to the labeled amount, add 60 mL of methanol, shake vigorously for 10 minutes, add methanol to make 100 mL, and filter through a membrane filter with a pore size not exceeding 0.45 \( \mu \)m. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry \( < 2.24 \); it exhibits a maximum between 271 nm and 275 nm.

**Uniformity of dosage units** \( < 6.02 \)—Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Take 1 tablet of Bisoprolol Fumarate Tablets, disintegrate by adding 8 mL of water, and add water to make exactly 10 mL, and then filter through a membrane filter with a pore size not exceeding 0.45 \( \mu \)m. Discard the first 3 mL of the filtrate, pipet 1 mL of the subsequent filtrate, add water to make exactly 1 mL so that each mL contains about 0.1 mg of bisoprolol fumarate \([C_{18}H_{31}NO_4]_2C_4H_4O_4\), and use as the sample solution. Separately, weigh accurately about 20 mg of bisoprolol fumarate for assay, previously dried under reduced pressure at 80°C for 5 hours, using phosphorus (V) oxide as a dessicant, dissolve in water to make exactly 200 mL, and use as the standard solution. Determine the absor-
that each mL contains about 2.8 solution medium to make exactly 100 mL. Pipet 2 mL of this solution with exactly 50 mL, and use this solution as the standard solution. Perform the solution, add the dissolution medium to make exactly 100 mL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Qf and Qs, of the peak area of bisoprolol to that of the internal standard.

Amount (mg) of bisoprolol fumarate [(C18H31NO4)2.C4H4O4]i n1t a b l e t

\[ M_S = \frac{\text{Amount (mg) of bisoprolol fumarate for assay}}{\frac{A_T}{A_S} \times \frac{V}{V} \times \frac{1}{1/20}} \]

\[ M_S: \text{Amount (mg) of bisoprolol fumarate for assay} \]

\[ C: \text{Labeled amount (mg) of bisoprolol fumarate} \]

\[ [(C18H31NO4)2.C4H4O4], \text{in 1 tablet} \]

Dissolution rate (%) with respect to the labeled amount of bisoprolol fumarate [(C18H31NO4)2.C4H4O4]

\[ M_5 = \frac{A_S}{A_5} \times \frac{V}{V} \times \frac{1}{1/C} \times 18 \]

\[ M_5: \text{Amount (mg) of bisoprolol fumarate for assay} \]

\[ A_T, A_S: \text{bances of the sample solution and standard solution at 271.5 nm as directed under Ultraviolet-visible Spectrophotometry} <2.24>. \]

Mobile phase: Dissolve 4.08 g of potassium dihydrogen phosphate in 800 mL of this solution, dissolve in the mixture of water and acetonitrile (3:1) to make 100 mL. Filter this solution through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 3 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg of bisoprolol fumarate for assay, previously dried in vacuum at 80°C for 5 hours using phosphorus (V) oxide as the desiccant, add exactly 10 mL of the internal standard solution, dissolve in the mixture of water and acetonitrile (3:1) to make 100 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Qf and Qs, of the peak area of bisoprolol to that of the internal standard.

Amount (mg) of bisoprolol fumarate [(C18H31NO4)2.C4H4O4] in 1 tablet

Internal standard solution—A solution of isopropyl parahydroxybenzoate in the mixture of water and acetonitrile (3:1) (1 in 250).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 4.08 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust to pH 2.5 with phosphoric acid. To 800 mL of this solution add 200 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of bisoprolol is about 8 minutes.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, fumaric acid, bisoprolol and the internal standard are eluted in this order with the resolution between the peaks of bisoprolol and the internal standard being not less than 12.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of bisoprolol to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.
Bleomycin Hydrochloride

Bleomycin Hydrochloride is the hydrochloride of a mixture of substances having antitumor activity produced by the growth of *Streptomyces verticillus*. It contains not less than 1400 μg (potency) and not more than 2000 μg (potency) per mg, calculated on the dried basis. The potency of Bleomycin Hydrochloride is expressed as mass (potency) of bleomycin A2 (C55H84ClN17O21S3: 1451.00).

**Description**
Bleomycin Hydrochloride occurs as a white to yellowish white powder. It is freely soluble in water, and slightly soluble in ethanol (95%). It is hygroscopic.

**Identification**
(1) To 4 mg of Bleomycin Hydrochloride add 5 mL of copper (II) sulfate TS, and dissolve in water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bleomycin Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Bleomycin Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> (2) for chloride.

**pH**
The pH of a solution obtained by dissolving 0.10 g of Bleomycin Hydrochloride in 20 mL of water is between 4.5 and 6.0.

**Content ratio of the active principle**
Dissolve 10 mg of Bleomycin Hydrochloride in 20 mL of water, and use this solution as the sample solution. Perform the test with 20 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of bleomycin A2 (the first principal peak) is between 55% and 70%, that of bleomycin B2 (the second principal peak) is between 25% and 32%, the total peak area of bleomycin A2 and bleomycin B2 is not less than 85%, the peak area of demethylbleomycin A2 (a peak having the relative retention time of 1.5 – 2.5 to bleomycin A2) is not more than 5.5%, and the total area of the rest peaks is not more than 9.5%.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase stock solution: Dissolve 0.96 g of sodium 1-pentanesulfonate and 1.86 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate in 1000 mL of water and 5 mL of acetic acid (100), and adjust the pH to 4.3 with ammonia TS.

Mobile phase A: A mixture of the mobile phase stock solution and methanol (9:1).

Mobile phase B: A mixture of the mobile phase stock solution and methanol (3:2).

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following...
Purity (1) Clarity and color of solution—A solution obtained by dissolving 80 mg of Bleomycin Hydrochloride in 4 mL of water is clear and colorless.

(2) Copper—Dissolve exactly 75 mg of Bleomycin Hydrochloride in exactly 10 mL of diluted nitric acid (1 in 100), and use this solution as the sample solution. Separately, to exactly 15 mL of Standard Copper Solution add diluted nitric acid (1 in 100) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Atomic Absorption Spectrophotometry <2.23> according to the following conditions: the absorbance of the sample solution is not more than that of the standard solution (not more than 200 ppm).

- Gas: Combustible gas—Acetylene
- Supporting gas—Air
- Lamp: Copper hollow-cathode lamp
- Wavelength: 324.8 nm

Loss on drying <2.47> Not more than 5.0% (60 mg, in vacuum, phosphorus (V) oxide, 60°C, 3 hours). Take the sample to be tested while avoiding moisture absorption.

Assay Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Mycobacterium smegmatis* ATCC 607

(ii) Agar medium for seed, base layer and transferring the test organism

| Glycerin   | 10.0 g |
| Peptone    | 10.0 g |
| Meat extract | 10.0 g |
| Sodium chloride | 3.0 g |
| Agar       | 15.0 g |
| Water      | 1000 mL |

Mix all the components, and sterilize. Adjust the pH after sterilization to 6.9 – 7.1 with sodium hydroxide TS.

(iii) Liquid media for suspending the test organism

| Glycerin   | 10.0 g |
| Peptone    | 10.0 g |
| Meat extract | 10.0 g |

Sodium chloride 3.0 g
Water 1000 mL
Mix all the components, and sterilize. Adjust the pH after sterilization to 6.9 – 7.1 with sodium hydroxide TS.

(iv) Preparation of seeded agar layer—Cultivate the test organism on the slant of the agar medium for transferring the test organism at 27°C for 40 to 48 hours, then inoculate the test organism thus obtained in 100 mL of the liquid media for suspending the test organism, cultivate with shaking at between 25°C and 27°C for 5 days, and use this as the suspension of test organism. Store the suspension of test organism at a temperature not exceeding 5°C, and use within 14 days. Add 0.5 mL of the suspension of test organism in 100 mL of the agar medium for seed previously kept at 48°C, mix thoroughly, and use as the seeded agar layer.

(v) Preparation of cylinder-agar plate—Proceed as directed in 1.7. Preparation of cylinder-agar plates under the Microbial Assay for Antibiotics, dispensing 5.0 mL of agar medium for base layer and 8.0 mL of the agar medium for seed into the Petri dish.

(vi) Standard solutions—Weigh accurately an amount of Bleomycin A2 Hydrochloride RS, previously dried under reduced pressure not exceeding 0.67 kPa at an ordinary temperature for 3 hours, equivalent to about 15 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 6.8 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below, and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 6.8 to make solutions so that each mL contains 30 μg (potency) and 15 μg (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(vii) Sample solutions—Weigh accurately an amount of Bleomycin Hydrochloride, equivalent to about 15 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 6.8 to make exactly 100 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 6.8 to make solutions so that each mL contains 30 μg (potency) and 15 μg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

Containers and storage Containers—tight containers.
Bleomycin Sulfate

Bleomycin Sulfate is the sulfate of a mixture of substances having antitumor activity produced by the growth of Streptomyces verticillus.

It contains not less than 1400 μg (potency) and not more than 2000 μg (potency) per mg, calculated on the dried basis. The potency of Bleomycin Sulfate is expressed as mass (potency) of bleomycin A₂ (C₅₅H₈₄ClN₁₇O₂₁S₃: 1451.00).

**Description**

Bleomycin Sulfate occurs as a white to yellowish white powder. It is freely soluble in water, and slightly soluble in ethanol (95).

It is hygroscopic.

**Identification**

(1) To 4 mg of Bleomycin Sulfate add 5 μL of copper (II) sulfate TS, and dissolve in water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bleomycin Sulfate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Bleomycin Sulfate (1 in 200) responds to the Qualitative Tests \(<1.09\rangle\) (1) and (2) for sulfate.

**pH** \(<2.54\rangle\)

The pH of a solution obtained by dissolving 10 mg of Bleomycin Sulfate in 20 mL of water is between 4.5 and 6.0.

**Content ratio of the active principle**

Dissolve 10 mg of Bleomycin Sulfate in 20 mL of water, and use this solution as the sample solution. Perform the test with 20 μL of the sample solution as directed under Liquid Chromatography \(<2.01\rangle\) according to the following conditions, and determine each peak area by the automatic integration method: the peak area of bleomycin A₂ (the first principal peak) is between 55% and 70%, that of bleomycin B₂ (the second principal peak) is between 25% and 32%, the total peak area of bleomycin A₂ and bleomycin B₂ is not less than 85%, the peak area of demethylbleomycin A₂ (a peak having the relative retention time of 1.5 - 2.5 against bleomycin A₂) is not more than 5.5%, and the total area of the rest peaks is not more than 9.5%.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase stock solution: Dissolve 0.96 g of sodium 1-pentanesulfonate and 1.86 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate in 1000 mL of water and 5 mL of acetic acid (100), and adjust the pH to 4.3 with ammonia TS.

Mobile phase A: A mixture of the mobile phase stock solution and methanol (9:1).

Mobile phase B: A mixture of the mobile phase stock solution and methanol (3:2).

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.
Flow rate: About 1.2 mL/min
Time span of measurement: Twenty minutes after elution of the peak of demethylbleomycin A₂ beginning after the solvent peak.
System suitability—
System performance: When the procedure is run with 20 μL of the sample solution under the above operating conditions, bleomycin A₂ and bleomycin B₂ are eluted in this order with the resolution between these peaks being not less than 5.
System repeatability: When the test is repeated 6 times with 20 μL of the sample solution under the above operating conditions, the relative standard deviation of the peak area of bleomycin A₂ is not more than 2.0%.

**Purity (1)**
Clarity and color of solution—A solution obtained by dissolving 80 mg of Bleomycin Sulfate in 4 mL of water is clear and colorless.

(2) Copper—Dissolve exactly 75 mg of Bleomycin Sulfate in 10 mL of diluted nitric acid (1 in 100), and use this solution as the sample solution. Separately, to exactly 15 mL of Standard Copper Solution add diluted nitric acid (1 in 100) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Atomic Absorption Spectrophotometry <2.23> according to the following conditions: the absorbance of the sample solution is not more than 2.41, and the absorbance of the standard solution is not more than 2.23, with the resolution between these peaks being not less than 5.

Wavelength: 324.8 nm
Lamp: Copper hollow-cathode lamp
Gas: Combustible gas—Acetylene
Supporting gas—Air

**Loss on drying <2.47>**
Not more than 3.0% (60 mg, in vacuum, phosphorus (V) oxide, 60°C, 3 hours). Take the sample to be tested while avoiding moisture absorption.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—*Mycobacterium smegmatis* ATCC 607
(ii) Agar medium for seed, base layer and transferring the test organism

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>

<td>0</td>
<td>100</td>
</tr>
</tbody>
</table>

Mix all the components and sterilize. Adjust the pH after sterilization to 6.9 – 7.1 with sodium hydroxide TS.

(iv) Preparation of seeded agar layer—Cultivate the test organism on the slant of the agar medium for transferring the test organism at 27°C for 40 to 48 hours, then inoculate the test organism thus obtained in 100 mL of the liquid medium for suspending the test organism, cultivate with shaking at between 25°C and 27°C for 5 days, and use this as the suspension of test organism. Store the suspension of test organism at a temperature not exceeding 5°C, and use within 14 days. Add 0.5 mL of the suspension of test organism in 100 mL of the agar medium for seed previously kept at 48°C, mix thoroughly, and use as the seeded agar layer.

(v) Preparation of cylinder-agar plate—Proceed as directed in 1.7. Preparation of cylinder-agar plates under the Microbial Assay for Antibiotics, dispensing 5.0 mL of agar medium for base layer and 8.0 mL of the agar medium for seed into the Petri dish.

(vi) Standard solutions—Weigh accurately an amount of Bleomycin A₂ Hydrochloride RS, previously dried under reduced pressure not exceeding 0.67 kPa at an ordinary temperature for 3 hours, equivalent to about 15 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 6.8 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below, and use within 30 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 6.8 to make solutions so that each mL contains 30 μg (potency) and 15 μg (potency), and use these solutions as the high concentration standard solution and low concentration standard solution, respectively.

(vii) Sample solutions—Weigh accurately an amount of Bleomycin Sulfate, equivalent to about 15 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 6.8 to make exactly 100 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 6.8 to make solutions so that each mL contains 30 μg (potency) and 15 μg (potency), and use these solutions as the high concentration sample solution and low concentration sample solution, respectively.

**Containers and storage**
Containers—Tight containers.

### Boric Acid

ホウ酸

**Identification**
Boric Acid, when dried, contains not less than 99.5% of H₃BO₃.

**Description**
Boric Acid occurs as colorless or white crystals or crystalline powder. It is odorless, and has a slight, characteristic taste.

It is freely soluble in warm water, in hot ethanol (95) and in glycerin, soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution of Boric Acid (1 in 20) is between 3.5 and 4.1.

**Identification** A solution of Boric Acid (1 in 20) responds...
to the Qualitative Tests <1.09> for borate.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Boric Acid in 25 mL of water or in 10 mL of hot ethanol (95): the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Boric Acid according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.1D>—Prepare the test solution with 0.40 g of Boric Acid according to Method 1, and perform the test (not more than 5 ppm).

**Loss on drying** <2.4I> Not more than 0.5% (2 g, silica gel, 5 hours).

**Assay** Weigh accurately about 1.5 g of Boric Acid, previously dried, add 15 g of D-sorbitol and 50 mL of water, and dissolve by warming. After cooling, titrate <2.50> with 1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS).

Each mL of 1 mol/L sodium hydroxide VS = 61.83 mg of H₃BO₃

**Containers and storage** Containers—Well-closed containers.

---

**Freeze-dried Botulism Antitoxin, Equine**

【乾燥ボツリヌスウマ抗毒素】

Freeze-dried Botulism Antitoxin, Equine, is a preparation for injection which is dissolved before use.

It contains botulism antitoxin type A, botulism antitoxin type B, botulism antitoxin type E and botulism antitoxin type F in immunoglobulin of horse origin. It may contain one, two or three of these four antitoxins.

It conforms to the requirements of Freeze-dried Botulism Antitoxin, Equine, in the Minimum Requirements for Biological Products.

**Description** Freeze-dried Botulism Antitoxin, Equine, becomes a colorless or yellow-brown, clear liquid or a slightly white-turbid liquid on the addition of solvent.

---

**Bromazepam**

【ブロマゼパム】

C₁₄H₁₀BrN₃O: 316.15
7-Bromo-5-(pyridin-2-yl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one

[1812-30-2]

Bromazepam, when dried, contains not less than 99.0% and not more than 101.0% of C₁₄H₁₀BrN₃O.

**Description** Bromazepam occurs as white to light yellowish white crystals or crystalline powder.

It is freely soluble in acetic acid (100), slightly soluble in methanol, in ethanol (99.5) and in acetone, and practically insoluble in water.

Melting point: about 245°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Bromazepam in ethanol (99.5) (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bromazepam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Bromazepam in a platinum crucible according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Bromazepam in 5 mL of a mixture of acetone and methanol (3:2), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mixture of acetone and methanol (3:2) to make exactly 50 mL. Pipet 5 mL of this solution, add the mixture of acetone and methanol (3:2) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 20 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, ammonia solution (28) and ethanol (99.5) (38:1:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution and the spot of the starting point are not more than 2, and not more intense than the spot from the standard solution.

**Loss on drying** <2.4I> Not more than 0.20% (1 g, 105°C, 4 hours).
Bromhexine Hydrochloride

**Description**  Bromhexine Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in formic acid, sparingly soluble in methanol, and slightly soluble in water and in ethanol (95%).

The pH of its saturated solution is between 3.0 and 5.0.

Melting point: about 239°C (with decomposition).

**Identification**

(1) Dissolve 3 mg of Bromhexine Hydrochloride in 0.01 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Bromhexine Hydrochloride as directed in the potassium bromide disk method under Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Add 20 mL of water to 1 g of Bromhexine Hydrochloride. After thorough shaking, add 3 mL of sodium hydroxide TS, and extract with four 20-mL portions of diethyl ether. Neutralize the water layer with dilute nitric acid; the solution responds to the Qualitative Tests <1.09> (2) for chloride.

**Purity**

(1) Heavy metals <1.07>—Proceed with 2.0 g of Bromhexine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 50 mg of Bromhexine Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add the mobile phase to make exactly 20 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 25 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than bromhexine is not larger than the peak area of bromhexine of the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 245 nm).

Column: A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.0 g of potassium dihydrogen phosphate in 900 mL of water, adjust the pH to 7.0 with 0.5 mol/L sodium hydroxide TS, and add water to make 1000 mL. To 200 mL of this solution add 800 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of bromhexine is about 6 minutes.

Selection of column: To 0.05 g of bamethane sulfate add 0.5 mL of the sample solution, and add the mobile phase to make 10 mL. Proceed with 5 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of bamethane and bromhexine in this order with the resolution between these peaks being not less than 7.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of bromhexine from 5 μL of the standard solution is between 5 mm and 15 mm.

Time span of measurement: About 2 times as long as the retention time of bromhexine beginning after the solvent peak.

**Loss on drying** <2.41>—Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44>—Not more than 0.1% (1 g).

**Assay**

Weigh accurately about 0.5 g of Bromhexine Hydrochloride, previously dried, dissolve in 2 mL of formic acid, add 60 mL of acetic anhydride, and warm in a water bath at 50°C for 15 minutes. After cooling, titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue-green to yellow-green (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 41.26 mg of \( \text{C}_{14}\text{H}_{10}\text{BrN}_{3}\text{O} \)

**Containers and storage**  Containers—Well-closed containers.

**Storage**—Light-resistant.
Bromocriptine Mesilate

Bromocriptine Mesilate occurs as a white to pale yellowish white or pale brownish white, crystalline powder. It is odorless, or has a faint characteristic odor. It is very soluble in acetic acid (100), freely soluble in methanol, sparingly soluble in ethanol (95), very slightly soluble in acetic anhydride, in dichloromethane and in chloroform, and practically insoluble in water and in diethyl ether.

It is gradually colored by light.

Identification (1) Dissolve 2 mg of Bromocriptine Mesilate in 1 mL of methanol, add 2 mL of a 4-dimethylaminobenzaldehyde-ferric chloride TS, and shake: a purplish blue color develops.

(2) Determine the absorption spectrum of a solution of Bromocriptine Mesilate in methanol (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Bromocriptine Mesilate as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Perform the test with Bromocriptine Mesilate as directed under Flame Coloration Test <1.04> (2): a green color appears.

Optical rotation <2.44> [α]D 20: +95° to +105° [0.1 g, calculated on the dried basis, a mixture of methanol and dichloromethane (1:1), 10 mL, 100 mm].

Purity (1) Clarity and color of solution—Dissolve 0.10 g of Bromocriptine Mesilate in 10 mL of methanol: the solution is clear, and has no more color than the following control solution.

Control solution: To 2.5 mL of Cobalt (II) Chloride CS, 6.0 mL of Iron (III) Chloride CS and 1.0 mL of Copper (II) Sulfate CS add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

Bromovalerylurea

Bromovalerylurea occurs as colorless or white crystals or crystalline powder. It is odorless, and has a slightly bitter taste.
It is soluble in ethanol (95%), sparingly soluble in diethyl ether, and very slightly soluble in water.

It dissolves in sulfuric acid, in nitric acid and in hydrochloric acid, and precipitates are produced on the addition of water.

It dissolves in sodium hydroxide TS.

Identification (1) Boil 0.2 g of Bromovalerylurea with 5 mL of a solution of sodium hydroxide (1 in 10): the gas evolved changes moistened red litmus paper to blue. Boil this solution with an excess of dilute sulfuric acid: the odor of valeric acid is perceptible.

(2) To 0.1 g of Bromovalerylurea add 0.5 g of anhydrous sodium carbonate, and decompose thoroughly by gentle heating. Dissolve the residue in 5 mL of hot water, cool, acidify with acetic acid (31), and filter: the filtrate responds to the Qualitative Tests (1.09) (2) for bromide.

Melting point 2.60° 151 – 155°C

Purity (1) Acidity or alkalinity—To 1.5 g of Bromovalerylurea add 30 mL of water, shake for 5 minutes, and filter: the filtrate is neutral.

(2) Chloride 1.03°—Perform the test with a 10-mL portion of the filtrate obtained in (1). Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.028%).

(3) Sulfate 1.14°—Perform the test with 10 mL of the filtrate obtained in (1). Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.038%).

(4) Heavy metals 1.07°—Proceed with 2.0 g of Bromovalerylurea according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Arsenic 1.11°—Dissolve 0.5 g of Bromovalerylurea in 5 mL of sodium hydroxide TS, use this solution as the test solution, and perform the test (not more than 4 ppm).

(6) Readily carbonizable substances 1.15°—Perform the test with 0.5 g of Bromovalerylurea: the solution is not more colored than Matching Fluid A.

Loss on drying 2.4I Not more than 0.5% (1 g, 80°C, 2 hours).

Residue on ignition 2.4I Not more than 0.1% (1 g).

Assay Weigh accurately about 0.4 g of Bromovalerylurea, previously dried, in a 300-mL conical flask, add 40 mL of sodium hydroxide TS, and boil gently for 20 minutes under a reflux condenser. Cool, wash the lower part of the reflux condenser and the mouth of the flask with 30 mL of water, and combine the washings with the solution in the conical flask. Add 5 mL of nitric acid and exactly 30 mL of 0.1 mol/L silver nitrate VS, and titrate 2.50° the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination.

Each mL of 0.1 mol/L silver nitrate VS = 22.31 mg of C₇H₁₃N₂O₃S₂

Containers and storage Containers—Well-closed containers.

Bucillamine

ブシラミン

C₇H₁₃NO₃S₂: 223.31

(2R)-2-(2-Methyl-2-sulfanylpropanoylamino)-3-sulfanylpropanoic acid [65002-17-7]

Bucillamine, when dried, contains not less than 98.5% and not more than 101.0% of C₇H₁₃NO₃S₂.

Description Bucillamine occurs as white, crystals or crystalline powder.

It is freely soluble in methanol and in ethanol (95), and slightly soluble in water.

Identification (1) To 5 mL of a solution of Bucillamine (1 in 250) add 2 mL of sodium hydroxide TS and 2 drops of sodium pentacyanonitrosylferrate (III) TS: the solution reveals a red-purple color.

(2) Determine the infrared absorption spectrum of Bucillamine as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25°, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation 2.49° [α]D: +33.0° – +36.5° (after drying, 2 g, ethanol (95), 50 mL, 100 mm).

Melting point 2.60° 136 – 140°C

Purity (1) Heavy metals 1.07°—Proceed with 1.0 g of Bucillamine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic 1.11°—Prepare the test solution with 1.0 g of Bucillamine according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 60 mg of Bucillamine in 20 mL of a mixture of water and methanol (1:1), and use this solution as the sample solution. Pipet 3 mL of the sample solution, add the mixture of water and methanol (1:1) to make exactly 200 mL, and use this solution as the standard solution. Immediately perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01° according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of related substances, having the relative retention time of about 2.3 and 3.1 with respect to the peak of bucillamine, obtained from the sample solution are not larger than 8/15 times and 2/5 times the peak area of bucillamine from the standard solution, respectively, and the area of the peak other than the peaks of bucillamine and two of the related substances mentioned above from the sample solution is not larger than 1/5 times the peak area of bucillamine from the standard solution. The total area of the peaks other than bucillamine from the sample solution is not larger than the peak area of bucil-
Bucillamine Tablets

Bucillamine Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of bucillamine (C7H13NO3S2: 223.31).

Method of preparation Prepare as directed under Tablets, with Bucillamine.

Identification (1) To a quantity of powdered Bucillamine Tablets, equivalent to 0.1 g of Bucillamine according to the labeled amount, add 0.1 g of sodium hydrogen carbonate and 10 mL of water, shake well, filter, and add 1 or 2 drops of ninhydrin TS to the filtrate: it exhibits a red-brown color.

(2) To a quantity of powdered Bucillamine Tablets, equivalent to 0.1 g of Bucillamine according to the labeled amount, add 25 mL of water, shake well, and filter. To 5 mL of the filtrate, add 2 mL of dilute sodium hydroxide TS and 1 or 2 drops of sodium pentacyanonitrosylferrate (III) TS: it exhibits a red-purple color.

Uniformity of dosage units <6.02>—Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Store the sample solution and standard solution in a cold place until performing the measurements. Take 1 tablet of Bucillamine Tablets, add exactly 1 mL of the internal standard solution per 0.1 g of bucillamine (C7H13NO3S2), then add 3 mL of water and 6 mL of methanol per 0.1 g of bucillamine (C7H13NO3S2), and stir well until the tablet completely disintegrated. To 1 mL of this solution add the mobile phase to make 25 mL, filter through a membrane filter with a pore size not exceeding 0.45 μm, and use the filtrate as the sample solution. Then, proceed as directed in the Assay.

Internal standard solution—A solution of 4-fluorobenzoic acid in methanol (1 in 100).

Dissolution <6.10>—When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Bucillamine Tablets is not less than 80%.

Store the sample solution and standard solution in a cold place until performing the measurements. Start the test with 1 tablet of Bucillamine Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, add 2 mL of dilute sodium hydroxide TS and 1 or 2 drops of sodium pentacyanonitrosylferrate (III) TS: it exhibits a red-purple color.
Mobile phase: A mixture of diluted phosphoric acid (1 in 1000) and methanol (11:9).
Flow rate: Adjust the flow rate so that the retention time of bucillamine is about 4 minutes.

System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of bucillamine are not less than 3000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of bucillamine is not more than 2.0%.

Assay—Store the sample solution and standard solution in a cold place until performing the measurements. Take 10 tablets of Bucillamine Tablets, add exactly 1 mL of the internal standard solution per 0.1 g of bucillamine (C7H13NO3S2), add 3 mL of water and 6 mL of methanol, and stir well until the tablets completely disintegrated. To 1 mL of this solution add the mobile phase to make 25 mL, filter through a membrane filter with a pore size not exceeding 0.45 μm, and use this solution as the sample solution. Separately, weigh accurately about 0.2 g of bucillamine for assay, previously dried in vacuum at 60°C to a constant weight, add exactly 2 mL of the internal standard solution as directed under Liquid Chromatography, and compare the ratio of the peak area of bucillamine to that of the internal standard.

\[
\text{Amount (mg) of bucillamine (C}_7\text{H}_{13}\text{NO}_3\text{S}_2) = M_5 \times \frac{Q_7}{Q_5} \times C \times \frac{1}{200}
\]

\(M_5\): Amount (mg) of bucillamine for assay
\(C\): Labeled amount (mg) of bucillamine (C7H13NO3S2) in 1 tablet

Internal standard solution—A solution of 4-fluorobenzoic acid in methanol (1 in 100).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: A mixture of diluted phosphoric acid (1 in 1000) and methanol (3:2).
Flow rate: Adjust the flow rate so that the retention time of bucillamine is about 4 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, bucillamine and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of bucillamine to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Tight containers.

Bucumolol Hydrochloride

Bucumolol Hydrochloride, when dried, contains not less than 99.0% of C17H23NO4.HCl.

Description
Bucumolol Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in water, sparingly soluble in methanol and in ethanol (95), slightly soluble in acetic acid (100), and practically insoluble in diethyl ether.

Melting point: about 228°C (with decomposition).

Identification (1) Dissolve 0.01 g of Bucumolol Hydrochloride in 10 mL of diluted ethanol (95) (1 in 2), and observe under ultraviolet light (main wavelength: 365 nm): the solution shows a yellow-green fluorescence. Render this solution alkaline by adding sodium hydroxide TS: the fluorescence disappears. Acidify the solution by adding dilute hydrochloric acid: the fluorescence reappears.

(2) Dissolve 0.1 g of Bucumolol Hydrochloride in 5 mL of water, and add 5 drops of Reinecke salt TS: a light red precipitate is formed.

(3) Determine the absorption spectrum of a solution of Bucumolol Hydrochloride (1 in 60,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Bucumolol Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(5) A solution of Bucumolol Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

Absorbance <2.24> \(E_{1 cm}^{10} = 330 \sim 360\) (after drying, 40 mg, water, 2500 mL).

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Bucumolol Hydrochloride in 20 mL of water: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of...
Bufetolol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic (1.10)—Prepare the test solution with 1.0 g of Bufetolol Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.10 g of Bufetolol Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add methanol to make exactly 25 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.03). Spot 5 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol and ammonia-ammonium chloride buffer solution, pH 10.7, (30:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** (2.41) Not more than 0.5% (1 g, 105°C, 5 hours).

**Residue on ignition** (2.44) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Bufetolol Hydrochloride, previously dried, add 45 mL of acetic acid (100), dissolve by warming at 60°C, and cool. Add 105 mL of acetic anhydride, and titrate (2.50) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 34.18 mg of C17H23NO4.HCl

**Containers and storage** Containers—Well-closed containers.

**Bufetolol Hydrochloride**

プフェトロール塩酸塩

C_{18}H_{29}NO_{4}.HCl: 359.89
1-(1,1-Dimethylethyl)amino-2-[5-(tetrahydrofuran-2-ylmethoxy)phenoxy]propan-2-ol monohydrochloride [35108-88-4]

Bufetolol Hydrochloride, when dried, contains not less than 98.5% of C_{18}H_{29}NO_{4}.HCl.

**Description** Bufetolol Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in water and in methanol, soluble in ethanol (95) and in acetic acid (100), and practically insoluble in diethyl ether.

A solution of Bufetolol Hydrochloride (1 in 10) is optically inactive.

**Identification** (1) To 5 mL of a solution of Bufetolol Hydrochloride (1 in 100) add 5 drops of Reinecke salt TS: a light red precipitate is formed.

(2) Determine the absorption spectrum of a solution of Bufetolol Hydrochloride (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Bufetolol Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Bufetolol Hydrochloride (1 in 50) responds to the Qualitative Tests (1.09) for chloride.

**Melting point** (2.60) 153 – 157°C

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Bufetolol Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Sulfate (1.14)—Perform the test with 0.5 g of Bufetolol Hydrochloride. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.038%).

(3) Heavy metals (1.07)—Proceed with 2.0 g of Bufetolol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Dissolve 0.20 g of Bufetolol Hydrochloride in 5 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.03). Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, acetone, ethanol (95) and ammonia solution (28) (40:20:5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** (2.41) Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** (2.44) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Bufetolol Hydrochloride, previously dried, dissolve in 10 mL of acetic acid (100), add 50 mL of acetic anhydride, and titrate (2.50) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 35.99 mg of C_{18}H_{29}NO_{4}.HCl

**Containers and storage** Containers—Tight containers.
Buformin Hydrochloride

プホルミン塩酸塩

Buformin Hydrochloride occurs as a white crystalline powder. It is freely soluble in water and in ethanol (99.5).

Identification (1) To 5 mL of a solution of Buformin Hydrochloride (1 in 2000) add 1 mL of dilute sodium pentacyanonitrosylferrate (III)-potassium hexacyanoferrate (III) TS: a red-brown color develops.

(2) Determine the absorption spectrum of a solution of Buformin Hydrochloride (1 in 125,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Buformin Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Buformin Hydrochloride (1 in 20) responds to the Qualitative Tests <1.00> for chlorides.

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Buformin Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Buformin Hydrochloride according to Method 1, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.10 g of Buformin Hydrochloride in 200 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine each peak area of both solutions by the automatic integration method: the area of the peak other than buformin obtained from the sample solution is not larger than 1/5 times the peak area of buformin from the standard solution. Furthermore, the total of the areas of all peaks other than the buformin peak from the sample solution is not larger than 1/2 times the peak area of buformin from the standard solution.

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilsanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: A mixture of a solution of sodium perchlorate monohydrate in diluted phosphoric acid (1 in 1000) (7 in 250) and acetonitrile (7:1).

Flow rate: Adjust the flow rate so that the retention time of buformin is about 6 minutes.

Time span of measurement: About 2 times as long as the retention time of buformin, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of buformin obtained from 10 μL of this solution is equivalent to 7 to 13% of that from 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of buformin are not less than 5000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of buformin is not more than 1.0%.

Loss on drying <2.47> Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.15 g of Buformin Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100:7:3), and immediately titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 9.684 mg of C₆H₁₅N₅.HCl

Containers and storage Containers—Tight containers.

Buformin Hydrochloride Enteric-coated Tablets

プホルミン塩酸塩腸溶錠

Buformin Hydrochloride Enteric-coated Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of buformin hydrochloride (C₆H₁₅N₅.HCl: 193.68).

Method of preparation Prepare as directed under Tablets, with Buformin Hydrochloride.

Identification To a quantity of powdered Buformin Hydrochloride Enteric-coated Tablets, equivalent to 0.1 g of Buformin Hydrochloride according to the labeled amount, add 10 mL of water, shake well, and then filter. To 4 mL of the filtrate add 1 mL of a mixture of hydrogen peroxide TS,
sodium pentacyanonitrosylferrate (III) TS and a solution of sodium hydroxide (1 in 10) (2:1:1): the solution exhibits a red to red-purple color.

**Uniformity of dosage units** \(\leq 6.02\%\) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Buformin Hydrochloride Enteric-coated Tablets add 5 mL of a mixture of ethanol (99.5) and acetone (1:1), disperse the pellicle to smaller using ultrasonic waves, add exactly 10 mL of the internal standard solution per 50 mg of buformin hydrochloride \((C_6H_{15}N_5.HCl)\), and then add diluted acetonitrile \((1 \text{ in } 2)\) to make 13\(V/20\) mL. Disintegrate the tablet using ultrasonic waves, then shake for 20 minutes, and add diluted acetonitrile \((1 \text{ in } 2)\) to make a solution, volume \(V\) mL, containing about 0.5 mg of buformin hydrochloride \((C_6H_{15}N_5.HCl)\) per mL. Centrifuge this solution, pipet 1 mL of the supernatant liquid, and add the mobile phase to make 50 mL. If necessary, filter this solution through a membrane filter with a pore size not exceeding 0.5 \(\mu\)m, and use the filtrate as the sample solution. Then, proceed as directed in the Assay.

**Internal standard solution**—A solution of \(p\)-acetasanisidine in diluted acetonitrile (1 in 2) (1 in 150).

**Dissolution** \(\leq 6.10\%\) When the tests are performed at 50 revolutions per minute according to the Paddle method, using 900 mL each of 1st fluid for dissolution test and 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 120 minutes of Buformin Hydrochloride Enteric-coated Tablets using the 1st fluid is not more than 5%, and that in 90 minutes of Buformin Hydrochloride Enteric-coated Tablets using the 2nd fluid is not less than 80%.

Start the test with 1 tablet of Buformin Hydrochloride Enteric-coated Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 \(\mu\)m. Discard the first 10 mL of the filtrate, pipet \(V\) mL of the subsequent filtrate, add the relevant dissolution medium to make exactly \(V\) mL so that each mL contains about 56 \(\mu\)g of buformin hydrochloride \((C_6H_{15}N_5.HCl)\) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of buformin hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in the relevant dissolution medium to make exactly 100 mL. Pipet 4 mL of this solution, add the relevant dissolution medium to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\%\) according to the following conditions, and determine the buformin peak areas, \(A_T\) and \(A_S\), of both solutions.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 230 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeceansilnized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).

**Flow rate:** Adjust the flow rate so that the retention time of buformin is about 6 minutes.

**System suitability**—

**System performance:** When the procedure is run with 20 \(\mu\)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of buformin are not less than 3000 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 20 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of buformin is not more than 2.0%.

**Assay** Add 20 mL of a mixture of ethanol (99.5) and acetone (1:1) to an amount of Buformin Hydrochloride Enteric-coated Tablets equivalent to 0.5 g of buformin hydrochloride \((C_6H_{15}N_5.HCl)\), disperse the pellicle to smaller using ultrasonic waves, and then add 100 mL of diluted acetonitrile (1 in 2). Disintegrate the tablets with the aid of ultrasonic waves, shake for 20 minutes, and then add diluted acetonitrile (1 in 2) to make exactly 200 mL. Centrifuge this solution, pipet 10 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, and then add diluted acetonitrile (1 in 2) to make 50 mL. Pipet 1 mL of this solution, and add the mobile phase to make 50 mL. If necessary, filter this solution through a membrane filter with a pore size not exceeding 0.5 \(\mu\)m, and use the filtrate as the sample solution.

Separately, weigh accurately about 25 mg of buformin hydrochloride for assay, previously dried at 105°C for 3 hours, dissolve in an adequate amount of diluted acetonitrile (1 in 2), add exactly 5 mL of the internal standard solution, and then add diluted acetonitrile (1 in 2) to make 50 mL. To 1 mL of this solution add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 10 \(\mu\)L of each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\%\) according to the following conditions, and calculate the ratios, \(Q_T\) and \(Q_S\), of the peak area of buformin to that of the internal standard.

**Operating conditions**—

**Detector:** An ultraviolet absorption photometer (wavelength: 233 nm).

**Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeceansilnized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).
gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: A mixture of a solution of sodium perchlorate (7 in 250) and acetonitrile (7:1).

Flow rate: Adjust the flow rate so that the retention time of buformin is about 7 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, buformin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of buformin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Well-closed containers.

Buformin Hydrochloride Tablets

ブホルミン塩酸塩

Buformin Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of buformin hydrochloride (C₆H₁₅N₅.HCl: 193.68).

Method of preparation Prepare as directed under Tablets, with Buformin Hydrochloride.

Identification To a quantity of powdered Buformin Hydrochloride Tablets, equivalent to 1 g of Buformin Hydrochloride according to the labeled amount, add 100 mL of water, shake well, and then filter. To 4 mL of the filtrate add 1 mL of dilute sodium pentacyanodisulfitoferrous (III)-potassium hexacyanoferrate (III) TS: the solution exhibits a red-brown color.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Take 1 tablet of Buformin Hydrochloride Tablets, add water to make exactly 200 mL, and then treat with ultrasonic waves for 5 minutes. Take 40 mL of this solution and centrifuge. Pipet V mL of the supernatant liquid equivalent to about 0.5 mg of buformin hydrochloride (C₆H₁₅N₅.HCl), add water to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of buformin hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 200 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A₁ and A₅, of the sample solution and standard solution at 233 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A₅, at 233 nm.

Amount (mg) of buformin hydrochloride (C₆H₁₅N₅.HCl) = M₅ × A₅ / A₁ × V / V / 1 / C × 18

M₅: Amount (mg) of buformin hydrochloride for assay

C: Labeled amount (mg) of buformin hydrochloride (C₆H₁₅N₅.HCl) in 1 tablet

Assay Weigh accurately not less than 20 Buformin Hydrochloride Tablets, and weigh accurately a portion of the powder, equivalent to about 60 mg of buformin hydrochloride (C₆H₁₅N₅.HCl), add water to make exactly 200 mL, and treat with ultrasonic waves for 5 minutes. Take 40 mL of this solution, centrifuge, pipet 2 mL of the supernatant liquid, add water to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 60 mg of buformin hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 200 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A₅, at 233 nm.

Amount (mg) of buformin hydrochloride (C₆H₁₅N₅.HCl) = M₅ × A₅ / A₁ × V

M₅: Amount (mg) of buformin hydrochloride for assay

Containers and storage Containers—Well-closed containers.

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Buformin Hydrochloride Tablets is not less than 80%.

Start the test with 1 tablet of Buformin Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, and add water to make exactly V mL so that each mL contains about 5.6 μg of buformin hydrochloride (C₆H₁₅N₅.HCl) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of buformin hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A₅, at 233 nm.

Amount (mg) of buformin hydrochloride (C₆H₁₅N₅.HCl) = M₅ × A₅ / A₁ × V / V / 1 / C × 18

M₅: Amount (mg) of buformin hydrochloride for assay
Bumetanide

ブメタニド

C₁₇H₂₃N₂O₅S: 364.42
3-Butylamino-4-phenoxy-5-sulfamoylbenzoic acid
[28395-03-1]

Bumetanide, when dried, contains not less than 98.5% of C₁₇H₂₃N₂O₅S.

Description Bumetanide occurs as white crystals or crystal-line powder.

It is freely soluble in pyridine, soluble in methanol and in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water.

It dissolves in potassium hydroxide TS.

It is gradually colored by light.

Identification (1) Dissolve 0.01 g of Bumetanide in 1 mL of pyridine, add 2 drops of copper (II) sulfate TS, shake, add 3 mL of water and 5 mL of chloroform, shake, and allow to stand: a light blue color develops in the chloroform layer.

(2) Dissolve 0.04 g of Bumetanide in 100 mL of phosphate buffer solution, pH 7.0, and dilute 10 mL of the solution with water to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Bumetanide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare with the spectrum of the Standard Solution: both spectra exhibit similar intensities of absorption at the same wave numbers.

Melting point <2.60> 232 – 237°C

Purity (1) Clarity and color of solution—Dissolve 50 mg of Bumetanide in 2 mL of a solution of potassium hydroxide (1 in 30) and 8 mL of water: the solution is clear, and is not more colored than the following control solution.

Control solution: Pipet 0.5 mL each of Cobalt (II) Chloride CS, Iron (III) Chloride CS and Copper (II) Sulfate CS, mix them, and add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

(2) Chloride <1.05>—Mix well 0.5 g of Bumetanide with 0.7 g of potassium nitrate and 1.2 g of anhydrous sodium carbonate, transfer in small portions, to a red-hot platinum crucible, and heat to red-hot until the reaction is complete.

After cooling, to the residue add 14 mL of dilute sulfuric acid and 6 mL of water, boil for 5 minutes, filter, wash the residue with 10 mL of water, combine the filtrate and the washing, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Bumetanide according to Method 2, and perform the test.

Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Bumetanide according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.10 g of Bumetanide in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 2 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, acetic acid (100), cyclohexane and methanol (32:4:4:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.44> Not more than 0.5% (1 g, 105°C, 2 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Bumetanide, previously dried, dissolve in 50 mL of ethanol (95), and titrate <2.30> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 36.44 mg of C₁₇H₂₃N₂O₅S

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Bunazosin Hydrochloride

ブナゾシン塩酸塩

C₁₉H₂₇N₅O₃.HCl: 409.91
4-Amino-2-(4-butanoyl-1,4-diazepan-1-yl)-6,7-dimethoxyquinazoline monohydrochloride
[72712-76-2]

Bunazosin Hydrochloride, when dried, contains not less than 98.0% of C₁₉H₂₇N₅O₃.HCl.

Description Bunazosin Hydrochloride occurs as a white
crystalline powder.

It is very soluble in formic acid, slightly soluble in water and in methanol, very slightly soluble in ethanol (99.5), and practically insoluble in diethyl ether.

Melting point: About 273°C (with decomposition).

**Identification (1)** Dissolve 0.1 g of Bunazosin Hydrochloride in 10 mL of 0.2 mol/L hydrochloric acid TS, and boil for 3 minutes over a flame: butyric acid like odor is perceptible.

(2) Determine the infrared absorption spectrum of Bunazosin Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Bunazosin Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> for chloride.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Bunazosin Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.05 g of Bunazosin Hydrochloride in 50 mL of the mobile phase, and use this solution as the sample solution. To exactly 1 mL of the sample solution add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of the peaks other than the peak of bunazosin from the sample solution is not larger than the peak area of bunazosin from the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecyldimethylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: Dissolve 1.44 g of sodium lauryl sulfate in a suitable amount of water, add 10 mL of acetic acid (100), 500 mL of acetonitrile and water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of bunazosin is about 5 minutes.

Selection of column: Proceed with 20 μL of a mixture of the standard solution and a solution of procaine hydrochloride in the mobile phase (1 in 20,000) (1:1) under the above operating conditions, and calculate the resolution. Use a column giving elution of procaine and bunazosin in this order with the resolution between these peaks being not less than 3.0.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of bunazosin obtained from 20 μL of the standard solution is 20 to 60% of the full-scale.

Time span of measurement: About 6 times of the retention time of bunazosin.

**Loss on drying <2.41>** Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Bunazosin Hydrochloride, previously dried, dissolve in 6 mL of formic acid, add exactly 15 mL of 0.1 mol/L perchloric acid, and heat for 20 minutes on a water bath. After cooling, add 20 mL of acetic acid (100), and titrate <2.50> the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS = 40.99 mg of C₁₉H₂₇N₅O₃.HCl

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

## Bupranolol Hydrochloride

### ブプラノール塩酸塩

C₁₄H₂₃ClN₂O₂.HCl: 308.24
(2R,5S)-3-(2-Chloro-5-methylphenoxy)-1-(1,1-dimethylethyl)aminopropan-2-ol monohydrochloride [15148-80-8]

Bupranolol Hydrochloride, when dried, contains not less than 98.0% of C₁₄H₂₃ClN₂O₂.HCl.

**Description** Bupranolol Hydrochloride occurs as a white, crystalline powder.

It is sparingly soluble in methanol, slightly soluble in water, in ethanol (95) and in acetic acid (100), very slightly soluble in acetic anhydride, and practically insoluble in diethyl ether.

The pH of a solution of Bupranolol Hydrochloride (1 in 1000) is between 5.2 and 6.2.

**Identification (1)** Take 0.01 g of Bupranolol Hydrochloride in a test tube, mix with 25 mg of potassium iodide and 25 mg of oxalic acid dihydrate, cover the mouth of the test tube with filter paper moistened with a solution of 2,6-dibromo-N-chloro-1,4-benzoquinone monooimine in ethanol (95) (1 in 100), and heat gently for several minutes. Expose the filter paper to ammonia gas: the filter paper acquires a blue color.

(2) Determine the absorption spectrum of a solution of Bupranolol Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Bupranolol Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Bupranolol Hydrochloride (1 in 200) responds to the Qualitative Tests <1.09> for chloride.
Absorbance $<2.24$  $E_{1\%}^{1\text{cm}}$ (275 nm): 57 – 60 (after drying, 50 mg, 0.1 mol/L hydrochloric acid TS, 500 mL).

**Purity** (1) Clarity and color of solution—Dissolve 0.1 g of Buprenolol Hydrochloride in 15 mL of water: the solution is clear and colorless.

(2) Acidity—Dissolve 0.1 g of Buprenolol Hydrochloride in 15 mL of freshly boiled and cooled water, and add 1 drop of methyl red TS: a light red color develops. To this solution add 0.05 mL of 0.01 mol/L sodium hydroxide VS: the color changes to yellow.

(3) Sulfate $<1.14$—Perform the test with 0.1 g of Buprenolol Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.168%).

(4) Heavy metals $<1.07$—Proceed with 1.0 g of Buprenolol Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(5) Arsenic $<1.15$—Prepare the test solution with 1.0 g of Buprenolol Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(6) Related substances—Dissolve 0.30 g of Buprenolol Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $<2.03>$. Spot 10 µL each of the sample solution and standard solution on a plate of polyamide with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol, ammonia solution (28) and water (16:4:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** $<2.47$  Not more than 0.5% (0.5 g, 105°C, 4 hours).

**Residue on ignition** $<2.44$  Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.18 g of Buprenolol Hydrochloride, previously dried, dissolve in 60 mL of a mixture of acetic anhydride and acetic acid (100) (2:1) by warming, cool, and titrate $<2.50$  with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 30.82 mg of C$_{14}$H$_{22}$ClNO$_2$.HCl

**Containers and storage** Containers—Well-closed containers.

---

**Buprenorphine Hydrochloride**

ブプレノルフィン塩酸塩

C$_{29}$H$_{41}$NO$_4$.HCl: 504.10
(2S)-2-[(5R,6R,7R,14S)-17-(Cyclopropylmethyl)-4,5-epoxy-3-hydroxy-6-methoxy-6,14-ethanomorphinan-7-yl]-3,3-dimethylbutan-2-ol monohydrochloride [53152-21-9]

Buprenorphine Hydrochloride, when dried, contains not less than 98.5% and not more than 101.0% of C$_{29}$H$_{41}$NO$_4$.HCl.

**Description** Buprenorphine Hydrochloride occurs as white to yellowish white, crystals or a crystalline powder.

It is freely soluble in methanol and in acetic acid (100), and sparingly soluble in water and in ethanol (99.5). Melting point: about 268°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Buprenorphine Hydrochloride (1 in 5000) as directed under Ultraviolet-visible Spectrophotometry $<2.24>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Buprenorphine Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Buprenorphine Hydrochloride (1 in 100) responds to the Qualitative Tests $<1.09>$ for chloride.

**Optical rotation** $<2.49>$  [α]$_D^2$: $-92$ – $-98$° (after drying, 0.4 g, methanol, 20 mL, 100 mm).

**pH** $<2.54>$  The pH of a solution prepared by dissolving 1.0 g of Buprenorphine Hydrochloride in 200 mL of water is between 4.0 and 6.0.

**Purity** (1) Clarity and color of solution—A solution obtained by dissolving 0.1 g of Buprenorphine Hydrochloride in 10 mL of water is clear and colorless.

(2) Heavy metals $<1.07$—Proceed with 1.0 g of Buprenorphine Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Dissolve 0.10 g of Buprenorphine Hydrochloride in 20 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution and standard solution as directed under Liquid Chromatography $<2.01>$ according to the following conditions. Determine each peak area of both solutions by the automatic integration...
Busulfan

Busulfan contains not less than 98.5% of C₆H₁₄O₆S₂, calculated on the dried basis.

**Description** Busulfan occurs as a white, crystalline powder. It is slightly soluble in diethyl ether, very slightly soluble in ethanol (95), and practically insoluble in water.

**Identification** (1) To 0.1 g of Busulfan add 10 mL of water and 5 mL of sodium hydroxide TS, dissolve by heating, and use this solution as the sample solution.

(i) To 7 mL of the sample solution add 1 drop of potassium permanganate TS: the red-purple color of potassium permanganate TS changes from blue-purple through blue to green.

(ii) Acidify 7 mL of the sample solution with dilute sulfuric acid, and add 1 drop of potassium permanganate TS: the color of potassium permanganate TS remains.

(2) Determine the infrared absorption spectrum of Busulfan, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** 2.60 115 – 118°C

**Purity** (1) Sulfate 1.14 To 1.0 g of Busulfan add 40 mL of water, and dissolve by heating. Cool in ice for 15 minutes, and filter. Wash the residue with 5 mL of water, combine the washings with the filtrate, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.019%).

(2) Heavy metals 1.07 Proceed with 1.0 g of Busulfan according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** 2.41 Not more than 2.0% (1 g, 115°C, 3 hours).

**Residue on ignition** 2.44 Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Buprenorphine Hydrochloride, previously dried, dissolve in 5 mL of acetic acid (100), add 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 50.41 mg of C₂₉H₄₁NO₄.HCl

**Containers and storage** Containers—Well-closed containers.

Tetramethylenedimethanesulfonate [55-98-1]

Busulfan...
Butenafine Hydrochloride

Butenafine Hydrochloride, when dried, contains not less than 99.0% and not more than 101.0% of C₂₃H₂₇N·HCl.

**Description** Butenafine Hydrochloride occurs as white, crystals or crystalline powder.

It is very soluble in formic acid, freely soluble in methanol and in ethanol (99.5), and slightly soluble in water.

The pH of a solution dissolved 0.20 g of Butenafine Hydrochloride in 100 mL of water by warming and cooled is 3.0 to 4.0.

Melting point: about 214°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Butenafine Hydrochloride in methanol (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Butenafine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Butenafine Hydrochloride in dilute ethanol (1 in 200) responds to the Qualitative Tests <1.09> (1) for chloride.

**Purity** (1) Heavy metals <1.07>—Dissolve 2.0 g of Butenafine Hydrochloride in 20 mL of ethanol (99.5), add 2 mL of dilute acetic acid and ethanol (99.5) to make 50 mL, and perform the test using this solution as the test solution.

The control solution: To 2.0 mL of Standard Lead Solution add 2 mL of dilute acetic acid, and add ethanol (99.5) to make 50 mL (not more than 10 ppm).

(2) Related substances—Dissolve 30 mg of Butenafine Hydrochloride in 50 mL of a mixture of water and acetonitrile for liquid chromatography (3:2), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of water and acetonitrile for liquid chromatography (3:2) to make exactly 50 mL. Pipet 1 mL of this solution, add a mixture of water and acetonitrile for liquid chromatography (3:2) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07>, according to the following conditions, and determine each peak area of both solutions by the automatic integration method: the area of the peak, having the relative retention time of about 0.16 to butenafine, obtained from the sample solution is not larger than 3/10 times the peak area of butenafine from the standard solution, and the area of the peak other than butenafine and other than the peak mentioned above obtained from the sample solution is not larger than the peak area of butenafine from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 217 nm).

Column: A stainless steel column 3.0 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase A: Diluted 0.5 mol/L ammonium acetate TS (1 in 1000).

Mobile phase B: Acetonitrile for liquid chromatography. Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0–10</td>
<td>60 → 20</td>
<td>40 → 80</td>
</tr>
<tr>
<td>10–60</td>
<td>20</td>
<td>80</td>
</tr>
</tbody>
</table>

Flow rate: 0.4 mL per minute.

Time span of measurement: For 60 minutes after injection, beginning after the solvent peak.

**System suitability**—

Test for required detectability: Pipet 2 mL of the standard solution, and add a mixture of water and acetonitrile for liquid chromatography (3:2) to make exactly 10 mL. Confirm that the peak area of butenafine obtained with 10 μL of this solution is equivalent to 14 to 26% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of butenafine are not less than 20,000 and 0.9 to 1.2, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of butenafine is not more than 2.0%.

(3) Residual solvents—Being specified separately.

**Loss on drying** <2.41> Not more than 0.1% (1 g, in vacuum, phosphorus (V) oxide, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Butenafine Hydrochloride, previously dried, dissolve in 5 mL of formic acid, add 80 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 35.39 mg of C₂₃H₂₇N·HCl.

**Containers and storage** Containers—Tight containers.
Butenafine Hydrochloride Cream

Butenafine Hydrochloride Cream contains not less than 95.0% and not more than 105.0% of the labeled amount of butenafine hydrochloride (C$_{23}$H$_{27}$N.HCl: 353.93).

**Method of preparation** Prepare as directed under Creams, with Butenafine Hydrochloride.

**Identification** To an amount of Butenafine Hydrochloride Cream, equivalent to 20 mg of Butenafine Hydrochloride according to the labeled amount, add 20 mL of acetonitrile, and warm on a water bath to melt the bases. Shake thoroughly, add an appropriate amount of sodium chloride, and allow to stand for 30 minutes in an ice cold water keeping not exceeding 0°C to separate out the bases. Centrifuge, collect the supernatant liquid, add an appropriate amount of sodium chloride to the liquid, allow to stand for 1 hour in an ice cold water keeping not exceeding 0°C, and filter while cooling. To 1 mL of the filtrate add methanol to make 20 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits maxima between 272 nm and 276 nm, between 281 nm and 285 nm, between 311 nm and 315 nm, and between 316 nm and 320 nm, and a shoulder between 289 nm and 299 nm.

**Assay** Weigh accurately a quantity of Butenafine Hydrochloride Cream, equivalent to about 5 mg of butenafine hydrochloride (C$_{23}$H$_{27}$N.HCl), add 20 mL of methanol, and add exactly 10 mL of the internal standard solution. Warm this in a water bath for 5 minutes, and shake vigorously for 20 minutes. Then, cool in an ice bath for 15 minutes, centrifuge, and filter the supernatant liquid with a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 5 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg of butenafine hydrochloride for assay, previously dried in vacuum at 60°C for 3 hours using phosphorus (V) oxide as desiccant, and dissolve in methanol to make exactly 100 mL. Pipet 20 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography: it exhibits maxima between 272 nm and 276 nm, between 281 nm and 285 nm, between 311 nm and 315 nm, and between 316 nm and 320 nm, and a shoulder between 289 nm and 299 nm.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 282 nm).

Column: A stainless steel column 3.0 mm in inside diameter and 5 cm in length, packed with octyacylsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of acetonitrile and diluted 0.5 mol/L ammonium acetate TS (1 in 500) (4:1).

Flow rate: Adjust the flow rate so that the retention time of butenafine is about 2.5 minutes.

**System suitability**—

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the internal standard and butenafine are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of butenafine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

Butenafine Hydrochloride Solution

Butenafine Hydrochloride Solution is a liquid for external use.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of butenafine hydrochloride (C$_{23}$H$_{27}$N.HCl: 353.93).

**Method of preparation** Prepare as directed under Liquids and Solutions for Cutaneous Application, with Butenafine Hydrochloride.

**Identification** To an amount of Butenafine Hydrochloride Solution, equivalent to 10 mg of Butenafine Hydrochloride according to the labeled amount, add methanol to make 200 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits maxima between 272 nm and 276 nm, between 281 nm and 285 nm, between 311 nm and 315 nm, and between 316 nm and 320 nm, and a shoulder between 289 nm and 299 nm.

**Assay** To an exact volume of Butenafine Hydrochloride Solution, equivalent to about 20 mg of butenafine hydrochloride (C$_{23}$H$_{27}$N.HCl), add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 4 mL of the internal standard solution, then add methanol to make 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of butenafine hydrochloride for assay, previously dried in vacuum at 60°C for 3 hours using phosphorus (V) oxide as desiccant, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 4 mL of the internal standard solution, then add methanol to make 25 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography: it exhibits maxima between 272 nm and 276 nm, between 281 nm and 285 nm, between 311 nm and 315 nm, and between 316 nm and 320 nm, and a shoulder between 289 nm and 299 nm.
Amount (mg) of butenafine hydrochloride (C\textsubscript{23}H\textsubscript{27}N.HCl) = \( M_s \times Q_T/Q_s \)

\( M_s \): Amount (mg) of butenafine hydrochloride for assay

**Internal standard solution**—A solution of diphenyl in methanol (3 in 2000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 282 nm).

Column: A stainless steel column 3.0 mm in inside diameter and 5 cm in length, packed with octylsilanized silica gel for liquid chromatography (3 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of acetonitrile and diluted 0.5 mol/L ammonium acetate TS (1 in 500) (4:1).

Flow rate: Adjust the flow rate so that the retention time of butenafine is about 2.5 minutes.

**System suitability**—

System performance: When the procedure is run with 5 \( \mu L \) of the standard solution under the above operating conditions, the internal standard and butenafine are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 5 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of butenafine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
Storage—Light-resistant.

**Butenafine Hydrochloride Spray**

プテナフィン塩酸塩スプレー

Butenafine Hydrochloride Spray contains not less than 95.0% and not more than 105.0% of the labeled amount of butenafine hydrochloride (C\textsubscript{23}H\textsubscript{27}N.HCl: 353.93).

**Method of preparation** Prepare as directed under Pump Sprays for Cutaneous Application, with Butenafine Hydrochloride.

**Identification** To an amount of Butenafine Hydrochloride Spray, equivalent to 10 mg of Butenafine Hydrochloride according to the labeled amount, add methanol to make 200 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (<2.24>); it exhibits maxima between 272 nm and 276 nm, between 281 nm and 285 nm, between 311 nm and 315 nm, and between 316 nm and 320 nm, and a shoulder between 289 nm and 299 nm.

**Assay** To an exact volume of Butenafine Hydrochloride Spray, equivalent to about 20 mg of butenafine hydrochloride (C\textsubscript{23}H\textsubscript{27}N.HCl), add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 4 mL of the internal standard solution, then add methanol to make 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of butenafine hydrochloride for assay, previously dried in vacuum at 60°C for 3 hours using phosphorus (V) oxide as desiccant, and dissolve in methanol to make exactly 50 mL. **Butropium Bromide**

ブトロピウム臭化物

Butropium Bromide occurs as white crystals or

\[
\text{Butropium Bromide (C}_{28}\text{H}_{38}\text{BrNO}_4 : 532.51}
\]

(1R,3r,5S)-8-(4-Butoxybenzyl)-3-[(25S)-hydroxy-2-phenylpropanoyloxy]-8-methyl-8-azoniabicyclo[3.2.1]octane bromide
[29025-14-7]

Butropium Bromide, when dried, contains not less than 98.0% of C\textsubscript{28}H\textsubscript{38}BrNO\textsubscript{4}.

**Description** Butropium Bromide occurs as white crystals or
Butropium Bromide in methanol (1 in 100,000) as directed.

**Identification (1)** To 1 mg of Butropium Bromide add 3 drops of fuming nitric acid, and evaporate on a water bath to dryness. Dissolve the residue in 1 mL of N,N-dimethylformamide, and add 5 to 6 drops of tetracylammonium hydroxide TS: a red-purple color develops.

(2) Determine the absorption spectrum of a solution of Butropium Bromide in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Butropium Bromide in methanol (1 in 5000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) A solution of Butropium Bromide in methanol (1 in 20) responds to the Qualitative Tests <1.09> (1) for bromide.

**Purity (1)** Heavy metals <1.07>—Dissolve 1.0 g of Butropium Bromide in 40 mL of ethanol (95), add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test, using this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Butropium Bromide in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the peak area having a ratio of the retention time about 0.5 to butropium from the sample solution is not larger than 1/4 times the peak area from the standard solution, and the total area of all peaks other than the peak eluted first, the peak having a ratio of the retention time to butropium about 0.5 and butropium peak from the sample solution is not larger than the peak area from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecyl-silanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.15 g of sodium lauryl sulfate in 1000 mL of a mixture of acetonitrile and 0.005 mol/L sulfuric acid (3:2).

Flow rate: Adjust the flow rate so that the retention time of butropium is about 5 minutes.

Selection of column: Dissolve 0.50 g of Butropium Bromide in 9 mL of ethanol (99.5) and 1 mL of 0.1 mol/L potassium hydroxide-ethanol TS, and heat at 70°C for 15 minutes. After cooling, to 1 mL of this solution add the mobile phase to make 100 mL. Proceed with 5 µL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of the peak of butropium and the peak having a ratio of the retention time about 0.7 to butropium with the resolution between these peaks being not less than 2.5.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of the butropium obtained from 5 µL of the standard solution is between 10 mm and 30 mm.

Time span of measurement: About twice as long as the retention time of butropium.

**Loss on drying <2.49>** Not more than 1.0% (1 g, 105°C, 3 hours).

**Residue on ignition <2.44>** Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.8 g of Butropium Bromide, previously dried, dissolve in 5 mL of formic acid, add 100 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid-dioxane VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid-dioxane VS = 53.25 mg of C11H14O3Br.

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

**Butyl Parahydroxybenzoate**

パラオキシ安息香酸ブチル

Butyl 4-hydroxybenzoate

C11H14O3: 194.23
Butyl 4-hydroxybenzoate [94-26-8]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols (**). Butyl Parahydroxybenzoate contains not less than 98.0% and not more than 102.0% of C11H14O3.

**Description** Butyl Parahydroxybenzoate occurs as colorless crystals or white, crystalline powder.

It is freely soluble in ethanol (95) and in acetone, and practically insoluble in water.

**Identification (1)** The melting point <2.60> of Butyl Parahydroxybenzoate is between 68°C and 71°C.

(2) Determine the infrared absorption spectrum of Butyl Parahydroxybenzoate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at...
the same wave numbers.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Butyl Parahydroxybenzoate in 10 mL of ethanol (95): the solution is clear and not more intensely colored than the following control solution.

Control solution: To 5.0 mL of Cobalt (II) Chloride CS, 12.0 mL of Iron (III) Chloride CS and 2.0 mL of Cupper (II) Sulfate CS add water to make 1000 mL.

(2) Acidity—Dissolve 0.20 g of Butyl Parahydroxybenzoate in 5 mL of ethanol (95), add 5 mL of freshly boiled and cooled water and 0.1 mL of bromoresol green-sodium hydroxide-ethanol TS, then add 0.1 mL of 0.1 mol/L sodium hydroxide VS: the solution shows a blue color.

*Heavy metals (3)*—Dissolve 1.0 g of Butyl Parahydroxybenzoate in 25 mL of acetone, add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 25 mL of acetone, 2 mL of dilute acetic acid, and water to make 50 mL (not more than 20 ppm).

(4) Related substances—Dissolve 0.10 g of Butyl Parahydroxybenzoate in 10 mL of acetone, and use this solution as the sample solution. Pipet 0.5 mL of the sample solution, add acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography *<2.07>*. Spot 2 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol, water and acetic acid (100) (70:30:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot other than the principal spot is not more intense than the spot obtained with the standard solution.

**Residue on ignition** *<2.44>—*Not more than 0.1% (1 g).

**Assay** Weigh accurately about 1 g of Butyl Parahydroxybenzoate, add exactly 20 mL of 1 mol/L sodium hydroxide VS, heat at about 70°C for 1 hour, and immediately cool in ice. Titrate *<2.50>—*the excess sodium hydroxide with 0.5 mol/L sulfuric acid VS up to the second equivalent point (potentiometric titration). Perform a blank determination.

\[
each \text{mL of 1 mol/L sodium hydroxide VS} = 194.2 \text{ mg of C}_{12}\text{H}_{22}\text{O}_{3}
\]

*Containers and storage* Containers—Well-closed containers.

**Cadralazine**

カドララジン

\[\text{C}_{12}\text{H}_{21}\text{N}_{5}\text{O}_{3}: 283.33}\]

Ethyl 3-(6-ethyl[2RS]-2-hydroxypropyl)amino)pyridazin-3-yl)carbazate

[64241-34-5]

Cadralazine, when dried, contains not less than 98.5% and not more than 101.0% of \(\text{C}_{12}\text{H}_{22}\text{N}_{5}\text{O}_{3}\).

**Description** Cadralazine occurs as a pale yellow to light yellow crystalline powder.

It is freely soluble in acetic acid (100), soluble in methanol, sparingly soluble in ethanol (99.5), and slightly soluble in water.

It dissolves in 0.05 mol/L sulfuric acid TS.

A solution of Cadralazine in methanol (1 in 40) shows no optical rotation.

Melting point: about 165°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Cadralazine in 0.05 mol/L sulfuric acid TS (1 in 125,000) as directed under Ultraviolet-visible Spectrophotometry *<2.25>*, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cadralazine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry *<2.25>*, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Purity (1)** Chloride *<1.03>—*Dissolve 0.40 g of Cadralazine in 15 mL of methanol, add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS by adding 15 mL of methanol, 6 mL of dilute nitric acid, and water to make 50 mL (not more than 0.036%).

(2) Heavy metals *<1.07>—*Proceed with 1.0 g of Cadrala-
Cadralazine Tablets / Official Monographs

Cadralazine Tablets

Cadralazine Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of cadralazine (C\(_{12}\)H\(_{21}\)N\(_{5}\)O\(_{3}\): 283.33).

**Method of preparation**
Prepare as directed under Tablets, with Cadralazine.

**Identification**
To a quantity of powdered Cadralazine Tablets, equivalent to 20 mg of Cadralazine according to the labeled amount, add 50 mL of 0.05 mol/L sulfuric acid TS, shake well, and centrifuge. To 1 mL of the supernatant liquid add 0.05 mol/L sulfuric acid TS to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 247 nm and 251 nm.

**Uniformity of dosage units**
Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Cadralazine Tablets add 30 mL of 0.05 mol/L sulfuric acid TS, shake well to disintegrate, and add 0.05 mol/L sulfuric acid TS to make exactly 50 mL. Centrifuge this solution, pipet 3 mL of the supernatant liquid, add 0.05 mol/L sulfuric acid TS to make exactly V mL so that each mL contains about 6 \(\mu\)g of cadralazine (C\(_{12}\)H\(_{21}\)N\(_{5}\)O\(_{3}\)), and use this solution as the sample solution. Separately, weigh accurately about 20 mg of cadralazine for assay, previously dried at 105°C for 3 hours, and dissolve in 0.05 mol/L sulfuric acid TS to make exactly 100 mL. Pipet 3 mL of this solution, add 0.05 mol/L sulfuric acid TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \(A_1\) and \(A_2\), of the sample solution and standard solution at 249 nm as directed under Ultraviolet-visible Spectrophotometry:

\[
\text{Amount (mg) of cadralazine (C}_{12}\text{H}_{21}\text{N}_{5}\text{O}_{3}) = M_S \times A_1 / A_2 \times V / 200
\]

\(M_S\): Amount (mg) of cadralazine for assay

**Dissolution**
When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Cadralazine Tablets is not less than 80%.

Start the test with 1 tablet of Cadralazine Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 \(\mu\)m. Discard the first 10 mL of the filtrate, pipet \(V\) mL of the subsequent filtrate, add water to make exactly \(V\) mL so that each mL contains
about 5.6 μg of cadralazine (C₁₂H₂₁N₅O₃) to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of cadralazine for assay, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 200 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \( A_T \) and \( A_S \), of the sample solution and standard solution at 254 nm as directed under Ultraviolet-visible Spectrophotometry <2.20>.

Dissolution rate (%) with respect to the labeled amount of cadralazine (C₁₂H₂₁N₅O₃)  
\[
\frac{M_S \times A_T}{M_S \times A_T + V/V \times 1/C \times 18}
\]

\( M_S \): Amount (mg) of cadralazine for assay
\( C \): Labeled amount (mg) of cadralazine (C₁₂H₂₁N₅O₃) in 1 tablet

**Assay** To 10 Cadralazine Tablets add 70 mL of 0.05 mol/L sulfuric acid TS, shake well to disintegrate, add 0.05 mol/L sulfuric acid TS to make exactly 200 mL. Centrifuge this solution, pipet a volume of the supernatant liquid, equivalent to exactly 5 mL of the internal standard solution, add water to make 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of cadralazine for assay, previously dried at 105°C for 3 hours, and dissolve in 0.05 mol/L of sulfuric acid TS to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, add water to make 25 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \( Q_T \) and \( Q_S \), of the peak area of cadralazine to that of the internal standard.

\[
\text{Amount (mg) of cadralazine (C₁₂H₂₁N₅O₃)} = M_S \times \frac{Q_T}{Q_S} \times \frac{1}{10}
\]

\( M_S \): Amount (mg) of cadralazine for assay

**Internal standard solution**—A solution of \( p \)-toluenesulfonylamine in acetonitrile (1 in 50).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 250 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 13.6 g of sodium acetate trihydrate in 800 mL of water, adjust the pH to 5.8 with dilute acetic acid, and add water to make 1000 mL. To 860 mL of this solution add 140 mL of acetonitrile.
Flow rate: Adjust the flow rate so that the retention time of cadralazine is about 10 minutes.

**System suitability**—
System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, cadralazine and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.
System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cadralazine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

### Anhydrous Caffeine

C₆H₁₀N₄O₂: 194.19
1,3,7-Trimethyl-1H-purine-2,6-(3H,7H)-dione [58-08-2]

**Anhydrous Caffeine**, when dried, contains not less than 98.5% of C₆H₁₀N₄O₂.

**Description** Anhydrous Caffeine occurs as white crystals or powder. It is odorless, and has a bitter taste.

It is freely soluble in chloroform, sparingly soluble in water, in acetic anhydride and in acetic acid (100), and slightly soluble in ethanol (95) and in diethyl ether. The pH of a solution of Anhydrous Caffeine (1 in 100) is between 5.5 and 6.5.

**Identification** (1) To 2 mL of a solution of Anhydrous Caffeine (1 in 500) add tannic acid TS dropwise: a white precipitate, which dissolves upon the dropwise addition of tannic acid TS, is produced.

(2) To 0.01 g of Anhydrous Caffeine add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, and evaporate on a water bath to dryness: the residue acquires a yellow-red color. Invert the residue over a vessel containing 2 to 3 drops of ammonia TS: the color turns red-purple, and disappears upon the addition of 2 to 3 drops of sodium hydroxide TS.

(3) Dissolve 0.01 g of Anhydrous Caffeine in water to make 50 mL. To 5 mL of this solution add 3 mL of diluted acetic acid (31) (3 in 100) and 5 mL of pyridine (1 in 10), mix, add 2 mL of diluted sodium hypochlorite TS (1 in 5), and allow to stand for 1 minute. Add 2 mL of sodium thiosulfate TS and 5 mL of sodium hydroxide TS to the solution: a yellow color develops.

**Melting point** <2.60> 235 – 238°C

**Purity** (1) Chloride <1.02>—Dissolve 2.0 g of Anhydrous Caffeine in 80 mL of hot water, cool rapidly to 20°C, add water to make 100 mL, and use this solution as the sample solution. To 40 mL of the sample solution add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).

(2) Sulfate <1.14>—To 40 mL of the sample solution obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).
(3) Heavy metals \(<1.07\)—Proceed with 2.0 g of Anhydrous Caffeine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Dissolve 0.10 g of Anhydrous Caffeine in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 100 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(2.03\). Spot 10 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and ethanol (95) (9:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

(5) Readily carbonizable substances \(<1.15\)—Perform the test using 0.5 g of Anhydrous Caffeine: the solution is not more colored than Matching Fluid D.

**Loss on drying** \(<2.41\) Not more than 0.5% (1 g, 80°C, 4 hours).

**Residue on ignition** \(<2.44\) Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 0.4 g of Anhydrous Caffeine, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100) (6:1), and titrate \(<2.50\) with 0.1 mol/L perchloric acid VS until the solution changes from purple through green to yellow (indicator: 3 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

\[=\text{19.42 mg of C}_7\text{H}_8\text{O}_2\text{N}_4\text{C}_6\]

**Containers and storage** Containers—Tight containers.

**Caffeine Hydrate**

カフェイン水和物

\[
\text{C}_9\text{H}_8\text{N}_4\text{O}_2\cdot\text{H}_2\text{O}: 212.21
\]

1,3,7-Trimethyl-1H-purine-2,6-(3H,7H)-dione monohydrate [5743-12-4]

Caffeine Hydrate, when dried, contains not less than 98.5% of caffeine (C\(_9\)H\(_8\)O\(_4\)N\(_4\)): 194.19.

**Description** Caffeine Hydrate occurs as white, soft crystals or powder. It is odorless, and has a slightly bitter taste. It is freely soluble in chloroform, sparingly soluble in water, in acetic acid (100) and in acetic anhydride, slightly soluble in ethanol (95), and very slightly soluble in diethyl ether.

The pH of a solution of Caffeine Hydrate (1 in 100) is between 5.5 and 6.5. It effloresces in dry air.

**Identification** (1) To 2 mL of a solution of Caffeine Hydrate (1 in 500) add tannic acid TS dropwise: a white precipitate, which dissolves upon the dropwise addition of tannic acid TS, is produced.

(2) To 0.01 g of Caffeine Hydrate add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, and evaporate to dryness on a water bath: the residue acquires a yellow-red color. Invert the residue over a vessel containing 2 to 3 drops of ammonia TS: the color turns red-purple, and disappears upon the addition of 2 to 3 drops of sodium hydroxide TS.

(3) Dissolve 0.01 g of Caffeine Hydrate in water to make 50 mL. To 5 mL of this solution add 3 mL of diluted acetic acid (31) (3 in 100) and 5 mL of a solution of pyridine (1 in 10), mix, add 2 mL of diluted sodium hypochlorite TS (1 in 5), and allow to stand for 1 minute. Add 2 mL of sodium thiosulfate TS and 5 mL of sodium hydroxide TS to the solution: a yellow color develops.

**Melting point** \(<2.60\) 235 – 238°C (after drying).

**Purity** (1) Chloride \(<1.03\)—Dissolve 2.0 g of Caffeine Hydrate in 80 mL of hot water, cool rapidly to 20°C, add water to make 100 mL, and use this solution as the sample solution. To 40 mL of the sample solution add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).

(2) Sulfate \(<1.14\)—To 40 mL of the sample solution obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(3) Heavy metals \(<1.07\)—Proceed with 2.0 g of Caffeine Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Dissolve 0.10 g of Caffeine Hydrate in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 100 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. Perform the test as directed under Thin-layer Chromatography \(<2.03\). Spot 10 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and ethanol (95) (9:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

(5) Readily carbonizable substances \(<1.15\)—Perform the test using 0.5 g of Caffeine Hydrate: the solution is not more colored than Matching Fluid D.

**Loss on drying** \(<2.41\) 0.5 – 8.5% (1 g, 80°C, 4 hours).

**Residue on ignition** \(<2.44\) Not more than 0.1% (0.5 g).

**Assay** Weigh accurately about 0.4 g of Caffeine Hydrate,
Caffeine and Sodium Benzoate

Description

Caffeine and Sodium Benzoate occurs as a white powder. It is odorless, and has a slightly bitter taste. It is freely soluble in water, soluble in acetic acid (100) and in acetic anhydride, sparingly soluble in ethanol (95), and practically insoluble in diethyl ether.

Identification (1) Dissolve 1 g of Caffeine and Sodium Benzoate in 10 mL of water in a separator, add 1 drop of phenolphthalein TS, and add carefully 0.01 mol/L sodium hydroxide VS dropwise until a faint red color develops. Extract with three 20-mL portions of chloroform by thorough shaking, and separate the chloroform layer from the water layer. Use the water layer for test (2). Filter the combined chloroform extracts, evaporate the filtrate to dryness on a water bath, and proceed the following tests with the residue:

(i) To 2 mL of a solution of the residue (1 in 500) add tannic acid TS dropwise: a white precipitate, which dissolves upon the dropwise addition of tannic acid TS, is produced.

(ii) To 0.01 g of the residue add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, evaporate to dryness on a water bath: the residue acquires a yellow-red color. Invert the residue over a vessel containing 2 to 3 drops of ammonia TS: the color turns red-purple, and disappears upon the addition of 2 to 3 drops of sodium hydroxide TS.

(iii) Dissolve 0.01 g of the residue in water to make 50 mL. To 5 mL of this solution add 3 mL of dilute acetic acid (31) (3 in 100) and 5 mL of a solution of pyridine (1 in 10), mix, add 2 mL of dilute sodium hypochlorite TS (1 in 5), and allow to stand for 1 minute. Add 2 mL of sodium thiosulfate TS and 5 mL of sodium hydroxide TS to the solution: a yellow color develops.

(2) To 5 mL of the water layer obtained in (1) add 5 mL of water: the solution responds to the Qualitative Tests <1.09> (2) for benzoate.

(3) Heat Caffeine and Sodium Benzoate: white fumes are evolved. Ignite furthermore, and to the residue add hydrochloric acid: bubbles are produced, and the solution responds to the Qualitative Tests <1.09> (1) for sodium salt.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Caffeine and Sodium Benzoate in 5 mL of water: the solution is clear and colorless.

Assay (1) Sodium benzoate—Weigh accurately about

JP XVI
Official Monographs / Caffeine and Sodium Benzoate 491
Calcitonin (Salmon)

Calcitonin (Salmon) occurs as a white powder. It is freely soluble in water and may dissolve in dilute acetic acid. It also dissolves in 1 mL of a mixture of acetic anhydride and acetic acid for nonaqueous titration (6:1), cool, and titrate $\leq 2.5\%$ with 0.1 mol/L perchloric acid-dioxane VS to the first equivalence point (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid-dioxane VS $= 14.41$ mg of $\text{C}_2\text{H}_3\text{NaO}_2$.

(2) Caffeine—Continue the titration $\leq 2.5\%$ in (1) with 0.1 mol/L perchloric acid-dioxane VS from the first equivalence point to the second equivalence point (potentiometric titration).

Each mL of 0.1 mol/L perchloric acid-dioxane VS $= 19.42$ mg of $\text{C}_2\text{H}_3\text{NaO}_2$.

Containers and storage Containers—Well-closed containers.

Calcitonin (Salmon)

Calcitonin (Salmon) is a synthetic polypeptide consisting of 32 amino acid residues. It is a hormone with a blood calcium lowering effect.

It contains not less than 4000 Units of calcitonin (salmon) per 1 mg of peptide.

Description Calcitonin (Salmon) occurs as a white powder. It is freely soluble in water. It dissolves in dilute acetic acid.

Dissolve $20$ mg of Calcitonin (Salmon) in $2$ mL of water: the pH of the solution is between 5.0 and 7.0.

It is hygroscopic.

Identification Dissolve $1$ mg of Calcitonin (Salmon) in $1$ mL of dilute acetic acid. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry $\leq 2.5\%$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

Absorbance $\leq 2.24\%$ $E_{1\%}^{1\text{cm}}$ (275 nm): 3.3 - 4.0 (1 mg, dilute acetic acid, 1 mL).

Optical rotation $\leq 2.49\%$ $[\alpha]_D$: $-24 - -32\%$ (25 mg, dilute acetic acid (100) (1 in 2), 10 mL, 100 mm).

Constituent amino acids Weigh accurately about $1$ mg of Calcitonin (Salmon), put in a test tube for hydrolysis, dissolve in 0.5 mL of diluted hydrochloric acid (1 in 2), freeze in a dry ice-acetone bath, seal the tube under reduced pressure, and heat at $110 \pm 2\%$C for 24 hours. After cooling, open the tube, evaporate the hydrolyzate to dryness under reduced pressure, dissolve the residue in exactly 5 mL of 0.02 mol/L hydrochloric acid TS, and use this solution as the sample solution. Separately, weigh accurately about 27 mg of L-aspartic acid, about 24 mg of L-threonine, about 21 mg of L-serine, about 29 mg of L-glutamic acid, about 23 mg of L-proline, about 15 mg of glycine, about 18 mg of L-alanine, about 23 mg of L-valine, about 48 mg of L-cystine, about 30 mg of methionine, about 26 mg of L-isoleucine, about 26 mg of L-leucine, about 36 mg of L-tyrosine, about 33 mg of phenylalanine, about 37 mg of L-lysine hydrochloride, about 42 mg of L-histidine hydrochloride monohydrate and about 42 mg of L-arginine hydrochloride, dissolve them in 10 mL of 1 mol/L hydrochloric acid TS, and add water to make exactly 100 mL. Pipet 5 mL of this solution, add 0.02 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 mL each of the sample solution and standard solution as directed under Liquid Chromatography $\leq 2.01\%$ according to the following conditions: 13 peaks of amino acids appear on the chromatogram obtained from the sample solution, and their respective molar ratios with respect to leucine ($= 5$) are 1.9 - 2.3 for lysine, 0.8 - 1.1 for histidine, 0.9 - 1.1 for arginine, 1.9 - 2.1 for aspartic acid, 4.5 - 4.9 for threonine, 3.2 - 3.8 for serine, 2.8 - 3.1 for glutamic acid, 1.9 - 2.4 for proline, 2.7 - 3.3 for glycine, 1.5 - 2.5 for 1/2 cystine, 0.9 - 1.0 for valine, and 0.8 - 1.0 for tyrosine.

Operating conditions—

Detector: A visible spectrophotometer (wavelength: 440 nm and 570 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 6 cm in length, packed with strongly acidic ion-exchange resin for liquid chromatography (Na type) composed with a sulfonated polystyrene copolymer (3 μm in particle diameter).

Column temperature: A constant temperature of about 57°C.

Chemical reaction bath temperature: A constant temperature of about 130°C.

Color developing time: About 1 minute.

Mobile phase: Prepare mobile phases A, B, C, D and E according to the following table.

Total volume 1000 mL 1000 mL 1000 mL 1000 mL 1000 mL

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A, B, C, D and E as directed in the following table.
Reaction reagent: Mix 407 g of lithium acetate dihydrate, 245 mL of acetic acid (100) and 801 mL of 1-methoxy-2-propanol, add water to make 2000 mL, stir for 10 minutes while passing nitrogen, and use this solution as solution A. Separately, to 1957 mL of 1-methoxy-2-propanol add 77 g of ninhydrin and 0.134 g of sodium borohydride, stir for 30 minutes while passing nitrogen, and use this solution as solution B. Mix solution A and solution B before use.

Flow rate of mobile phase: About 0.4 mL per minute.
Flow rate of reaction reagent: About 0.35 mL per minute.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, aspartic acid, threonine, serine, glutamic acid, proline, glycine, alanine, cystine, valine, methionine, isoleucine, leucine, tyrosine, phenylalanine, lysine, histidine and arginine are eluted in this order with the resolutions between the peaks of threonine and serine, glycine and alanine, and isoleucine and leucine being not less than 1.2, 1.0 and 1.2, respectively.

System repeatability: When the test is repeated 3 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviations of the peak areas of aspartic acid, proline, valine and arginine are not more than 2.0%, respectively.

Peptide content Calculate the peptide content in Calcitonin (Salmon) by the following equation using amino acid analysis values (μmol/mL) obtained in the Constituent amino acids: its is not less than 80.0%.

\[
P \text{Peptide content} = \frac{343.185 \times 5/A 	imes A/11 \times 100}{M \times \text{Amount (μmol/mL)}}
\]

A: Total (μmol/mL) of the amino acid analysis values of valine, leucine, glycine and proline
M: Amount (μg) of sample
11: Total of the theoretical residue numbers of valine, leucine, glycine and proline per one mole of calcitonin (salmon)

Purity (1) Acetic acid—Weigh accurately about 10 mg of Calcitonin (Salmon), dissolve in water to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 1 g of acetic acid (100), and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 100 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.0) according to the following conditions. Determine the peak areas, A₁ and A₅, of acetic acid in each solution, and calculate the amount of acetic acid by the following equation: the amount of acetic acid is not more than 7.0%.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 210 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase A: To 0.7 mL of phosphoric acid add 900 mL of water, adjust the pH to 3.0 with 8 mol/L sodium hydroxide TS, and add water to make 1000 mL.
Mobile phase B: Methanol.
Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

Flow rate: Adjust the flow rate so that the retention time of acetic acid is about 4 minutes.

System suitability—
System performance: When the procedure is run with 100 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of acetic acid are not less than 3000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 100 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of acetic acid is not more than 2.0%.

(2) Related substances—Dissolve 2 mg of Calcitonin (Salmon) in 2 mL of dilute acetic acid, and use this solution as the sample solution. Perform the test with 20 μL of the sample solution as directed under Liquid Chromatography (2.0) according to the following conditions. Determine each peak area from the sample solution by the automatic integration method, and calculate the amount of them by the area percentage method: the total amount of the peaks other than calcitonin (salmon) is not more than 3%.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 210 nm).
Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of 1% trimethylamine-phosphate buffer solution, pH 3.0, and acetonitrile (27:13).
Flow rate: Adjust the flow rate so that the retention time
of calcitonin (salmon) is about 9 minutes.

Time span of measurement: About 2 times as long as the retention time of calcitonin (salmon) beginning after the solvent peak.

System suitability—
Test for required detectability: To 1 mL of the sample solution add the mobile phase to make 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of calcitonin (salmon) obtained from 20 μL of this solution is equivalent to 5 to 15% of that from 20 μL of the solution for system suitability test.

System performance: Dissolve 5 mg of methyl parahydroxybenzoate and 7 mg of ethyl parahydroxybenzoate in 100 mL of acetonitrile. When the procedure is run with 20 μL of this solution under the above operating conditions methyl parahydroxybenzoate and ethyl parahydroxybenzate are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 20 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of calcitonin (salmon) is not more than 2.0%.

(3) Residual solvent—Being specified separately.

Water <2.48> Not more than 10.0% (5 mg, coulometric titration).

Assay (i) Test animals: Select healthy albino rats weighing between 55 and 180 g, fasted for 24 hours before the test but allowed to drink water ad libitum.

(ii) Standard solutions: Dissolve a quantity of Calcitonin (Salmon) RS in acetic acid buffer solution containing 0.1% bovine serum albumin, and prepare a high-dose standard solution SH and a low-dose standard solution SL containing exactly 0.050 and 0.025 Units per mL, respectively.

(iii) Sample solutions: According to the labeled units, weigh accurately a suitable amount of Calcitonin (Salmon), and dissolve in acetic acid buffer solution containing 0.1% bovine serum albumin, and prepare a high-dose sample solution TH and the low-dose sample solution TL having Units equal to the standard solutions in equal volumes, respectively.

(iv) Dose for injection: Inject 0.3 mL per animal.

(v) Procedure: Divide the test animals at random into 4 groups, A, B, C and D, with not less than 8 animals and equal numbers in each group. Inject SH, SL, TH and TL into the tail vein or subcutaneously into the neck of each animal of the respective groups. At 1 hour after the injection, collect blood from the abdominal aorta in a way that minimizes the suffering of the animals, allow the blood samples to stand at room temperature for about 30 minutes, and centrifuge at 3000 revolutions per minute for 10 minutes to separate serum.

(vi) Serum calcium determination: Pipet 0.1 mL of the serum, add exactly 6.9 mL of strontium TS, mix well, and use this solution as the sample solution for calcium determination. Separately, pipet a suitable volume of Standard Calcium Solution for Atomic Absorption Spectrophotometry, dissolve in strontium TS to make a solution so that each mL contains 0.2 to 3 μg of calcium (Ca: 40.08), and use this solution as the standard solution for calcium determination. Perform the test as directed under Atomic Absorption Spectrometry <2.23> according to the following conditions, and calculate the calcium content of the sample solution for calcium determination from the calibration curve obtained from the absorbance of the standard solution for calcium determination.

Amount (mg) of Calcium (Ca) in 100 mL of the serum
= Calcium content (ppm) in the sample solution for calcium determination × 7

Gas: Combustible gas—Acetylene.
Supporting gas—Air.
Lamp: Calcium hollow-cathode lamp.
Wavelength: 422.7 nm.

(vii) Calculation: Amounts of calcium in the serum obtained with SH, SL, TH and TL are symbolized as y1, y2, y3 and y4, respectively. Sum up y1, y2, y3 and y4 on each set to Y1, Y2, Y3 and Y4, respectively.

Units per mg of peptide = antilog M × b/a × 1/c × 5

M = 0.3010 × (Y1/Y5)
Y5 = Y1 – Y2 + Y3 + Y4
Y6 = Y1 – Y2 + Y3 – Y4
a: Amount (mg) of sample
b: Total volume (mL) of the high-dose sample solution prepared by dissolving Calcitonin (Salmon) in acetic acid buffer solution containing 0.1% bovine serum albumin.
c: Peptide content (%)

F' computed by the following equation should be smaller than F1 shown in the table against n with which s2 is calculated. Calculate L (P = 0.95) by use of the following equation:
L should be not more than 0.20. If F' exceeds F1, or if L exceeds 0.20, repeat the test, increasing the number of animals or arranging the assay conditions so that F' is not more than F1 and L is not more than 0.20.

F' = (−Y1 + Y2 + Y3 − Y4)/4f^2
f: Number of the test animals of each group.
s2 = (Σy^2 − (Y/f))/n
Σy^2: The sum of squares of y1, y2, y3 and y4 in each group.
Y = Y1^2 + Y2^2 + Y3^2 + Y4^2
n = 4(f − 1)
L = 2L(SC − 1)(CM^2 + 0.09062)
C = Y1^2/Y3^4 − 4f^2t^2

t^2: Value shown in the following table against n used to calculate s^2.

Precipitated Calcium Carbonate

CaCO₃: 100.09

Precipitated Calcium Carbonate, when dried, contains not less than 98.5% of calcium carbonate (CaCO₃).

Description Precipitated Calcium Carbonate occurs as a white, fine crystalline powder. It is odorless and tasteless. It is practically insoluble in water, but its solubility in water is increased in the presence of carbon dioxide. It is practically insoluble in ethanol (95%) and in diethyl ether.

It dissolves with effervescence in dilute acetic acid, in dilute hydrochloric acid and in dilute nitric acid.

Identification (1) Dissolve 0.5 g of Precipitated Calcium Carbonate in 10 mL of dilute hydrochloric acid, boil, then cool, and neutralize with ammonia TS: the solution responds to the Qualitative Tests <1.09> for calcium salt.

(2) Precipitated Calcium Carbonate responds to the Qualitative Tests <1.09> (1) for carbonate.

Purity (1) Acid-insoluble substances—To 5.0 g of Precipitated calcium Carbonate add 50 mL of water, then add 20 mL of hydrochloric acid dropwise with stirring, boil for 5 minutes, cool, add water to make 200 mL, and filter through filter paper for quantitative analysis. Wash the residue until the last washing shows no turbidity with silver nitrate TS, and ignite the residue together with the filter paper: the mass of the residue is not more than 10.0 mg.

(2) Heavy metals <1.07>—Mix 2.0 g of Precipitated Calcium Carbonate with 5 mL of water, add slowly 6 mL of dilute hydrochloric acid, and evaporate on a water bath to dryness. Dissolve the residue in 50 mL of water, and filter. To 25 mL of the filtrate add 2 mL of dilute acetic acid, 1 drop of ammonia TS and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: evaporate 3 mL of hydrochloric acid on a water bath to dryness, and add 2 mL of dilute acetic acid, 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 20 ppm).

(3) Barium—Mix 1.0 g of Precipitated Calcium Carbonate with 10 mL of water, add dropwise 4 mL of hydrochloric acid with stirring, boil for 5 minutes, cool, add water to make 40 mL, and filter. With the filtrate, perform the test as directed under Flame Coloration Test <1.06> (1): no green color appears.

(4) Magnesium and alkali metals—Dissolve 1.0 g of Precipitated Calcium Carbonate in a mixture of 20 mL of water and 10 mL of dilute hydrochloric acid, boil, neutralize with ammonia TS, and add ammonium oxalate TS until precipitation of calcium oxalate is completed. Heat the mixture on a water bath for 1 hour, cool, dilute with water to 100 mL, shake well, and filter. To 50 mL of the filtrate add 0.5 mL of sulfuric acid, evaporate to dryness, and ignite at 600°C to constant mass: the mass of the residue is not more than 5.0 mg.

(5) Arsenic <1.11>—Moisten 0.40 g of Precipitated Calcium Carbonate with 1 mL of water, then dissolve in 4 mL of dilute hydrochloric acid, use this solution as the test solution, and perform the test (not more than 5 ppm).

Loss on drying <2.4I> Not more than 1.0% (1 g, 180°C, 4 hours).

Assay Weigh accurately about 0.12 g of Precipitated Calcium Carbonate, previously dried, and dissolve in 20 mL of water and 3 mL of dilute hydrochloric acid. Add 80 mL of water, 15 mL of a solution of potassium hydroxide (1 in 10) and 0.05 g of NN indicator, and titrate <2.5D> immediately with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to blue.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 5.005 mg of CaCO₃

Containers and storage Containers—Hermetic containers.

Precipitated Calcium Carbonate Fine Granules

Precipitated Calcium Carbonate Fine Granules contain not less than 95.0% and not more than 105.0% of the labeled amount of calcium carbonate (CaCO₃: 100.09).

Method of preparation Prepare as directed under Granules, with Precipitated Calcium Carbonate.

Identification (1) To a quantity of powdered Precipitated Calcium Carbonate Fine Granules, equivalent to 0.5 g of Precipitated Calcium Carbonate according to the labeled amount, add 10 mL of dilute hydrochloric acid, shake thoroughly, and filter. Boil the filtrate, then cool, and neutralize with ammonia TS: the solution responds to the Qualitative Tests <1.09> (1), (2) and (3) for calcium salt.

(2) Powdered Precipitated Calcium Carbonate Fine Granules responds to the Qualitative Tests <1.09> (1) for carbonate.

Uniformity of dosage units <6.02> The granules in single-unit containers meet the requirement of the Mass variation test.

Dissolution <6.1D> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 1st fluid for dissolution test as the dissolution medium, the dissolution rate in 10 minutes of Precipitated Calcium Carbonate Fine Granules is not less than 80%.

Start the test with an accurately weighed amount of Precipitated Calcium Carbonate Fine Granules, equivalent to about 0.5 g of calcium carbonate (CaCO₃) according to the labeled amount, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet 2 mL
Precipitated Calcium Carbonate Tablets

Precipitated Calcium Carbonate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of calcium carbonate (CaCO₃: 100.09).

**Method of preparation** Prepare as directed under Tablets, with Precipitated Calcium Carbonate.

**Identification** (1) To a quantity of powdered Precipitated Calcium Carbonate Tablets, equivalent to 0.5 g of Precipitated Calcium Carbonate, add 10 mL of dilute hydrochloric acid, shake throughly, and filter, if necessary. Boil, then cool, and neutralize with ammonia TS: the solution responds to the Qualitative Tests <1.09> (1), (2) and (3) for calcium salt.

(2) Powdered Precipitated Calcium Carbonate Tablets responds to the Qualitative Tests <1.09> (1) for carbonate.

**Uniformity of dosage units** <6.02> It meets the requirement of the Mass variation test.

**Disintegration** <6.09> Apply to the preparation intended to be used as antacid.

Perform the test using the disk: it meets the requirement.

**Dissolution** <6.10> Apply to the preparation intended to be used as hyperphosphatemia.

When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 1st fluid for dissolution test as the dissolution medium, the dissolution rate in 10 minutes of Precipitated Calcium Carbonate Tablets is not less than 80%.

Start the test with 1 tablet of Precipitated Calcium Carbonate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the mobile phase to make exactly V mL so that each mL contains about 56 μg of calcium carbonate (CaCO₃), and use this solution as the sample solution. Separately, weigh accurately about 28 mg of calcium carbonate for assay, previously dried at 180°C for 4 hours, and dissolve in the dissolution medium to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution.

Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and A₅, of calcium of both solutions.

Dissolution rate (%) with respect to the labeled amount of calcium carbonate (CaCO₃) = \( \frac{M₃}{M₁} \times \frac{A₁}{A₅} \times \frac{1}{C} \times 1800 \)

Where:
- \( M₃ \): Amount (mg) of calcium carbonate for assay
- \( M₁ \): Amount (mg) of Precipitated Calcium Carbonate Fine Granules
- \( C \): Labeled amount (mg) of calcium carbonate (CaCO₃) in 1 g

**System suitability**

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, sodium and calcium are eluted in this order with the resolution between these peaks being not less than 4.5. System repeatability: When the test is repeated 5 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of calcium is not more than 2.0%.

**Particle size** <6.09> It meets the requirements of Fine granules.

**Assay** Weigh accurately a quantity of powdered Precipitated Calcium Carbonate Fine Granules, equivalent to about 0.12 g of calcium carbonate (CaCO₃), add 20 mL of water and 3 mL of dilute hydrochloric acid, and agitate for 15 minutes with the aid of ultrasonic waves. Then, add 80 mL of water, 15 mL of a solution of potassium hydroxide (1 in 10) and 50 mg of NN indicator, and titrate <2.50> immediately with 0.05 mol/L disodium dihydrogen ethylenediamine tetaacetate VS until the color of the solution changes from red-purple to blue.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetaacetate VS = 5.005 mg of CaCO₃

**Containers and storage** Containers—Well-closed containers.

of the subsequent filtrate, add the mobile phase to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of calcium carbonate for assay, previously dried at 180°C for 4 hours, and dissolve in the dissolution medium to make exactly 100 mL. Pipet 10 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and A₅, of calcium of both solutions.
Operation conditions—
Detector: An electric conductivity detector.
Column: A polyether ether ketone tube 4.6 mm in inside diameter and 10 cm in length, packed with slightly acidic ion-exchange silica gel for liquid chromatography (7 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: A mixture of a solution of tartaric acid (3 in 2000) and a solution of dipicolinic acid (1 in 3000) (1:1).
Flow rate: Adjust the flow rate so that the retention time of calcium is about 8 minutes.
System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, sodium and calcium are eluted in this order with the resolution between these peaks being not less than 4.5.
System repeatability: When the test is repeated 5 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of calcium is not more than 2.0%.

Acid-neutralizing capacity ≤6.0mg
Apply to the preparation intended to be used as antacid.

Weigh accurately and powder not less than 40 Precipitated Calcium Carbonate Tablets. Perform the test with an accurately weighed amount of the powder, equivalent to about 0.25 g of Calcium Carbonate according to the labeled amount: the amount of 0.1 mol/L hydrochloric acid VS consumed per 1 g of Precipitated Calcium Carbonate is not less than 190 mL.

Assay Weigh accurately and powder not less than 20 Precipitated Calcium Carbonate Tablets. To an accurately weighed portion of the powder, equivalent to about 0.12 g of calcium carbonate (CaCO₃), add 20 mL of water, 3 mL of dilute hydrochloric acid, and agitate, if necessary, for 15 minutes with the aid of ultrasonic waves. Then, add 80 mL of water, 15 mL of a solution of potassium hydroxide (1 in 10) and 50 mg of NN indicator, and titrate ≤2.50 mL immediately with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to blue.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 5.005 mg of CaCO₃

Containers and storage Containers—Tight containers.

Calcium Chloride Hydrate
塩化カルシウム水和物

CaCl₂·2H₂O: 147.01

Calcium Chloride Hydrate contains not less than 96.7% and not more than 103.3% of CaCl₂·2H₂O.

Description Calcium Chloride Hydrate occurs as white granules or masses. It is odorless.
It is very soluble in water, and soluble in ethanol (95), and practically insoluble in diethyl ether.
It is deliquescent.

Identification A solution of Calcium Chloride Hydrate (1 in 10) responds to the Qualitative Tests ≤1.09% for calcium salt and for chloride.

pH ≤2.54
The pH of a solution of 1.0 g of Calcium Chloride Hydrate in 20 mL of freshly boiled and cooled water is between 4.5 and 9.2.

Purity (1) Clarity and color of solution—A solution of 1.0 g of Calcium Chloride Hydrate in 20 mL of water is clear and colorless.

(2) Sulfate ≤1.14—Take 1.0 g of Calcium Chloride Hydrate, and perform the test. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(3) Hypochlorite—Dissolve 0.5 g of Calcium Chloride Hydrate in 5 mL of water, add 2 to 3 drops of dilute hydrochloric acid and 2 to 3 drops of zinc iodide-starch TS: no blue color develops immediately.

(4) Heavy metals ≤0.07—Proceed with 2.0 g of Calcium Chloride Hydrate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Iron, aluminum or phosphate—Dissolve, in a Nessler tube, 1.0 g of Calcium Chloride Hydrate in 20 mL of water and 1 drop of dilute hydrochloric acid, boil, then cool, add 3 drops of ammonia TS, and heat the solution to boil: no turbidity or precipitate is produced.

(6) Barium—Dissolve 0.5 g of Calcium Chloride Hydrate in 5 mL of water, add 2 drops of dilute hydrochloric acid and 2 mL of potassium sulfate TS, and allow to stand for 10 minutes: no turbidity is produced.

(7) Arsenic ≤0.11—Prepare the test solution with 1.0 g of Calcium Chloride Hydrate according to Method 1, and perform the test (not more than 2 ppm).

Assay Weigh accurately about 0.4 g of Calcium Chloride Hydrate, and dissolve in water to make exactly 200 mL. Measure exactly 20 mL of this solution, add 40 mL of water, 2 mL of 8 mol/L potassium hydroxide TS and 0.1 g of NN indicator, and titrate ≤2.50 mL immediately with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to blue.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 2.940 mg of CaCl₂·2H₂O

Containers and storage Containers—Tight containers.

Calcium Chloride Injection
塩化カルシウム注射液

Calcium Chloride Injection is an aqueous solution for injection.
It contains not less than 95.0% and not more than 105.0% of the labeled amount of calcium chloride (CaCl₂: 110.98).
The concentration of Calcium Chloride Injection is expressed as the quantity of calcium chloride (CaCl₂).

Method of preparation Prepare as directed under Injection, with Calcium Chloride Hydrate.
Calcium Folate

Calcium Folinate / Official Monographs

Description Calcium Chloride Injection is a clear, colorless liquid.

Identification Calcium Chloride Injection responds to the Qualitative Tests \(<1.00\) for calcium salt and for chloride.

pH \(<2.54\) 4.5 – 7.5

Bacterial endotoxins \(<4.01\) Less than 0.30 EU/mg.

Extractable volume \(<6.05\) It meets the requirement.

Foreign insoluble matter \(<6.06\) Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter \(<6.07\) It meets the requirement.

Sterility \(<4.06\) Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Measure exactly a volume of Calcium Chloride Injection, equivalent to about 0.4 g of calcium chloride (CaCl₂), and proceed as directed in the Assay under Calcium Chloride Hydrate.

Containers and storage Containers—Hermetic containers.

Plastic containers for aqueous injections may be used.

Calcium Folate

Calcium Leucovorin

ホリナートカルシウム

Calcium Folate contains not less than 95.0% and not more than 102.0% of \(\text{C}_{20}\text{H}_{21}\text{CaN}_{7}\text{O}_{7}\), calculated on the anhydrous basis.

Description Calcium Folate occurs as a white to light yellow, crystalline powder.

It is sparingly soluble in water, and practically insoluble in methanol and in ethanol (99.5).

Identification (1) Determine the absorption spectrum of a solution of Calcium Folate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelength.

(2) A solution of Calcium Folate (1 in 100) responds to the Qualitative Tests \(<1.09\) (2) and (3) for calcium salt.

Optical rotation \(<2.49\) \([\alpha]_D^\text{20} +14− +19^\circ\) (0.1 g calculated on the anhydrous basis, water, 10 mL, 100 mm).

pH \(<2.54\) To 1.25 g of Calcium Folate add 50 mL of freshly boiled and cooled water, and warm to 40°C, if necessary, to dissolve: the pH of this solution is between 6.8 and 8.0.

Purity (1) Clarity and color of solution—To 1.25 g of Calcium Folate add 50 mL of freshly boiled and cooled water, and warm to 40°C, if necessary, to dissolve: the solution is clear, and the absorbance at 420 nm of it, determined as directed under Ultraviolet-visible Spectrophotometry \(<2.24\), is not more than 0.25.

(2) Heavy metals \(<1.07\)—Proceed with 0.40 g of Calcium Folate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 50 ppm).

(3) Related substances—Dissolve 10 mg of Calcium Folate in 25 mL of water, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\) according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak obtained from the sample solution is not larger than the peak area obtained from the standard solution, and the total area of the peaks other than the peak of folinate is not larger than 5 times the peak area of folinate from the standard solution.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2.5 times as long as the retention time of folinate, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 5 mL of the standard solution, and add water to make exactly 50 mL. Confirm that the peak area of folinate obtained from 20 \(\mu\)L of this solution is equivalent to 7 to 13% of that from 20 \(\mu\)L of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 20 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of folinate is not more than 2.0%.

Water \(<2.48\) Not less than 7.0% and not more than 17.0% (0.2 g, volumetric titration, direct titration).

Assay Weigh accurately about 10 mg each of Calcium Folate and Calcium Folate RS (separately determine the water \(<2.48\) in the same manner as Calcium Folate), dis-
solve in water to make them exactly 25 mL. Pipet 5 mL each of these solutions, add the mobile phase to make exactly 25 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.03> according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of folinate of both solutions.

\[
M_S: \text{Amount (mg) of Calcium Folinate RS, calculated on the anhydrous basis}
\]

\[
M_S = \frac{A_T}{A_S} \times \frac{A_T}{A_S}
\]

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 45°C.

Mobile phase: A mixture of disodium hydrogen phosphate dodecahydrate solution (287 in 100,000), methanol and tetrabutylammonium hydroxide TS (385:110:4), adjusted to pH 7.5 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of folinate is about 10 minutes.

**System suitability**

System performance: Dissolve 10 mg each of Calcium Folinate and folic acid in 100 mL of the mobile phase. When the procedure is run with 20 μL of this solution under the above operating conditions, folinate and folic acid are eluted at 15.4 minutes and 45.7 minutes, respectively. Perform the test with exactly 20 μL of the sample solution and standard solution as directed under Liquid Chromatography <2.03>.

Flow rate: Adjust the flow rate so that the retention time of folinate is about 10 minutes. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 g of Calcium Gluconate Hydrate and 1.0 g of Calcium Folinate Hydrate in 20 mL of water by warming: the pH of the solution is between 6.0 and 8.0.

**Purity (1)**

Clarity and color of solution—Dissolve 1.0 g of Calcium Gluconate Hydrate in 50 mL of water by warming: the solution is clear and colorless.

(2) Chloride

Take 0.40 g of Calcium Gluconate Hydrate, and perform the test. Prepare the control solution with 0.80 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.071%).

(3) Sulfate

Take 1.0 g of Calcium Gluconate Hydrate, and perform the test. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(4) Heavy metals

Dissolve 1.0 g of Calcium Gluconate Hydrate in 30 mL of water and 2 mL of dilute acetic acid by warming, cool, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution, 2 mL of dilute acetic acid, and water to make 50 mL (not more than 20 ppm).

(5) Arsenic

Dissolve 0.6 g of Calcium Gluconate Hydrate in 5 mL of water by warming, add 5 mL of dilute sulfuric acid and 1 mL of bromine TS, and concentrate on a water bath to 5 mL. Perform the test with this solution as the test solution (not more than 3.3 ppm).

(6) Sucrose and reducing sugars—To 0.5 g of Calcium Gluconate Hydrate add 10 mL of water and 2 mL of dilute hydrochloric acid, and boil the solution for 2 minutes. After cooling, add 5 mL of sodium carbonate TS, allow to stand for 5 minutes, add water to make 20 mL, and filter. To 5 mL of the filtrate add 2 mL of Fehling’s TS, and boil for 1 minute: no orange-yellow to red precipitate is formed immediately.

**Loss on drying**

Not more than 1.0% (1 g, 80°C, 2 hours).

**Assay**

Weigh accurately about 0.4 g of Calcium Gluconate Hydrate, previously dried, dissolve in 100 mL of water, add 2 mL of 8 mol/L potassium hydroxide TS and 0.1 g of NN indicator, and titrate immediately with 0.05 mol/L
Calcium Hydroxide / Official Monographs

Calcium Hydroxide

Slaked Lime

Calcium Hydroxide contains not less than 90.0% of Ca(OH)₂.

Description Calcium Hydroxide occurs as a white powder. It has a slightly bitter taste. It is slightly soluble in water, very slightly soluble in boiling water, and practically insoluble in ethanol (95) and in diethyl ether. It dissolves in dilute acetic acid, in dilute hydrochloric acid and in dilute nitric acid. It absorbs carbon dioxide from air.

Identification (1) Mix Calcium Hydroxide with 3 to 4 times its mass of water: the mixture is slushy and is alkaline.

(2) Dissolve 1 g of Calcium Hydroxide in 30 mL of dilute acetic acid, and boil. After cooling, neutralize with ammonia TS: the solution responds to the Qualitative tests <1.09> (2) and (3) for calcium salt.

Purity (1) Acid-insoluble substances—To 5 g of Calcium Hydroxide add 100 mL of water, add hydrochloric acid dropwise with stirring until the solution becomes acidic, and further add 1 mL of hydrochloric acid. Boil this solution for 5 minutes, cool, and filter through a tared glass filter (G4). Wash the residue with boiling water until the last washing is clear.

(2) Heavy metals <1.07>—Dissolve 1.0 g of Calcium Hydroxide in 10 mL of dilute hydrochloric acid, evaporate on a water bath to dryness, dissolve the residue in 40 mL of water, and filter. To 20 mL of the filtrate add 2 mL of dilute acetic acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: evaporate 5 mL of dilute hydrochloric acid on a water bath to dryness, and add 2 mL of dilute acetic acid, 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 40 ppm).

(3) Magnesium and alkali metals—Dissolve 1.0 g of Calcium Hydroxide in a mixture of 20 mL of water and 10 mL of dilute hydrochloric acid, boil, neutralize with ammonium TS, and precipitate calcium oxalate completely by adding dropwise ammonium oxalate TS. Heat the mixture on a water bath for 1 hour, cool, dilute with water to 100 mL, shake, and filter. To 50 mL of the filtrate add 0.5 mL of sulfuric acid, evaporate to dryness, and ignite at 600°C to constant mass: the mass of the residue does not exceed 24 mg.

(4) Arsenic <1.17>—Dissolve 0.5 g of Calcium Hydroxide in 5 mL of dilute hydrochloric acid, and perform the test with this solution as the test solution (not more than 4 ppm).

Assay Weigh accurately about 1 g of Calcium Hydroxide, dissolve by adding 10 mL of dilute hydrochloric acid, and add water to make exactly 100 mL. Measure exactly 10 mL of this solution, add 90 mL of water and 1.5 mL of 8 mol/L potassium hydroxide TS, shake, allow to stand for 3 to 5 minutes, and then add 0.1 g of NN indicator. Titrate <2.5D> immediately with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, until the red-purple color of the solution changes to blue.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS

= 3.705 mg of Ca(OH)₂

Containers and storage Containers—Well-closed containers.

Calcium Lactate Hydrate

Monocalcium disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red-purple to blue.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS

= 22.42 mg of C₁₂H₂₂CaO₁₄.H₂O

Containers—Well-closed containers.

Calcium Lactate Hydrate occurs as a white powder. It exhibits no turbidity upon addition of silver nitrate TS, and precipitates calcium oxalate completely by adding dropwise ammonium oxalate TS. Heat the mixture on a water bath for 1 hour, cool, dilute with water to 100 mL, and perform the test using this solution as the test solution. Prepare the control solution from 2.0 mL of Standard Lead Solution and 2 mL of dilute acetic acid, and dilute with water to 50 mL (not more than 20 ppm).

Calcium Lactate Hydrate, when dried, contains not less than 97.0% of calcium lactate (C₆H₁₀CaO₆: 218.22).

Description Calcium Lactate Hydrate occurs as white powder or granules. It is odorless, and has a slightly acid taste. A 1 g portion of it dissolves gradually in 20 mL of water, and it is slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

It is partly efflorescent at ordinary temperature, and yields the anhydride at 120°C.

Identification A solution of Calcium Lactate Hydrate (1 in 20) responds to the Qualitative tests <1.09> for calcium salt and for lactate.

Purity (1) Clarity of solution—Dissolve 1.0 g of Calcium Lactate Hydrate in 20 mL of water by warming: the solution is clear.

(2) Acidity or alkalinity—To the solution obtained in (1) add 2 drops of phenolphthalein TS: no red color is produced. Then add 0.50 mL of 0.1 mol/L sodium hydroxide VS: a red color develops.

(3) Heavy metals <1.07>—Dissolve 1.0 g of Calcium Lactate Hydrate in 30 mL of water and 5 mL of dilute acetic acid by warming, cool, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution from 2.0 mL of Standard Lead Solution and 2 mL of dilute acetic acid, and dilute with water to 50 mL (not more than 20 ppm).

(4) Magnesium or alkali metals—Dissolve 1.0 g of Calcium Lactate Hydrate in 40 mL of water, add 0.5 g of am-
Calcium Pantothenate occurs as a white powder. It is odorless, and has a bitter taste. Calcium Pantothenate, when dried, contains not less than 5.7% and not more than 6.0% of nitrogen (N: 14.01), and not less than 8.2% and not more than 8.6% of calcium (Ca: 40.08).

**Description**
Calcium Pantothenate occurs as a white powder. It is odorless, and has a bitter taste. It is freely soluble in water, very slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution of Calcium Pantothenate (1 in 20) is 7.50–8.60.

**Containers and storage**
Containers—Tight containers.

### Calcium Oxide

**Quick Lime**

酸化カルシウム

CaO: 56.08

Calcium Oxide, when incinerated, contains not less than 98.0% of CaO.

**Description**
Calcium Oxide occurs as hard, white masses, containing a powder. It is odorless.

It is very slightly soluble in boiling water, and practically insoluble in ethanol (95).

One gram of Calcium Oxide dissolves almost completely in 2500 mL of water.

It slowly absorbs moisture and carbon dioxide from air.

**Identification**
(1) Moisten Calcium Oxide with water: heat is generated and a white powder is obtained. Mix the powder with about 5 times its mass of water; the mixture is alkaline.

(2) Dissolve 1 g of Calcium Oxide in 20 mL of water by adding a few drops of acetic acid (31): the solution responds to the Qualitative Tests <1.09> for calcium salt.

**Purity**
(1) Acid-insoluble substances—Disintegrate 5.0 g of Calcium Oxide with a small amount of water, add 100 mL of water, add dropwise hydrochloric acid with stirring until the solution becomes acidic, and further add 1 mL of hydrochloric acid. Boil the solution for 5 minutes, cool, filter through a glass filter (G4), wash the residue with boiling water until no turbidity is produced when silver nitrate TS is added to the last washing, and dry at 105°C to constant mass: the mass of the residue is not more than 15 mg.

(2) Carbonate—Disintegrate 1.0 g of Calcium Oxide with a small amount of water, mix thoroughly with 50 mL of water, allow to stand for a while, remove most of the supernatant milky liquid by decantation, and add an excess of dilute hydrochloric acid to the residue: no vigorous effervescence is produced.

(3) Magnesium and alkali metals—Dissolve 1.0 g of Calcium Oxide in 75 mL of water by adding dropwise hydrochloric acid, and further add 1 mL of hydrochloric acid. Boil for 1 to 2 minutes, neutralize with ammonia TS, add dropwise an excess of hot ammonium oxalate TS, heat the mixture on a water bath for 2 hours, cool, add water to make 200 mL, mix thoroughly, and filter. Evaporate 50 mL of the filtrate with 0.5 mL of sulfuric acid to dryness, and heat the residue strongly at 600°C to constant mass: the mass of the residue is not more than 15 mg.

**Loss on ignition** <2.43> Not more than 10.0% (1 g, 900°C, constant mass).

**Assay**
Weigh accurately about 0.7 g of Calcium Oxide, previously incinerated at 900°C to constant mass and cooled in a desiccator (silica gel), and dissolve in 50 mL of water and 8 mL of diluted hydrochloric acid (1 in 3) by heating. Cool, and add water to make exactly 250 mL. Pipet 10 mL of the solution, add 50 mL of water, 2 mL of 8 mol/L potassium hydroxide TS and 0.1 g of NN indicator, and titrate <2.50> immediately with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the red-purple color of the solution changes to blue.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 1.122 mg of CaO

### Containment and Storage
Containers—Tight containers.
Calcium Paraaminosalicylate Hydrate

**Pas-calcium Hydrate**

\[
\text{C}_7\text{H}_5\text{CaNO}_3 \cdot 3 \frac{1}{2}\text{H}_2\text{O}: 254.25
\]

Monocalcium 4-amino-2-oxidobenzoate hemiheptahydrate (133-15-3, anhydride)

Calcium Paraaminosalicylate Hydrate contains not less than 97.0% and not more than 103.0% of calcium para-aminosalicylic acid (C₇H₅CaNO₃: 191.20), calculated on the anhydrous basis.

**Description**
Calcium Paraaminosalicylate Hydrate occurs as a white to slightly colored powder. It has a slightly bitter taste.

It is very slightly soluble in water, and practically insoluble in methanol and in ethanol (99.5).

It is gradually colored to brown by light.

**Identification (1)** To 50 mg of Calcium Paraaminosalicylate Hydrate add 100 mL of water, shake well, and filter. To 10 mL of the filtrate add 1 mL of 1 mol/L hydrochloric acid TS, shake, and add 1 drop of iron (III) chloride TS: a red-purple color develops.

(2) Determine the infrared absorption spectrum of Calcium Paraaminosalicylate Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 3 g of Calcium Paraaminosalicylate Hydrate add 15 mL of ammonium chloride TS and 15 mL of water, heat on a water bath until almost dissolved, and filter after cooling: the filtrate responds to the Qualitative Tests <1.09> (1), (2) and (3) for calcium salt.

**Purity (1)** Chloride <1.03>—Dissolve 1.0 g of Calcium Paraaminosalicylate Hydrate in 15 mL of dilute nitric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.70 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.025%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Calcium Paraaminosalicylate Hydrate according to method 3, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Dissolve 0.40 g of Calcium Paraaminosalicylate Hydrate in 20 mL of 0.1 mol/L hydrochloric acid TS by warming on a water bath, use this solution as the test solution, and perform the test (not more than 5 ppm).

(4) 3-Aminophenol—To 0.10 g of Calcium Paraaminosalicylate Hydrate add 5 mL of 0.1 mol/L disodium ethylenediamine tetraacetate VS, then 10 mL of the filtrate add 1 mL of 1 mol/L hydrochloric acid VS (not more than 0.025%).

**Containers and storage**
Containers—Tight containers.
Calcium Paraaminosalicylate Granules

Pass-calcium Granules

パラアミノサリチル酸カルシウム顆粒

Calcium Paraaminosalicylate Granules contain not less than 95.0% and not more than 105.0% of the labeled amount of calcium paraaminosalicylate hydrate (C₇H₅CaNO₃.3½H₂O: 254.25).

Method of preparation Prepare as directed under Granules, with Calcium Paraaminosalicylate Hydrate.

Identification Powder Calcium Paraaminosalicylate Granules, weigh a portion of the powder, equivalent to 50 mg of Calcium Paraaminosalicylate Hydrate according to the labeled amount, add 100 mL of water, shake, and filter. To 10 mL of the filtrate add 1 mL of 1 mol/L hydrochloric acid TS, shake, and add 1 drop of iron (III) chloride TS: a red-purple color develops.

Dissolution <6.10 When the test is performed at 75 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 60 minutes of Calcium Paraaminosalicylate Granules is not less than 75%.

Start the test with an accurately weighed amount of Calcium Paraaminosalicylate Granules, equivalent to about 0.25 g of calcium paraaminosalicylate hydrate (C₇H₅CaNO₃.3½H₂O) according to the labeled amount, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly 100 mL, and use this solution as the standard solution. Separately, weigh accurately about 28 mg of calcium paraaminosalicylate hydrate for assay (separately determine the water <2.40 in the same manner as Calcium Paraaminosalicylate Hydrate), and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A₂ and A₈, at 300 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24.

Dissolution rate (%) with respect to the labeled amount of calcium paraaminosalicylate hydrate (C₇H₅CaNO₃.3½H₂O)

\[ \frac{M_S}{M_T} \times \frac{A_T}{A_S} \times \frac{1}{C} \times 900 \times 1.330 \]

Mₕ: Amount (mg) of calcium paraaminosalicylate hydrate for assay, calculated on the anhydrous basis
Mₜ: Amount (g) of sample
C: Labeled amount (mg) of calcium paraaminosalicylate hydrate (C₇H₅CaNO₃.3½H₂O) in 1 g

Assay Powder Calcium Paraaminosalicylate Granules, weigh accurately a portion of the powder, equivalent to about 0.2 g of calcium paraaminosalicylate hydrate (C₇H₅CaNO₃.3 1/2H₂O), add 60 mL of water and 0.75 mL of dilute hydrochloric acid, and dissolve by heating on a water bath. After cooling, add water to make exactly 100 mL, and filter. Pipet 30 mL of the filtrate, transfer to an iodine flask, and proceed as directed in the Assay under Calcium Para-aminosalicylate Hydrate.

Each mL of 0.05 mol/L bromine VS

\[ = 3.187 \text{ mg of } C₇H₅CaNO₃ \]

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Calcium Paraaminosalicylate

Powder Calcium Paraaminosalicylate Granules, with Calcium Paraaminosalicylate Hydrate.

Identification Powder Calcium Paraaminosalicylate Granules, weigh a portion of the powder, equivalent to 50 mg of Calcium Paraaminosalicylate Hydrate according to the labeled amount, add 100 mL of water, shake, and filter. To 10 mL of the filtrate add 1 mL of 1 mol/L hydrochloric acid TS, shake, and add 1 drop of iron (III) chloride TS: a red-purple color develops.
Anhydrous Dibasic Calcium Phosphate

無水リン酸水素カルシウム

CaHPO$_4$: 136.06
[7757-93-9]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbols ($\ast$ $\bullet$).

Anhydrous Dibasic Calcium Phosphate contains not less than 98.0% and not more than 103.0% of CaHPO$_4$.

*Description*  Anhydrous Dibasic Calcium Phosphate occurs as white, crystalline powder or granules.

It is practically insoluble in water and in ethanol (99.5). It dissolves in dilute hydrochloric acid and in dilute nitric acid.

Identification (1)  Dissolve 0.1 g of Anhydrous Dibasic Calcium Phosphate in 10 mL of 2 mol/L hydrochloric acid TS by warming, add 2.5 mL of ammonia TS dropwise with shaking, and add 5 mL of ammonium oxalate TS: a white precipitate is produced.

(2)  Dissolve 0.1 g of Anhydrous Dibasic Calcium Phosphate in 5 mL of dilute nitric acid, and add 2 mL of hexammonium heptamolybdate TS after warming at 70°C for 1 to 2 minutes: a yellow precipitate is produced.

Purity (1)  Acid-insoluble substances—Dissolve 5.0 g of Anhydrous Dibasic Calcium Phosphate in 40 mL of water and 10 mL of hydrochloric acid, and boil gently for 5 minutes. After cooling, collect the insoluble substance using a filter paper for assay. Wash with water until no more turbidity forms. It dissolves in dilute hydrochloric acid.

(2)  Chloride $<1.00$—Dissolve 0.20 g of Anhydrous Dibasic Calcium Phosphate in 20 mL of water and 13 mL of dilute nitric acid, add water to make 100 mL, and filter, if necessary. Perform the test using a 50-mL portion of this solution as the test solution. Prepare the control solution with 0.70 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.248%).

(3)  Sulfate $<1.14$—Dissolve 0.5 g of Anhydrous Dibasic Calcium Phosphate in 5 mL of water and 5 mL of dilute hydrochloric acid, add water to make 100 mL, and filter, if necessary. Take 20 mL of this solution, add 1 mL of dilute hydrochloric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.48%).

(4)  Carbonate—Mix 1.0 g of Anhydrous Dibasic Calcium Phosphate with 5 mL of freshly boiled and cooled water, and add immediately 2 mL of hydrochloric acid: no effervescence occurs.

*5* Heavy metals $<0.07$—Dissolve 0.65 g of Anhydrous Dibasic Calcium Phosphate in a mixture of 5 mL of water and 5 mL of dilute hydrochloric acid by warming, cool, and add ammonia TS until precipitates begin to form in the solution. Dissolve the precipitates by adding a small amount of dilute hydrochloric acid dropwise, add 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 31 ppm).

(6)  Barium—Heat 0.5 g of Anhydrous Dibasic Calcium Phosphate with 10 mL of water, add 1 mL of hydrochloric acid dropwise with stirring, and filter after cooling, if necessary. Add 2 mL of potassium sulfate TS to this solution, and allow to stand for 10 minutes: no turbidity forms.

*7* Arsenic $<1.10$—Dissolve 1.0 g of Anhydrous Dibasic Calcium Phosphate in 5 mL of dilute hydrochloric acid, and perform the test with this solution as the test solution (not more than 2 ppm).

**8** Loss on ignition $<2.43$  Not less than 6.6% and not more than 8.5% (1 g, 800 – 825°C, constant mass).

Assay  Weigh accurately about 0.4 g of Anhydrous Dibasic Calcium Phosphate, dissolve in 12 mL of dilute hydrochloric acid, and add water to make exactly 200 mL. Pipet 20 mL of this solution, add exactly 25 mL of 0.02 mol/L disodium dihydrogen ethylenediaminetetraacetate VS, 50 mL of water and 5 mL of ammonia-ammonium chloride buffer solution, pH 10.7, and titrate $2.50$ the excess of disodium dihydrogen ethylenediaminetetraacetate with 0.02 mol/L zinc sulfate VS (indicator: 25 mg of eriochrome black T-sodium chloride indicator). Perform a blank determination in the same manner.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediaminetetraacetate VS = 2.721 mg of CaHPO$_4$.

Dibasic Calcium Phosphate Hydrate

リン酸水素カルシウム水和物

CaHPO$_4$.2H$_2$O: 172.09
[7789-77-7]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbols ($\ast$ $\bullet$).

Dibasic Calcium Phosphate Hydrate contains not less than 98.0% and not more than 105.0% of CaHPO$_4$.2H$_2$O.

*Description*  Dibasic Calcium Phosphate Hydrate occurs as a white, crystalline powder.

It is practically insoluble in water and in ethanol (99.5). It dissolves in dilute hydrochloric acid and in dilute nitric acid.

Identification (1)  Dissolve 0.1 g of Dibasic Calcium
Phosphate Hydrate in 10 mL of 2 mol/L hydrochloric acid TS by warming, add 2.5 mL of ammonia TS dropwise with shaking, and add 5 mL of ammonium oxalate TS: a white precipitate is produced.

(2) Dissolve 0.1 g of Dibasic Calcium Phosphate Hydrate in 5 mL of dilute nitric acid, and add 2 mL of hexammonium heptamolybdate TS after warming at 70°C for 1 to 2 minutes: a yellow precipitate is produced.

**Purity (1)** Acid-insoluble substance—Dissolve 5.0 g of Dibasic Calcium Phosphate Hydrate in 40 mL of water and 10 mL of hydrochloric acid, and boil gently for 5 minutes. After cooling, collect the insoluble substance using a filter paper for assay. Wash with water until no more turbidity of the washing is produced when silver nitrate TS is added. Ignite to incinerate the residue and filter paper at 600°C: the mass is not more than 10 mg (not more than 0.2%).

(2) Chloride (1.07)—Dissolve 0.20 g of Dibasic Calcium Phosphate Hydrate, in 20 mL of water and 13 mL of dilute nitric acid, add water to make 100 mL, and filter, if necessary. Perform the test using a 50-mL portion of this solution as the test solution. Prepare the control solution with 0.70 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.24%).

(3) Sulfate (1.14)—Dissolve 0.5 g of Dibasic Calcium Phosphate Hydrate in 5 mL of water and 5 mL of dilute hydrochloric acid, add water to make 100 mL, and filter, if necessary. Take 20 mL of this solution, add 1 mL of dilute hydrochloric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.48%).

(4) Carbonate—Mix 1.0 g of Dibasic Calcium Phosphate Hydrate with 5 mL of freshly boiled and cooled water, and add immediately 2 mL of hydrochloric acid: no effervescence occurs.

*5* Heavy metals (1.07)—Dissolve 0.65 g of Dibasic Calcium Phosphate Hydrate in a mixture of 5 mL of water and 5 mL of dilute hydrochloric acid by warming, cool, and add ammonia TS until precipitates begin to form in the solution. Dissolve the precipitates by adding a small amount of dilute hydrochloric acid dropwise, add 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 31 ppm).

(6) Barium—Heat 0.5 g of Dibasic Calcium Phosphate Hydrate with 10 mL of water, add 1 mL of hydrochloric acid dropwise with stirring, and filter after cooling, if necessary. Add 2 mL of potassium sulfate TS to this solution, and allow to stand for 10 minutes: no turbidity forms.

*7* Arsenic (1.17)—Dissolve 1.0 g of Dibasic Calcium Phosphate Hydrate in 5 mL of dilute hydrochloric acid, and perform the test with this solution as the test solution (not more than 2 ppm).

**Loss on ignition (2.43)** Not less than 24.5% and not more than 26.5% (1 g, 800–825°C, constant mass).

**Assay** Weigh accurately about 0.4 g of Dibasic Calcium Phosphate Hydrate, dissolve in 12 mL of dilute hydrochloric acid, and add water to make exactly 200 mL. Pipet 20 mL of this solution, add exactly 25 mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, 50 mL of water and 5 mL of ammonium-ammonium chloride buffer solution, pH 10.7, and titrate 0.02 mol/L zinc sulfate VS (indicator: 25 mg of eriochrome black T-sodium chloride indicator). Perform a blank determination in the same manner.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS

\[
= 3.442 \text{ mg of CaHPO}_4\cdot2\text{H}_2\text{O}
\]

**Containers and storage** Containers—Well-closed containers.

### Monobasic Calcium Phosphate Hydrate

リン酸二水素カルシウム水和物

\[
\text{Ca(H}_2\text{PO}_4)_2\cdot\text{H}_2\text{O}: 252.07
\]

Monobasic Calcium Phosphate Hydrate, when dried, contains not less than 90.0% of \(\text{Ca(H}_2\text{PO}_4)_2\cdot\text{H}_2\text{O}\).

**Description** Monobasic Calcium Phosphate Hydrate occurs as white crystals or crystalline powder. It is odorless and has an acid taste.

It is sparingly soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

It dissolves in dilute hydrochloric acid and in dilute nitric acid.

It is slightly deliquescent.

**Identification (1)** Dissolve 0.1 g of Monobasic Calcium Phosphate Hydrate in 10 mL of diluted hydrochloric acid (1 in 6) by warming, add 2.5 mL of ammonia TS dropwise with shaking, and add 5 mL of ammonium oxalate TS: a white precipitate is produced.

(2) Dissolve 0.1 g of Monobasic Calcium Phosphate Hydrate in 5 mL of dilute nitric acid, and add 2 mL of hexammonium heptamolybdate TS after warming for 1 to 2 minutes at 70°C: a yellow precipitate is produced.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Monobasic Calcium Phosphate Hydrate in 19 mL of water and 2 mL of diluted hydrochloric acid (3 in 4), and heat on a water bath for 5 minutes with occasional shaking: the solution is clear and colorless.

(2) Dibasic phosphate and acid—Triturate 1.0 g of Monobasic Calcium Phosphate Hydrate with 3 mL of water, and add 100 mL of water and 1 drop of methyl orange TS: a red color develops. Then add 1.0 mL of 1 mol/L sodium hydroxide VS: the color changes to yellow.

(3) Chloride (1.03)—Dissolve 1.0 g of Monobasic Calcium Phosphate Hydrate in 20 mL of water and 12 mL of dilute nitric acid, add water to make exactly 100 mL, and filter, if necessary. Perform the test using 50 mL of this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than...
0.018%).

(4) Sulfate <1.14>—Dissolve 1.0 g of Monobasic Calcium Phosphate Hydrate in 20 mL of water and 1 mL of hydrochloric acid, add water to make 100 mL, and filter, if necessary. Perform the test using 50 mL of this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(5) Heavy metals <1.07>—Dissolve 0.65 g of Monobasic Calcium Phosphate Hydrate in a mixture of 5 mL of water and 5 mL of dilute hydrochloric acid by warming, cool, and add ammonia TS until precipitates begin to form in the solution. Dissolve the precipitates by adding a small amount of dilute hydrochloric acid dropwise, add 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 10 mL of hydrochloric acid-ammonium acetate buffer solution, pH 3.5, add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 31 ppm).

(6) Arsenic <1.17>—Dissolve 1.0 g of Monobasic Calcium Phosphate Hydrate in 5 mL of dilute hydrochloric acid, and perform the test with this solution as the test solution (not more than 2 ppm).

Loss on drying <2.41> Not more than 3.0% (1 g, silica gel, 24 hours).

Assay Weigh accurately about 0.4 g of Monobasic Calcium Phosphate Hydrate, previously dried, dissolve in 3 mL of dilute hydrochloric acid, and add water to make exactly 100 mL. Pipet 20 mL of this solution, add exactly 25 mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, 50 mL of water and 5 mL of ammonia-ammonium chloride buffer solution, pH 10.7, and titrate <2.50> the excess disodium dihydrogen ethylenediamine tetraacetate with 0.02 mol/L zinc acetate VS (indicator: 25 mg of eriochrome black T-sodium chloride indicator). Perform a blank determination.

Each mL of 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 5.041 mg of Ca(H2PO4)2 H2O

Containers and storage Containers—Tight containers.

Calcium Polystyrene Sulfonate

ポリスチレンスルホン酸カルシウム

Calcium Polystyrene Sulfonate is a cation exchange resin prepared as the calcium form of the sulfonated styrene divinylbenzene copolymer.

When dried, it contains not less than 7.0% and not more than 9.0% of calcium (Ca: 40.08).

Each g of Calcium Polystyrene Sulfonate, when dried, exchanges with 53 to 71 mg of potassium (K: 39.10).

Description Calcium Polystyrene Sulfonate occurs as a pale yellowish white to light yellow powder. It is odorless and tasteless.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

Identification (1) Determine the infrared absorption spectrum of Calcium Polystyrene Sulfonate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Mix 0.5 g of Calcium Polystyrene Sulfonate with 10 mL of dilute hydrochloric acid, filter, and neutralize the filtrate with ammonia TS: the solution responds to the Qualitative Tests <1.09> for calcium salt.

Purity (1) Ammonium—Place 1.0 g of Calcium Polystyrene Sulfonate in a flask, add 5 mL of sodium hydroxide TS, cover the flask with a watch glass having a moistened strip of red litmus paper on the underside, and boil for 15 minutes: the gas evolved does not change the red litmus paper to blue (not less than 5 ppm).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Calcium Polystyrene Sulfonate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.17>—Prepare the test solution with 1.0 g of Calcium Polystyrene Sulfonate according to Method 3, and perform the test (not more than 2 ppm).

(4) Styrene—To 10.0 g of Calcium Polystyrene Sulfonate...
add 10 mL of acetone, shake for 30 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 10 mg of styrene in acetone to make exactly 100 mL. Pipet 1 mL of this solution, dilute with acetone to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Gas Chromatography ≤0.2% according to the following conditions.

Determine the peak heights, H_T and H_S, of styrene in each solution: H_T is not larger than H_S.

Operating conditions—

Detector: A hydrogen flame-ionization detector.

Column: A stainless steel column 3 mm in inside diameter and 2 m in length, having polyethylene glycol 20 M coated at the ratio of 15% on siliceous earth for gas chromatography (150 to 180 μm in particle diameter).

Column temperature: A constant temperature of about 90°C.

Carrier gas: Nitrogen.

Flow rate: Adjust the flow rate so that the retention time of styrene is about 9 minutes.

System suitability—

System performance: Mix 10 mg of styrene with 1000 mL of acetone. When the procedure is run with 5 μL of this solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of styrene are not less than 800 and 0.8 to 1.2, respectively.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak heights of styrene is not more than 3%.

(5) Sodium—Pipet 2 mL of the 50-mL solution obtained in the Assay (1), add 0.02 mol/L hydrochloric acid TS to make exactly 500 mL, and use this solution as the sample solution. Separately, weigh accurately 0.2542 g of sodium chloride, previously dried at 130°C for 2 hours, and dissolve in 0.02 mol/L hydrochloric acid TS to make exactly 1000 mL. Pipet a suitable volume of this solution, and dilute with 0.02 mol/L hydrochloric acid TS to make a solution containing 1 to 3 μg of sodium (Na: 22.99) per mL, and use these solutions as the standard solutions. Perform the test with the sample solution and standard solutions according to the Atomic Absorption Spectrophotometry ≤0.2% under the following conditions, and determine the amount of sodium in the sample solution using the calibration curve obtained from the standard solutions: the amount of sodium is not more than 1%.

Gas: Combustible gas—Acetylene.

Supporting gas—Air.

Lamp: A sodium hollow-cathode lamp.

Wavelength: 589.0 nm.

Loss on drying ≤0.4% Not more than 10.0% (1 g, in vacuum, 80°C, 5 hours).

Microparticles (i) Apparatus: Use an apparatus as shown in the illustration.

(ii) Procedure: Weigh accurately about 5.5 g of Calcium Polystyrene Sulfonate, previously dried, add 300 mL of water of 25°C, and mix for 5 minutes. Transfer this turbid solution to the sedimentation tube J, keeping a temperature at 25°C, add water of 25°C to 2 mm below the mark F of 20 cm of the sedimentation tube J, and then insert the pipet. Open the two-way stopcock C, exhaust air, add exactly water from the vent-hole D to the mark F of 20 cm, and close the two-way stopcock C. Shake the apparatus vertically and horizontally, disperse Calcium Polystyrene Sulfonate in water, and then open the two-way stopcock, and allow to stand at 25 ± 1°C for 5 hours and 15 minutes.

Then, draw exactly the meniscus of the turbid solution in the sedimentation tube J up to the mark of pipet bulb A by suction, open the two-way stopcock C to the outlet of pipet H, and transfer exactly measured 20 mL of the turbid solution to a weighing bottle. Repeat the procedure, and combine exactly measured 20 mL of the turbid solution. Evaporate 20 mL of this turbid solution on a water bath to dryness, dry to constant mass at 105°C, and weigh the residue as M_S (g).

Pipet 20 mL of used water, and make exactly 100 mL. Pipet 10 mL of this solution, add 0.02 mol/L hydrochloric acid TS to make exactly 200 mL, and adjust with ammonia TS to a pH of 2.2 to 2.4. Pipet 5 mL of the supernatant liquid as the sample solution, using the calibration curve obtained from the following equation: the amount of microparticles is not more than 0.1%.

\[
S (\%) = \frac{(mi \times V)}{(20 \times m_T) \times 100}
\]

M_T: Amount (g) of Calcium Polystyrene Sulfonate

V: Actual volume (mL) to the mark of 20 cm at which the suction part of pipet is inserted.

Assay (1) Calcium—Weigh accurately about 1 g of Calcium Polystyrene Sulfonate, previously dried, and disperse in 5 mL of 3 mol/L hydrochloric acid TS. Transfer this mixture, and wash out completely with the aid of a small quantity of 3 mol/L hydrochloric acid TS to a column 12 mm in inside diameter and 70 mm in length, packed with a pledged of fine glass wool in the bottom of it, placing a 50-mL volumetric flask as a receiver under the column. Then collect about 45 mL of eluate, adding 3 mol/L hydrochloric acid TS to the column, and add water to make exactly 50 mL. Pipet 20 mL of this solution, adjust with ammonia TS to a pH of exactly 10. Titrate ≤0.50% immediately with 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the red-purple color of the solution disappears, and a blue color develops (indicator: 0.04 g eriochrome black T-sodium dihydrogen ethylenediamine tetraacetate VS) until the purple color of the solution develops, and a blue color develops (indicator: 0.04 g eriochrome black T-sodium dihydrogen ethylenediamine tetraacetate VS) until the purple color of the solution disappears, and a blue color develops (indicator: 0.04 g eriochrome black T-sodium dihydrogen ethylenediamine tetraacetate VS). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS = 2.004 mg of Ca

(2) Potassium exchange capacity—Pipet 50 mL of Standard Potassium Stock Solution into a glass-stoppered flask containing about 1 g of dried Calcium Polystyrene Sulfonate, accurately weighed, stir for 120 minutes, filter, and discard the first 20 mL of the filtrate. Pipet 5 mL of the subsequent filtrate, and add 0.02 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 10 mL of this solution, add 0.02 mol/L hydrochloric acid TS to make exactly 1000 mL, and use this solution as the sample solution. Separately, measure exactly a suitable volume of Standard Potassium Stock Solution, dilute with 0.02 mol/L hydrochloric acid TS to make solutions containing 0.5 to 2.5 μg of potassium (K: 39.10) per mL, and use these solutions as the standard solutions. Perform the test with the sample solution and standard solutions as directed under Atomic Absorption Spectrophotometry ≤0.2% according to the following conditions, and determine the amount, Y (mg), of potassium in 1000 mL of the sample solution, using the calibration curve obtained from
the standard solutions. The exchange quantity for potassium per g of dried Calcium Polystyrene Sulfonate is 53 to 71 mg, calculating by the following equation.

Exchange quantity (mg) for potassium (K) per g of dried Calcium Polystyrene Sulfonate

\[ \frac{X}{M} = \frac{(X - 100) Y}{M} \]

Where:
- \( X \): The amount (mg) of potassium in 50 mL of Standard Potassium Stock Solution before exchange.
- \( M \): The amount (g) of dried Calcium Polystyrene Sulfonate.
- \( Y \): The amount (mg) of Standard Lead Solution.

Gas: Combustible gas—Acetylene
Supporting gas—Air
Lamp: A potassium hollow-cathode lamp
Wavelength: 766.5 nm

Containers and storage  Containers—Tight containers.

Calcium Stearate

Calcium Stearate mainly consists of calcium salts of stearic acid (C\textsubscript{17}H\textsubscript{35}O\textsubscript{2}: 284.48) and palmitic acid (C\textsubscript{16}H\textsubscript{32}O\textsubscript{2}: 256.42).

Calcium Stearate, when dried, contains not less than 6.4% and not more than 7.1% of calcium (Ca: 40.08).

Description  Calcium Stearate occurs as a white, light, bulky powder. It feels smooth when touched, and is adhesive to the skin. It is practically insoluble in water, in ethanol (95) and in diethyl ether.

Identification

(1) Shake vigorously 3 g of Calcium Stearate with 20 mL of diluted hydrochloric acid (1 in 2) and 30 mL of diethyl ether for 3 minutes, and allow to stand: the separated aqueous layer responds to the Qualitative Tests for calcium salt.

(2) Wash the diethyl ether layer obtained in (1) with 20 mL and 10 mL of dilute hydrochloric acid and 20 mL of water successively, and evaporate the diethyl ether on a water bath: the residue melts at a temperature not below 54°C.

Purity

(1) Heavy metals  Not more than 0.1 mg of Calcium Stearate with caution at the beginning, and heat further, gradually raising the temperature, to incineration. After cooling, add 2 mL of hydrochloric acid, evaporate on a water bath to dryness, warm the residue with 20 mL of water and 2 mL of dilute acetic acid for 2 minutes, cool, filter, and wash the residue with 15 mL of water. Combine the filtrate and the washings, add water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution by evaporating 2 mL of hydrochloric acid on a water bath to dryness and by adding 2 mL of dilute acetic acid, 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 20 ppm).

(2) Arsenic  To 1.0 g of Calcium Stearate add 5 mL of diluted hydrochloric acid (1 in 2) and 20 mL of chloroform, shake vigorously for 3 minutes, allow to stand, and separate the water layer. Perform the test with the water layer as the test solution (not more than 2 ppm).

Loss on drying  Not more than 4.0% (1 g, 105°C, 3 hours).

Assay  Weigh accurately about 0.5 g of Calcium Stearate, previously dried, heat gently with caution at first, and then ignite gradually to ash. Cool, add 10 mL of dilute hydrochloric acid to the residue, warm for 10 minutes on a water bath, and transfer the contents to a flask with the aid of 10-mL, 10-mL, and 5-mL portions of hot water. Add sodium hydroxide TS until the solution becomes slightly turbid, and then add 25 mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS, 10 mL of ammonium-ammonium chloride buffer solution, pH 10.7, 4 drops of eriochrome black T TS and 5 drops of methyl yellow TS, and titrate rapidly the excess disodium dihydrogen ethylenediamine tetraacetate with 0.05 mol/L magnesium chloride VS, until the green color of the solution disappears and a red color develops. Perform a blank determination.

Each mL of 0.05 mol/L disodium dihydrogen ethylenediamine tetraacetate VS

\[ \frac{2.004}{\text{mg}} = \frac{X}{\text{mg}} \]

Containers and storage  Containers—Well-closed containers.

Camellia Oil

Oleum Camelliae

ツバキ油

Camellia Oil is the fixed oil obtained from the peeled seeds of Camellia japonica Linné (Theaceae).

Description  Camellia Oil is a colorless or pale yellow, clear oil. It is nearly odorless and tasteless.

It is miscible with diethyl ether and with petroleum ether. It is miscible with diethyl ether and with petroleum ether. It is miscible with diethyl ether and with petroleum ether.

It is miscible with diethyl ether and with petroleum ether. It is miscible with diethyl ether and with petroleum ether. It is miscible with diethyl ether.

Identification  To 2 mL of Camellia Oil add dropwise 10 mL of a mixture of fuming nitric acid, sulfuric acid, and water (1:1:1), previously cooled to room temperature: a bluish green color develops at the zone of contact.

Acid value  Not more than 2.8.

Saponification value  188 – 194

Unsaponifiable matters  Not more than 1.0%.

Iodine value  78 – 83

Containers and storage  Containers—Tight containers.
Camostat Mesilate

Description
Camostat Mesilate occurs as white crystals or crystalline powder. It is sparingly soluble in water, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Identification
(1) To 4 mL of a solution of Camostat Mesilate (1 in 1000) add 2 mL of 1-naphthol TS and 1 mL of diacetyl TS, and allow to stand for 10 minutes: a red color develops.

(2) Determine the absorption spectrum of a solution of Camostat Mesilate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Camostat Mesilate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) A 0.1 g portion of Camostat Mesilate responds to the Qualitative Tests 1.00 (1) for mesilate.

Melting point
194 - 198°C

Purity
(1) Heavy metals 1.07—Dissolve 1.0 g of Camostat Mesilate in 40 mL of water by warming, and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution and 2 mL of dilute acetic acid (not more than 20 ppm).

(2) Arsenic 1.11—Dissolve 2.0 g of Camostat Mesilate in 20 mL of 2 mol/L hydrochloric acid TS by heating in a water bath, and continue to heat for 20 minutes. After cooling, centrifuge, take 10 mL of the supernatant liquid, and use this solution as the test solution. Perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 30 mg of Camostat Mesilate in 10 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.01. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, water and acetic acid (100:200:100:50:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand overnight in iodine vapor: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying 2.41—Not more than 1.0% (1 g, silica gel, 105°C, 3 hours).

Residue on ignition 2.44—Not more than 0.2% (1 g).

Assay
Weigh accurately about 50 mg each of Camostat Mesilate and Camostat Mesilate RS, previously dried, and dissolve each in water to make exactly 50 mL. Pipet 5 mL each of these solutions, add exactly 5 mL of the internal standard solution, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 2 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and calculate the ratios, Qt and Qs, of the peak area of camostat to that of the internal standard.

\[
\text{Amount (mg)} = M_S \times \frac{Q_t}{Q_s}
\]

Mₜ: Amount (mg) of C₂₀H₂₂N₄O₅.CH₄O₃S

Residue on ignition 2.44—Not more than 0.2% (1 g).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 265 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of methanol, a solution of sodium 1-heptane sulfonate (1 in 500), a solution of sodium laureyl sulfate (1 in 1000) and acetic acid (100) (200:100:50:1).
Flow rate: Adjust the flow rate so that the retention time of camostat is about 10 minutes.

System suitability—
System performance: When the procedure is run with 2 μL of the standard solution under the above operating conditions, camostat and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.
System repeatability: When the test is repeated 6 times with 2 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of camostat to that of the internal standard is not more than 1.0%.

Containers and storage
Containers—Tight containers.
**d-Camphor**

\[ C_{10}H_{16}O: 152.23 \]

(1R,4R)-1,7,7-Trimethylbicyclo[2.2.1]-heptan-2-one [464-49-3]

*d*-Camphor contains not less than 96.0% of 
\[ C_{10}H_{16}O. \]

**Description**  
*d*-Camphor occurs as colorless or white, translucent crystals, crystalline powder or masses. It has a characteristic, agreeable odor, and a slightly bitter taste, followed by a pleasant, cooling sensation. It is freely soluble in ethanol (95), in diethyl ether and in carbon disulfide, and slightly soluble in water. It slowly volatilizes at room temperature.

**Identification**  
Dissolve 0.1 g of *d*-Camphor in 2 mL of methanol, add 1 mL of 2,4-dinitrophenylhydrazine TS, and heat for 5 minutes on a water bath: an orange-red precipitate is formed.

**Optical rotation** &lt;2.49&gt;  
[α]D₂₀: +41.0 – +43.0° (5 g, ethanol (95), 50 mL, 100 mm).

**Melting point** &lt;2.60&gt;  
177 – 182°C

**Purity**  
(1) Water—Shake 1.0 g of *d*-Camphor with 10 mL of carbon disulfide: the solution is clear.

(2) Chlorinated compounds—Mix 0.2 g of finely powdered *d*-Camphor with 0.4 g of sodium peroxide in a dried porcelain crucible. Heat the crucible gently by the open flame until the incineration is complete. Dissolve the residue in 20 mL of warm water, acidify with 12 mL of dilute nitric acid, and filter the solution into a Nessler tube. Wash the filter paper with three 5-mL portions of hot water, adding acid until the incineration is complete. Dissolve the residue in 20 mL of warm water, acidify with 12 mL of dilute nitric acid, and filter the solution into a Nessler tube. Wash the filter paper with three 5-mL portions of hot water, adding acid until the incineration is complete. Dissolve the residue in 20 mL of warm water, acidify with 12 mL of dilute nitric acid, and filter the solution into a Nessler tube.

(3) Non-volatile residue—Heat 2.0 g of *d*-Camphor on a water bath until sublimation is complete, then dry the residue at 105°C for 3 hours: the mass of the residue does not exceed 1.0 mg.

**Assay**  
Weigh accurately about 0.1 g each of *d*-Camphor and *d*-Camphor RS, add exactly 5 mL each of the internal standard solution, dissolve in ethanol (99.5) to make 100 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 2 μL each of these solutions as directed under Gas Chromatography &lt;2.02&gt; according to the following conditions, and calculate the ratios, \( Q_d \) and \( Q_s \), of the peak area of *d*-camphor to that of the internal standard.

\[ \text{Amount (mg) of } C_{10}H_{16}O = M_s \times Q_s/Q_d \]

\( M_s \): Amount (mg) of *d*-Camphor RS

**Internal standard solution**—A solution of methyl salicylate in ethanol (99.5) (1 in 25).

**Operating conditions**—  
Detector: A hydrogen flame-ionization detector.  
Column: A glass column 3 mm in inside diameter and 3 m in length, which is packed with 10% of polyethylene glycol 20 M for gas chromatography supported on 180 to 250 μm mesh silanized siliceous earth for gas chromatography.

**Column temperature**: A constant temperature of about 160°C.

**Carrier gas**: Nitrogen

**Flow rate**: Adjust the flow rate so that the retention time of *d*-camphor is about 6 minutes.

**System suitability**—  
System performance: When the procedure is run with 2 μL of the standard solution under the above operating conditions, *d*-camphor and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 2 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of *d*-camphor to that of the internal standard is not more than 1.0%.

**Containers and storage**  
Containers—Tight containers.

**dl-Camphor**

**Synthetic Camphor**

\[ C_{10}H_{16}O: 152.23 \]

(1RS,4RS)-1,7,7-Trimethylbicyclo[2.2.1]-heptan-2-one [76-22-2]

*dl*-Camphor contains not less than 96.0% of 
\[ C_{10}H_{16}O. \]

**Description**  
*dl*-Camphor occurs as colorless or white, translucent crystals, crystalline powder or masses. It has a characteristic, agreeable odor, and has a slightly bitter taste followed by a pleasant, cooling sensation. It is freely soluble in ethanol (95), in diethyl ether and in carbon disulfide, and slightly soluble in water. It slowly volatilizes at room temperature.

**Identification**  
Dissolve 0.1 g of *dl*-Camphor in 2 mL of methanol, add 1 mL of 2,4-dinitrophenylhydrazine TS, and heat for 5 minutes on a water bath: an orange-red precipitate is formed.

**Optical rotation** &lt;2.49&gt;  
[α]D₂₀: −1.5 – +1.5° (5 g, ethanol (95), 50 mL, 100 mm).

**Melting point** &lt;2.60&gt;  
175 – 180°C
Candesartan Cilexetil

**C₁₃H₁₂N₂O₆: 610.66**
(1RS)-1-(Cyclohexyloxycarbonyloxy)ethyl-2-ethoxy-1-[[2’-(1H-tetrazol-5-yl)biphenyl-4-yl)methyl]-1H-benzo[δ]imidazole-7-carboxylate

Candesartan Cilexetil contains not less than 99.0% and not more than 101.0% of C₁₃H₁₂N₂O₆, calculated on the anhydrous basis.

**Description**
Candesartan Cilexetil occurs as white crystals or a white crystalline powder.

It is soluble in acetic acid (100), sparingly soluble in methanol, slightly soluble in ethanol (99.5), and practically insoluble in water.

A solution of Candesartan Cilexetil in methanol (1 in 100) shows no optical rotation.

**Identification**
(1) Determine the absorption spectrum of a solution of Candesartan Cilexetil in methanol (1 in 50,000) as directed under Infrared Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Candesartan Cilexetil as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

If any difference appears between the spectra, recrystallize the sample and the RS according to the method otherwise specified, filter and dry the crystals, and perform the test with the crystals.

**Purity**
(1) Heavy metals <1.07>—Proceed with 1.0 g of Candesartan Cilexetil according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 20 mg of Candesartan Cilexetil in 50 mL of a mixture of acetonitrile and water (3:2), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of acetonitrile and water (3:2) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.21 according to the following conditions, and determine each peak area by the automatic integration method: the area of the peaks, having the relative retention time of about 0.4 and about 2.0 to Candesartan Cilexetil, obtained from the sample solution is not
larger than 1/5 times the peak area of candesartan cilexetil from the standard solution, the area of the peak, having the relative retention time of about 0.5, from the sample solution is not larger than 3/10 times the peak area of candesartan cilexetil from the standard solution, the area of the peak other than candesartan cilexetil and the peaks mentioned above is not smaller than 1/10 times the peak area of candesartan cilexetil from the standard solution, and the total area of the peaks other than candesartan cilexetil from the sample solution is not larger than 3/5 times the peak area of candesartan cilexetil from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: A mixture of acetonitrile, water and acetic acid (100) (57:43:1).

Mobile phase B: A mixture of acetonitrile, water and acetic acid (100) (90:10:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 30</td>
<td>100 → 0</td>
<td>0 → 100</td>
</tr>
</tbody>
</table>

Flow rate: 0.8 mL per minute.

Time span of measurement: For 30 minutes after injection, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 2 mL of the standard solution, and add a mixture of acetonitrile and water (3:2) to make exactly 20 mL. Confirm that the peak area of candesartan cilexetil obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of candesartan cilexetil are not less than 12,000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of candesartan cilexetil is not more than 2.0%.

(3) Residual solvent—Being specified separately.

Water <2.48> Not more than 0.3% (0.5 g, coulometric titration).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Candesartan Cilexetil, dissolve in 60 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 61.07 mg of C33H34N6O6

Containers and storage Containers—Well-closed containers.

Candesartan Cilexetil Tablets

Candesartan Cilexetil Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of candesartan cilexetil (C33H34N6O6: 610.66).

Method of preparation Prepare as directed under Tablets, with Candesartan Cilexetil.

Identification Pulverize Candesartan Cilexetil Tablets. To a portion of the powder, equivalent to 1 mg of Candesartan Cilexetil according to the labeled amount, add 50 mL of methanol, shake vigorously for 10 minutes, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits its absorption maxima between 252 nm and 256 nm and between 302 nm and 307 nm.

Purity Related substances—Weigh the mass of not less than 10 Candesartan Cilexetil Tablets, and powder. To a portion of the powder, equivalent to 6 mg of Candesartan Cilexetil according to the labeled amount, add 15 mL of a mixture of acetonitrile and water (3:2), shake vigorously for 10 minutes, and centrifuge. Filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 3 mL of the filtrate, and use the subsequent filtrate as the sample solution. Pipet 1 mL of the sample solution, add a mixture of acetonitrile and water (3:2) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak having the relative retention time of about 0.5 to candesartan cilexetil obtained from the sample solution is not larger than 1.5 times the peak area of candesartan cilexetil from the standard solution, the area of the peak having the relative retention time of about 0.8, about 1.1 and about 1.5 to candesartan cilexetil is not larger than 1/2 times the peak area of candesartan cilexetil from the standard solution, the area of the peak having the relative retention time of about 2.0 from the sample solution is not larger than the peak area of candesartan cilexetil from the standard solution, and the total area of the peaks other than candesartan cilexetil from the sample solution is not larger than 4 times the peak area of candesartan cilexetil from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.
25°C.

Mobile phase A: A mixture of acetonitrile, water and acetic acid (100) (57:43:1).

Mobile phase B: A mixture of acetonitrile, water and acetic acid (100) (90:10:1).

Flowing of mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

</tbody>
</table>

Flow rate: 0.8 mL per minute.

Time span of measurement: For 30 minutes after injection, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 2 mL of the standard solution, and add a mixture of acetonitrile and water (3:2) to make exactly 20 mL. Confirm that the peak area of candesartan cilexetil with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of candesartan cilexetil are not less than 12,000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of candesartan cilexetil is not more than 2.0%.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Candesartan Cilexetil Tablets add 30 mL of a mixture of acetonitrile and water (3:2), shake vigorously for 20 minutes, then add a mixture of acetonitrile and water (3:2) to make exactly V mL so that each mL contains about 40 μg of candesartan cilexetil (C23H34N6O6), centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of candesartan cilexetil for assay (separately determine the water <2.48> in the same manner as Candesartan Cilexetil), and dissolve in acetonitrile to make exactly 50 mL. Pipet 4 mL of this solution, add a mixture of acetonitrile and water (3:2) to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A1 and A5, of the sample solution and standard solution at 305 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
\text{Amount (mg) of candesartan cilexetil (C23H34N6O6)} = M_S \times A_1/A_5 \times V/1250
\]

\[
M_S: \text{Amount (mg) of candesartan cilexetil for assay, calculated on the anhydrous basis}
\]

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of a solution of polysorbate 20 (1 in 100) as the dissolution medium, the dissolution rate in 45 minutes of Candesartan Cilexetil Tablets is not less than 75%.

Start the test with 1 tablet of Candesartan Cilexetil Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 5 mL of the filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V’ mL so that each mL contains about 2.2 μg of candesartan cilexetil (C23H34N6O6) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of candesartan cilexetil for assay (separately determine the water <2.48> in the same manner as Candesartan Cilexetil), and dissolve in acetonitrile to make exactly 50 mL. Pipet 5 mL of this solution, add acetonitrile to make exactly 50 mL. Pipet 1 mL of this solution, add the dissolution medium to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07>, and determine the peak areas, A1 and A5, of candesartan cilexetil of both solutions.

\[
\text{Dissolution rate (％) with respect to the labeled amount of candesartan cilexetil (C23H34N6O6)} = M_S \times A_1/A_5 \times V'/V \times 1/C \times 18/5
\]

\[
M_S: \text{Amount (mg) of candesartan cilexetil for assay, calculated on the anhydrous basis}
\]

C: Labeled amount (mg) of candesartan cilexetil (C23H34N6O6) in 1 tablet

Operating conditions—

Proceed as directed in the operating conditions in the Assay.

System suitability—

System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of candesartan cilexetil are not less than 7000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of candesartan cilexetil is not more than 2.0%.

Assay Weigh accurately the mass of not less than 20 Candesartan Cilexetil Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 6 mg of candesartan cilexetil (C23H34N6O6), add exactly 15 mL of the internal standard solution, then add a mixture of acetonitrile and water (3:2) to make 150 mL, shake vigorously for 10 minutes, and allow to stand. Filter the supernatant liquid through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 5 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 50 mg of candesartan cilexetil for assay (separately determine the water <2.48> in the same manner as Candesartan Cilexetil), dissolve in acetonitrile to make exactly 50 mL. Pipet 4 mL of this solution, add exactly 10 mL of the internal standard solution, then add a mixture of acetonitrile and water (3:2) to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Qo and Qs, of the peak area of candesartan cilexetil to that of the internal standard.
Amount (mg) of candesartan cilexetil \((C_{33}H_{34}N_6O_6)\)

\[ M_s = \frac{M_s \times Q_T \times Q_s}{3/25} \]

Candesartan cilexetil for assay, calculated on the anhydrous basis

Internal standard solution—A solution of acenaphthene in acetonitrile (1 in 800).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of acetonitrile, water and acetic acid (100) (57:43:1).

Flow rate: Adjust the flow rate so that the retention time of candesartan cilexetil is about 13 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and candesartan cilexetil are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of candesartan cilexetil to that of the internal standard is not more than 1.0%.

Containers and storage—Tight containers.

Candesartan cilexetil for assay, calculated on the anhydrous basis.
Perform the test with exactly 20 μL each of these solutions as directed under Liquid Chromatography \(<2.0D\rangle\) according to the following conditions, and determine the peak area, \(A_F\) and \(A_S\), of 1,1’-[3,3’-dithiobis(2-methyl-1-oxopropyl)]-L-diproline of these solutions: \(A_F\) is not larger than \(A_S\).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Flow rate: Adjust the flow rate so that the retention time of 1,1’-[3,3’-dithiobis(2-methyl-1-oxopropyl)]-L-diproline is about 10 minutes.

System performance—Dissolve 25 mg each of Captopril and 1,1’-[3,3’-dithiobis(2-methyl-1-oxopropyl)]-L-diproline in 200 mL of methanol. When the procedure is run with 20 μL of this solution under the above operating conditions, captopril and 1,1’-[3,3’-dithiobis(2-methyl-1-oxopropyl)]-L-diproline are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 5 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of 1,1’-[3,3’-dithiobis(2-methyl-1-oxopropyl)]-L-diproline is not more than 2.0%.

**Loss on drying <2.4I>** Not more than 1.0% (1 g, in vacuum, 80°C, 3 hours).

**Residue on ignition <2.4I>** Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.3 g of Captopril, dissolve in 100 mL of water, add 20 mL of dilute sulfuric acid and 1 g of potassium iodide, and shake. Titrate \(<2.50\rangle\) with 1/60 mol/L potassium iodate VS (indicator: 2 mL of starch TS). Perform a blank determination in the same manner, and determine the peak area, and leaves a slightly bitter aftertaste.

It is freely soluble in chloroform, sparingly soluble in ethanol (95) and in acetone, and very slightly soluble in water and in diethyl ether.

**Identification (1)** To 0.1 g of Carbamazepine add 2 mL of nitric acid, and heat on a water bath for 3 minutes: an orange-red color is produced.

(2) To 0.1 g of Carbamazepine add 2 mL of sulfuric acid, and heat on a water bath for 3 minutes: a yellow color is produced with a green fluorescence.

(3) Examine Carbamazepine under ultraviolet light: the solution shows an intense blue fluorescence.

(4) Determine the absorption spectrum of the solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Melting point <2.60>** 189 – 193°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Carbamazepine in 10 mL of chloroform: the solution is clear and colorless to pale yellow.

(2) Acidity—To 2.0 g of Carbamazepine add exactly 40 mL of water, stir well for 15 minutes, and filter through a glass filter (G3). To 10 mL of this filtrate add 1 drop of phe- nolphthalein TS and 0.50 mL of 0.01 mol/L sodium hydroxide VS: a red color is produced.

(3) Alkalinity—To 10 mL of the filtrate obtained in (2) add 1 drop of methyl red TS and 0.50 mL of 0.01 mol/L hydrochloric acid VS: a red color is produced.

(4) Chloride \(<1.03\rangle—\)Dissolve 0.25 g of Carbamazepine in 30 mL of acetone, add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.20 mL of 0.01 mol/L hydrochloric acid VS add 30 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.028%).

(5) Heavy metals \(<1.07\rangle—\)Proceed with 2.0 g of Carbamazepine according to Method 2, and perform the test. Prepared the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(6) Related substances—Dissolve 0.25 g of Carbamazepine in 10 mL of chloroform, and use this solution as the sample solution. Separately, dissolve 5.0 mg of iminodibenzyln in chloroform to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.0D\rangle\). Spot 10 μL of each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene and methanol (19:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly potassium dichromate-sulfuric acid TS on the plate: the spots other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

**Loss on drying <2.4I>** Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition <2.4I>** Not more than 0.1% (1 g).

**Assay** Dissolve about 50 mg of Carbamazepine, previously
dried and accurately weighed, in ethanol (95) to make exactly 250 mL. Pipet 5 mL of this solution and add ethanol (95) to make exactly 100 mL. Perform the test as directed under Ultraviolet-visible Spectrophotometry \( \leq 2.4 \), and determine the absorbance \( A \) of this solution at the wavelength of maximum absorption at about 285 nm.

\[
\text{Amount (mg) of } C_{16}H_{14}N_2O_5 = \frac{A}{490} \times 50,000
\]

Containers and storage  Containers—Tight containers.

### Carbazochrome Sodium Sulfonate Hydrate

カルバゾクロムスルホン酸ナトリウム水和物

\[
\text{C}_{10}\text{H}_{11}\text{N}_{4}\text{NaO}_{5}\text{S} \cdot 3\text{H}_{2}\text{O}: 376.32
\]

Monosodium (2RS)-1-methyl-6-oxo-5-semicarbazono-2,3,5,6-tetrahydroindole-2-sulfonate trihydrate

[51460-26-5, anhydride]

Carbazochrome Sodium Sulfonate Hydrate contains not less than 98.0% and not more than 102.0% of carbazochrome sodium sulfonate \( (C_{16}H_{14}N_2O_5S) : 322.27 \), calculated on the anhydrous basis.

**Description**  Carbazochrome Sodium Sulfonate Hydrate occurs as orange-yellow, crystals or crystalline powder. It is sparingly soluble in water, very slightly soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether.

A solution of Carbazochrome Sodium Sulfonate (1 in 100) shows no optical rotation.

Melting point: about 210°C (with decomposition).

**Identification (1)**  Determine the absorption spectrum of a solution of Carbazochrome Sodium Sulfonate Hydrate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \( \leq 2.24 \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2)  Determine the infrared absorption spectrum of Carbazochrome Sodium Sulfonate Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \( \leq 2.25 \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3)  A solution of Carbazochrome Sodium Sulfonate Hydrate (1 in 100) responds to the Qualitative Tests \( \leq 1.09 \) (1) for sodium salt.

**pH \( \leq 2.54 \)**  Dissolve 0.8 g of Carbazochrome Sodium Sulfonate Hydrate in 50 mL of water by warming, and cool: the pH of this solution is between 5.0 and 6.0.

**Purity (1)**  Clarity of solution—Dissolve 1.0 g of Carbazochrome Sodium Sulfonate Hydrate in 50 mL of water by warming, and allow to cool: the solution is clear. Perform the test with this solution as directed under Ultraviolet-visible Spectrophotometry \( \leq 2.4 \): the absorbance at 590 nm is not more than 0.070.

(2)  Heavy metals \( \leq 1.07 \)—Proceed with 1.0 g of Carbazochrome Sodium Sulfonate Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3)  Related substances—Dissolve 50 mg of Carbazochrome Sodium Sulfonate Hydrate in 100 mL of water, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography \( \leq 2.01 \) according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the total area of the peaks other than the peak of carbazochrome sulfonate from the sample solution is not larger than the peak area of carbazochrome sulfonate from the standard solution.

**Operating conditions—**  
   - Detector: An ultraviolet absorption photometer (wavelength: 360 nm).
   - Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 \( \mu \)m in particle diameter).
   - Column temperature: A constant temperature of about 40°C.
   - Mobile phase: Dissolve 1.2 g of ammonium dihydrogen phosphate in 1000 mL of water, and filter through a membrane filter (0.4 \( \mu \)m in pore size) if necessary. To 925 mL of this solution add 75 mL of ethanol (95), shake, and adjust the pH to 3 with phosphoric acid.
   - Flow rate: Adjust the flow rate so that the retention time of carbazochrome sulfonate is about 7 minutes.
   - Time span of measurement: About 3 times as long as the retention time of carbazochrome sulfonate beginning after the solvent peak.

**System suitability—**  
   - Test for required detection: To exactly 2 mL of the standard solution add the mobile phase to make exactly 20 mL. Confirm that the peak area of carbazochrome sulfonate obtained from 10 \( \mu \)L of this solution is equivalent to 7 to 13% of that of carbazochrome sulfonate obtained from 10 \( \mu \)L of the standard solution.
   - System performance: Dissolve 10 mg each of Carbazochrome Sodium Sulfonate and carbazochrome in 100 mL of water by warming. When the procedure is run with 10 \( \mu \)L of this solution under the above operating conditions, carbazochrome sulfonate and carbazochrome are eluted in this order with the resolution between these peaks being not less than 3.

**System repeatability:**  When the test is repeated 6 times with 10 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of carbazochrome sulfonate is not more than 2.0%.

**Water \( \leq 2.48 \) 13.0 – 16.0% (0.3 g, volumetric titration, direct titration).

**Assay**  Weigh accurately about 0.25 g of Carbazochrome Sodium Sulfonate Hydrate, dissolve in 50 mL of water, apply to a chromatographic column, 10 mm in diameter, previously prepared with 20 mL of strongly acidic ion ex-
change resin for column chromatography (type H), and allow to flow at a rate of 4 mL per minute. Wash the column with 150 mL of water, combine the washing and the former effluent solution, and titrate \(<2.5\times\) with 0.05 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L sodium hydroxide VS = 16.11 mg of \(\text{C}_6\text{H}_4\text{N}_2\text{NaO}_5\text{S}\)

Containers and storage Containers—Well-closed containers.

**Carbidopa Hydrate**

![Chemical structure of Carbidopa Hydrate](image)

\(\text{C}_{10}\text{H}_{14}\text{N}_2\text{O}_4\cdot\text{H}_2\text{O}: 244.24\)

(2S)-2-(3,4-Dihydroxybenzyl)-2-hydrazinopropanoic acid monohydrate

[38821-49-7]

Carbidopa Hydrate contains not less than 98.0% of \(\text{C}_{10}\text{H}_{14}\text{N}_2\text{O}_4\cdot\text{H}_2\text{O}\).

**Description** Carbidopa Hydrate occurs as a white to yellowish white powder.

It is sparingly soluble in methanol, slightly soluble in water, very slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: About 197°C (with decomposition).

**Identification (1)** Dissolve 0.01 g of Carbidopa Hydrate in 250 mL of a solution of hydrochloric acid in methanol (9 in 1000). Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry \(<2.2\times\) at the wavelengths between 240 nm and 300 nm, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Carbidopa RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Carbidopa Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.2\times\), and compare the spectrum with the reference spectrum of the spectrum of Carbidopa RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** \(<2.4\times\) \([\alpha]_D^{20}\): \(-21.0\) to \(-23.5\)° (1 g, aluminum (III) chloride TS, 100 mL, 100°C).

**Purity (1)** Heavy metals \(<1.07\)—Proceed with 2.0 g of Carbidopa Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Carbidopa Hydrate in 70 mL of the mobile phase, by warming and using ultrasonication, if necessary. After cooling, add the mobile phase to make 100 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.0\times\) according to the following conditions. Determine each peak area from both solutions by the automatic integration method: the total area of all peaks other than the peak of carbidopa from the sample solution is not larger than the peak area of carbidopa from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of carbidopa.

**System suitability**—

Test for required detection: To exactly 2 mL of the standard solution add the mobile phase to make exactly 20 mL. Confirm that the peak area of carbidopa obtained from 20 \(\mu\)L of this solution is equivalent to 7 to 13% of that of carbidopa obtained from 20 \(\mu\)L of the standard solution.

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

**Loss on drying** \(<2.4\times\) 6.9 – 7.9% (1 g, in vacuum not exceeding 0.67 kPa, 100°C, 6 hours).

**Residue on ignition** \(<2.4\times\) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 50 mg each of Carbidopa Hydrate and Carbidopa RS (determine separately the loss on drying \(<2.4\times\) in the same manner as Carbidopa Hydrate), and dissolve each in 70 mL of the mobile phase, by warming and using ultrasonication if necessary. After cooling, add the mobile phase to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.0\times\) according to the following conditions, and determine the peak areas, \(A_1\) and \(A_5\), of carbidopa in each solution.

Amount (mg) of \(\text{C}_{10}\text{H}_{14}\text{N}_2\text{O}_4\cdot\text{H}_2\text{O}\) = \(M_5\times \frac{A_1}{A_5}\times 1.080\)

\(M_5\): Amount (mg) of Carbidopa RS, calculated on the dried basis

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To 950 mL of 0.05 mol/L sodium dihydrogen phosphate TS add 50 mL of ethanol (95), and adjust the pH to 2.7 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of carbidopa is about 6 minutes.

**System suitability**—

System performance: Dissolve 50 mg each of Carbidopa and methyldopa in 100 mL of the mobile phase. When the procedure is run with 20 \(\mu\)L of this solution under the above operating conditions, methyldopa and carbidopa are eluted
in this order with the resolution between these peaks being not less than 0.9.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of carbodiopa is not more than 1.0%.

Containers and storage  Containers—Tight containers.

Storage—Light-resistant.

### L-Carbocisteine

L-カルボシステイン

\[
C_5H_9NO_4S: 179.19
\]

(2R)-2-Amino-3-carboxymethylsulfanylpropanoic acid

[C5H9NO4S]-2-Amino-3-carboxymethylsulfanylpropanoic acid

L-Carbocisteine, when dried, contains not less than 98.5% of C5H9NO4S.

Description  L-Carbocisteine occurs as a white crystalline powder. It is odorless, and has a slightly acid taste.

It is very slightly soluble in water, and practically insoluble in ethanol (95).

It dissolves in dilute hydrochloric acid or in sodium hydroxide TS.

Melting point: about 186°C (with decomposition).

Identification (1)  To 0.2 g of L-Carbocisteine add 1 mL of lead acetate TS and 3 mL of water, shake, add 0.2 g of sodium hydroxide, and heat over a flame for 1 minute: a dark brown to black precipitate is formed.

(2)  Determine the infrared absorption spectrum of L-Carbocisteine as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49>  \([\alpha]_D^{20} = -33.5 \sim -36.5^\circ\) Weigh accurately about 5 g of L-Carbocisteine, previously dried, dissolve in 20 mL of water and a suitable amount of a solution of sodium hydroxide (13 in 100), and adjust the pH with 1 mol/L hydrochloric acid TS or 0.1 mol/L hydrochloric acid TS to 6.0, and add water to make exactly 50 mL. Determine the optical rotation of this solution in a 100-mm cell.

Purity (1)  Clarity and color of solution—Dissolve 1.0 g of L-Carbocisteine in 10 mL of sodium hydroxide TS: the solution is clear and colorless.

(2)  Chloride <1.03>—Dissolve 0.20 g of L-Carbocisteine in 10 mL of water and 20 mL of nitric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows. To 0.40 mL of 0.01 mol/L hydrochloric acid VS add 20 mL of nitric acid and water to make 50 mL (not more than 0.071%).

(3)  Ammonium <1.02>—Perform the test with 0.25 g of L-Carbocisteine using the distillation under reduced pressure. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(4)  Heavy metals <1.07>—Proceed with 1.0 g of L-Carbocisteine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(5)  Arsenic <1.17>—Prepare the test solution with 1.0 g of L-Carbocisteine according to Method 3, and perform the test (not more than 2 ppm).

(6)  Related substances—Dissolve 0.30 g of L-Carbocisteine in 10 mL of 0.2 mol/L sodium hydroxide TS, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add 0.2 mol/L sodium hydroxide TS to make exactly 100 mL. Pipet 1 mL of this solution, and add 0.2 mol/L sodium hydroxide TS to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution, in 15 mm length along the starting line on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly a solution of ninhydrin in acetone (1 in 50) on the plate, and heat at 80°C for 5 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.47>  Not more than 0.30% (1 g, 105°C, 2 hours).

Residue on ignition <2.44>  Not more than 0.1% (1 g).

Assay  Weigh accurately about 0.25 g of L-Carbocisteine, previously dried, dissolve in exactly 20 mL of 0.1 mol/L perchloric acid VS and 50 mL of acetic acid (100), and titrate <2.30> the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS = 17.92 mg of C5H9NO4S

Containers and storage  Containers—Tight containers.

## Carbon Dioxide

二酸化炭素

CO₂: 44.01

[124-38-9]

Carbon Dioxide contains not less than 99.5 vol% of CO₂.

Description  Carbon Dioxide is a colorless gas at room temperature and under atmospheric pressure. It is odorless.

A 1 mL volume of Carbon Dioxide dissolves in 1 mL of water, and the solution is slightly acid.

1000 mL of Carbon Dioxide at 0°C and under a pressure of 101.3 kPa weighs about 1.978 g.

Identification (1)  Pass 100 mL of Carbon Dioxide through a carbon dioxide measuring detector tube: the detector tube is changed to a stipulated color tone by each detector tube, provided that the detector tube with a upper limit of measurement of not less than 10% is used.
(2) Pass Carbon Dioxide into calcium hydroxide TS: a white precipitate is produced. Collect the precipitate, and add acetic acid (31): it dissolves with effervescence.

**Purity (1)** Acidity—Place 50 mL of freshly boiled and cooled water in a Nessler tube, and pass 1000 mL of Carbon Dioxide into it for 15 minutes through an introducing tube about 1 mm in diameter extending to 2 mm from the bottom of the Nessler tube, then add 0.10 mL of methyl orange TS: the solution is not more colored than the following control solution.

Control solution: To 50 mL of freshly boiled and cooled water in a Nessler tube add 0.10 mL of methyl orange TS and 1.0 mL of 0.01 mol/L hydrochloric acid VS.

(1) Hydrogen phosphate, hydrogen sulfide or reducing organic substances—Place 25 mL of silver nitrate-ammonia TS and 3 mL of ammonia TS in each of two Nessler tubes A and B, and designate the solution in each tube as solution A and solution B, respectively. Pass 1000 mL of Carbon Dioxide into solution A in the same manner as directed in (1): the turbidity and color of this solution are the same as that of solution B.

(3) Carbon monoxide—Pass a specified amount of Carbon Dioxide through a carbon monoxide measuring detector tube: the concentration of carbon monoxide is less than 15 ppm, provided that the passing amount (mL) of Carbon Dioxide is stipulated according to each detector tube.

**Assay** Place 125 mL of a solution of potassium hydroxide (1 in 2) in a gas pipet of suitable capacity. Measure exactly about 100 mL of Carbon Dioxide in a 100-mL gas buret filled with water. Force the entire volume of gas into the gas pipet, and shake for 5 minutes. Draw some of the unabsorbed gas into the gas buret, measure the volume, force the residual back upon the surface of the liquid in the gas pipet, and repeat this procedure until a constant volume of the residual reading is obtained. Determine the volume $V_1$ (mL) of the residual gas. Calculate the volume of the sample and $V_2$ on the basis of the gas volume at 20°C and at 101.3 kPa.

$$\text{Volume (mL) of CO}_2 = \text{volume (mL) of the sample} - V_1 (\text{mL})$$

**Containers and storage** Containers—Cylinders. Storage—Not exceeding 40°C.

## Carmellose

### Carboxymethylcellulose

カルメロース

[9000-11-7]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols (•).°

Carmellose is a carboxymethyl ether of cellulose.

•**Description** Carmellose occurs as a white powder. It is practically insoluble in ethanol (95). It swells with water to form suspension. It becomes viscid in sodium hydroxide TS. It is hygroscopic.

**Identification (1)** Determine the infrared absorption spectrum of Carmellose as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) The pH <2.54> of a suspension, obtained by shaking 1 g of Carmellose with 100 mL of water, is between 3.5 and 5.0.

**Purity (1)** Chloride <1.03>—Shake well 0.8 g of Carmellose with 50 mL of water, dissolve in 10 mL of sodium hydroxide TS, and add water to make 100 mL. Heat 20 mL of this solution with 10 mL of dilute nitric acid on a water bath until a flocculent precipitate is produced, cool, centrifuge, and take out the supernatant liquid. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant liquid and the washings, and add water to make 100 mL. Take 25 mL of this solution, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.36%).

(2) Sulfate <1.14>—Shake well 0.40 g of Carmellose with 25 mL of water, dissolve in 5 mL of sodium hydroxide TS, and add 20 mL of water. Heat this solution with 2.5 mL of hydrochloric acid in a water bath until a flocculent precipitate is produced. Cool, centrifuge, and take out the supernatant liquid. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant liquid and the washings, and add water to make 100 mL. Filter this solution, discard 5 mL of the first filtrate, take 25 mL of the subsequent filtrate, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.5 mL of 0.005 mol/L sulfuric acid VS (not more than 0.72%).

•**Heavy metals** <1.07>—Proceed with 1.0 g of Carmellose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** <2.41> Not more than 8.0% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 1.5% (after drying, 1 g).

•**Containers and storage** Containers—Tight containers.

## Carmellose Calcium

### Carboxymethylcellulose Calcium

カルメロースカルシウム

[9050-04-8]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols (•).°
Carmellose Calcium is the calcium salt of a polycarboxymethyl ether of cellulose.

**Description** Carmellose Calcium occurs as a white to yellowish white powder. It is practically insoluble in ethanol (95%) and in diethyl ether. It swells with water to form a suspension. The pH of a suspension, obtained by shaking 1.0 g of Carmellose Calcium with 100 mL of water, is between 4.5 and 6.0.

It is hygroscopic.

**Identification (1)** Shake thoroughly 0.1 g of Carmellose Calcium with 10 mL of water, followed by 2 mL of sodium hydroxide TS, allow to stand for 10 minutes, and use this solution as the sample solution. To 1 mL of the sample solution add water to make 5 mL. To 1 drop of this solution add 0.5 mL of chromotropic acid TS, and heat in a water bath for 10 minutes: a red-purple color develops.

(2) Shake 5 mL of the sample solution obtained in (1) with 10 mL of acetone: a white, flocculent precipitate is produced.

(3) Shake 5 mL of the sample solution obtained in (1) with 1 mL of iron (III) chloride TS: a brown, flocculent precipitate is produced.

(4) Ignite 1 g of Carmellose Calcium to ash, dissolve the residue in 10 mL of water and 6 mL of acetic acid (31), and filter, if necessary. Boil the filtrate, cool, and neutralize with ammonia TS: the solution responds to the Qualitative Tests <1.09> (1) and (3) for calcium salt.

**Purity (1)** Alkalinity—Shake thoroughly 1.0 g of Carmellose Calcium with 50 mL of freshly boiled and cooled water, and add 2 drops of phenolphthalein TS: no red color develops.

(2) Chloride <1.03>—Shake thoroughly 0.80 g of Carmellose Calcium with 50 mL of water, add 10 mL of sodium hydroxide TS to dissolved, add water to make 100 mL, and use this solution as the sample solution. Heat 20 mL of the sample solution with 10 mL of 2 mol/L nitric acid TS on a water bath until a flocculent precipitate is produced. After cooling, centrifuge, and take out the supernatant liquid. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant and the washings, and add water to make 100 mL. Take 25 mL of this solution, and add 1 mL of nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.36%).

(3) Sulfate <1.14>—Heat 10 mL of the sample solution obtained in (2) with 1 mL of hydrochloric acid in a water bath until a flocculent precipitate is produced. Cool, centrifuge, and take out the supernatant liquid. Wash the precipitate with three 10-mL portions of water by centrifuging each time, combine the supernatant and the washings, and add water to make 100 mL. Perform the test with 25 mL this solution as the test solution. Prepare the control solution with 0.42 mL of 0.005 mol/L sulfuric acid VS. To the test solution and the control solution add 1 mL of 3 mol/L hydrochloric acid TS and 3 mL of barium chloride TS, then add water to make 50 mL, and mix. Allow to stand for 10 minutes, and compare the turbidity of these solutions: the turbidity obtained with the test solution is not more than that obtained with the control solution (not more than 1.0%).

(4) Heavy metals <1.07>—Proceed with 1.0 g of Carmellose Calcium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying <2.41>** Not more than 10.0% (1 g, 105°C, 4 hours).

**Residue on ignition <2.44>** 10 - 20% (after drying 1 g).

**Containers and storage** Containers—Tight containers.

**Carmellose Sodium**

**Carboxymethylcellulose Sodium**

カルメロースナトリウム

**[9004-32-4]**

Carmellose Sodium is the sodium salt of a polycarboxymethyl ether of cellulose.

It, when dried, contains not less than 6.5% and not more than 8.5% of sodium (Na: 22.99).

**Description** Carmellose Sodium occurs as a white to yellowish white powder or granules. It has no taste. It is practically insoluble in methanol, in ethanol (95), in acetic acid (100) and in diethyl ether. It forms a viscous solution in water and in warm water.

It is hygroscopic.

**Identification (1)** Dissolve 0.2 g of Carmellose Sodium in 20 mL of warm water with stirring, cool, and use this solution as the sample solution. To 1 mL of the sample solution add water to make 5 mL. To 1 drop of this solution add 0.5 mL of concentrated chromotropic acid TS, and heat in a water bath for 10 minutes: a red-purple color develops.

(2) To 10 mL of the sample solution obtained in test (1) add 1 mL of copper (II) sulfate TS: a blue flocculent precipitate is produced.

(3) To 3 g of Carmellose Sodium add 20 mL of methanol and 2 mL of dilute hydrochloric acid, boil gently on a water bath for 5 minutes, and filter. Evaporate the filtrate to dryness, and add 20 mL of water to the residue: the solution responds to the Qualitative Tests <1.09> for sodium salt.

**pH <2.54>** Add 1.0 g of Carmellose Sodium in small portions to 100 mL of warm water with stirring, dissolve, and cool: the pH of this solution is between 6.0 and 8.0.

**Purity (1)** Clarity and color of solution—Firmly attach a glass plate of good quality 2 mm in thickness, to the bottom of a glass column 250 mm in height, 25 mm in inner diameter and 2 mm in thickness. This is used as an outer tube. Similarly prepare an inner tube by attaching a glass plate of good quality 2 mm in thickness to the bottom of a glass column 300 mm in height, 15 mm in inner diameter and 2 mm in thickness. Dissolve 1.0 g of Carmellose Sodium in 100 mL of water, pour this solution into the outer tube, and place on a piece of white paper on which 15 parallel black lines 1 mm in width and 1 mm in interval are drawn. Moving the inner tube up and down and observing from the upper part, deter-
mine the height of the solution up to the lower edge of the inner tube when the distinction of the lines becomes impossible. Repeat the operation 3 times, and calculate the mean value: it is larger than that calculated from the similar operation, using the following control solution.

Control solution: To 5.50 mL of 0.005 mol/L sulfuric acid VS add 1 mL of dilute hydrochloric acid, 5 mL of ethanol (95) and water to make 50 mL. Add 2 mL of barium chloride TS, mix well, and allow to stand for 10 minutes. SHAKE WELL this solution before use.

(2) Chloride <1.0%>—Dissolve 0.5 g of Carmellose Sodium in 50 mL of water, and use this solution as the sample solution. SHAKE 10 mL of the sample solution with 10 mL of dilute nitric acid, heat to produce a flocculent precipitate in a water bath, cool, and centrifuge. Separate the supernatant liquid, wash the precipitate with three 10-mL portions of water, centrifuging each time, combine the supernatant liquid and washings, and dilute with water to 200 mL. PERFORM THE TEST using 50 mL of this solution as the test solution. Prepare the control solution with 0.45 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.640%).

(3) Sulfate <1.14>—Add 1 mL of hydrochloric acid to 10 mL of the sample solution obtained in (2), shake well, heat to produce a flocculent precipitate in a water bath, cool, and centrifuge. Separate the supernatant liquid, wash the precipitate with three 10-mL portions of water, centrifuging each time, combine the washings with the supernatant liquid mentioned above, and dilute to 50 mL with water. TAKE 10 mL of this solution, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.960%).

(4) Silicate—WEIGH accurately about 1 g of Carmellose Sodium, ignite in a platinum dish, add 20 mL of dilute hydrochloric acid, cover with a watch glass, and boil gently for 30 minutes. Remove the watch glass, and evaporate on a water bath to dryness with the aid of a current of air. Continue heating for further 1 hour, add 10 mL of hot water, stir well, and filter through a filter paper for qualitative analysis. Wash the residue with hot water, dry together with the filter paper after no turbidity is produced on the addition of silver nitrate with three 10-mL portions of water, centrifuging each time, combine the supernatant liquid and washings, and filter through a filter paper for quantitative analysis. Prepare the test solution (not more than 10 ppm).

(5) Heavy metals <1.07>—Proceed with 1.0 g of Carmellose Sodium according to Method 2, and perform the test. PREPARE THE CONTROL SOLUTION with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(6) Arsenic <1.17>—To 1.0 g of Carmellose Sodium add 20 mL of nitric acid, heat gently until it becomes fluid, cool, add 5 mL of sulfuric acid, and heat until white fumes are evolved. ADD, if necessary, 5 mL of nitric acid after cooling, and heat again. Repeat this operation until the solution becomes colorless or slightly yellow. After cooling, add 15 mL of a saturated solution of ammonium oxalate monohydrate, and heat until white fumes are evolved again, cool, and dilute with water to 25 mL. TAKE 5 mL of this solution as the test solution, and perform the test. The solution has no more color than the following color standard.

Color standard: Without using Carmellose Sodium, proceed in the same manner, then transfer 5 mL of this solution to a generator bottle, add exactly 2 mL of Standard Arsenic Solution, and proceed as directed for the test with the test solution (not more than 10 ppm).

(7) Starch—Add 2 drops of iodine TS to 10 mL of the sample solution obtained in (2): no blue color develops.

Loss on drying <2.41> Not more than 10.0% (1 g, 105°C, 4 hours).

Assay Weigh accurately about 0.5 g of Carmellose Sodium, previously dried, add 80 mL of acetic acid (100), connect with a reflux condenser, and heat in an oil bath maintained at 130°C for 2 hours. Cool, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). PERFORM A BLANK DETERMINATION, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 2.299 mg of Na.

Containers and storage Containers—Tight containers.

Carmofur

カルモフール

C_{11}H_{16}FN_{3}O_{3}: 257.26
5-Fluoro-1-(hexylaminocarbonyl)uracil
[61422-45-5]

Carmofur, when dried, contains not less than 98.0% of C_{11}H_{16}FN_{3}O_{3}.

Description Carmofur occurs as a white crystalline powder.

It is very soluble in N,N-dimethylformamide, freely soluble in acetic acid (100), soluble in diethyl ether, sparingly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

Melting point: about 111°C (with decomposition).

Identification (1) Proceed with 5 mg of Carmofur as directed under Oxygen Flask Combustion Method <1.09>, using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid, and prepare the test solution: the test solution responds to the Qualitative Tests <1.09> (2) for fluoride.

(2) Determine the absorption spectrum of a solution of Carmofur in a mixture of methanol and phosphoric acid-acetic acid-boric acid buffer solution, pH 2.0, (9:1) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Carmofur, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of
Carmofur according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 0.02 g of Carmofur in 10 mL of a mixture of methanol and acetic acid (100:99:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of methanol and acetic acid (100:99:1) to make exactly 500 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 15 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of toluene and acetone (5:3) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution. After exposure of the plate to bromine vapor for 30 second, spray evenly a solution of fluorescein in ethanol (95) (1 in 2500): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, in vacuum, 50°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Carmofur, previously dried, dissolve in 20 mL of N,N-dimethylformamide, and titrate <2.50> with 0.1 mol/L tetramethylammonium hydroxide-methanol VS until the color of the solution changes from yellow through blue-green to blue (indicator: 3 drops of thymol blue-dimethylformamide TS).

Each mL of 0.1 mol/L tetramethylammonium hydroxide-methanol VS = 25.73 mg of C11H16FN3O3

Containers and storage Containers—Well-closed containers.

Carnauba Wax

Cera Carnauba

カルナウバロウ

Carnauba Wax is the wax obtained from the leaves of Copernicia cerifera Mart (Palmae).

Description Carnauba Wax occurs as light yellow to light brown, hard and brittle masses or white to light yellow powder. It has a slight, characteristic odor. It is tasteless.

It is practically insoluble in water, in ethanol (95), in diethyl ether and in xylene.

Specific gravity d° 20/40: 0.990 – 1.002

Melting point: 80 – 86°C

Acid value <1.13> Not more than 10.0. Use a mixture of xylene and ethanol (95) (2:1) as solvent.

Saponification value <1.13> 78 – 95 Weigh accurately about 3 g of Carnauba Wax in a 300-mL flask, add 25 mL of xylene, and dissolve by warming. To this solution add 50 mL of ethanol (95) and exactly 25 mL of 0.5 mol/L potassium hydroxide-ethanol VS, and proceed as directed in the Saponification value. The time of heating should be 2 hours and the titration should be done by warming.

Iodine value <1.13> 5 – 14 (Dissolve the sample by shaking a glass-stoppered flask in warm water.)

Containers and storage Containers—Well-closed containers.

Carteolol Hydrochloride

カルテオロール塩酸塩

Carteolol Hydrochloride occurs as white crystals or crystalline powder.

It is soluble in water, sparingly soluble in methanol, very slightly soluble in ethanol (95) and in acetic acid (100), and practically insoluble in diethyl ether.

The pH of a solution of Carteolol Hydrochloride (1 in 100) is between 5.0 and 6.0.

The solution of Carteolol Hydrochloride (1 in 20) shows no optical rotation.

Melting point: about 277°C (with decomposition).

Identification (1) Dissolve 0.1 g of Carteolol Hydrochloride in 5 mL of water, and add 5 drops of Reinecke salt TS: a light red precipitate is formed.

(2) Determine the absorption spectrum of a solution of Carteolol Hydrochloride (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Carteolol Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Carteolol Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Carteolol Hydrochloride in 30 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Carteolol Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g
of Carteolol Hydrochloride according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.20 g of Carteolol Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia solution (28:50:20:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Carteolol Hydrochloride, previously dried, add 30 mL of acetic acid (100), and in ethanol (99.5). Weigh accurately about 0.5 g of Carteolol Hydrochloride, and make any necessary correction. Pipet 3 hours).

Containers and storage Containers—Well-closed containers.

Carumonam Sodium
カルモナムナトリウム

\[
\text{C}_{12}\text{H}_{12}\text{N}_{6}\text{Na}_{2}\text{O}_{10}\text{S}_{2} \cdot 466.40
\]

Carumonam Sodium contains not less than 850 μg (potency) and not more than 920 μg (potency) per mg, calculated on the anhydrous basis. The potency of Carumonam Sodium is expressed as mass (potency) of carumonam (\(\text{C}_{12}\text{H}_{14}\text{N}_{6}\text{O}_{10}\text{S}_{2}\cdot 466.40\)).

Description Carumonam Sodium occurs as a white to yellowish white, crystals or crystalline powder. It is freely soluble in water, soluble in formamide, very slightly soluble in methanol, and practically insoluble in acetic acid (100) and in ethanol (99.5).

Identification (1) Determine the absorption spectrum of a solution of Carumonam Sodium (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Carumonam Sodium RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Carumonam Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Carumonam Sodium RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the H spectrum of a solution of Carumonam Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.27>, using sodium-3-trimethylsilylpropionate-d₄ for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a double signal A at around δ 5.5 ppm, and a single signal B at around δ 7.0 ppm. The ratio of the integrated intensity of these signals, A:B, is about 1:1.

(4) Carumonam Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

Optical rotation <2.49> [α]D²⁺ : +18.5 – +21.0° (0.1 g calculated on the anhydrous basis, water, 10 mL, 100 mm).

pH <2.54> The pH of a solution obtained by dissolving 1.0 g of Carumonam Sodium in 10 mL of water is between 5.0 and 6.5.

Purity (1) Clarity and color of solution—Dissolve 0.5 g of Carumonam Sodium in 5 mL of water: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Carumonam Sodium according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 15 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 2.0 g of Carumonam Sodium according to Method 4, and perform the test (not more than 1 ppm).

(4) Related substance 1—Weigh accurately about 0.1 g of Carumonam Sodium, and dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of Carumonam Sodium RS, and dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, and add the mobile phase to make exactly 25 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of the related substances by the following equation: the amount of the related substance having the relative retention time of 0.7 to the peak of carumonam is not more than 4.0%, and each amount of the related substances other than the related substance having the relative retention time of 0.7 to the peak of carumonam is not more than 1.0%.
Amount (%) of related substance

\[ M_s / M_f \times A_f / A_s \]

- **Mₜ**: Amount (g) of Carumonam Sodium RS
- **Mₛ**: Amount (g) of the sample
- **Aₛ**: Peak area of carumonam from the standard solution
- **Aₜ**: Each peak area other than carumonam from the sample solution

**Operating conditions**

- **Detector**: column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.
- **Time span of measurement**: About 3 times as long as the retention time of carumonam.

**System suitability**

Test for required detectability: Measure exactly 5 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of carumonam obtained from 10 µL of this solution is equivalent to 7 to 13% of that from 10 µL of the standard solution.

Operating conditions:

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 10 times as long as the retention time of carumonam.

**System performance**

- **Test for required detectability**: Measure exactly 5 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of carumonam obtained from 10 µL of this solution is equivalent to 7 to 13% of that from 10 µL of the standard solution.
- **System repeatability**: When the test is repeated 3 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of carumonam is not more than 2.0%.

**Related substance 2**

Weigh accurately about 0.1 g of Carumonam Sodium, and dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of Carumonam Sodium RS, and dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, and add the mobile phase to make exactly 25 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography (2.017) according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of each related substance by the following equation: the amount of each related substance is not more than 1.0%.

Amount (%) of related substance

\[ M_s / M_f \times A_f / A_s \]

- **Mₜ**: Amount (mg (potency)) of Carumonam (C₁₂H₁₄N₆O₁₀S₂)
- **Mₛ**: Amount (mg (potency)) of carumonam (C₁₂H₁₄N₆O₁₀S₂)

Flow rate: Dissolve 0.01 g of phthalic acid in the mobile phase to make 100 mL. Adjust the flow rate so that the retention time of phthalic acid is about 6.5 minutes when the procedure is run with 10 µL of this solution.

**Time span of measurement**: About 10 times as long as the retention time of carumonam.

**System suitability**

- **Test for required detectability**: Measure exactly 5 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of carumonam obtained from 10 µL of this solution is equivalent to 7 to 13% of that from 10 µL of the standard solution.

System performance: Dissolve 40 mg of Carumonam Sodium in 20 mL of the mobile phase. To 5 mL of this solution add 5 mL of a solution of resorcinol in the mobile phase (9 in 1000) and the mobile phase to make 25 mL. When the procedure is run with 10 µL of this solution under the above operating conditions, resorcinol and carumonam are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 3 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of carumonam is not more than 2.0%.

Total amount of related substances—The total of the amounts of the related substances obtained in the Related substance 1 and the Related substance 2 is not more than 6.0%.

**Water**

Not more than 2.0% (0.2 g, volumetric titration, direct titration; Use a mixture of formamide for water determination and methanol for water determination (3:1) instead of methanol for water determination).

**Assay**

Weigh accurately an amount of Carumonam Sodium and Carumonam Sodium RS, equivalent to about 40 mg (potency), and dissolve each in the mobile phase to make exactly 20 mL. Measure exactly 5 mL each of these solutions, add exactly 5 mL of the internal standard solution and the mobile phase to make 25 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography (2.017) according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of carumonam to that of the internal standard.

Amount [µg (potency)] of carumonam (C₁₂H₁₄N₆O₁₀S₂) = \( M_s \times Q_1 / Q_2 \times 1000 \)

- **Mₜ**: Amount (mg (potency)) of Carumonam Sodium RS

**Internal standard solution**—A solution of Carumonam Sodium RS equivalent to about 0.1 g (potency), and dissolve in the mobile phase to make exactly 20 mL. Measure exactly 5 mL each of these solutions, add exactly 5 mL of the internal standard solution and the mobile phase to make 25 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography (2.017) according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of carumonam to that of the internal standard.

Amount (mg (potency)) of Carumonam Sodium RS

**Operating conditions**

- **Detector**: An ultraviolet absorption photometer (wavelength: 254 nm).

- **Column**: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

- **Column temperature**: A constant temperature of about 25°C.

- **Mobile phase**: A mixture of a solution of ammonium sulfate (1 in 10,000), methanol and acetic acid (100) (97:2:1).

Flow rate: Adjust the flow rate so that the retention time of
of carumonam is about 10 minutes.

**System suitability—**

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and carumonam are eluted in this order with the resolution between these peaks being not less than 2.5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of carumonam to that of the internal standard is not more than 1.0%.

**Containers and storage**  Containers—Hermetic containers.

Storage—Light-resistant.

---

**Carvedilol**

カルベジロール

![Chemical Structure](https://example.com/structure.png)

C₂₅H₂₆N₂O₄: 406.47

(2RS)-1-[9H-Carbazol-4-yloxy]-3-[[2-(2-methoxyphenoxy)ethyl]amino]propan-2-ol [72956-09-3]

Carvedilol, when dried, contains not less than 99.0% and not more than 101.0% of C₂₅H₂₆N₂O₄.

**Description**  Carvedilol occurs as white to pale yellowish white crystals or crystalline powder.

It is freely soluble in acetic acid (100), sparingly soluble in methanol, slightly soluble in ethanol (99.5), and practically insoluble in water.

A solution of Carvedilol in methanol (1 in 100) shows no optical rotation.

**Identification (1)**  Determine the absorption spectrum of a solution of Carvedilol in methanol (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Identification (2)**  Determine the infrared absorption spectrum of Carvedilol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point**  <2.60> 114 - 119°C

**Purity (1)**  Heavy metals <1.07>—Wrap 2.0 g of Carvedilol with a filter paper for quantitative analysis, then proceed according to Method 4, and perform the test. Prepare the control solution as follows: Put a filter paper for quantitative analysis in a crucible, add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10), then proceed as directed for the test solution, and add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 10 ppm).

(2) Related substances—Dissolve 65 mg of Carvedilol in 100 mL of the mobile phase. To 1 mL of this solution add the mobile phase to make 10 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area by the automatic integration method: the area of the peak other than carvedilol obtained from the sample solution is not larger than 3/20 times the peak area of carvedilol from the standard solution, and the total area of the peaks other than carvedilol is not larger than 1/2 times the peak area of carvedilol from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 55°C.

Mobile phase: Dissolve 2.72 g of potassium dihydrogen phosphate in 900 mL of water, adjust to pH 2.0 with phosphoric acid, and add water to make 1000 mL. To 650 mL of this solution add 350 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of carvedilol is about 4 minutes.

Time span of measurement: About 9 times as long as the retention time of carvedilol, beginning after the solvent peak.

**System suitability—**

Test for required detectability: Pipet 2 mL of the standard solution, add the mobile phase to make exactly 20 mL. Confirm that the peak area of carumonam obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of carvedilol are not less than 6000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of carvedilol is not more than 2.0%.

(3) Residual solvent—Being specified separately.

**Loss on drying**  <2.41>  Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition**  <2.44>  Not more than 0.1% (1 g).

**Assay**  Weigh accurately about 0.5 g of Carvedilol, previously dried, dissolve in 60 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform the blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 40.65 mg of C₂₅H₂₆N₂O₄

**Containers and storage**  Containers—Tight containers.
Carvedilol Tablets

カルベジロール錠

Carvedilol Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of carvedilol (C₂₄H₂₆N₂O₄: 406.47).

Method of preparation Prepare as directed under Tablets, with Carvedilol.

Identification Powder Carvedilol Tablets. To a portion of the powder, equivalent to 20 mg of Carvedilol according to the labeled amount, add 10 mL of methanol, shake well, and filter. To 0.5 mL of the filtrate add methanol to make 200 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \( \lambda_1 \). It exhibits maxima between 222 nm and 226 nm, between 241 nm and 245 nm, between 284 nm and 288 nm, between 317 nm and 321 nm and between 350 nm and 334 nm.

Purity Related substances—In this procedure the sample solution should be stored not exceeding 5°C and used within 24 hours after preparation. Powder Carvedilol Tablets. Dissolve a portion of the powder, equivalent to 12.5 mg of Carvedilol according to the labeled amount, add an adequate amount of the mobile phase and disperse the particles with the aid of ultrasonic waves, if necessary, add the mobile phase to make 100 mL, and shake for 30 minutes. Filter through a membrane filter with a pore size not exceeding 0.45 \( \mu \)m, discard the first 5 mL of the filtrate, and use the subsequent filtrate as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography \( \lambda_2 \) according to the following conditions, and determine each peak area by the automatic integration method: the area of the two peaks, having the relative retention time between 1.7 and 1.9, and between 2.0 and 3.1 with respect to carvedilol, obtained from the sample solution of 1.25-mg or 2.5-mg tablet is not larger than 3/10 times and 4/5 times the area of carvedilol from the standard solution, respectively, the area of the peak other than carvedilol and the peaks mentioned above from the sample solution is not larger than 1/5 times the peak area of carvedilol from the standard solution, and the total area of the peaks other than carvedilol from the sample solution is not larger than 2.2 times the peak area of carvedilol from the standard solution. The area of the two peaks, having the relative retention time between 1.7 and 1.9 and between 2.0 and 3.1 with respect to carvedilol, obtained from the sample solution of 10-mg or 20-mg tablet is not larger than 1/10 times and 2/5 times the peak area of carvedilol from the standard solution, respectively, the area of the peak other than carvedilol and other than the area mentioned above from the sample solution is not larger than 1/10 times the peak area of carvedilol from the standard solution, and the total area of the peaks other than carvedilol from the sample solution is not larger than 3/5 times the peak area of carvedilol from the standard solution. For these calculations use the area of the peak, having the relative retention time between 1.7 and 1.9, after multiplying by the relative response factor 1.25.

Operating conditions—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.
Time span of measurement: About 10 times as long as the retention time of carvedilol, beginning after the solvent peak.
System suitability—
Test for required detectability: To exactly 5 mL of the standard solution add the mobile phase to make exactly 100 mL, and confirm that the peak area of carvedilol obtained with 50 \( \mu \)L of this solution is equivalent to 3.5 to 6.5% of that with 50 \( \mu \)L of the standard solution.
System performance: When the procedure is run with 50 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of carvedilol are not less than 3000 and not more than 2.0, respectively.
System repeatability: When the test is repeated 6 times with 50 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of carvedilol is not more than 1.0%.

Uniformity of dosage units Perform the test according to the following method: it meets the requirement of the Content uniformity test.
To 1 tablet of Carvedilol Tablets add 70 mL of a mixture of 0.1 mol/L hydrochloric acid TS and methanol (1:1), shake until the tablet is completely disintegrated, then add a mixture of 0.1 mol/L hydrochloric acid TS and methanol (1:1) to make exactly 100 mL, and filter through a membrane filter with a pore size not exceeding 0.45 \( \mu \)m. Discard the first 10 mL of the filtrate, and the volume of the subsequent filtrate, add a mixture of 0.1 mol/L hydrochloric acid TS and methanol (1:1) to make exactly 20 mL so that each mL contains about 5 \( \mu \)g of carvedilol (C₂₄H₂₆N₂O₄), and use this solution as the standard solution. Separately, weigh accurately about 25 mg of carvedilol for assay, previously dried at 105°C for 2 hours, and dissolve in a mixture of 0.1 mol/L hydrochloric acid TS and methanol (1:1) to make exactly 100 mL. Pipet 2 mL of this solution, add a mixture of 0.1 mol/L hydrochloric acid TS and methanol (1:1) to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \( A_T \) and \( A_{Sz} \), of the sample solution and standard solution at 240 nm as directed under Ultraviolet-visible Spectrophotometry \( \lambda_2 \).

Amount (mg) of carvedilol (C₂₄H₂₆N₂O₄)
\[ M_S \times \frac{A_T}{A_{Sz}} \times \frac{V}{V} \times \frac{100}{50} \]
\[ M_S \]: Amount (mg) of carvedilol for assay

Dissolution

10-mg tablet and 20-mg tablet
When the test is performed at 75 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L acetic acid-sodium acetate buffer solution, pH 4.0 as the dissolution medium, the dissolution rate in 30 minutes of Carvedilol Tablets is not less than 80%.

Start the test with 1 tablet of Carvedilol Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \( \mu \)m. Discard the first 10 mL of the filtrate, and the filter volume of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 11 \( \mu \)g of carvedilol (C₂₄H₂₆N₂O₄) accord-
ing to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of carvedilol for assay, previously dried at 105°C for 2 hours, and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, $A_{T}$ and $A_{s}$, at 285 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry $<224>$, using the dissolution medium as the blank.

Dissolution rate (%) with respect to the labeled amount of carvedilol (C$_{24}$H$_{26}$N$_{2}$O$_{4}$) = $M_{S} \times A_{T}/A_{S} \times V/\sqrt{V} \times 1/C \times 36$

$M_{S}$: Amount (mg) of carvedilol for assay
$C$: Labeled amount (mg) of carvedilol (C$_{24}$H$_{26}$N$_{2}$O$_{4}$) in 1 tablet

(2) 1.25-mg tablet and 2.5-mg tablet. When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L acetic acid-sodium acetate buffer solution, pH 4.0 as the dissolution medium, the dissolution rate in 20 minutes is not less than 75%.

Start the test with 1 tablet of Carvedilol Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet $V$ mL of the subsequent filtrate, add the dissolution medium to make exactly $V$ mL so that each mL contains about 1.4 μg of carvedilol (C$_{24}$H$_{26}$N$_{2}$O$_{4}$) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of carvedilol for assay, previously dried at 105°C for 2 hours, and dissolve in methanol to make exactly 200 mL. Pipet 2 mL of this solution, add the dissolution medium to make exactly 200 mL, and use this solution as the standard solution. Determine the absorbances, $A_{T}$ and $A_{s}$, at 240 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry $<224>$, using the dissolution medium as the blank.

Dissolution rate (%) with respect to the labeled amount of carvedilol (C$_{24}$H$_{26}$N$_{2}$O$_{4}$) = $M_{S} \times A_{T}/A_{S} \times V/\sqrt{V} \times 1/C \times 9/2$

$M_{S}$: Amount (mg) of carvedilol for assay
$C$: Labeled amount (mg) of carvedilol (C$_{24}$H$_{26}$N$_{2}$O$_{4}$) in 1 tablet

**Assay** Weigh accurately the mass of not less than 20 Carvedilol Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 25 mg of carvedilol (C$_{24}$H$_{26}$N$_{2}$O$_{4}$), add exactly 5 mL of the internal standard solution, add a mixture of 0.1 mol/L hydrochloric acid TS and methanol (1:1) to make 250 mL, and shake for 30 minutes. To 2 mL of this solution, add the mobile phase to make 20 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg of carvedilol for assay, previously dried at 105°C for 2 hours, and add exactly 5 mL of the internal standard solution, and add a mixture of 0.1 mol/L hydrochloric acid TS and methanol (1:1) to make 250 mL. To 2 mL of this solution add the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography $<$2.01$>$ under the following conditions, and calculate the ratios, $Q_{T}$ and $Q_{S}$, of the peak area of carvedilol to that of the internal standard.

\[
\text{Amount (mg) of carvedilol (C}_{24}\text{H}_{26}\text{N}_{2}\text{O}_{4}) = M_{S} \times Q_{T}/Q_{S}
\]

$M_{S}$: Amount (mg) of carvedilol for assay

**Internal standard solution**—A solution of isomyl parahydroxybenzoate in the mobile phase (1 in 70).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 240 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 2.7 g of potassium dihydrogen phosphate in water to make 1000 mL, and adjust to pH 5.0 with a solution prepared by dissolving 0.7 g of dipotassium hydrogen phosphate in water to make 200 mL. To 450 mL of this solution add 550 mL of methanol.
Flow rate: Adjust the flow rate so that the retention time of carvedilol is about 5 minutes.

**System suitability**—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, carvedilol and the internal standard are eluted in this order with the resolution between these peaks being not less than 20.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of carvedilol to that of the internal standard is not more than 1.0%.

**Containers and storage**—Containers—Tight containers.

---

**Castor Oil**

**Oleum Ricini**

ヒマシ油

Castor Oil is the fixed oil obtained by compression from the seeds of *Ricinus communis* Linné (*Euphorbiaceae*).

**Description** Castor Oil is a colorless or pale yellow, clear, viscous oil. It has a slight, characteristic odor, and has a bland at first, and afterwards slightly acid taste. It is miscible with ethanol (99.5) and with diethyl ether. It is freely soluble in ethanol (95), and practically insoluble in water.

When cooled to 0°C, it becomes more viscous, and turbidity is gradually formed.

**Identification** To 3 g of Castor Oil add 1 g of potassium hydroxide, and heat the mixture carefully to fuse: a charac-
Containers—Tight containers. Containers and storage of ethanol (95): no turbidity is produced. Add 15 mL of ethanol (95): it dissolves clearly. Add 15 mL of ethanol (95): no turbidity is produced.

Hydroxyl value \(<1.13\)
Saponification value \(<1.13\)
Iodine value \(<1.13\)

Purity
Adulteration—Shake to mix 1.0 g of Castor Oil with 4.0 mL of ethanol (95): it dissolves clearly. Add 15 mL of ethanol (95): no turbidity is produced.

Containers and storage—Containers—Tight containers.

**Aromatic Castor Oil**

加香ヒマシ油

Mix the above ingredients.

**Description**

Aromatic Castor Oil is a colorless or yellowish, clear, viscous liquid. It has an aromatic odor.

**Identification**

To 3 g of Aromatic Castor Oil add 1 g of potassium hydroxide, and heat the mixture carefully to fuse: a characteristic odor is perceptible. Dissolve the fused matter in 30 mL of water, add an excess of magnesium oxide, and filter. Acidify the filtrate with hydrochloric acid: white crystals are produced.

Containers and storage—Containers—Tight containers.

**Cefaclor**

セファクロル

![Cefaclor molecule](image)

C_{13}H_{14}ClN_{3}O_{4}S: 367.81

\((6R,7R)-7\text{-}([2R]\text{-}2\text{-}\text{Amino}\text{-}2\text{-}\text{phenylacetlamino}\text{-}3\text{-}\text{chloro}\text{-}8\text{-}\text{oxo}\text{-}5\text{-}\text{thia}\text{-}1\text{-}azabicyclo}\{4.2.0\}\text{oct}\text{-}2\text{-}\text{ene}\text{-}2\text{-}\text{carboxylic acid}\)

Cefaclor occurs as a white to yellowish white crystalline powder.

It is slightly soluble in water and in methanol, and practically insoluble in \(N, N\text{-}dimethylformamide\) and in ethanol (99.5).

**Identification**

1. Determine the absorption spectrum of a solution of Cefaclor (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

2. Determine the infrared absorption spectrum of Cefaclor as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\rangle\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

3. Dissolve 40 mg of Cefaclor in 0.5 mL of heavy water for nuclear magnetic resonance spectroscopy and 1 drop of deuterated hydrochloric acid for nuclear magnetic resonance spectroscopy, and determine the \(^1H\) spectrum of this solution as directed under Nuclear Magnetic Resonance Spectroscopy \(<2.2D\rangle\), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits an AB type quartet signal A at around \(\delta 3.7\text{ ppm}\), and a single signal or a sharp multiple signal B at around \(\delta 7.6\text{ ppm}\). The ratio of the integrated intensity of each signal, A:B, is about 2:5.

4. Perform the test with Cefaclor as directed under Flame Coloration Test \(<1.04\rangle\) (2): a green color appears.

**Optical rotation** \(<2.49\rangle\ [\alpha]_{D}^{20}: +105 – +120^\circ\ (0.1 \text{ g calculated on the anhydrous basis}, \text{ water, 25 mL, 100 mm}).

**Purity**

1. Heavy metals \(<1.07\rangle\)—Proceed with 1.0 g of Cefaclor according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

2. Arsenic \(<1.11\rangle\)—Prepare the test solution by suspending 1.0 g of Cefaclor in 10 mL of \(N, N\text{-}dimethylformamide\), and perform the test (not more than 2 ppm).

3. Related substances—Dissolve 50 mg of Cefaclor in 10 mL of sodium dihydrogen phosphate TS, \(pH \ 2.5\), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add sodium dihydrogen phosphate TS, \(pH \ 2.5\) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 \(\mu\text{L}\) each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\rangle\) according to the following conditions, and determine each peak area by the automatic integration method: the peak areas other than cefaclor from the sample solution are not larger than 1/2 times the peak area of cefaclor from the standard solution, and the total of the peak areas other than cefaclor is not larger than 2 times of the peak area of cefaclor from the standard solution. If necessary, proceed with 20 \(\mu\text{L}\) of sodium dihydrogen phosphate TS, \(pH \ 2.5\) in the same manner as above to compensate the base line.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu\text{m in particle diameter}).
Column temperature: A constant temperature of about 25°C.

Mobile phase A: Dissolve 7.8 g of sodium dihydrogen phosphate dihydrate in 1000 mL of water, and adjust the pH to 4.0 with phosphoric acid.

Mobile phase B: To 550 mL of the mobile phase A add 450 mL of acetonitrile for liquid chromatography.

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>

</tbody>
</table>

Flow rate: 1.0 mL per minute.

Time span of measurement: About 2.5 times as long as the retention time of cefaclor beginning after the solvent peak.

System suitability—
Test for required detectability: Measure exactly 1 mL of the standard solution, and add sodium dihydrogen phosphate TS, pH 2.5 to make exactly 20 mL. Confirm that the peak area of cefaclor obtained from 20 μL of this solution is equivalent to 4 to 6% of that from 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefaclor are not less than 40,000 and 0.8 to 1.3, respectively.

System repeatability: When the test is repeated 3 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviations of the peak areas and the retention times of cefaclor are not more than 2.0%, respectively.

Water (2.48) Not more than 6.5% (0.2 g, volumetric titration, back titration).

Assay Weigh accurately an amount of Cefaclor and Cefaclor RS, equivalent to about 50 mg (potency), and dissolve each in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution, pH 4.5 to make 50 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.04) according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of cefaclor to that of the internal standard.

Amount [μg (potency)] of C₁₅H₁₄ClN₃O₄S
\[ M_s \times Q_1/Q_2 \times 1000 \]

Mₙ: Amount [μg (potency)] of Cefaclor RS

Internal standard solution—A solution of 4-aminoacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 6.8 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust the pH to 3.4 with diluted phosphoric acid (3 in 500). To 940 mL of this solution add 60 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefaclor is about 7 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, cefaclor and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefaclor to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Cefaclor Capsules

Cefaclor Capsules contain not less than 90.0% and not more than 110.0% of the labeled amount of cefaclor (C₁₅H₁₄ClN₃O₄S: 367.81).

Method of preparation Prepare as directed under Capsules, with Cefaclor.

Identification Shake vigorously a quantity of the contents of one capsule of Cefaclor Capsules, equivalent to 20 mg (potency) of Cefaclor according to the labeled amount, with 10 mL of water, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 20 mg of Cefaclor RS in 10 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.03). Spot 2 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of acetonitrile, water, ethyl acetate and formic acid (30:10:10:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot from the sample solution and the spot from the standard solution show the same R₁ value.

Purity Related substances—Weigh accurately not less than 5 Cefaclor Capsules, open the capsules and carefully take out the contents, mix well, and powder, if necessary. Wash the empty capsules with a little amount of diethyl ether, if necessary, allow the capsules to stand at room temperature to vaporize adhering diethyl ether, and weigh accurately the capsules to calculate the mass of the contents. Weigh accurately a quantity of the contents, equivalent to about 0.25 g
(potency) of Cefaclor, shake with 40 mL of 0.1 mol/L phosphate buffer solution, pH 4.5 for 10 minutes, add the same buffer solution to make exactly 50 mL, and filter through a 0.45-μm pore-size membrane filter. Discard the first 1 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately an amount of Cefaclor RS, equivalent to about 20 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 20 mL. Pipet 2.5 mL of this solution, add the same buffer solution to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography. Calculate the amount of each related substance by automatic integration method. Calculate the amount of each liquid chromatography of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry.

System performance: When the procedure is run with 20 μL of the standard solution, and add 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 20 mL. Confirm that the peak area of cefaclor obtained with 20 μL of this solution is equivalent to 3.5 to 6.5% of that of cefaclor obtained with 20 μL of the standard solution.

System repeatability: When the test is repeated 3 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefaclor is not more than 2.0%.

Water: Not more than 8.0% (0.2 g, volumetric titration, back titration).

Uniformity of dosage units: It meets the requirement of the Mass variation test.

Dissolution: When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Cefaclor Capsules is not less than 80%.

Start the test with 1 capsule of Cefaclor Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 20 μg (potency) of Cefaclor according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefaclor RS, and dissolve in water to make exactly 20 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A₁ and A₅, at 265 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry. Dissolution rate (%) with respect to the labeled amount of cefaclor (C₆₁₆H₁₄Cl₁₅N₅O₆S) = Mₛ × A₁/₅/A₅ × V/V × 1/C × 90

M₅: Amount [mg (potency)] of Cefaclor RS
C: Labeled amount [mg (potency)] of Cefaclor in 1 capsule

Assay: Weigh accurately not less than 5 Cefaclor Capsules, open the capsules and carefully take out the contents, mix well, and powder, if necessary. Wash the empty capsules with a little amount of diethyl ether, if necessary, allow the capsules to stand at room temperature to vaporize adhering diethyl ether, and weigh accurately the capsules to calculate the mass of the contents. Weigh accurately a quantity of the contents, equivalent to about 0.1 g (potency) of Cefaclor according to the labeled amount, shake vigorously with 60 mL of 0.1 mol/L phosphate buffer solution, pH 4.5 for 10 minutes, add the same buffer solution to make exactly 100 mL, and centrifuge. Pipet 10 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefaclor RS, equivalent to about 50 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefaclor.

Amount [mg (potency)] of cefaclor (C₆₁₆H₁₄Cl₁₅N₅O₆S) = Mₛ × Qₛ/Qₛ × 2

M₅: Amount [mg (potency)] of Cefaclor RS

Internal standard solution—A solution of 4-aminoacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

Containers and storage—Containers—Tight containers. Storage—Light-resistant.
Cefaclor Fine Granules

セファクロル細粒

Cefaclor Fine Granules contain not less than 90.0% and not more than 110.0% of the labeled amount of cefaclor (C15H14ClN3O4S: 367.81).

Method of preparation  Prepare as directed under Granules, with Cefaclor.

Identification  Shake vigorously a quantity of Cefaclor Fine Granules, equivalent to 20 mg (potency) of Cefaclor according to the labeled amount, with 10 mL of water, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 20 mg (potency) of Cefaclor RS in 10 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.08>. Spot 2 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of acetonitrile, water, ethyl acetate and formic acid (30:10:10:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot from the sample solution and the spot from the standard solution show the same Rf value.

Purity  Related substances—Weigh accurately about 20 mg (potency) of Cefaclor Fine Granules after powdered if necessary, equivalent to about 0.1 g (potency) of Cefaclor according to the labeled amount, shake with 40 mL of 0.1 mol/L phosphate buffer solution, pH 4.5 for 10 minutes, add the same buffer solution to make exactly 50 mL, and filter through a 0.45-µm pore-size membrane filter. Discard the first 1 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefaclor RS, and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 10 mL. Pipet 2 mL of this solution, add the same buffer solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of acetonitrile, water, ethyl acetate and formic acid (30:10:10:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot from the standard solution and the spot from the sample solution show the same Rf value.

System suitability— Test for required detectability: Pipet 1 mL of the standard solution, and add 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 20 mL. Confirm that the peak area of cefaclor obtained with 50 µL of this solution is equivalent to 3.5 to 6.5% of that of cefaclor obtained with 50 µL of the standard solution.

System performance: When the procedure is run with 50 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefaclor are not less than 40,000 and between 0.8 and 1.3, respectively.

System repeatability: When the test is repeated 3 times with 50 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefaclor is not more than 2.0%.

Water <2.48>  Not more than 1.5% (1 g, volumetric titration, back titration).

Uniformity of dosage units <6.02>  The granules in single-unit containers meet the requirements of the Mass variation test.

Dissolution <6.10>  When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Cefaclor Fine Granules is not less than 85%.

Start the test with an accurately weighed amount of Cefaclor Fine Granules, equivalent to about 0.25 g (potency) of Cefaclor according to the labeled amount, withdraw not less than about 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 µm. Discard the first 10 mL of the filtrate, pipet 4 V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 20 µg (potency) of Cefaclor according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefaclor RS, and dissolve in water to make exactly 20 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A4 and A8, at 265 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.22>.

Dissolution rate (%) with respect to the labeled amount of cefaclor (C15H14ClN3O4S)

\[ \frac{M_s}{M_f} \times A_T/A_S \times \frac{V}{V + 1/C \times 90} \]

M6: Amount [mg (potency)] of Cefaclor RS
Mf: Amount [mg (potency)] of sample
C: Labeled potency [mg (potency)] of cefaclor (C15H14ClN3O4S) per g of the sample

Particle size <6.03>  It meets the requirements of Fine granules.

Assay  Weigh accurately a quantity of Cefaclor Fine Granules after powdered if necessary, equivalent to about 0.1 g
Cefaclor Compound Granules

**Method of preparation** Prepare as directed under Granules, with Cefaclor, and divide into packs.

**Identification** Shake vigorously a quantity of Cefaclor Compound Granules, equivalent to 20 mg (potency) of Cefaclor according to the labeled total potency, with 10 mL of water, centrifuge, and use the supernatant liquid as the sample solution. Perform the test with exactly 50 μL of the sample solution and standard solution as directed under Liquid Chromatography <2.04> according to the following conditions, and determine each peak area of both solutions by the automatic integration method. Calculate the amount of each related substance by the following equation: the amount of each related substance is not more than 0.6%, and the total amount of the related substances is not more than 2.8%. If necessary, correct the fluctuation of the base line by performing the test in the same way with 50 μL of 0.1 mol/L phosphate buffer solution, pH 4.5.

**Operating conditions**

Proceed as directed in the operating conditions in the Purity (3) under Cefaclor.

**System suitability**

Test for required detectability: Pipet 1 mL of standard solution, and add 0.1 mol/L phosphate buffer solution, pH 4.5, to make exactly 20 mL. Perform the test with exactly 50 μL of the sample solution and standard solution as directed under Liquid Chromatography <2.04> according to the following method: it meets the requirement of the Content uniformity test.

(1) Total potency—Take out the total contents of 1 Cefaclor Compound Granules, add a little amount of 0.1 mol/L phosphate buffer solution, pH 4.5, to make exactly V mL so that each mL contains about 5 mg (potency) of Cefaclor according to the labeled total potency. Pipet 10 mL of this solution, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make exactly 25 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 1 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately an amount of Cefaclor RS, equivalent to about 20 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solutions, pH 4.5, to make exactly 20 mL. Pipet 2 mL of this solution, add 0.1 mol/L phosphate buffer solutions, pH 4.5, to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.04> according to the following method, and determine each peak area of both solutions by the automatic integration method. Calculate the amount of each related substance by the following equation: the amount of each related substance is not more than 0.6%, and the total amount of the related substances is not more than 2.8%. If necessary, correct the fluctuation of the base line by performing the test in the same way with 50 μL of 0.1 mol/L phosphate buffer solution, pH 4.5.

**Purity** Related substances—Take out the total contents of not less than 5 packs of Cefaclor Compound Granules, add a small amount of 0.1 mol/L phosphate buffer solution, pH 4.5, grind, add 0.1 mol/L phosphate buffer solution, pH 4.5, shake vigorously for 10 minutes, and add 0.1 mol/L phosphate buffer solution, pH 4.5, to make exactly V mL so that each mL contains about 5 mg (potency) of Cefaclor according to the labeled total potency. Pipet 10 mL of this solution, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make exactly 25 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 1 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately an amount of Cefaclor RS, equivalent to about 20 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solutions, pH 4.5, to make exactly 20 mL. Pipet 2 mL of this solution, add 0.1 mol/L phosphate buffer solutions, pH 4.5, to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.04> according to the following conditions, and determine each peak area of both solutions by the automatic integration method. Calculate the amount of each related substance by the following equation: the amount of each related substance is not more than 0.6%, and the total amount of the related substances is not more than 2.8%. If necessary, correct the fluctuation of the base line by performing the test in the same way with 50 μL of 0.1 mol/L phosphate buffer solution, pH 4.5.
mol/L phosphate buffer solution, pH 4.5, grind well, add the same buffer solutions to make exactly V mL so that each mL contains about 3.8 mg (potency) of Cefaclor according to the labeled total potency after shaking vigorously for 10 minutes, and centrifuge. Pipet 3 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefaclor RS, equivalent to about 50 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefaclor.

Amount [mg (potency)] of cefaclor (C15H14ClN3O4S)  
\[ M_S = \frac{Q_T/Q_S \times V}{15} \]

\( M_S \): Amount [mg (potency)] of Cefaclor RS

**Internal standard solution**—A solution of 4-aminoacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

(2) Potency of gastric granule—Take out the total contents of 1 Cefaclor Compound Granules stir gently with 60 mL of 0.1 mol/L phosphate buffer solution, pH 4.5 for 5 minutes, add the same buffer solution to make exactly V mL so that each mL contains about 1.5 mg (potency) of Cefaclor according to the labeled potency of gastric granule, and centrifuge. Pipet 7 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefaclor RS, equivalent to about 50 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefaclor.

Amount [mg (potency)] of cefaclor (C15H14ClN3O4S)  
\[ M_S = \frac{Q_T/Q_S \times V}{35} \]

\( M_S \): Amount [mg (potency)] of Cefaclor RS

**Internal standard solution**—A solution of 4-aminoacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

**Dissolution** (6.10) When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 60 minutes of Cefaclor Compound Granules is not less than 70%.

Start the test with the total content of 1 pack of Cefaclor Fine Granules, withdraw not less than about 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add 0.01 mol/L hydrochloric acid TS to make exactly V mL so that each mL contains about 20 μg (potency) of Cefaclor according to the labeled total potency, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefaclor RS, equivalent to about 20 mg (potency), dissolve in the dissolution medium to make exactly 20 mL. Pipet 2 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \( A_T \) and \( A_S \), at 265 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry (2.24), using 0.01 mol/L hydrochloric acid TS as the blank.

Dissolution rate (%) of cefaclor (C15H14ClN3O4S) with respect to the labeled potency  
\[ M_S = \frac{A_T/A_S \times V/V \times 1/C \times 90}{C} \]

\( M_S \): Amount [mg (potency)] of Cefaclor RS

C: Labeled total potency [mg (potency)] of Cefaclor in 1 pack

Cefadroxil

Cefadroxil occurs as a white to light yellow-white powder. It is sparingly soluble in water, slightly soluble in methanol, and very slightly soluble in ethanol (95).

Identification (1) Determine the absorption spectrum of a solution of Cefadroxil (1 in 50,000) as directed under Ultra-violet-visible Spectrophotometry <2.49>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefadroxil RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefadroxil as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefadroxil RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the ¹H spectrum of a solution of Cefadroxil in a mixture of heavy water for nuclear magnetic resonance spectroscopy and deuterated hydrochloric acid (3:1) (1 in 10), using sodium 3-(trimethylsilyl)propionate-d₄ for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>: it exhibits a single signal A at around δ 2.1 ppm, a double signal B at around δ 7.0 ppm, and a double signal C at around δ 7.5 ppm. The ratio of integrated intensity of each signal, A:B:C, is about 3:2:2.

Optical rotation <2.49> [α]D²⁰: +164° to +182° (0.6 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH <2.49> Dissolve 1.0 g of Cefadroxil in 200 mL of water: pH of the solution is between 4.0 and 6.0.

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Cefadroxil according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 0.1 g of Cefadroxil in 4 mL of a mixture of ethanol (99.5), water and dilute hydrochloric acid (1 in 5) (75:22:3), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of ethanol (99.5), water and dilute hydrochloric acid (1 in 5) (75:22:3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.67>. Spot 2 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop with a mixture of ethyl acetate, water, ethanol (99.5) and formic acid (14:5:5:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly ninhydrin-citric acid-acetic acid TS on the plate, and heat at 100°C for 10 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Water <2.48> Not less than 4.2% and not more than 6.0% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately an amount of Cefadroxil and Cefadroxil RS equivalent to about 50 mg (potency), dissolve each in water to make exactly 500 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 µL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and A₅, of cefadroxil of the solutions.

\[
M₅ = \frac{A₁}{A₅} \times 1000
\]

Amount [µg (potency)] of C₁₆H₁₇N₃O₅S
\[
= M₅ \times \frac{Q₅}{Q₅} \times 1/5
\]

M₅: Amount [µg (potency)] of Cefadroxil RS

Internal standard solution—A solution of 4-aminoacetoephonone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

(2) Potency of gastric granule—Stir gently the total contents of not less than 5 Cefadroxil Compound Granules with about 100 mL of 0.1 mol/L phosphate buffer solution, pH 4.5 for 5 minutes, the same buffer solution so that each mL containing about 2 mg (potency) of Cefadroxil according to the labeled potency of gastric granule, and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefadroxil RS, equivalent to about 50 mg (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the same buffer solution to make 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefadroxil.

Amount [µg (potency)] of cefadroxil (C₁₆H₁₇N₃O₅S)
\[
= M₅ \times \frac{Q₅}{Q₅} \times 1/5
\]

M₅: Amount [µg (potency)] of Cefadroxil RS

Internal standard solution—A solution of 4-aminoacetoephonone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 700).

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Cefadroxil

C₁₆H₁₇N₃O₅S: 363.39
(6R,7R)-7-[(2R)-2-Amino-2-(4-hydroxyphenyl)acetylamino]-3-methyl-8-oxo-5-thia-1-azabicycle[4.2.0]oct-2-ene-2-carboxylic acid [50370-12-2]
Cefadroxil Capsules

セファドロキシルカプセル

Cefadroxil Capsules contain not less than 95.0% and not more than 105.0% of the labeled amount of cefadroxil (C_{16}H_{17}N_{3}O_{5}S: 363.39).

Method of preparation Prepare as directed under Capsules, with Cefadroxil.

Identification Dissolve the contents of Cefadroxil Capsules, equivalent to 10 mg (potency) of Cefadroxil according to the labeled amount, in 500 mL of water, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry 〈2.24〉: it exhibits maxima between 228 nm and 232 nm, and between 261 nm and 265 nm.

Water 〈2.48〉 Not more than 7.0% (0.15 g, volumetric titration, direct titration).

Uniformity of dosage units 〈6.02〉 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Place 1 capsule of Cefadroxil Capsules in 300 mL of water, disperse with the aid of ultrasonic waves, shake for 30 minutes, and add water to make exactly 500 mL. Pipet 5 mL of this solution, and add water to make exactly V mL so that each mL contains about 0.1 mg (potency) of Cefadroxil. Filter the solution, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefadroxil RS, dissolve in water to make exactly 200 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefadroxil.

Amount [mg (potency)] of cefadroxil (C_{16}H_{17}N_{3}O_{5}S) = M_{S} × A_{T} × V/90

M_{S} = Amount [mg (potency)] of Cefadroxil RS

Dissolution 〈6.10〉 When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L acetic acid-sodium acetate buffer solution, pH 4.0 as the dissolution medium, the dissolution rate in 90 minutes of Cefadroxil Capsules is not less than 80%.

Start the test with 1 capsule of Cefadroxil Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 22 μg (potency) of Cefadroxil according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 22 mg (potency) of Cefadroxil RS, and add water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A_{T} and A_{S}, at 263 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry 〈2.24〉, using water as the blank.

Dissolution rate (%) with respect to the labeled amount of cefadroxil (C_{16}H_{17}N_{3}O_{5}S) = M_{S} × A_{T} × V’/V × V × 1/C × 90

M_{S} = Amount [mg (potency)] of Cefadroxil RS

C Labeled amount [mg (potency)] of cefadroxil in 1 capsule

Cefadroxil for Syrup

シロップ用セファドロキシル

Cefadroxil for Syrup is a preparation for syrup, which is suspended before use.

It contains not less than 95.0% and not more than 110.0% of the labeled amount of cefadroxil (C_{16}H_{17}N_{3}O_{5}S: 363.39).

Method of preparation Prepare as directed under Preparations for Syrups, with Cefadroxil.
Identification Dissolve an amount of Cefadroxil for Syrup, equivalent to 10 mg (potency) of Cefadroxil according to the labeled amount, in 500 mL of water, and determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry \( \lambda_{\text{max}} < 230 \text{ nm} \) and \( \lambda_{\text{max}} > 265 \text{ nm} \). Make a standard solution of Cefadroxil RS, equivalent to about 22 mg (potency) per g, in 20 mL of dimethylformamide, and compare the Spectrophotometry: both spectra exhibit similar intensities of absorption at the same wave numbers.

Water \(< 2.48\) Not more than 3.0% (0.5 g, volumetric titration, direct titration).

Uniformity of dosage units \(< 6.02\) The syrup in single-unit containers meets the requirement of the Mass variation test.

Dissolution \(\text{JP XVI} <6.10\) When the test is performed at 50 revolutions per minute according to the Paddle method (put the sample in the dissolution medium so that it disperses), using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Cefadroxil for Syrup is not less than 85%.

Start the test with accurately weighed amount of Cefadroxil for Syrup, equivalent to about 0.1 g (potency) of Cefadroxil according to the labeled amount, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \( \mu \text{m} \). Discard the first 10 mL of the filtrate, pipet 4 mL of the subsequent filtrate, add water to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 22 mg (potency) of Cefadroxil RS, and dissolve in water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, \( A_1 \) and \( A_9 \), at 263 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry \( \lambda_{\text{max}} < 230 \text{ nm} \) and \( \lambda_{\text{max}} > 265 \text{ nm} \).

Cefadroxil contains not less than 950 \( \mu \text{g} \) (potency) and not more than 1030 \( \mu \text{g} \) (potency) per mg, calculated on the anhydrous basis. The potency of Cefadroxil is expressed as mass (potency) of cefalexin (C\(_{16}\)H\(_{17}\)N\(_3\)O\(_4\)S) per mg.

Description Cefadroxil occurs as a white to light yellowish white, crystals or crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, and practically insoluble in ethanol (95) and in \( N,N \)-dimethylformamide.

It is hygroscopic.

Identification (1) Determine the absorption spectrum of a solution of Cefadroxil (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \( \lambda_{\text{max}} < 230 \text{ nm} \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefadroxil as directed in the potassium bromide disk method under Infrared Spectrophotometry \( \lambda_{\text{max}} < 230 \text{ nm} \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the \( \text{H} \) spectrum of a solution of Cefadroxil in heavy water for nuclear magnetic resonance spectroscopy (1 in 200) as directed under Nuclear Magnetic Resonance Spectroscopy \( \lambda_{\text{max}} < 230 \text{ nm} \), using sodium 3-trimethylsilylpropionate-2,2,2-trifluoroacetate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around \( \delta 1.8 \text{ ppm} \), and a single or a sharp multiple signal B at around \( \delta 7.5 \text{ ppm} \). The ratio of integrated intensity of these signals, A:B, is about 3:5.

Optical rotation \(< 2.49\) \([\alpha]_D^\text{23} + 144° \pm 158° \) (0.125 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

Purity (1) Heavy metals \(< 1.07\) Proceed with 2.0 g of Cefadroxil according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic \(< 1.11\) Prepare the test solution with 1.0 g of Cefadroxil by suspending in 10 mL of \( N,N \)-dimethylformamide, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve about 25 mg of Cefadroxil in a solution of potassium dihydrogenphosphate (9 in 500) to make 5 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a solution of potassium dihydrogenphosphate (9 in 500) to make ex-
Actly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01>\) according to the following conditions, and determine the areas of each peak by the automatic integration method. If necessary, correct the change of the base-line due to the potassium dihydrogenphosphate solution by proceeding in the same manner with 20 \( \mu L \) of a solution of potassium dihydrogenphosphate (9 in 500): each peak area other than cefalexin from the sample solution is not larger than the peak area of cefalexin from the standard solution, and the total of the peak areas which are larger than 1/50 times the peak area of cefalexin from the standard solution and those other than cefalexin from the sample solution is not larger than 5 times of the peak area of cefalexin from the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \( \mu m \) in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: Dissolve 1.0 g of sodium 1-pentanesulfonate in 1000 mL of water, add 15 mL of triethylamine, and adjust to pH 2.5 with phosphoric acid.

Mobile phase B: Dissolve 1.0 g of sodium 1-pentanesulfonate in 300 mL of water, add 15 mL of triethylamine, and adjust to pH 2.5 with phosphoric acid. To this solution add 350 mL of acetonitrile and 350 mL of methanol.

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 1</td>

</tbody>
</table>

Flow rate: 1.0 mL per minute.

Time span of measurement: About 2 times as long as the retention time of cefalexin beginning after the solvent peak.

**System suitability**

Test for required detection: Pipet 2 mL of the standard solution, add a solution of potassium dihydrogenphosphate (9 in 500) to make exactly 100 mL. Confirm that the peak area of cefalexin obtained from 20 \( \mu L \) of this solution is equivalent to 1.8 to 2.2% of that of cefalexin obtained from 20 \( \mu L \) of the standard solution.

System performance: When the procedure is run with 20 \( \mu L \) of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefalexin are not less than 150,000 steps and between 0.8 and 1.3, respectively.

System repeatability: When the test is repeated 3 times with 20 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the retention time and the peak areas of cefalexin are not more than 2.0%, respectively.

**Water** Not more than 8.0% (0.2 g, volumetric titration, back titration).

**Assay** Weigh accurately an amount of Cefalexin and Cefalexin RS, equivalent to about 25 mg (potency), dissolve each in 0.1 mol/L phosphate buffer solution, pH 4.5 to make exactly 25 mL. Pipet 10 mL of these solutions, add exactly 5 mL of the internal standard solution, then add 0.1 mol/L phosphate buffer solution, pH 4.5 to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01>\) according to the following conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of cefalexin to that of the internal standard.

\[
\text{Amount} [\mu g \text{ (potency)}] \ of \ C_{16}H_{17}N_{3}O_{4}S = M_S \times Q_1/Q_2 \times 1000
\]

Where:

- \( M_S \): amount [mg (potency)] of Cefalexin RS

**Internal standard solution—**A solution of \( m \)-hydroxyacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 1500).

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \( \mu m \) in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 6.8 g of potassium dihydrogenphosphate in 1000 mL of water, adjust to pH 3.0 with diluted phosphoric acid (3 in 500). To 800 mL of this solution add 200 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefalexin is about 7 minutes.

**System suitability**

System performance: When the procedure is run with 10 \( \mu L \) of the standard solution under the above operating conditions, cefalexin and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 5 times with 10 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefalexin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

**Cefalexin Capsules**

セファレキシンカプセル

Cefalexin Capsules contain not less than 93.0% and not more than 107.0% of the labeled potency of cefalexin (\( C_{16}H_{17}N_{3}O_{4}S \): 347.39).

**Method of preparation** Prepare as directed under Capsules, with Cefalexin.

**Identification** Take out the contents of Cefalexin Capsules, to a quantity of the contents, equivalent to 70 mg (potency)
of Cefalexin according to the labeled amount, add 25 mL of water, shake vigorously for 5 minutes, and filter. To 1 mL of the filtrate add water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \( <2.24 > \); it exhibits a maximum between 260 nm and 264 nm.

**Water** \(<2.48 >\) Not more than 10.0% (0.2 g, volumetric titration, back titration).

**Uniformity of dosage units** \(<6.02 >\) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Open 1 capsule of Cefalexin Capsules, add 3\( V/5 \) mL of 0.1 mol/L phosphate buffer solution, pH 4.5, shake vigorously for 10 minutes, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make exactly \( V \) mL so that each mL contains about 1.25 mg (potency) of Cefalexin. Centrifuge this solution, pipet 2 mL of the supernatant liquid, add about 10 mL of the internal standard solution, and add 0.1 mol/L phosphate buffer solution, pH 4.5, to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefalexin RS, equivalent to about 25 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5, to make 100 mL, and use this solution as the standard solution. Perform the test with 10 \( \mu \)L of each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.07 >\) according to the following conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of cefalexin to that of the internal standard in each solution.

\[
\text{Amount [mg (potency)] of cefalexin (C}_{16}\text{H}_{17}\text{N}_{3}\text{O}_{4}\text{S)} = M_S \times \frac{Q_1}{Q_2} \times \frac{V}{20}
\]

*\( M_S \): Amount [mg (potency)] of Cefalexin RS

**Internal standard solution**—A solution of \( m \)-hydroxyacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 15,000).

**Operating conditions**—

Proceed as directed in the operating conditions in the Assay.

**System suitability**—

- System performance: When the procedure is run with 10 \( \mu \)L of the standard solution under the above operating conditions, cefalexin and the internal standard substance are eluted in this order with the resolution between these peaks being not less than 8.
- System repeatability: When the test is repeated 6 times with 10 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cefalexin to that of the internal standard substance is not more than 1.0%.

**Dissolution** \(<6.10 >\) When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rates in 30 minutes of 125-mg (potency) capsule and in 60 minutes of 250-mg (potency) capsule are not less than 75% and 80%, respectively.

Start the test with 1 capsule of Cefalexin Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 \( \mu \)m. Discard the first 10 mL of the filtrate, pipet \( V \) mL of the subsequent filtrate, add water to make exactly \( V \) mL so that each mL contains about 22 \( \mu \)g (potency) of Cefalexin according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefalexin RS, equivalent to about 22 mg (potency), and dissolve in water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24 >\), and determine the absorbances, \( A_T \) and \( A_S \), at 262 nm.

Dissolution rate (%) with respect to the labeled amount of cefalexin (\( \text{C}_{16}\text{H}_{17}\text{N}_{3}\text{O}_{4}\text{S) }\) 
\[
M_S \times \frac{A_T}{A_S} \times \frac{V}{V \times \frac{1}{C} \times 90}
\]

*\( M_S \): Amount [mg (potency)] of Cefalexin RS

C: Labeled amount [mg (potency)] of cefalexin (\( \text{C}_{16}\text{H}_{17}\text{N}_{3}\text{O}_{4}\text{S) in 1 capsule.}

**Assay** Take out the contents of not less than 20 capsules of Cefalexin Capsules, weigh accurately the mass of the contents, and powder. Weigh accurately a portion of the powder, equivalent to about 0.1 g (potency) of Cefalexin, add 60 mL of 0.1 mol/L phosphate buffer solution, pH 4.5, shake vigorously for 10 minutes, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make exactly 100 mL, and centrifuge. Pipet 2 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefalexin RS, equivalent to about 20 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5, to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make 100 mL, and use this solution as the standard solution. Perform the test with 10 \( \mu \)L of each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.07 >\) according to the following conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of cefalexin to that of the internal standard in each solution.

\[
\text{Amount [mg (potency)] of cefalexin (C}_{16}\text{H}_{17}\text{N}_{3}\text{O}_{4}\text{S) = M_S \times \frac{Q_1}{Q_2} \times 5}}
\]

*\( M_S \): Amount [mg (potency)] of Cefalexin RS

**Internal standard solution**—A solution of \( m \)-hydroxyacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 15,000).

**Operating conditions**—

- Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
- Column: A stainless steel column 3.0 mm in inside diameter and 7.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 \( \mu \)m in particle diameter).
- Column temperature: A constant temperature of about 25°C.
- Mobile phase: Dissolve 2.72 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust the pH to 3.0 with diluted phosphoric acid (3 in 500). To 800 mL of this solution add 200 mL of methanol.
Flow rate: Adjust the flow rate so that the retention time of cefalexin is about 6 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, cefalexin and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cefalexin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Cefalexin for Syrup
シロップ用セファレキシン

Cefalexin for Syrup is a preparation for syrup, which is dissolved or suspended before use.

It contains not less than 90.0% and not more than 110.0% of the labeled potency of cefalexin (C16H17N3O4S: 347.39).

Method of preparation Prepare as directed under Preparations for Syrups, with Cefalexin.

Identification Dissolve a quantity of Cefalexin for Syrup, equivalent to 3 mg (potency) of Cefalexin according to the labeled amount, in water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24); it exhibits a maximum between 260 nm and 264 nm.

Water Not more than 5.0% (0.4 g, volumetric titration, back titration).

Uniformity of dosage units (6.02) Perform the test according to the following method: Cefalexin for Syrup in single-unit containers meets the requirement of the Content uniformity test.

Take out the total contents of 1 pack of Cefalexin for Syrup, add 3 V/5 mL of 0.1 mol/L phosphate buffer solution, pH 4.5, shake vigorously for 10 minutes, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make exactly V mL so that each mL contains about 1 mg (potency) of Cefalexin, and centrifuge. Pipet 2 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make 100 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount [mg (potency)] of cefalexin (C16H17N3O4S) = M5 × Q5/Q8 × V/20

M5: Amount [mg (potency)] of Cefalexin RS

Internal standard solution—A solution of m-hydroxyacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 15,000).

Dissolution (6.10b) When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Cefalexin for Syrup is not less than 80%.

Start the test with an accurately weighed amount of Cefalexin, equivalent to about 0.25 g (potency) of Cefalexin for Syrup according to the labeled amount, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add water to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefalexin RS, equivalent to about 22 mg (potency), and dissolve in water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry (2.24), and determine the absorbances, A1 and A8, at 262 nm.

Dissolution rate (%) with respect to the labeled amount of cefalexin (C16H17N3O4S) = M5/M8 × A8/A5 × 1/C × 1125

M5: Amount [mg (potency)] of Cefalexin RS
M8: Amount (g) of Cefalexin for Syrup
C: Labeled amount [mg (potency)] of cefalexin (C16H17N3O4S) in 1 g

Assay Powder Cefalexin for Syrup, if necessary, and weigh accurately a portion of the powder, equivalent to about 0.1 g (potency) of Cefalexin, add 60 mL of 0.1 mol/L phosphate buffer solution, pH 4.5, shake vigorously for 10 minutes, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make exactly 100 mL, and centrifuge. Pipet 2 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefalexin RS, equivalent to about 20 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 4.5, to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add 0.1 mol/L phosphate buffer solution, pH 4.5, to make 100 mL, and use this solution as the sample solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and calculate the ratios, Q1 and Q8, of the peak area of cefalexin to that of the internal standard in each solution.

Amount [mg (potency)] of cefalexin (C16H17N3O4S) = M5 × Q8/Q1 × 5

M5: Amount [mg (potency)] of Cefalexin RS

Internal standard solution—A solution of m-hydroxyacetophenone in 0.1 mol/L phosphate buffer solution, pH 4.5 (1 in 15,000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 3.0 mm in inside diameter and 7.5 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 2.72 g of potassium dihydrogen...
phosphate in 1000 mL of water, and adjust the pH to 3.0 with diluted phosphoric acid (3 in 500). To 800 mL of this solution add 200 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefalexin is about 6 minutes.

System suitability—

- System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, cefalexin and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.
- System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cefalexin to that of the internal standard is not more than 1.0%.

Containers and storage — Containers—Tight containers.
Storage—Light-resistant.

Cefalotin Sodium

Cefalotin Sodium occurs as white to light yellowish white, crystals or crystalline powder.

It is freely soluble in water, slightly soluble in methanol, very slightly soluble in ethanol (95), and practically insoluble in acetone.

Identification (1) Determine the absorption spectrum of a solution of Cefalotin Sodium (1 in 5,000) as directed under Ultraviolet-visible Spectrophotometry 2.2.4, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefalotin Sodium RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefalotin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.2.5, and compare the spectrum with the Reference Spectrum or the spectrum of Cefalotin Sodium RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the 1H spectrum of a solution of Cefalotin Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy 2.2.17, using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around 3.1 ppm, a single or sharp multiple signal B at around 3.9 ppm, and a multiple signal C at around 7.0 ppm. The ratio of the integrated intensity of these signals, A:B:C, is about 3:2:2.

(4) Cefalotin Sodium responds to the Qualitative Tests 1.09 (1) for sodium salt.

Optical rotation 2.4.9 [α]D: +124° – +134° (5 g, water, 100 mL, 100 mm).

pH 2.5.4 The pH of a solution obtained by dissolving 1.0 g of Cefalotin Sodium in 10 mL of water is between 4.5 and 7.0.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Cefalotin Sodium in 10 mL of water: the solution is clear. The absorbance of this solution at 450 nm, determined as directed under Ultraviolet-visible Spectrophotometry 2.2.4, is not more than 0.20.

(2) Heavy metals 1.07—Proceed with 1.0 g of Cefalotin Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic 1.11—Prepare the test solution with 1.0 g of Cefalotin Sodium according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Pipet 1 mL of the standard solution obtained in the Assay, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution obtained in the Assay and the standard solution prepared here as directed under Liquid Chromatography 2.01 according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than cefalotin from the sample solution is not larger than the peak area of cefalotin from the standard solution, and the total area of the peaks other than cefalotin from the sample solution is not larger than 3 times the peak area of cefalotin from the standard solution.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 4 times as long as the retention time of cefalotin.

System suitability—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cefalotin obtained from 10 μL of this solution is equivalent to 7 to 13% of that from 10 μL of the standard solution.

System performance: Heat the standard solution in a water bath of 90°C for 10 minutes, and cool. Measure exactly 2.5 mL of this solution, and add the mobile phase to make exactly 100 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, the resolution between the peak of cefalotin and the peak, having the relative retention time of about 0.5 with respect to cefalotin, is not less than 9, and the symmetry factor of the peak of cefalotin is not more than 1.8.

System repeatability: When the test is repeated 3 times
Cefatrizine Propylene Glycolate

C_{18}H_{18}N_{6}O_{5}S_{2}: C_{3}H_{8}O_{2}: 538.60
(6R,7R)-7-[(2R)-2-Amino-2-(4-hydroxyphenyl)acetyl]-amino]-8-oxo-3-[1(1H,1,2,3-triazol-4-yl)sulfonylmethyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monopropionate,1,2-diolate (1/1)

Cefatrizine Propylene Glycolate contains not less than 816 µg (potency) and not more than 876 µg (potency) per mg, calculated on the anhydrous basis. The potency of Cefatrizine Propylene Glycolate is expressed as mass (potency) of cefatrizine (C_{18}H_{18}N_{6}O_{5}S_{2}: 462.50).

Description  
Cefatrizine Propylene Glycolate occurs as a white to yellowish white powder. It is sparingly soluble in water, and practically insoluble in methanol and in ethanol (95).

Identification (1)  
Determine the absorption spectrum of a solution of Cefatrizine Propylene Glycolate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefatrizine Propylene Glycolate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefatrizine Propylene Glycolate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefatrizine Propylene Glycolate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the 1H spectrum of a solution of Cefatrizine Propylene Glycolate in a mixture of heavy water for nuclear magnetic resonance spectroscopy and deuterated hydrochloric acid for nuclear magnetic resonance spectroscopy (3:1) (1 in 10), using sodium 3-(trimethylsilyl)propionate-d_{4} for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>: it exhibits a double signal A at around δ 1.2 ppm, a double signal B at around δ 7.0 ppm, a double signal C at around δ 7.5 ppm and a single signal D at around δ 8.3 ppm. The ratio of integrated intensity of these signals, A:B:C:D, is about 3:2:2:1.

Optical rotation <2.49>  
[α]_{D}: +52 – +58° (2.5 g calculated on the anhydrous bases, 1 mol/L hydrochloric acid TS, 50 mL, 100 mm).

Purity (1)  
Heavy metals <1.07>—Proceed with 1.0 g of
Cefatrizine Propylene Glycolate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic $<\text{1.1}>$—Prepare the test solution with 1.0 g of Cefatrizine Propylene Glycolate according to Method 3, and perform the test (not more than 2 ppm). Use a solution of magnesium nitrate hexahydrate in ethanol (1 in 25).

(3) Related substances—Dissolve 25 mg of Cefatrizine Propylene Glycolate in 5 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $<2.01>$. Spot 5 $\mu$L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop with a mixture of 1-butanol, water and acetic acid (100:3:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly ninhydrin-citric acid-acetic acid TS on the plate, and heat at 100°C for 10 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Water $<2.48>$—Not more than 2.0% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately an amount of Cefatrizine Propylene Glycolate and Cefatrizine Propylene Glycolate RS equivalent to about 0.1 g (potency), dissolve each in water to make exactly 20 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 $\mu$L of each of the sample solution and standard solution as directed under Liquid Chromatography $<2.01>$ according to the following conditions, and determine the peak areas, $A_1$ and $A_5$, of cefatrizine of these solutions.

Amount $[\mu g \text{ (potency)}]$ of cefatrizine $(C_{18}H_{18}N_6O_5S_2)$

$$M_2: \text{Amount } [\text{mg } \text{ (potency)}] \text{ of Cefatrizine Propylene Glycolate RS}$$

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 270 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilaized silica gel for liquid chromatography (5 $\mu$m in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: A mixture of a solution of potassium dihydrogenphosphate (17 in 12,500) and methanol (17:3).
Flow rate: Adjust the flow rate so that the retention time of cefatrizine is about 11 minutes.

System suitability—
System performance: Dissolve about 5 mg (potency) of Cefadroxil and about 10 mg (potency) of Cefatrizine Propylene Glycolate in 50 mL of water. When the procedure is run with 10 $\mu$L of this solution under the above operating conditions, cefadroxil and cefatrizine are eluted in this order with the resolution between these peaks being not less than 4.
System repeatability: When the test is repeated 6 times with 10 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of peak areas of cefatrizine is not more than 1.0%.

Containers and storage Containers—Tight containers.

Cefatrizine Propylene Glycolate for Syrup シロップ用セファトリジンプロピレングリコール

Cefatrizine Propylene Glycolate for Syrup is a preparation for syrup, which is dissolved before use. It contains not less than 90.0% and not more than 105.0% of the labeled potency of Cefatrizine $(C_{18}H_{18}N_6O_5S_2$: 462.50).

Method of preparation Prepare as directed under Preparations for Syrup, with Cefatrizine Propylene Glycolate.

Identification Powder Cefatrizine Propylene Glycolate for Syrup, weigh a portion of the powder, equivalent to 10 mg (potency) of Cefatrizine Propylene Glycolate according to the labeled amount, and dissolve in 10 mL of water. To 2 mL of this solution add water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry $<2.24>$: it exhibits maxima between 225 nm and 229 nm, and between 266 nm and 271 nm.

pH $<2.5>$—Take an amount of Cefatrizine Propylene Glycolate for Syrup, equivalent to 0.4 g (potency) of Cefatrizine Propylene Glycolate according to the labeled amount, and suspend in 10 mL of water: the pH of this suspension is between 4.0 and 6.0.

Purity Related substances—Use the sample solution obtained in the Assay as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 $\mu$L of each of the sample solution and standard solution as directed under Liquid Chromatography $<2.01>$ according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of each peak other than cefatrizine obtained from the sample solution is not larger than the peak area of cefatrizine from the standard solution, and the total area of the peaks other than the peak of cefatrizine is not larger than 2 times the peak area of cefatrizine from the standard solution.

Operating conditions—
Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay under Cefatrizine Propylene Glycolate.

Time span of measurement: About 2.5 times as long as the retention time of cefatrizine, beginning after the solvent peak.

System suitability—
Test for required detectability: Pipet 2 mL of the standard solution, and add water to make exactly 10 mL. Confirm that the peak area of cefatrizine obtained from 10 $\mu$L of this solution is equivalent to 15 to 25% of that of cefatrizine from 10 $\mu$L of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay under Cefatrizine Propylene Glycolate.

System repeatability: When the test is repeated 6 times with 10 $\mu$L of the standard solution under the above operat-
ing conditions, the relative standard deviation of the peak area of cefatrizine is not more than 2.0%.

**Uniformity of dosage units** 6.02\(\Delta\) Cefatrizine Propylene Glycolate for Syrup in single-unit containers meets the requirement of the Mass variation test.

**Assay** Powder Cefatrizine Propylene Glycolate for Syrup, weigh accurately a portion of the powder, equivalent to about 0.1 g (potency) of Cefatrizine Propylene Glycolate, dissolve in water to make exactly 500 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefatrizine Propylene Glycolate RS, equivalent to about 20 mg (potency), dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefatrizine Propylene Glycolate.

Amount \([\text{mg (potency)}]\) of cefatrizine \(\left(C_{13}H_{18}N_{8}O_{4}S_{3}\right)\)

\[M_5 = \frac{M \times A_T}{A_S} \times 5\]

\(M_5:\) Amount \([\text{mg (potency)}]\) of Cefatrizine Propylene Glycolate RS

**Containers and storage** Containers—Tight containers.

## Cefazolin Sodium

セファゾリンナトリウム

![Cefazolin Sodium structure](image)

\(C_{14}H_{13}N_{8}NaO_{4}S_{3}: 476.49\)

Monosodium \((6R,7R)-3-(5\text{-methyl}-1,3,4\text{-thiadiazol-2-ylsulfanylmethyl})-8\text{-oxo-7-(2-(1H-tetrazol-1-yl)acetamido)-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate}\)

\([27164-46-1]\)

Cefazolin Sodium contains not less than 900 \(\mu\)g (potency) and not more than 975 \(\mu\)g (potency) per mg, calculated on the anhydrous basis. The potency of Cefazolin Sodium is expressed as mass (potency) of cefazolin \(\left(C_{14}H_{13}N_{8}O_{4}S_{3}\right): 454.51\)

**Description** Cefazolin Sodium occurs as a white to light yellow-white, crystals or crystalline powder.

It is freely soluble in water and in formamide, slightly soluble in methanol, and practically insoluble in ethanol (95).

**Identification** (1) Determine the absorption spectrum of a solution of Cefazolin Sodium (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry \(\leq 2.24\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefazolin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry \(\leq 2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the \(^1\)H spectrum of a solution of Cefazolin Sodium in heavy water for nuclear magnetic resonance spectroscopy \(1 \text{ in } 10\), using sodium 3-trimethylsilylpropionate-\(d_4\) for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy \(\leq 2.22\): it exhibits single signals, A and B, at around \(\delta\) 2.7 ppm and at around \(\delta\) 9.3 ppm, respectively. The ratio of integrated intensity of these signals, A:B, is about 3:1.

(4) Cefazolin Sodium responds to the Qualitative Tests \(\leq 1.09\) (1) for sodium salt.

**Optical rotation** \(\leq 2.49\) \([\alpha]_{D}^{20}\): \(-19 \sim -23^\circ\) (2.5 \(g\) calculated as the anhydrous basis, water, 25 \(mL\), 100 \(mm\)).

**pH** \(\leq 2.54\) Dissolve 1.0 \(g\) of Cefazolin Sodium in 10 \(mL\) of water: pH of the solution is between 4.8 and 6.3.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 \(g\) of Cefazolin Sodium in 10 \(mL\) of water: the solution is clear and colorless to pale yellow, and its absorbance at 400 nm determined as directed under Ultraviolet-visible Spectrophotometry \(\leq 2.24\) is not more than 0.35. The test should be performed within 10 minutes after preparing of the solution.

(2) Heavy metals \(\leq 2.07\)—Proceed with 2.0 \(g\) of Cefazolin Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 \(mL\) of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic \(\leq 1.11\)—Prepare the test solution with 2.0 \(g\) of Cefazolin Sodium according to Method 3, and perform the test. When prepare the test solution, add 1.5 \(mL\) of hydrogen peroxide (30) after addition of 10 \(mL\) of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 50), and then ignite (not more than 1 ppm).

(4) Related substances—Dissolve 0.10 \(g\) of Cefazolin Sodium in 20 \(mL\) of 0.1 \(mol/L\) phosphate buffer solution, pH 7.0 and use this solution as the sample solution. Prepare the sample solution before use. Perform the test with 5 \(\muL\) of the sample solution as directed under Liquid Chromatography \(\leq 2.07\) according to the following conditions, and measure the areas of a peak appeared at the relative retention time of about 0.2 to the retention time of cefazolin and peaks other than cefazolin by the automatic integration method, and calculate the amounts of these peak areas by the area percentage method: the amount of each peak area is not more than 1.5%, and the total area of the peaks other than cefazolin is not more than 2.5%. The area of the peak appeared at the relative retention time of about 0.2 to the retention time of cefazolin obtained here is used after multiplying by its relative response factor, 1.43.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of cefazolin beginning after the solvent peak.

**System suitability**—

Test for required detection: Dissolve about 80 \(mg\) of Cefazolin RS in 0.1 \(mol/L\) phosphate buffer solution, pH 7.0 to make 100 \(mL\), and use this solution as the solution for system suitability test. Pipet 1 \(mL\) of the solution for system suitability test, and add 0.1 \(mol/L\) phosphate buffer solu-
Cefazolin Sodium for Injection

Cefazolin Sodium for Injection is a preparation for injection which is dissolved before use.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of cefazolin (C14H14N8O4S3: 454.51).

Method of preparation

Prepare as directed under Injections, with Cefazolin Sodium.

Description

Cefazolin Sodium for Injection occurs as white to light yellowish white crystals or crystalline powder or masses.

Identification (1) Determine the absorption spectrum of a solution of Cefazolin Sodium for Injection (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.242>: it exhibits a maximum between 270 nm and 274 nm.

(2) Cefazolin Sodium for Injection responds to the Qualitative Tests <1.09> (1) for chloride.

Osmotic pressure ratio

Being specified separately.

pH <2.54> The pH of a solution prepared by dissolving an amount of Cefazolin Sodium for Injection, equivalent to 1.0 g (potency) of Cefazolin Sodium according to the labeled amount, in 10 mL of water is 4.5 to 6.5.

Purity (1) Clarity and color of solution—Conduct this procedure within 10 minutes after the preparation of the solutions. A solution prepared by dissolving an amount of Cefazolin Sodium for Injection, equivalent to 1.0 g (potency) of Cefazolin Sodium according to the labeled amount, in 10 mL of water is clear, and the absorbance of this solution at 400 nm, determined as directed under Ultraviolet-visible Spectrophotometry <2.242>, is not more than 0.35.

(2) Related substances—Dissolve an amount of Cefazolin Sodium for Injection, equivalent to 0.10 g (potency) of Cefazolin Sodium according to the labeled amount, in 20 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the sample solution. Prepare the sample solution before use. Perform the test with 5 µL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of each peak by the area percentage method: each area of the peaks other than cefazolin is not more than 1.5%. Furthermore the total area of the peaks other than cefazolin is not more than 2.5%. For these calculations, use the area of the peak, having the relative retention time of about 0.2 with respect to cefazolin, after multiplying by the relative response factor, 1.43.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay under Cefazolin Sodium.

Time span of measurement: About 3 times as long as the retention time of cefazolin, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 8 mL of the sample solution, add 0.1 mol/L phosphate buffer solution, pH 7.0

Assay

Weigh accurately an amount of Cefazolin Sodium and Cefazolin RS, equivalent to about 0.1 g (potency), dissolve each in the internal standard solution to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 5 µL of each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q1 and Q2, of the peak area of cefazolin to that of the internal standard.

Amount [µg (potency)] of cefazolin (C14H14N8O4S3) = M6 × Q1/Q2 × 1000

M6: Amount [µg (potency)] of Cefazolin RS

Internal standard solution—A solution of p-acetoanisidide in 0.1 mol/L phosphate buffer solution, pH 7.0 (11 in 20,000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2.27 g of disodium hydrogen phosphate dodecahydrate and 0.47 g of citric acid monohydrate in water to make 935 mL, and add 65 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefazolin is about 8 minutes.

System suitability—

System performance: Proceed as directed in the system suitability test. The relative standard deviation of the ratios of the peak areas of cefazolin is not more than 1.0%.

System repeatability: When the test is repeated 6 times with 5 µL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of cefazolin is not more than 1.0%.

Water <2.48> Not more than 2.5% (1.0 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

Containers and storage—Tight containers.

Cefazolin Sodium for Injection

注射用セファゾリンナトリウム

Cefazolin Sodium for Injection is a preparation for injection which is dissolved before use.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of cefazolin (C14H14N8O4S3: 454.51).

Method of preparation

Prepare as directed under Injections, with Cefazolin Sodium.

Water <2.48> Not more than 2.5% (1.0 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

Containers and storage—Tight containers.
to make exactly 50 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 20 mL. Confirm that the peak area of cefazolin obtained from 5 μL of this solution is equivalent to 3 to 7% of that from 5 μL of the solution for system suitability test.

System performance: Proceed as directed in the system suitability in the Assay under Cefazolin Sodium.

System repeatability: When the test is repeated 6 times with 5 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of cefazolin is not more than 1.0%.

Water <2.48> Not more than 3.0% (0.5 g, volumetric titration, direct titration). Use a mixture of formamide for Karl Fischer method and methanol for Karl Fischer method (2:1) instead of methanol for Karl Fischer method.

Bacterial endotoxins <4.01> Less than 0.05 EU/mg (potency).

Uniformity of dosage units <6.02> It meets the requirement of the Mass variation test.

Foreign insoluble matter <6.06> Perform the test according to Method 2: it meets the requirement.

Insoluble particulate matter <6.07> It meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Weigh accurately the mass of the contents of not less than 10 containers of Cefazolin Sodium for Injection. Weigh accurately an amount of the contents, equivalent to about 50 mg (potency) of Cefazolin Sodium, dissolve in the internal standard solution to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefazolin RS, equivalent to about 50 mg (potency), dissolve in the internal standard solution to make exactly 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefazolin Sodium.

Amount [mg (potency)] of cefazolin (C_{14}H_{13}N_{8}NaO_{4}S_{3})

\[ M_s \times \frac{Q_t}{Q_i} \]

\( M_s \): Amount [mg (potency)] of Cefazolin RS

Internal standard solution—A solution of p-acetanisidide in 0.1 mol/L phosphate buffer solution, pH 7.0 (11 in 20,000).

Containers and storage Containers—hermetic containers. Plastic containers for aqueous injections may be used.

Cefazolin Sodium Hydrate セファゾリンナトリウム水和物

C_{14}H_{13}N_{8}NaO_{4}S_{3}.5H_{2}O: 566.57

Monosodium (6R,7R)-3-(5-methyl-1,3,4-thiadiazol-2-ylsulfonyl[methyl])-8-oxo-7-[2-(1H-tetrazol-1-yl)acetylamino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate pentahydrate [115850-11-8]

Cefazolin Sodium Hydrate contains not less than 920 μg (potency) and not more than 975 μg (potency) per mg, calculated on the anhydrous basis. The potency of Cefazolin Sodium Hydrate is expressed as mass (potency) of cefazolin (C_{14}H_{13}N_{8}O_{4}S_{3}: 454.51).

Description Cefazolin Sodium Hydrate occurs as white to pale yellowish white crystals.

It is freely soluble in water, sparingly soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Identification (1) Determine the absorption spectrum of a solution of Cefazolin Sodium Hydrate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefazolin Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the \(^1\)H spectrum of a solution of Cefazolin Sodium Hydrate in heavy water for nuclear magnetic resonance spectroscopy (1 in 10), using sodium 3-trimethylsilylpropionate-\(d_2\) for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.22>: it exhibits single signals, A and B, at around \(\delta 2.7\) ppm and at around \(\delta 9.3\) ppm. The ratio of integrated intensity of each signal, A:B, is about 3:1.

(4) Cefazolin Sodium Hydrate responds to the Qualitative Tests <1.09> (1) for sodium salt.

Absorbance <2.24> \(E_{1\text{cm}}^{1\text{cm}}\) (272 nm): 272 - 292 (80 mg calculated on the anhydrous basis, water, 5000 mL).

Optical rotation <2.49> \([\alpha]_D^{20}\): -20 - -25° (2.5 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH <2.54> Dissolve 1.0 g of Cefazolin Sodium Hydrate in 10 mL of water: the pH of the solution is between 4.8 and 6.3.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Cefazolin Sodium Hydrate in 10 mL of water: the solu-
tion is clear, and when determine the absorbance at 400 nm of this solution as directed under Ultraviolet-visible Spectrophotometry, it is not more than 0.15.

(2) Heavy metals \(< 0.07\) — Proceed with 2.0 g of Cefazolin Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances — Dissolve 0.10 g of Cefazolin Sodium Hydrate in 20 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the sample solution. Perform the test with 5.0 mL of the sample solution as directed under Liquid Chromatography \(< 0.01\) according to the following conditions. Determine each peak area by the automatic integration method, and calculate the amount of them by the area percentage method: the area of the peak having the relative retention time of about 0.2 with respect to cefazolin is not more than 1.0%, the area of the peak other than cefazolin and the peak mentioned above is not more than 0.5%, and the total area of the peaks other than cefazolin is not more than 2.0%. For this calculation use the area of the peak, having the relative retention time of about 0.2 with respect to cefazolin, after multiplying by its relative response factor 1.43.

Operating conditions —

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of cefazolin, beginning after the solvent peak.

System suitability —

Test for required detectability: To 1 mL of the sample solution add 0.1 mol/L phosphate buffer solution, pH 7.0 to make 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 10 mL. Confirm that the peak area of cefazolin obtained with 5.0 mL of this solution is equivalent to 7 to 13% of that with 5.0 mL of the solution for system suitability test.

System performance: Dissolve 20 mg of Cefazolin Sodium Hydrate in 20 mL of a solution of \(p\)-acetoanisidide in 0.1 mol/L phosphate buffer solution, pH 7.0 (11 in 20,000). When the procedure is run with 5.0 mL of this solution under the above operating conditions, cefazolin and \(p\)-acetoanisidide are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 5.0 mL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of cefazolin is not more than 2.0%.

(4) Residual solvents — Be specified separately.

Water \(< 2.48\) — Not less than 13.7% and not more than 16.0%, 0.1 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination.

Bacterial endotoxins \(< 0.01\) — Less than 0.10 EU/mg (potency).

Assay Weigh accurately an amount of Cefazolin Sodium Hydrate and Cefazolin RS, equivalent to about 20 mg (potency), dissolve in exactly 20 mL of the internal standard solution, and use these solutions as the sample solution and standard solution. Perform the test with 5.0 mL each of the sample solution and standard solution as directed under Liquid Chromatography \(< 0.01\) according to the following conditions, and calculate the ratios, \(Q_1\) and \(Q_2\), of the peak area of cefazolin to that of the internal standard.

Amount [\(\mu g\) (potency)] of cefazolin (C\(_{14}\)H\(_{14}\)N\(_8\)O\(_4\)S\(_3\))

\[
M_5 = \frac{M_5}{2} \times \frac{Q_1}{Q_2} \times 1000
\]

\(M_5\): Amount [mg (potency)] of Cefazolin RS

Internal standard solution — A solution of \(p\)-acetoanisidide in 0.1 mol/L phosphate buffer solution, pH 7.0 (11 in 20,000).

Operating conditions —

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 \(\mu m\) in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2.27 g of disodium hydrogen phosphate dodecahydrate and 0.47 g of citric acid monohydrate in water to make 935 mL. To this solution, add 65 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefazolin is about 8 minutes.

System suitability —

System performance: When the procedure is run with 5.0 mL of the standard solution under the above operating conditions, cefazolin and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 5.0 mL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefazolin is not more than 1.0%.

Containers and storage Containers — Hermetic containers.

Storage — Light-resistant.

Cefbuperazone Sodium

セフブペラゾンナトリウム

C\(_{22}\)H\(_{28}\)N\(_9\)NaO\(_9\)S\(_2\): 649.63

Monosodium (6\(R\),7\(S\))-7-\(R\)-\(2,3\)-dioxopiperazine-1-carbonyl]amino]-3-hydroxybutanoylamino]-7-methoxy-3-\(R\)\(-\text{methyl}-1H-tetrazol-5-ylsulfanylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate

Cefbuperazone Sodium contains not less than 870 \(\mu g\) (potency) per mg, calculated on the anhydrous
Cefbuperazone Sodium occurs as white to light yellowish white, powder or masses.

It is very soluble in water, freely soluble in methanol and in pyridine, sparingly soluble in ethanol (95), and very slightly soluble in acetonitrile.

**Identification (1)** Determine the absorption spectrum of a solution of Cefbuperazone Sodium (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 0.1 g of Cefbuperazone Sodium in 0.5 mL of deuterated pyridine for nuclear magnetic resonance spectroscopy and 1 drop of heavy water for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a triplet signal A at around δ 1.1 ppm, and two doublet signals, B and C, at around δ 1.6 ppm and at around δ 5.1 ppm, respectively. The ratio of the integrated intensity of each signal, A:B:C, is about 3:3:1.

(3) Cefbuperazone Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49> [α]D: +48° - +56° (0.4 g calculated on the anhydrous basis, water, 20 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefbuperazone Sodium in 4 mL of water: the pH of the solution is between 4.0 and 6.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cefbuperazone Sodium in 4 mL of water: the solution is clear and light yellow.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Cefbuperazone Sodium according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefbuperazone Sodium according to Method 4, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.10 g of Cefbuperazone Sodium in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 25 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the percentages of each peak area of related substances from the sample solution against 50 times of the peak area of cefbuperazone from the standard solution; the amount of related substance I having the relative retention time of about 0.2 to cefbuperazone is not more than 2.0%, the amount of related substance II having the relative retention time of about 0.6 to cefbuperazone is not more than 4.5% and the amount of related substance III having the relative retention time of about 1.6 to cefbuperazone is not more than 1.0%, and the total amount of these related substances is not more than 6.0%. For these calculations, use the values of the peak areas of the related substances I and III obtained by the automatic integration method after multiplying by each relative response factors, 0.72 and 0.69, respectively.

**System suitability—**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of cefbuperazone.

**System performance**—When the procedure is run with 25 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefbuperazone is not more than 2.0%.

**Water** <2.48> Not more than 1.0% (3 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefbuperazone Sodium and Cefbuperazone RS, equivalent to about 0.1 g (potency), and dissolve each in the mobile phase to make exactly 100 mL. Measure exactly 10 mL of each of these solutions, add exactly 10 mL of the internal standard solution and the mobile phase to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the ratios, Q1 and Q2, of the peak area of cefbuperazone to that of the internal standard.

\[
\text{Amount [μg (potency)] of cefbuperazone (C}_{22}\text{H}_{29}\text{N}_{9}\text{O}_{9}\text{S}_{2}) = M_3 \times Q_1/Q_2 \times 1000
\]

M3: Amount [mg (potency)] of Cefbuperazone RS

**Internal standard solution—** A solution of acetonitrile in the mobile phase (1 in 4000).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 2.0 g of tetra-n-propylammonium bromide in 1000 mL of a mixture of water, acetonitrile and acetic acid-sodium acetate buffer solution, pH 5.0 (83:13:4). Flow rate: Adjust the flow rate so that the retention time of cefbuperazone is about 16 minutes.

**System suitability—**

System performance: When the procedure is run with 10 μL of the standard solution under the above operating con-
Cefcapene Pivoxil Hydrochloride Hydrate

セフカペン ピボキシル塩酸塩水和物

C$_2$H$_3$N$_2$O$_5$S$_2$·HCl·H$_2$O: 622.11
2,2-Dimethylpropanoyloxymethyl (6R,7R)-7-{(2Z)-2-(2-
aminothiazol-4-yl)pent-2-enylamino}-3-
carbamoyloxymethyl-8-oxo-5-thia-1-azabicyclo[4.2.0]
2-
ene-2-carboxylate monohydrochloride monohydrate
[147816-24-8]

Cefcapene Pivoxil Hydrochloride Hydrate contains
not less than 722 μg (potency) and not more than 764
μg (potency) per mg, calculated on the anhydrous
basis. The potency of Cefcapene Pivoxil Hydrochloride Hydrate is expressed as mass (potency) of cefca-
pene (C$_{17}$H$_{19}$N$_2$O$_5$S$_2$: 453.49).

Description Cefcapene Pivoxil Hydrochloride Hydrate occurs as a white to pale yellowish white, crystalline powder or mass. It has slightly a characteristic odor.

It is freely soluble in N,N-dimethylformamide and in methanol, soluble in ethanol (99.5), slightly soluble in water, and practically insoluble in diethyl ether.

Identification (1) Determine the absorption spectrum of a solution of Cefcapene Pivoxil Hydrochloride Hydrate in methanol (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefcapene Pivoxil Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectra of Cefcapene Pivoxil Hydrochloride Hydrate and Cefcapene Pivoxil Hydrochloride RS as directed in the paste method under In-
frared Spectrophotometry <2.25>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the 'H spectrum of a solution of Cefcapene Pivoxil Hydrochloride Hydrate in deuterated methanol for nuclear magnetic resonance spectroscopy (1 in 50) as dis-
rected under Nuclear Magnetic Resonance Spectroscopy <2.22>, using tetramethylsilane for nuclear magnetic reso-
nance spectroscopy as an internal reference compound: it exhibits a triplet signal A at around δ 6.3 ppm, and a single signal B at around δ 6.7 ppm, and the ratio of integrated intensity of each signal, A:B, is about 1:1.

(4) Dissolve 10 mg of Cefcapene Pivoxil Hydrochloride Hydrate in 2 mL of a mixture of water and methanol (1:1), and add 1 drop of silver nitrate TS: a white precipitate is formed.

Optical rotation <2.49> [α]$_D^{20}$: +51 – +54° (0.1 g calculated on the anhydrous basis, methanol, 10 mL, 100 mm).

Purity (1) Heavy metals <1.07> Proceed with 2.0 g of Cefcapene Pivoxil Hydrochloride Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substance I—Dissolve an amount of Cefca-
pen Pivoxil Hydrochloride Hydrate, equivalent to about 10
mg (potency), in 2 mL of methanol, add a mixture of water and methanol (1:1) to make 50 mL, and use this solution as the sample solution. Perform the test with 30 μL of the sample solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine each peak area by the automatic integration method. If neces-

Ssary, compensate the baseline by performing in the same
manner as the test with 30 μL of a mixture of water and methanol (1:1). Measure the amount of the peak other than cefcapene pivoxil by the area percentage method: the amounts of the peaks, having the relative retention times of about 1.5 and about 1.7 with respect to cefcapene pivoxil, are not more than 0.2%, respectively. The amount of the peak other than the peaks mentioned above is not more than 0.1%, and the total of them is not more than 1.5%.

Operating conditions—

Detector: An ultraviolet absorption photometer (wave-
length: 265 nm).

Column: A stainless steel column 4.6 mm in inside diam-
ter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 20°C.

Mobile phase A: Dissolve 5.99 g of potassium dihydrogen phosphate in water to make 1100 mL. To this solution add 0.1 g calculated on the anhydrous basis, methanol, 10 mL, 100 mm).

Purity (1) Heavy metals <1.07> Proceed with 2.0 g of Cefcapene Pivoxil Hydrochloride Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substance I—Dissolve an amount of Cefca-
pen Pivoxil Hydrochloride Hydrate, equivalent to about 10
mg (potency), in 2 mL of methanol, add a mixture of water and methanol (1:1) to make 50 mL, and use this solution as the sample solution. Perform the test with 30 μL of the sample solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine each peak area by the automatic integration method. If neces-

Ssary, compensate the baseline by performing in the same
manner as the test with 30 μL of a mixture of water and methanol (1:1). Measure the amount of the peak other than cefcapene pivoxil by the area percentage method: the amounts of the peaks, having the relative retention times of about 1.5 and about 1.7 with respect to cefcapene pivoxil, are not more than 0.2%, respectively. The amount of the peak other than the peaks mentioned above is not more than 0.1%, and the total of them is not more than 1.5%.

Operating conditions—

Detector: An ultraviolet absorption photometer (wave-
length: 265 nm).

Column: A stainless steel column 4.6 mm in inside diam-
ter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 20°C.

Mobile phase A: Dissolve 5.99 g of potassium dihydrogen phosphate in water to make 1100 mL. To this solution add 0.1 g calculated on the anhydrous basis, methanol, 10 mL, 100 mm).

Mobile phase B: A mixture of methanol and water (22:3). Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>

Flow rate: 0.8 mL per minute.

Time span of measurement: About 2.5 times as long as the retention time of cefcapene pivoxil.
**System suitability**—

Test for required detectability: To exactly 1 mL of the sample solution add a mixture of water and methanol (1:1) to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add the mixture of water and methanol (1:1) to make exactly 10 mL. Confirm that the peak area of cefcapene pivoxil obtained from 30 μL of this solution is equivalent to 7 to 13% of that of cefcapene pivoxil obtained from 30 μL of the solution for system suitability test.

System performance: Dissolve 10 mg of Cefcapene Pivoxil Hydrochloride Hydrate and 10 mg of propyl parahydroxybenzoate in 25 mL of methanol, and add water to make 50 mL. To 5 mL of this solution add the mixture of water and methanol (1:1) to make 50 mL. When the procedure is run with 30 μL of this solution under the above operating conditions, cefcapene pivoxil and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 7. System repeatability: When the test is repeated 3 times with 30 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of cefcapene pivoxil is not more than 4.0%.

(3) Related substance II—Dissolve an amount of Cefcapene Pivoxil Hydrochloride Hydrate, equivalent to about 2 mg (potency), in N,N-dimethylformamide for liquid chromatography to make 20 mL, and use this solution as the sample solution. Perform the test with 20 μL of the sample solution as directed under Liquid Chromatography to make 20 mL, and use this solution as the system suitability test. Pipet 1 mL of the solution add a mixture of water and methanol (1:1) to make exactly 10 mL. Confirm that the peak area of cefcapene pivoxil obtained from 30 μL of this solution is equivalent to 7 to 13% of that of cefcapene pivoxil obtained from 30 μL of the solution for system suitability test.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 7.8 mm in inside diameter and 30 cm in length, packed with styrene-divinylbenzene copolymer for liquid chromatography.

Column temperature: A constant temperature of about 25°C.

Mobile phase: A solution of lithium bromide in N,N-dimethylformamide for liquid chromatography (13 in 5000).

Flow rate: Adjust the flow rate so that the retention time of cefcapene pivoxil is about 22 minutes.

Time span of measurement: About 1.8 times as long as the retention time of cefcapene pivoxil.

**System suitability**—

Test for required detection: To exactly 1 mL of the sample solution add N,N-dimethylformamide for liquid chromatography to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 3 mL of the solution for system suitability test, and add N,N-dimethylformamide for liquid chromatography to make exactly 10 mL. Confirm that the peak area of cefcapene pivoxil obtained from 20 μL of this solution is equivalent to 7 to 13% of that of cefcapene pivoxil obtained from 20 μL of the solution for system suitability test.

System performance: When the procedure is run with 20 μL of the sample solution under the above operating conditions, the number of theoretical plates of the peak of cefcapene pivoxil is not less than 12,000 steps.

System repeatability: When the test is repeated 6 times with 20 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of cefcapene pivoxil is not more than 4.0%.

**Water [2.48]** Not less than 2.8% and not more than 3.7% (0.5 g, volumetric titration, back titration).

**Assay**—

Weigh accurately an amount of Cefcapene Pivoxil Hydrochloride Hydrate and Cefcapene Pivoxil Hydrochloride RS, equivalent to about 20 mg (potency), and dissolve each in a mixture of water and methanol (1:1) to make exactly 50 mL. Pipet 10 mL of each of these solutions, add exactly 10 mL of the internal standard solution and the mixture of water and methanol (1:1) to them to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography [2.07] according to the following conditions, and calculate the ratios, Qc and Qo, of the peak area of cefcapene pivoxil to that of the internal standard of these solutions.

\[
\text{Amount [μg (potency)] of cefcapene (C}_{17}\text{H}_{19}\text{N}_{5}\text{O}_{6}\text{S}_2} = M_S \times Q_c / Q_o \times 1000
\]

\[
M_S: \text{Amount [mg (potency)] of Cefcapene Pivoxil Hydrochloride RS}
\]

**Internal standard solution**—A solution of p-benzylphenol in a mixture of water and methanol (1:1) (7 in 4000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 265 nm).

Column: A stainless steel column 3.0 mm in inside diameter and 7.5 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (3 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.56 g of sodium dihydrogenphosphate dihydrate and 1.22 g of sodium 1-decanesulfonate in water to make 1000 mL. To 700 mL of this solution add 300 mL of acetonitrile and 100 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefcapene pivoxil is about 5 minutes.

**System suitability**—

System performance: Dissolve 0.2 g of Cefcapene Pivoxil Hydrochloride Hydrate in 10 mL of methanol, and warm in a water bath at 60°C for 20 minutes. After cooling, pipet 1 mL of this solution, and add exactly 10 mL of the internal standard solution and the mixture of water and methanol (1:1) to make 50 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, cefcapene pivoxil, trans-cefcapene pivoxil and the internal standard are eluted in this order, the ratios of the retention time of trans-cefcapene pivoxil and the internal standard to that of cefcapene pivoxil are about 1.7 and 2.0, respectively, and the resolution between the peaks of trans-cefcapene pivoxil and the internal standard is not less than 1.5.

System repeatability: When the test is repeated 5 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of
Cefcapene Pivoxil Hydrochloride Fine Granules

Cefcapene Pivoxil Hydrochloride Fine Granules contain not less than 90.0% and not more than 110.0% of cefcapene (C<sub>17</sub>H<sub>19</sub>N<sub>5</sub>O<sub>6</sub>S<sub>2</sub>: 453.49).

**Method of preparation** Prepare as directed under Granules, with Cefcapene Pivoxil Hydrochloride Hydrate.

**Identification** Powder Cefcapene Pivoxil Hydrochloride Fine Granules. To a portion of the powder, equivalent to 10 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate, add 40 mL of methanol, shake vigorously, and add methanol to make 50 mL. To 4 mL of this solution add methanol to make 50 mL, and filter through a membrane filter with a pore size of 0.45 μm. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry 2.24: it exhibits a maximum between 264 nm and 268 nm.

**Purity** (1) Related substances I—Powder Cefcapene Pivoxil Hydrochloride Fine Granules. To a portion of the powder, equivalent to 5 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate, add 1 mL of methanol, shake, and shake vigorously for 5 minutes, and filter through a membrane filter with a pore size of 0.45 μm. Discard the first 3 mL of the filtrate, and use the subsequent filtrate as the sample solution. Perform the test with 30 μL of the sample solution as directed under Liquid Chromatography 2.01 according to the following conditions. Determine each peak area by the automatic integration method: the total area of the peaks eluted before that of cefcapene pivoxil is not more than 4.0% of the total area of all peaks other than the solvent peak.

**Operating conditions**—
Proceed as directed in the operating conditions in the Purity (3) under Cefcapene Pivoxil Hydrochloride Hydrate.

**System suitability**—
Proceed as directed in the system suitability in the Purity (3) under Cefcapene Pivoxil Hydrochloride Hydrate.

**Water** Not more than 1.4% (0.5 g, volumetric titration, back titration). Perform the test without pulverizing the sample, and handling the sample under a relative humidity of less than 30%.

**Uniformity of dosage units** The granules in single-unit containers meet the requirement of the Mass variation test.

**Dissolution** Being specified separately.

**Particle size** It meets the requirements of Fine granules.

**Assay** Weigh accurately an amount of Cefcapene Pivoxil Hydrochloride Fine Granules, equivalent to about 0.2 g (potency) of and Cefcapene Pivoxil Hydrochloride Hydrate, add 100 mL of the mixture of water and methanol (1:1), shake vigorously for 10 minutes, add the mixture of water and methanol (1:1) to make exactly 200 mL, and centrifuge at 3000 rpm for 5 minutes. Filter the supernatant liquid through a membrane filter with a pore size of 0.45 μm, discard the first 1 mL of the filtrate, pipet the subsequent 2 mL of the filtrate, add exactly 5 mL of the internal standard solution and the mixture of water and methanol (1:1) to make 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg (potency) of Cefcapene Pivoxil Hydrochloride RS, and dissolve in the mixture of water and methanol (1:1) to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and the mixture of water and methanol (1:1) to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefcapene Pivoxil Hydrochloride Hydrate.

\[
\text{Amount [mg (potency)] of cefcapene (C}_{17}\text{H}_{19}\text{N}_{5}\text{O}_{6}\text{S}_{2}) = \frac{M_S}{M_C} \times \frac{Q_T}{Q_S} \times 10
\]

\(M_S\): Amount [mg (potency)] of Cefcapene Pivoxil Hydrochloride RS

**Internal standard solution**—A solution of p-benzylphenol in the mixture of water and methanol (1:1) (7 in 4000).

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.
Cefcapene Pivoxil Hydrochloride Tablets

セフカペン ピボキシル塩酸塩錠

Cefcapene Pivoxil Hydrochloride Tablets contain not less than 90.0% and not more than 105.0% of the labeled amount of cefcapene (C17H19N5O6S2: 453.49).

**Method of preparation** Prepare as directed under Tablets, with Cefcapene Pivoxil Hydrochloride Hydrate.

**Identification** To an amount of powdered Cefcapene Pivoxil Hydrochloride Tablets, equivalent to about 10 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate according to the labeled amount, add 40 mL of methanol, shake vigorously, and add methanol to make 50 mL. To 4 mL of this solution add methanol to make 50 mL, filter through a membrane filter with pore size of 0.45 μm, and use the filtrate as the sample solution. Determine the absorbance spectrum of the sample solution as directed under Ultraviolet-Visible Spectrophotometry \(<2.24\): it exhibits a maximum between 263 nm and 267 nm.

**Purity (1)** Related substances—To an amount of powdered Cefcapene Pivoxil Hydrochloride Tablets, equivalent to about 5 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate according to the labeled amount, add 1 mL of methanol, and shake. Add 25 mL of a mixture of water and methanol (1:1), shake vigorously for 5 minutes, and filter through a membrane filter with pore size of 0.45 μm. Discard the first 3 mL of the filtrate, and use the subsequent filtrate as the sample solution. Perform the test with 30 μL of the sample solution as directed under Liquid Chromatography \(<2.07\) according to the following conditions, and determine each peak area by the automatic integration method. If necessary, proceed with 30 μL of the mixture of water and methanol (1:1) in the same manner as the sample solution to compensate the base line. Calculate the amounts of the peaks other than cefcapene pivoxil by the area percentage method: the peak, having the relative retention time of about 1.3 with respect to cefcapene pivoxil, is not more than 0.4%, the peak of cefcapene pivoxil trans-isomer, having the relative retention time of about 1.5, is not more than 0.5%, any other peaks are not more than 0.3%, respectively, and the total of these peaks is not more than 2.0%.

**Operating conditions**—Proceed as directed in the operating conditions in the Purity (2) under Cefcapene Pivoxil Hydrochloride Hydrate.

**System suitability**—Proceed as directed in the system suitability in the Purity (2) under Cefcapene Pivoxil Hydrochloride Hydrate.

**Water** \(<2.48\) Not more than 3.9% (0.5 g, volumetric titration, back titration). Powdering of the sample tablets and handling of the powder are performed under the relative humidity of not exceeding 30%.

**Uniformity of dosage units** \(<6.02\> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Cefcapene Pivoxil Hydrochloride Tablets add 5 mL of water, and shake vigorously for 5 minutes to disintegrate. Add 20 mL of methanol, shake vigorously for 5 minutes, add a mixture of methanol and water (4:1) to make exactly 50 mL, and centrifuge at 3000 rpm for 5 minutes. Filter the supernatant liquid through a membrane filter with pore size of 0.45 μm, and discard the first 1 mL of the filtrate. Pipet 0.5 mL of the subsequent filtrate, equivalent to about 6 mg (potency) of Cefcapene Pivoxil Hydrochloride Hydrate according to the labeled amount, add exactly 15 mL of the internal standard solution, add a mixture of water and methanol (1:1) to make 75 mL, and use this solution as the sample solution. Hereinafter, proceed as directed in the Assay.

\[
\text{Amount [mg (potency)] of cefcapene (C}_{17}\text{H}_{19}\text{N}_{5}\text{O}_{6}\text{S}_2} = \frac{M_S \times Q_T}{Q_S} \times \frac{15}{V}
\]

\(M_S\): Amount [mg (potency)] of Cefcapene Pivoxil Hydrochloride RS

**Internal standard solution**—A solution of p-benzylphenol in a mixture of water and methanol (1:1) (7 in 4000).

**Dissolution** Being specified separately.

**Assay** To an amount of Cefcapene Pivoxil Hydrochloride Tablets, equivalent to about 0.6 g (potency) of Cefcapene Pivoxil Hydrochloride Hydrate according to the labeled amount, add 20 mL of water, and shake for 5 minutes to disintegrate. Add 80 mL of methanol, shake vigorously for 5 minutes, add a mixture of methanol and water (4:1) to make exactly 200 mL, and centrifuge at 3000 rpm for 5 minutes. Filter the supernatant liquid through a membrane filter with pore size of 0.45 μm, and discard the first 1 mL of the filtrate. Pipet 2 mL of the subsequent filtrate, add exactly 15 mL of the internal standard solution, add the mixture of water and methanol (1:1) to make 75 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefcapene Pivoxil Hydrochloride RS, equivalent to about 20 mg (potency), and dissolve in the mixture of water and methanol (1:1) to make exactly 50 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add the mixture of water and methanol (1:1) to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefcapene Pivoxil
Cefdinir / Official Monographs

Hydrochloride Hydrate.

Amount [mg (potency)] of cefcapene (C_{17}H_{18}N_{5}O_{6}S_{2})

\[ M_s = M_s \times Q_t / Q_o \times 30 \]

M_s: Amount [mg (potency)] of Cefcapene Pivoxil Hydrochloride RS

Containers and storage—Tight containers.

Cefdinir

セフジニル

![Cefdinir structure](image)

C_{14}H_{13}N_{5}O_{5}S_{2}: 395.41

(6R,7R)-7-[[2-(2-Aminothiazol-4-yl)-2-(hydroxyimino)acetylamino]-8-oxo-3-vinyl-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid [91832-40-5]

Cefdinir contains not less than 930 μg (potency) and not more than 1020 μg (potency) per mg. The potency of Cefdinir is expressed as mass (potency) of cefdinir (C_{14}H_{13}N_{5}O_{5}S_{2}).

Description—Cefdinir occurs as a white to light yellow crystalline powder. It is practically insoluble in water, in ethanol (95%) and in diethyl ether.

It dissolves in 0.1 mol/L phosphate buffer solution, pH 7.0.

Identification (1) Determine the absorption spectra of solutions of Cefdinir and Cefdinir RS in 0.1 mol/L phosphate buffer solution, pH 7.0 (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.20>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectra of Cefdinir and Cefdinir RS as directed in the past method under Infrared Spectrophotometry <2.25>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the ^1H spectrum of a solution of Cefdinir in a mixture of deuterated dimethyl sulfoxide and heavy water for nuclear magnetic resonance spectroscopy (4:1) (1 in 10), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>:

Absorbance <2.24> \[ E_{1%}^{10} (287 nm): 570 - 610 \]

Optical rotation <2.49> \[ [\alpha]_{D}^{20}: -58 - -66^\circ \]
System performance: Dissolve 0.03 g of Cefdinir RS and 2 mg of cefdinir lactam ring-cleavage lactones in 3 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and add tetramethylammonium hydroxide TS, pH 5.5, to make 20 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, peak 1 and peak 2 of cefdinir lactam ring-cleavage lactones separated into 4 peaks, cefdinir, peak 3 and peak 4 of remaining cefdinir lactam ring-cleavage lactones are eluted in this order. Relative retention time of peak 3 of cefdinir lactam ring-cleavage lactone to the retention time of cefdinir is not less than 1.09. The number of theoretical plates and the symmetry factor of the peak of cefdinir are not less than 7000 steps and not more than 3.0, respectively.

System repeatability: When the test is repeated 3 times with 10 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of cefdinir is not more than 2.0%.

Water Not more than 2.0% (% g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

Assay Weigh accurately an amount of Cefdinir and Cefdinir RS equivalent to about 20 mg (potency), dissolve each in 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 5 μL of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and determine the peak areas, A₁ and A₃, of cefdinir of the solutions.

\[
\text{Amount [μg (potency)] of } C_{14}H_{13}N_{5}O_{5}S_{2} = M_o \times A_1 / A_3 \times 1000
\]

\[
M_o: \text{Amount [mg (potency)] of Cefdinir RS}
\]

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: To 1000 mL of tetramethylammonium hydroxide TS, pH 5.5, add 0.4 mL of 0.1 mol/L disodium dihydrogen ethylenediamine tetraacetate TS. To 900 mL of this solution add 60 mL of acetonitrile for liquid chromatography and 40 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefdinir is about 8 minutes.

System suitability—

System performance: Dissolve 2 mg of Cefdinir RS and 5 mg of cefdinir lactam ring-cleavage lactones in 10 mL of 0.1 mol/L phosphate buffer solution, pH 7.0. When the procedure is run with 5 μL of this solution under the above operating conditions, peak 1 and peak 2 of cefdinir lactam ring-cleavage lactones separated into 4 peaks, cefdinir, peak 3 and peak 4 of remaining cefdinir lactam ring-cleavage lactones are eluted in this order. The resolution between the peak 2 of cefdinir lactam ring-cleavage lactone and that of cefdinir is not less than 1.2. The number of theoretical plates and the symmetry factor of the peak of cefdinir are not less than 2000 steps and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefdinir is not more than 1.0%.

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Cefdinir Capsules

Cefdinir Capsules contain not less than 90.0% and not more than 110.0% of the labeled amount of cefdinir (C₁₄H₁₃N₅O₅S₂: 395.41).

Method of preparation Prepare as directed under Capsules, with Cefdinir.

Identification To an amount of the contents of Cefdinir Capsules, equivalent to 10 mg (potency) of Cefdinir according to the labeled amount, add 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, exposure to ultrasonic waves for 1 minute, and filter. To 2 mL of the filtrate add 0.1 mol/L phosphate buffer solution, pH 7.0 to make 20 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits maxima between 221 nm and 225 nm and between 285 nm and 289 nm.

Uniformity of dosage unit It meets the requirement of the Mass variation test.

Dissolution When the test is performed at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate of a 50-mg capsule in 30 minutes is not less than 80%, and that of a 100-mg capsule in 45 minutes is not less than 75%.

Start the test with 1 capsule of Cefdinir Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 56 μg (potency) of Cefdinir according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg (potency) of Cefdinir RS, and dissolve in the dissolution medium to make exactly 100 mL. Pipet 4 mL of this solution, add the dissolution medium to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography, and determine the peak areas, A₁ and A₃, of cefdinir.

Dissolution rate (%) with respect to the labeled amount of cefdinir (C₁₄H₁₃N₅O₅S₂)

\[
= M_o \times A_1 / A_3 \times V/V \times 1/C \times 180
\]

\[
M_o: \text{Amount [mg (potency)] of Cefdinir RS}
\]

C: Labeled amount [mg (potency)] of cefdinir (C₁₄H₁₃N₅O₅S₂) in 1 capsule
Operating conditions—
Proceed as directed in the operating conditions in the Assay under Cefdinir.

System suitability—
System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefdinir are not less than 2000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefdinir is not more than 1.0%.

Assay
Weigh accurately not less than 5 Cefdinir Capsules, take out the contents, and powder. Wash the empty capsules with a little amount of diethyl ether, if necessary, to allow to stand at a room temperature to vaporize the adhering diethyl ether, and weigh accurately the mass of the capsules to calculate the mass of the contents. Weigh accurately an amount of the contents, equivalent to about 0.1 g (potency) of Cefdinir according to the labeled amount, add 70 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, shake for 30 minutes, and add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL. Centrifuge this solution at 3000 revolutions per minute for 10 minutes, and use this solution as the sample solution.

Separately, weigh accurately an amount of Cefdinir RS, equivalent to about 0.1 g (potency) of Cefdinir according to the labeled amount, add 70 mL of 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefdinir.

Assay under Cefdinir
Proceed as directed in the operating conditions in the Assay under Cefdinir.

System suitability—
System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefdinir are not less than 2000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefdinir is not more than 1.0%.

Cefdinir Fine Granules
セフジニル細粒

Cefdinir Fine Granules contain not less than 93.0%, and not more than 107.0% of the labeled amount of cefdinir (C14H13N5O5S2: 395.41).

Method of preparation
Prepare as directed under Granules, with Cefdinir.

Identification
To an amount of Cefdinir Fine Granules, equivalent to 10 mg (potency) of Cefdinir according to the labeled amount, add 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, exposure to ultrasonic waves for 1 minute, and filter. To 2 mL of the filtrate add 0.1 mol/L phosphate buffer solution, pH 7.0 to make 20 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 221 nm and 225 nm and between 285 nm and 289 nm.

Uniformity of dosage units <6.02>
The granules in single-unit containers meet the requirement of the Mass variation test.

Dissolution <6.10>
When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 30 minutes of Cefdinir Fine Granules is not less than 75%.

Start the test with an accurate amount of Cefdinir Fine Granules, equivalent to about 0.1 g (potency) of Cefdinir according to the labeled amount, withdraw not less than about 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 µm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 28 mg (potency) of Cefdinir RS, and dissolve in the dissolution medium to make exactly 50 mL. Pipet 4 mL of this solution, add the dissolution medium to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01>, and determine the peak areas, A1 and A5, of cefdinir.

Dissolution rate (%) with respect to the labeled amount of cefdinir (C14H13N5O5S2)

\[
M_s = \frac{A_5}{A_1} \times \frac{A_1}{A_5} \times \frac{1}{C} \times 360
\]

Operating conditions—
Proceed as directed in the operating conditions in the Assay under Cefdinir.

System suitability—
System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefdinir are not less than 2000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefdinir is not more than 1.0%.

Particle size <6.03>
It meets the requirements of Fine granules.

Assay
Powder, if necessary, and weigh accurately an amount of Cefdinir Fine Granules, equivalent to about 0.1 g (potency) of Cefdinir according to the labeled amount, add 70 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, shake for 30 minutes, and add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL. Centrifuge at 3000 revolutions per minute for 10 minutes, pipet 4 mL of the supernatant liquid, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefdinir RS, equivalent to about 20 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefdinir.

Assay under Cefdinir

\[
M_s = \frac{A_5}{A_1} \times \frac{A_1}{A_5} \times 5
\]
Cefditoren Pivoxil

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Cefditoren Pivoxil**

C₂₅H₂₈N₆O₇S₃: 620.72
2,2-Dimethylpropanoyloxymethyl (6R,7R)-7-([Z]-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetylamino]-3-([Z]-2-(4-methylthiazol-5-yl)ethenyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate

C₂₂H₂₃N₇O₇S₃: 506.58

**Description** Cefditoren Pivoxil occurs as a light yellowish white to light yellow crystalline powder.

It is sparingly soluble in methanol, slightly soluble in acetonitrile and in ethanol (95), very slightly soluble in diethyl ether and practically insoluble in water.

It dissolves in dilute hydrochloric acid.

**Identification** (1) Dissolve 5 mg of Cefditoren Pivoxil in 3 mL of hydroxyammonium chloride-ethanol TS, allow to stand for 5 minutes, add 1 mL of acidic ammonium iron (III) sulfate TS and shake: a red-brown color develops.

(2) Dissolve 1 mg of Cefditoren Pivoxil in 1 mL of dilute hydrochloric acid and 4 mL of water, add 3 drops of sodium nitrite TS under ice-cooling, shake, and allow to stand for 2 minutes. Then add 1 mL of ammonium amidosulfate TS, shake well, and allow to stand for 1 minute, and add 1 mL of N,N-diethyl-N'-1-naphthylethylenediamine oxalate TS: a purple color develops.

(3) Determine the absorption spectrum of a solution of Cefditoren Pivoxil in methanol (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefditoren Pivoxil RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the 1H spectrum of a solution of Cefditoren Pivoxil in deuterated chloroform for nuclear magnetic resonance spectroscopy (1 in 50), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.27>:

- It exhibits single signals A, B and C, at around δ 1.1 ppm, at around δ 2.4 ppm and at around δ 6.0 ppm
- Double signals D and E, at around δ 4.0 ppm
- Single signals F and G, at around δ 8.6 ppm
- The ratio of integrated intensity of each signal A:B:C:D:E:F is 9:3:3:1:1:1.

**Assay** Conduct this procedure using light-resistant vessels. Weigh accurately an amount of Cefditoren Pivoxil and Cefditoren Pivoxil RS, equivalent to about 40 mg (potency), dissolve in 40 mL of acetonitrile, add exactly 10 mL each of the internal standard solution, and add acetonitrile to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> and calculate the ratios, Q₂ and Q₃, of the peak area of cefditoren pivoxil to that of the internal standard.

Amount [μg (potency)] of cefditoren (C₁₉H₁₈N₆O₅S₃) = \[\frac{M₅ \times Q₂}{Q₃} \times 1000\]

M₅: Amount [mg (potency)] of Cefditoren Pivoxil RS

**Related substances**—Being specified separately.

**Residue on ignition** Being specified separately.

**Assay** Conduct this procedure using light-resistant vessels. Weigh accurately an amount of Cefditoren Pivoxil and Cefditoren Pivoxil RS, equivalent to about 40 mg (potency), dissolve in 40 mL of acetonitrile, add exactly 10 mL each of the internal standard solution, and add acetonitrile to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> and calculate the ratios, Q₂ and Q₃, of the peak area of cefditoren pivoxil to that of the internal standard.

Amount [μg (potency)] of cefditoren (C₁₉H₁₈N₆O₅S₃) = \[\frac{M₅ \times Q₂}{Q₃} \times 1000\]

M₅: Amount [mg (potency)] of Cefditoren Pivoxil RS

**Internal standard solution**—A solution of propyl p-hydroxybenzoate in acetonitrile (1 in 200).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 1.58 g of ammonium formate in 900 mL of water, adjust to pH 6.0 with dilute formic acid (1 in 250), and add water to make 1000 mL. To 450 mL of this solution add 275 mL of acetonitrile and 275 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cefditoren pivoxil is about 15 minutes.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and cefditoren pivoxil are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 5 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefditoren pivoxil to that of the internal standard is not more than 1.0%.
Cefditoren Pivoxil Fine Granules

Cefditoren Pivoxil Fine Granules contain not less than 90.0% and not more than 110.0% of the labeled amount of cefditoren (C19H18N6O5S3: 506.58).

Method of preparation Prepare as directed under Granules, with Cefditoren Pivoxil.

Identification To an amount of powdered Cefditoren Pivoxil Fine Granules, equivalent to 0.1 g (potency) of Cefditoren Pivoxil according to the labeled amount, add 10 mL of acetonitrile, shake vigorously, and filter. To 1 mL of the filtrate add acetonitrile to make 50 mL. To 1 mL of this solution add acetonitrile to make 20 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry 2.24: it exhibits a maximum between 229 nm and 233 nm.

Purity Related substances—Being specified separately.

Loss on drying 2.41 Not more than 4.5% (0.5 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

Uniformity of dosage units 6.02 The granules in single-unit containers meet the requirement of the Mass variation test.

Dissolution Being specified separately.

Particle size 6.03 It meets the requirements of Fine granules.

Assay Conduct this procedure using light-resistant vessels. Weigh accurately an amount of powdered Cefditoren Pivoxil Fine Granules, equivalent to about 40 mg (potency) of Cefditoren Pivoxil according to the labeled amount, add 70 mL of diluted acetonitrile (3 in 4), and shake vigorously. To this solution add exactly 10 mL of the internal standard solution, then add acetonitrile to make 100 mL, filter, and use the filtrate as the sample solution. Separately, weigh accurately an amount of Cefditoren Pivoxil RS, equivalent to about 20 mg (potency), dissolve in 20 mL of acetonitrile, shake, and filter. To 5 mL of the filtrate add methanol to make 100 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry 2.24: it exhibits a maximum between 229 nm and 233 nm.

Purity Related substances—Being specified separately.

Loss on drying 2.41 Not more than 4.0% (0.5 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

Uniformity of dosage units 6.02 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Cefditoren Pivoxil Tablets

Cefditoren Pivoxil Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of cefditoren (C19H18N6O5S3: 506.58).

Method of preparation Prepare as directed under Tablets, with Cefditoren Pivoxil.

Identification To an amount of powdered Cefditoren Pivoxil Tablets, equivalent to 35 mg (potency) of Cefditoren Pivoxil according to the labeled amount, add 100 mL of methanol, shake, and filter. To 5 mL of the filtrate add methanol to make 100 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry 2.24: it exhibits a maximum between 229 nm and 233 nm.

Purity Related substances—Being specified separately.

Loss on drying 2.41 Not more than 4.0% (0.5 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

Uniformity of dosage units 6.02 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Start the test with 1 tablet of Cefditoren Pivoxil Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet the subsequent 5 V/mL of the filtrate add to make exactly 5 V/mL, and use this solution as the standard solution. Separately, weigh accurately an amount of Cefditoren
Pivoxil RS, equivalent to about 22 mg (potency), dissolve in 20 mL of diluted acetonitrile (3 in 4), then add the dissolution medium to make exactly 200 mL. Pipet 2 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Determine the absorbances, $A_T$ and $A_S$, at 272 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry $<2.24>$ using water as the control.

Dissolution rate (%) with respect to the labeled amount

$$A_T = \frac{M_s \times A_t/A_s \times V/V \times 1/C \times 45}{M_s}$$

$M_S$: Amount [mg (potency)] of Cefditoren Pivoxil RS
$C$: Labeled amount [mg (potency)] of cefditoren pivoxil 
($C_{19}H_{24}N_6O_{5}S_2$) in 1 tablet

**Assay** Conduct this procedure using light-resistant vessels. To an amount of Cefditoren Pivoxil Tablets, equivalent to 0.5 g (potency) of Cefditoren Pivoxil according to the labeled amount, add 63 mL of the 1st fluid for disintegration test, shake vigorously, add about 125 mL of acetonitrile, shake again, and add acetonitrile to make exactly 250 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, then add acetonitrile (3 in 4) to make 50 mL, filter, and use the filtrate as the sample solution. Separately, weigh accurately an amount of Cefditoren Pivoxil RS, equivalent to about 20 mg (potency), dissolve in 20 mL of acetonitrile, add exactly 5 mL of the internal standard solution, then add acetonitrile to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefditoren Pivoxil.

Amount [mg (potency)] of cefditoren ($C_{19}H_{24}N_6O_{5}S_2$)

$$A_T = \frac{M_s \times A_t/A_s \times V/V \times 1/C \times 25}{M_s}$$

$M_S$: Amount [mg (potency)] of Cefditoren Pivoxil RS

**Internal standard solution**—A solution of propyl parahydroxybenzoate in acetonitrile (1 in 200).

**Containers and storage** Containers—Tight containers.

### Cefepime Dihydrochloride Hydrate

セフェピム塩酸塩水和物

Cefepime Dihydrochloride Hydrate contains not less than 835 μg (potency) and not more than 886 μg (potency) per mg, calculated on the anhydrous basis. The potency of Cefepime Dihydrochloride Hydrate is expressed as mass (potency) of cefepime ($C_{19}H_{24}N_6O_{5}S_2$: 480.56).

**Description** Cefepime Dihydrochloride Hydrate occurs as a white to yellowish white, crystals or crystalline powder.

It is freely soluble in water and in methanol, and slightly soluble in ethanol (95), and practically in soluble in diethyl ether.

**Identification** (1) Dissolve 0.02 g of Cefepime Dihydrochloride Hydrate in 2 mL of water, add 1 mL of a solution of hydroxylationmonium chloride (1 in 10) and 2 mL of sodium hydroxide TS, allow to stand for 5 minutes, then add 3 mL of 1 mol/L hydrochloric acid TS and 3 drops of iron (III) chloride TS: a red-brown color develops.

(2) Determine the absorption spectra of solutions (1 in 20,000) of Cefepime Dihydrochloride Hydrate and Cefepime Dihydrochloride RS as directed under Ultraviolet-visible Spectrophotometry $<2.24>$, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectra of Cefepime Dihydrochloride Hydrate and Cefepime Dihydrochloride RS as directed in the potassium bromide disk method under Infrared Spectrophotometry $<2.25>$, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Determine the pH spectrum of a solution of Cefepime Dihydrochloride Hydrate in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy $<2.21>$, using sodium 3-trimethylsilylpropionate-d$_4$ for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A and B, at around δ 3.1 ppm and at around δ 7.2 ppm, respectively, and the ratio of integrated intensity of each signal, A:B, is about 3:1.

(5) Dissolve 15 mg of Cefepime Dihydrochloride Hydrate in 5 mL of water, and add 2 drops of silver nitrate TS: a white turbidity is produced.

**Absorbance** $<2.24>$ $E_{1cm}^{1\%}$ (259 nm): 310 - 340 (50 mg calculated on the anhydrous basis, water, 1000 mL).

**Optical rotation** $<2.49> [\alpha]_{D}^{20} + 39 - +47^\circ$ (60 mg calculated on the anhydrous basis, water, 20 mL, 100 mm)

**pH** $<2.54>$ Dissolve 0.1 g of Cefepime Dihydrochloride Hydrate in 10 mL of water: the pH of this solution is between 1.6 and 2.1.

**Purity** (1) Clarity and color of solution—Dissolve 0.5 g of Cefepime Dihydrochloride Hydrate in 5 mL of a solution of L-arginine (3 in 50): the solution is clear and has no more color than Matching Fluid H.

(2) Heavy metals $<1.07>$—Proceed with 1.0 g of Cefepime Dihydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) N-Methylpyrrrolidine—Weigh accurately an amount of Cefepime Dihydrochloride Hydrate equivalent to about 80 mg (potency), dissolve in diluted nitric acid (2 in 3125) to make exactly 10 mL, and use this solution as the sample solution. Separately, put 30 mL of water in a 100-mL volumetric flask, weigh accurately the mass of flask, then add about 0.125 g of N-methylpyrrrolidine, weigh accurately the mass of the flask again, and add water to make exactly 100 mL. Pipet 4 mL of this solution, add diluted nitric acid (2 in 3125) to make exactly 100 mL, and use this solution as the
standard solution. Perform the test with exactly 100 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.0> according to the following conditions, and determine the peak areas, $A_t$ and $A_S$, of N-methylpyrrolidine by the automatic integration method. Calculate the amount of N-methylpyrrolidine per 1 mg (potency) of Cefepime Dihydrochloride Hydrate by the following equation: not more than 0.5%. The sample solution must be tested within 20 minutes after preparation.

$$\text{Amount (mg) of N-methylpyrrolidine} = \frac{M_S \times f}{M_t} \times \frac{A_t}{A_S} \times \frac{1}{250}$$

$M_S$: Amount (mg) of N-methylpyrrolidine  
$M_t$: Amount [mg (potency)] of sample  
$f$: Purity (%) of N-methylpyrrolidine

**Operating conditions—**

Detector: An electric conductivity detector

Column: A plastic tube 4.6 mm in inside diameter and 5 cm in length, packed with hydrophilic silica gel for liquid chromatography carrying sulfonic acid groups having the exchange capacity of about 0.3 meq per g (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: To 990 mL of diluted nitric acid (2 in 3125) add 10 mL of acetonitrile.

Flow rate: 1.0 mL per minute.

**System suitability—**

System performance: To 20 mL of a solution of sodium chloride (3 in 1000) add 0.125 g of N-methylpyrrolidine, and add water to make 100 mL. To 4 mL of this solution add diluted nitric acid (2 in 3125) to make 100 mL. When the procedure is run with 100 μL of this solution under the above operating conditions, sodium and N-methylpyrrolidine are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 3 times with 100 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of N-methylpyrrolidine is not more than 4.0%.

(4) Related substances—Dissolve about 0.1 g of Cefepime Dihydrochloride Hydrate in the mobile phase A to make 50 mL, and use this solution as the sample solution. Perform the test with 5 μL of the sample solution as directed under Liquid Chromatography <2.0> according to the following conditions, and determine the area of each peak by the automatic integration method. Calculate the total of the peak areas other than cefepime: not more than 0.5%.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: Dissolve 0.57 g of ammonium dihydrogenphosphate in 1000 mL of water.

Mobile phase B: Acetonitrile.

Flow of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 25</td>
<td>100 → 75</td>
<td>0 → 25</td>
</tr>
</tbody>
</table>

Flow rate: Adjust the flow rate so that the retention time of cefepime is about 9.5 minutes.

Time span of measurement: About 2.5 times as long as the retention time of cefepime.

**System suitability—**

Test for required detection: To 1 mL of the sample solution add the mobile phase A to make 10 mL, and use this solution as the solution for system suitability test. To 1 mL of the solution for system suitability test add the mobile phase A to make 10 mL, and use this solution as the solution for test for required detection. Pipet 1 mL of the solution for test for required detection, add the mobile phase A to make exactly 10 mL. Conform that the peak area of cefepime obtained from 5 μL of this solution is equivalent to 7 to 13% of that of cefepime obtained from 5 μL of the solution for test for required detection.

System performance: When the procedure is run with 5 μL of the solution for system suitability test under the above operating conditions, the number of theoretical plates of the peak of cefepime is not less than 6000 steps.

System repeatability: When the test is repeated 3 times with 5 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of cefepime is not more than 2.0%.

**Water <2.4>** Not less than 3.0% and not more than 4.5% (Weigh accurately about 50 mg, and add exactly 2 mL of methanol for water determination to dissolve. Use exactly 0.5 mL of this solution as the test solution; coulometric titration).

**Residue on ignition <2.4>** Not more than 0.1% (1 g).

**Bacterial endotoxins <4.0>** Less than 0.04 EU/mg (potency).

**Assay** Weigh accurately an amount of Cefepime Dihydrochloride Hydrate and Cefepime Dihydrochloride RS, equivalent to about 60 mg (potency), dissolve in the mobile phase to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.0> according to the following conditions, and determine the peak areas, $A_t$ and $A_S$, of cefepime of each solution.

$$\text{Amount [μg (potency)] of cefepime (C_{19}H_{24}N_{6}O_{5}S_{2})} = \frac{M_S \times A_t}{A_S} \times 1000$$

$M_S$: Amount [μg (potency)] of Cefepime Dihydrochloride RS

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.
Cefepime Dihydrochloride for Injection

Cefepime Dihydrochloride for Injection is a preparation for injection, which is dissolved before use. It contains not less than 95.0% and not more than 110.0% of the labeled amount of Cefepime (C₁₉H₂₄N₆O₅S₂: 480.56).

Method of preparation
Prepare as directed under Injections, with Cefepime Dihydrochloride Hydrate.

Description
Cefepime Dihydrochloride for Injection occurs as a white to pale yellow powder.

Identification
(1) Dissolve 40 mg of Cefepime Dihydrochloride in 2 mL of water, add 1 mL of a solution of hydroxylammonium chloride (1 in 10) and 2 mL of sodium hydroxide TS, allow to stand for 5 minutes, then add 3 mL of 1 mol/L hydrochloric acid TS and 3 drops of iron (III) chloride TS: a red-brown color develops.

(2) Determine the absorption spectrum of a solution of Cefepime Dihydrochloride for Injection (1 in 12,500) as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits maxima between 233 nm and 237 nm and between 255 nm and 259 nm.

pH <2.54> The pH of a solution obtained by dissolving an amount of Cefepime Dihydrochloride for Injection, equivalent to 0.5 g (potency) of Cefepime Dihydrochloride Hydrate according to the labeled amount, in 5 mL of water is between 4.0 and 6.0.

Purity
(1) Clarity and color of solution—Dissolve an amount of Cefepime Dihydrochloride for Injection, equivalent to 0.5 g (potency) of Cefepime Dihydrochloride Hydrate according to the labeled amount, in 5 mL of water: the solution is clear and colorless or light yellow. The color is not darker than Matching Fluid 1.

(2) N-Methylpyrrolidine—Weigh accurately an amount of Cefepime Dihydrochloride for Injection, equivalent to about 0.2 g (potency) of Cefepime Dihydrochloride Hydrate according to the labeled amount, dissolve in diluted nitric acid (2 in 625) to make exactly 20 mL, and use this solution as the sample solution. Separately, transfer 30 mL of water into a 100-mL volumetric flask, weigh accurately the mass of the flask, add about 0.125 g of N-methylpyrrolidine, then weigh accurately the mass, and add water to make exactly 100 mL. Pipet 4 mL of this solution, add diluted nitric acid (2 in 3125) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 100 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine the peak areas of N-methylpyrrolidine, A₁ and A₂, by the automatic integration method within 20 minutes after the sample solution is prepared. Calculate the amount of N-methylpyrrolidine per mg (potency) of Cefepime Dihydrochloride for Injection by the following formula: not more than 1.0%.

\[
\text{Amount (mg) of N-methylpyrrolidine} = \frac{M_s \times A_2}{A_1} \times \frac{A_1}{A_2} \times 125
\]

Mₛ: Amount (mg) of N-methylpyrrolidine
M₁: Amount [mg (potency)] of cefepime in the sample
f: Purity (%) of N-methylpyrrolidine

Operating conditions—Proceed as directed in the operating conditions in the Purity (3) under Cefepime Dihydrochloride Hydrate.

System suitability—Proceed as directed in the system suitability in the Purity (3) under Cefepime Dihydrochloride Hydrate.

Water <2.48> Not more than 4.0% (Weigh accurately about 50 mg of Cefepime Dihydrochloride for Injection, dissolve in exactly 2 mL of methanol for Karl Fischer method, and perform the test with exactly 0.5 mL of this solution. Coulometric titration).

Bacterial endotoxins <4.01> Less than 0.06 EU/mg (potency).

Uniformity of dosage units <6.02> It meets the requirement of the Mass variation test.

Foreign insoluble matter <6.06> Perform the test according to the Method 2: it meets the requirement.

Insoluble particulate matter <6.07> Perform the test according to the Method 1: it meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay
Weigh accurately the mass of the contents of not less than 10 Cefepime Dihydrochloride for Injection. Weigh accurately an amount of the content, equivalent to about 60 mg (potency) of Cefepime Dihydrochloride Hydrate according to the labeled amount, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefepime Dihydrochloride RS, equivalent to about 60 mg (potency), dissolve in the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefepime Dihydrochloride Hydrate.

Amount [μg (potency)] of cefepime (C₁₉H₂₄N₆O₅S₂)
\[
= M_S \times \frac{A_1}{A_2} \times 1000
\]
Mₕ: Amount [mg (potency)] of Cefepime Dihydrochloride RS

Containers and storage  Containers—Hermetic containers. Storage—Light-resistant.

Cefixime Hydrate

Cefixime Hydrate occurs as a white to light yellow crystalline powder. It is freely soluble in methanol and in dimethylsulfoxide, sparingly soluble in ethanol (99.5), and practically insoluble in water.

Identification  (1) Determine the absorption spectrum of a solution of Cefixime Hydrate in 0.1 mol/L phosphate buffer solution, pH 7.0 (1 in 62,500) as directed under Ultraviolet-visible Spectrophotometry <2.22>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefixime RS prepared in the same manner as the sample solution; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefixime Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefixime RS; both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 0.05 g of Cefixime Hydrate in 0.5 mL of a mixture of deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy and heavy water for nuclear magnetic resonance spectroscopy (4:1). Determine the ¹H spectrum of this solution, using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.27>; it exhibits a single signal A at around δ 4.7 ppm, and a multiple signal B between δ 6.5 ppm and δ 7.4 ppm. The ratio of integrated intensity of these signals, A:B, is about 1:1.

Optical rotation <2.49> [α]D: −75° to −88° (0.45 g calculated on the anhydrous basis, a solution of sodium hydrogen carbonate (1 in 50), 50 mL, 100 mm).

Purity  Dissolve 0.1 g of Cefixime Hydrate in 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, measure the areas of the peaks by the automatic integration method, and calculate the amounts of these peak areas by the area percentage method: the amount of each peak area other than cefixime is not more than 1.0%, and the total area of the peaks other than cefixime is not more than 2.5%.

Operating conditions—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.
Time span of measurement: About 3 times as long as the retention time of cefixime beginning after the solvent peak.

System suitability—
Test for required detection: Pipet 1 mL of the sample solution, and add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL. Confirm that the peak height of cefixime obtained from 10 μL of this solution is equivalent to 20 to 60 mm.

System performance: Dissolve about 2 mg of Cefixime RS in 200 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the solution for system suitability test. When the procedure is run with 10 μL of the solution according to the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefixime are not less than 4000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of cefixime is not more than 2.0%.

Water <2.48> Not less than 9.0 and not more than 12.0% (0.1 g, volumetric titration, direct titration).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay  Weigh accurately an amount of Cefixime Hydrate and Cefixime RS, equivalent to about 0.1 g (potency), and dissolve in 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL each. Pipet 10 mL each of these solutions, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 50 mL each, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and A₃, of cefixime of these solutions.

Amount [μg (potency)] of C₁₆H₁₅N₅O₇S₂ = Mₕ × A₁/A₃ × 1000

Mₕ: Amount [mg (potency)] of Cefixime RS

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4 mm in inside diameter and 125 mm in length, packed with octadecylsilylized silica gel for liquid chromatography (4 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: To 25 mL of a solution of tetrabutylammonio-
Cefixime Capsules

Cefixime Capsules contain not less than 90.0% and not more than 105.0% of the labeled potency of cefixime (C16H15N5O7S2: 453.45).

Method of preparation
Prepare as directed under Capsules, with Cefixime Hydrate.

Identification
Take out the contents of Cefixime Capsules, to a quantity of the contents of Cefixime Capsules, equivalent to 70 mg (potency) of Cefixime Hydrate according to the labeled amount, add 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, shake for 30 minutes, and filter. To 1 mL of the filtrate add 0.1 mol/L phosphate buffer solution, pH 7.0, to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24\): it exhibits a maximum between 286 nm and 290 nm.

Purity
Related substances—Take out the contents of Cefixime Capsules, to a quantity of the contents of Cefixime Capsules, equivalent to 0.1 g (potency) of Cefixime Hydrate according to the labeled amount, add 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, shake for 30 minutes, and filter, and use the filtrate as the sample solution. Perform the test with 10 mL of the sample solution as directed under Liquid Chromatography \(<2.26\): the retention time of the peak of cefixime are not less than 4000 and not more than 2.0, respectively.

System suitability
System performance: When the procedure is run with 10 \(\mu\)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefixime are not less than 4000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of peak areas of cefixime is not more than 2.0%.

Containers and storage
Containers—Tight containers.
Storage—Light-resistant.

Dissolution
When the test is performed at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of disodium hydrogen phosphate-citric acid buffer solution, pH 7.5 as the dissolution medium, the dissolution rates in 60 minutes of 50-mg (potency) capsule and in 90 minutes of 100-mg (potency) capsule are not less than 80%, respectively.

Start the test with 1 capsule of Cefixime Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.5 \(\mu\)m. Discard the first 10 mL of the filtrate, pipet \(V\) mL of the subsequent filtrate, add the dissolution medium to make exactly \(V\) mL so that each mL contains about 56 \(\mu\)g (potency) of Cefixime Hydrate according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefixime RS, equivalent to about 28 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefixime Hydrate.

Amount [mg (potency)] of cefixime \((C_{16}H_{15}N_{5}O_{7}S_{2})\) = \(M_{S} \times A_{T} / A_{S} \times V / 20\)

\(M_{S}\): Amount [mg (potency)] of Cefixime RS

Note: Not more than 12.0% (0.1 g of the contents, volumetric titration, direct titration).

Water \(<2.40\): Not more than 12.0% (0.1 g of the contents, volumetric titration, direct titration).

Uniformity of dosage units \(<6.02\)
Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Related substances—Take out the contents of 1 capsule of Cefixime Capsules, and to the contents and the capsule shells add 7\(V\)/10 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, shake for 30 minutes, and add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly \(V\) mL so that each mL contains about 1 mg (potency) of Cefixime Hydrate. Centrifuge this solution, pipet 10 mL of the supernatant liquid, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefixime RS, equivalent to about 20 mg (potency), dissolve in 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefixime Hydrate.

Amount [mg (potency)] of cefixime \((C_{16}H_{15}N_{5}O_{7}S_{2})\) = \(M_{S} \times A_{T} / A_{S} \times V / 20\)

\(M_{S}\): Amount [mg (potency)] of Cefixime RS

Note: Not more than 12.0% (0.1 g of the contents, volumetric titration, direct titration).

Operating conditions—
Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay under Cefixime Hydrate.

Time span for measurement: Proceed as directed in the operating conditions in the Purity under Cefixime Hydrate.

System suitability—
Test for required detectability: Pipet 1 mL of the sample solution, and add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 10 mL. Confirm that the peak area of cefixime obtained from 10 mL of this solution is equivalent to 17 to 13% of that from 10 \(\mu\)L of the solution for system suitability test.

System performance: When the procedure is run with 10 \(\mu\)L of the solution for system suitability test under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefixime are not less than 4000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 \(\mu\)L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of cefixime is not more than 2.0%.
Cefmenoxime Hydrochloride

System suitability—
System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefixime are not less than 4000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefixime is not more than 2.0%.

Assay Take out the contents of not less than 20 Cefixime Capsules, weigh accurately the mass of the contents, and powder. Weigh accurately a portion of the powder, equivalent to about 0.1 g (potency) of Cefixime Hydrate, add 70 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and shake for 30 minutes, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL. Centrifuge this solution, pipet 10 mL of the supernatant liquid, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL. Centrifuge this solution, pipet 10 mL of the supernatant liquid, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL. Centrifuge this solution, pipet 10 mL of the supernatant liquid, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL. Centrifuge this solution, pipet 10 mL of the supernatant liquid, add 0.1 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL.

Amount [mg (potency)] of cefixime (C_{16}H_{15}N_{5}O_{7}S_{2})
= M_{S} \times A_{T} / A_{S} \times V / V \times 1 / C \times 180

= M_{S} \times A_{T} / A_{S} \times V / V \times 1 / C \times 180

M_{S}: Amount [mg (potency)] of Cefixime RS
C: Labeled amount [mg (potency)] of Cefixime Hydrate in 1 capsule

Operating conditions—
Proceed as directed in the operating conditions in the Assay under Cefixime Hydrate.

Dissolution rate (%) with respect to the labeled amount of cefixime (C_{16}H_{15}N_{5}O_{7}S_{2})
= M_{S} \times A_{T} / A_{S} \times V / V \times 1 / C \times 180

ene-2-carboxylic acid hemihydrochloride

[C = 511.56].

Cefmenoxime Hydrochloride contains not less than 890 µg (potency) and not more than 975 µg (potency) per mg, calculated on the dehydrated basis. The potency of Cefmenoxime Hydrochloride is expressed as mass (potency) of cefmenoxime (C_{16}H_{17}N_{9}O_{5}S_{3}.)_{2}: 511.56).

Description Cefmenoxime Hydrochloride occurs as white to light orange-yellow crystals or crystalline powder.

It is freely soluble in formamide and in dimethylsulfoxide, slightly soluble in methanol, very slightly soluble in water, and practically insoluble in ethanol (95).

Identification (1) Determine the absorption spectrum of a solution of Cefmenoxime Hydrochloride in 0.1 mol/L phosphate buffer solution, pH 6.8 (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry 2<.2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefmenoxime Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefmenoxime Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry 2<.2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefmenoxime Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the ^1H spectrum of a solution of Cefmenoxime Hydrochloride in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy 2<.2.21>, using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits two single signals, A and B, at around δ 3.9 ppm, and a single signal C at around δ 6.8 ppm. The ratio of the integrated intensity of each signal, A:B:C, is about 3:3:1.

(4) Dissolve 10 mg of Cefmenoxime Hydrochloride in 1 mL of diluted sodium carbonate TS (1 in 20), add 5 mL of acetic acid (100) and 2 drops of silver nitrate TS: a white precipitate is formed.

Optical rotation 2<.2.49> [α]_{D}: −27 – −35° (1 g, 0.1 mol/L phosphate buffer solution, pH 6.8, 100 mL, 100 mm).
Purity (1) Clarity and color of solution—A solution obtained by dissolving 1.0 g of Cefmenoxime Hydrochloride in 10 mL of dilute sodium carbonate TS (1 in 4) is clear and colorless to light yellow.

(2) Heavy metals <1.0%—Proceed with 1.0 g of Cefmenoxime Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.1%—Prepare the test solution with 1.0 g of Cefmenoxime Hydrochloride according to Method 4 and adding 10 mL of dilute hydrochloric acid to the residue after cooling, and perform the test (not more than 2 ppm).

(4) Related substances—Weigh accurately about 0.1 g of Cefmenoxime Hydrochloride RS, dissolve in 20 mL of 0.1 mol/L phosphate buffer solution, pH 6.8, and add the mobile phase to make exactly 100 mL. Pipet 4 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of 1-methyl-1H-tetrazol-5-thiol, and dissolve in the mobile phase to make exactly 100 mL. Pipet 4 mL of this solution, add the mobile phase to make exactly 250 mL, and use this solution as the standard solution (1). Weigh accurately about 0.1 g of Cefmenoxime Hydrochloride RS, dissolve in 20 mL of 0.1 mol/L phosphate buffer solution, pH 6.8, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 250 mL, and use this solution as the standard solution (2). Perform the test immediately after preparation of these solutions with exactly 10 µL each of the sample solution and standard solutions (1) and (2) as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area obtained from the chromatograms of these solutions by the automatic integration method, and calculate the amounts of 1-methyl-1H-tetrazol-5-thiol and the total related substance by the following formula: the amount of 1-methyl-1H-tetrazol-5-thiol and the total related substance by the following formula:

\[
\text{Amount of 1-methyl-1H-tetrazol-5-thiol} = \frac{M_{5s}}{M_f} \times \frac{A_{1s}}{A_{5s}} \times 20
\]

\[
\text{Amount of total related substances} = \frac{M_{5s}}{M_f} \times \frac{A_{1s}}{A_{5s}} \times 20 + \frac{M_{5s}}{M_f} \times \frac{S_l}{A_{5s}} \times 5
\]

\[M_{5s}: \text{Amount (g) of 1-methyl-1H-tetrazol-5-thiol}\]

\[M_{5s}: \text{Amount (g) of Cefmenoxime Hydrochloride RS}\]

\[M_f: \text{Amount (g) of the sample}\]

\[A_{1s}: \text{Peak area of 1-methyl-1H-tetrazol-5-thiol from the standard solution (1)}\]

\[A_{5s}: \text{Peak area of cefmenoxime from the standard solution (2)}\]

\[A_{1s}: \text{Peak area of 1-methyl-1H-tetrazol-5-thiol from the sample solution}\]

\[S_l: \text{Total area of the peaks other than 1-methyl-1H-tetrazol-5-thiol and other than cefmenoxime from the sample solution}\]

Operating conditions—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2.5 times as long as the retention time of cefmenoxime.

System suitability—
Test for required detectability: Measure exactly 5 mL of the standard solution (1), add the mobile phase to make exactly 100 mL. Confirm that the peak area of 1-methyl-1H-tetrazol-5-thiol obtained from 10 µL of this solution is equivalent to 4.5 to 5.5% of that from 10 µL of the standard solution (1). Then, measure exactly 2 mL of the standard solution (2), add the mobile phase to make exactly 100 mL. Confirm that the peak area of cefmenoxime obtained from 10 µL of this solution is equivalent to 1.5 to 2.5% of that from 10 µL of the standard solution (2).

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution (1) under the above operating conditions, the relative standard deviation of the peak area of 1-methyl-1H-tetrazol-5-thiol is not more than 1.0%.

Water <2.48> Not more than 1.5% (1 g, volumetric titration, direct titration. Use a mixture of formamide for Karl Fisher method and methanol for Karl Fisher method (2:1)).

Assay Weigh accurately an amount of Cefmenoxime Hydrochloride and Cefmenoxime Hydrochloride RS, equivalent to about 50 mg (potency), dissolve each in 10 mL of 0.1 mol/L phosphate buffer solution, pH 6.8, and add the mobile phase to make exactly 50 mL. Pipet 4 mL each of these solutions, add exactly 20 mL of the internal standard solution and mobile phase to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \(Q_T\) and \(Q_{S_l}\), of the peak area of cefmenoxime to that of the internal standard.

Amount [µg (potency)] of cefmenoxime (\(C_{16}H_{17}N_4O_5S_3\))

\[\frac{M_s}{A_{1s}} \times Q_T/Q_{S_l} \times 1000\]

\[M_s: \text{Amount [mg (potency)] of Cefmenoxime Hydrochloride RS}\]

Internal standard solution—A solution of phthalimide in methanol (3 in 2000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water, acetonitrile and acetic acid (100:50:10:1).

Flow rate: Adjust the flow rate so that the retention time of cefmenoxime is about 8 minutes.

System suitability—
System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, cefmenoxime and the internal standard are eluted in
Cefmetazole Sodium

セフェメタゾールナトリウム

C$_{15}$H$_{17}$N$_7$O$_5$S$_3$: 471.53
Monosodium (6R,7R)-7-[(cyanomethylsulfanyl)acetylamino]-7-methoxy-3-(1-methyl-1H-tetrazol-5-ylsulfanyl)methyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate

[56796-20-4]

Cefmetazole Sodium contains not less than 860 μg (potency) and not more than 965 μg (potency) per mg, calculated on the anhydrous basis. The potency of Cefmetazole Sodium is expressed as mass (potency) of cefmetazole (C$_{15}$H$_{17}$N$_7$O$_5$S$_3$: 471.53).

Description

Cefmetazole Sodium occurs as a white to light yellowish white, powder or mass.

It is very soluble in water, freely soluble in methanol, slightly soluble in ethanol (95), and very slightly soluble in tetrahydrofuran.

It is hygroscopic.

Identification

(1) Determine the absorption spectrum of a solution of Cefmetazole Sodium (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefmetazole Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the $^1$H spectrum of a solution of Cefmetazole Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.27>, using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A, B and C, at around δ 3.6 ppm, at around δ 4.1 ppm and at around δ 5.2 ppm, respectively. The ratio of integrated intensity of each signal, A:B:C, is about 3:3:1.

(4) Cefmetazole Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

Optical rotation <2.49> [α]$_D^2$: +73 - +85° (0.25 g, water, 25 mL, 100 mm).

pH <2.54> Dissolve 1.0 g of Cefmetazole Sodium in 10 mL of water: the pH of the solution is between 4.2 and 6.2.

Purity

(1) Clarity and color of solution—Dissolve 1.0 g of Cefmetazole Sodium in 10 mL of water: the solution is clear and colorless to pale yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cefmetazole Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefmetazole Sodium according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.10 g of Cefmetazole Sodium in 2 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 25 mL, and use this solution as the standard solution (1). Separately, dissolve 0.10 g of 1-methyl-1H-tetrazole-5-thiol in water to make exactly 100 mL, and use this solution as the standard solution (2). Immediately perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 1 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop with a mixture of 1-buthanol, water and acetic acid (100) (4:1:1) to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand in iodine vapor: the spot obtained from the sample solution corresponding to the spot from the standard solution (2) is not more intense than the spot from the standard solution (2), and the spots other than this spot and other than the principal spot are not more intense than the spot from the standard solution (1).

Water <2.48> Not more than 1.0% (1 g, volumetric titration, direct titration).

Assay

Weigh accurately an amount of Cefmetazole Sodium and Cefmetazole RS, equivalent to about 50 mg (potency), and dissolve each in mobile phase to make exactly 25 mL. Pipet 1 mL each of these solutions, add water to make exactly 10 mL of the internal standard solution, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of these solutions as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Q$_T$ and Q$_S$, of the peak area of cefmetazole to that of the internal standard of each solution.

Amount [μg (potency)] of cefmetazole (C$_{15}$H$_{17}$N$_7$O$_5$S$_3$) = $M_S \times Q_T/Q_S \times 1000$

$M_S$: Amount [mg (potency)] of Cefmetazole RS

Internal standard solution—A solution of methyl parahydroxybenzoate in the mobile phase (1 in 10,000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 214 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecysilianized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 5.75 g of ammonium dihydrogen-phosphate in 700 mL of water, add 280 mL of methanol, 20 mL of tetrahydrofuran and 3.2 mL of 40% tetrabutylammonium hydroxide TS, and adjust to pH 4.5 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of cefmetazole is about 8 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, cefmetazole and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 5 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefmetazole to that of the internal standard is not more than 2.0%.

Containers and storage Containers—Hermetic containers.

Cefmetazole Sodium for Injection
注射用セフメタゾールナトリウム

Cefmetazole Sodium for Injection is a preparation for injection which is dissolved before use.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of cefmetazole (C\textsubscript{15}H\textsubscript{17}N\textsubscript{7}O\textsubscript{5}S\textsubscript{3}: 471.53).

Method of preparation Prepare as directed under Injections, with Cefmetazole Sodium.

Description Cefmetazole Sodium for Injection is a white to light yellow powder or masses.

It is hygroscopic.

Identification (1) Determine the absorption spectrum of a solution of Cefmetazole Sodium for Injection (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefmetazole Sodium for Injection as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

pH <2.54> Take an amount of Cefmetazole Sodium for Injection equivalent to 1.0 g (potency) of Cefmetazole Sodium according to the labeled amount, and dissolve in 10 mL of water: the pH of the solution is 4.2 to 6.2.

Purity (1) Clarity and color of solution—Dissolve an amount of Cefmetazole Sodium for Injection, equivalent to 1.0 g (potency) of Cefmetazole Sodium according to the labeled amount, in 10 mL of water: the solution is clear and the color is not darker than the following control solution.

Control solution: Pipet 5 mL of Iron (III) Chloride CS and 0.5 mL of Cobalt (II) Chloride CS, and add water to make exactly 50 mL. Pipet 15 mL of this solution, and add water to make exactly 20 mL.

(2) Related substances—Proceed as directed in the Purity (4) under Cefmetazole Sodium.

Bacterial endotoxins <4.01> Less than 0.06 EU/mg (potency).

Uniformity of dosage units <6.02> It meets the requirement of the Mass variation test.

Foreign particulate matter <6.06> Perform the test according to Method 2: it meets the requirement.

Insoluble particulate matter <6.07> It meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Take 10 containers of Cefmetazole Sodium for Injection, dissolve the contents of each in the mobile phase, rinse each of the containers with the mobile phase, combine the rinse with the respective previous solution, and add the mobile phase to make exactly 500 mL. Take exactly a volume of this solution equivalent to about 0.2 g (potency) of Cefmetazole Sodium, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefmetazole RS, equivalent to about 50 mg (potency), and dissolve in the mobile phase to make exactly 25 mL. Pipet 1 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefmetazole Sodium.

Amount [mg (potency)] of cefmetazole (C\textsubscript{15}H\textsubscript{17}N\textsubscript{7}O\textsubscript{5}S\textsubscript{3})
\[ M_5 = M_5 \times \frac{Q_1}{Q_5} \times 4 \]

\( M_5 \): Amount [mg (potency)] of Cefmetazole RS

Internal standard solution—A solution of methyl parahydroxybenzoate in the mobile phase (1 in 10,000).

Containers and storage Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

Cefminox Sodium Hydrate
セフミノクスナトリウム水和物

C\textsubscript{16}H\textsubscript{20}N\textsubscript{7}NaO\textsubscript{7}S\textsubscript{3}·7H\textsubscript{2}O: 667.66

Cefminox Sodium Hydrate contains not less than 900 μg (potency) and not more than 970 μg (potency).
Cefodizime Sodium / Official Monographs

per mg, calculated on the anhydrous basis. The potency of Cefminox Sodium Hydrate is expressed as mass (potency) of cefminox (C_{16}H_{21}N_{7}O_{7}S_{3}: 519.58).

**Description** Cefminox Sodium Hydrate occurs as a white to light yellow crystalline powder.

It is freely soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol (99.5).

**Identification** (1) Determine the absorption spectrum of a solution of Cefminox Sodium Hydrate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefminox Sodium RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefminox Sodium Hydrate as directed in the potassium bromide method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefminox Sodium RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the 1H spectrum of a solution of Cefminox Sodium Hydrate in heavy water for nuclear magnetic resonance spectroscopy (1 in 30) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>, using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a multiple signal, A, at around 3.2 ppm, a single signal, B, at around 3.5 ppm, a single signal, C, at around 4.0 ppm, and a single signal, D, at around 5.1 ppm. The ratio of integrated intensity of each signal, A:B:C:D, is about 2:3:3:1.

(4) Cefminox Sodium Hydrate responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49> [α]_D: +62° to +72° (50 mg, water, 10 mL, 100 mm).

**pH** <2.54> Dissolve 0.70 g of Cefminox Sodium Hydrate in 10 mL of water: the pH of the solution is between 4.5 and 6.0.

**Purity** (1) Heavy metals <1.07>—Proceed with 2.0 g of Cefminox Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11D>—Prepare the test solution with 2.0 g of Cefminox Sodium Hydrate according to Method 3, and perform the test (not more than 1 ppm).

**Water** <2.48> Not less than 18.0% and not more than 20.0% (0.1 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—Escherichia coli NIHJ
(ii) Culture medium—Use the medium iii in 3) under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 6.5 to 6.6 after sterilization.
(iii) Standard solution—Weigh accurately an amount of Cefminox Sodium RS, equivalent to about 40 mg (potency), dissolve in 0.05 mol/L phosphate buffer solution, pH 7.0 to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.05 mol/L phosphate buffer solution, pH 7.0 to make solutions so that each mL contains 40 μg (potency) and 20 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solution—Weigh accurately an amount of Cefminox Sodium Hydrate equivalent to about 40 mg (potency), dissolve in 0.05 mol/L phosphate buffer solution, pH 7.0 to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.05 mol/L phosphate buffer solution, pH 7.0 to make solutions so that each mL contains 40 μg (potency) and 20 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

(v) Procedure—Incubate between 32°C and 35°C.

**Containers and storage** Containers—Hermetic containers.

Cefodizime Sodium

セフォジジムナトリウム

C_{20}H_{18}N_{6}Na_{2}O_{7}S_{4}: 628.63

Cefodizime Sodium contains not less than 890 μg (potency) per mg, calculated on the anhydrous basis and corrected by the ethanol amount. The potency of Cefodizime Sodium is expressed as mass (potency) of cefodizime (C_{20}H_{20}N_{6}O_{7}S_{4}: 584.67).

**Description** Cefodizime Sodium occurs as a white to light yellowish white crystalline powder.

It is very soluble in water, and practically insoluble in acetonitrile and in ethanol (99.5).

**Identification** (1) Determine the absorption spectrum of a solution of Cefodizime Sodium (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefodizime Sodium RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefodizime Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefodizime Sodium RS: both spectra exhibit similar intensities of absorption at the same wave numbers.
(3) Determine the \(1^H\) spectrum of a solution of Cefodizime Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy (2.21), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A, B and C, at around \(\delta\) 2.3 ppm, at around \(\delta\) 4.0 ppm, and at around \(\delta\) 7.0 ppm. The ratio of the integrated intensity of these signals, A:B:C, is about 3:3:1.

(4) Cefodizime Sodium responds to the Qualitative Tests (1.099) (1) for sodium salt.

**Optical rotation**<sup>2.49</sup> \([\alpha]_D^{20}\) = \(-56 \pm -62^\circ\) (0.2 g calculated on the anhydrous basis and corrected by the ethanol amount, water, 20 mL, 100 mm).

**pH**<sup>2.54</sup> Dissolve 1.0 g of Cefodizime Sodium in 10 mL of water: the pH of the solution is between 5.5 and 7.5.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Cefodizime Sodium in 10 mL of water: the solution is clear and pale yellow to light yellow.

(2) Heavy metals<sup>1.077</sup>—Weigh 1.0 g of Cefodizime Sodium in a crucible, cover loosely, and carbonize by gentle heating. After cooling, add 2 mL of sulfuric acid, heat gradually until the white fumes are no longer evolved, and ignite between 500°C and 600°C. Proceed according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic<sup>1.111</sup>—Prepare the test solution with 1.0 g of Cefodizime Sodium according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 30 mg of Cefodizime Sodium in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography (2.07) according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than cefodizime from the sample solution is not larger than the peak area of cefodizime from the standard solution, and the total area of the peaks other than cefodizime from the sample solution is not larger than 3 times the peak area of cefodizime from the standard solution.

**Operating conditions**—
- Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.
- Time span of measurement: About 4 times as long as the retention time of cefodizime beginning after the solvent peak.

**System suitability**—
- Test for required detectability: Measure exactly 2 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of cefodizime obtained from 5 \(\mu\)L of this solution is equivalent to 7 to 13% of that from 5 \(\mu\)L of the standard solution.
- System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

(5) Ethanol—Weigh accurately about 1 g of Cefodizime Sodium, and dissolve in water to make exactly 10 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 2 g of ethanol for gas chromatography, and add water to make exactly 1000 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 10 \(\mu\)L each of the sample solution and standard solution as directed under Gas Chromatography (2.02) according to the following conditions, and calculate the ratio, \(Q_1\) and \(Q_0\), of the peak area of ethanol to that of the internal standard: the amount of ethanol is not more than 2.0%.

\[
\text{Amount (\%) of ethanol} = \frac{M_S}{M_T} \times \frac{Q_1}{Q_S}
\]

\(M_S\): Amount (g) of ethanol for gas chromatography
\(M_T\): Amount (g) of the sample

**Internal standard solution**—A solution of 1-propanol (1 in 400).

**Operating conditions**—
- Detector: A hydrogen flame-ionization detector.
- Column: A glass column 3.2 mm in inside diameter and 3 m in length, packed with tetrafluoroethylene polymer for gas chromatography (180 – 250 \(\mu\)m in particle diameter) coated in 15% with polyethylene glycol 20 M.
- Column temperature: A constant temperature of about 100°C.
- Carrier gas: Nitrogen.
- Flow rate: Adjust the flow rate so that the retention time of ethanol is about 3 minutes.

**System suitability**—
- System performance: When the procedure is run with 10 \(\mu\)L of the standard solution under the above operating conditions, ethanol and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.5.
- System repeatability: When the test is repeated 6 times with 10 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ethanol to that of the internal standard is not more than 2.0%.

**Water**<sup>2.45</sup> Not more than 4.0% (0.5 g, volumetric titration, direct titration).

**Assay**—Weigh accurately an amount of Cefodizime Sodium and Cefodizime Sodium RS, equivalent to about 50 mg (potency), add exactly 10 mL of the internal standard solution to dissolve, add water to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography (2.07) according to the following conditions, and calculate the ratios, \(Q_1\) and \(Q_0\), of the peak area of cefodizime to that of the internal standard.

\[
\text{Amount [mg (potency)] of cefodizime (C\textsubscript{20}H\textsubscript{20}N\textsubscript{4}O\textsubscript{3}S\textsubscript{2})} = \frac{M_S}{M_T} \times \frac{Q_1}{Q_S} \times 1000
\]

\(M_S\): Amount [mg (potency)] of Cefodizime Sodium RS

**Internal standard solution**—A solution of anhydrous caffeine (3 in 400).

**Operating conditions**—
- Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 0.80 g of potassium dihydrogen phosphate and 0.20 g of anhydrous disodium hydrogen phosphate in a suitable amount of water, and add 80 mL of acetonitrile and water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of cefodizime is about 5 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, cefodizime and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefodizime to that of the internal standard is not more than 2.0%.

Containers and storage—Containers—Tight containers.

Cefoperazone Sodium  

セフォペラゾンナトリウム

C₂₅H₂₆N₉NaO₈S₂: 667.65

Monosodium (6R,7R)-7-[(2R)-2-[(4-ethyl-2,3-dioxopiperazine-1-carbonyl)amino]-2-(4-hydroxyphenyl)acetamido]-3-(1-methyl-1H-tetrazol-5-ylsulfanyl)methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [62893-20-3]

Cefoperazone Sodium contains not less than 871 μg (potency) per mg, calculated on the anhydrous basis. The potency of Cefoperazone Sodium is expressed as mass (potency) of cefoperazone (C₂₅H₂₇N₉O₈S₂: 645.67).

Description—Cefoperazone Sodium occurs as a white to yellowish white crystalline powder.

It is very soluble in water, soluble in methanol, and slightly soluble in ethanol (99.5).

Identification—(1) Determine the absorption spectrum of a solution of Cefoperazone Sodium (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the ‘H spectrum of a solution of Cefoperazone Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.23>, using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a triplet signal A at around δ 1.2 ppm, and double signals, B and C, at around δ 6.8 ppm and at around δ 7.3 ppm. The ratio of integrated intensity of these signals, A:B:C, is about 3:2:2.

(3) Cefoperazone Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

Optical rotation—[α]D²⁵ + 25 to +25° (1 g, water, 100 mL, 100 mm).

pH—Dissolve 1.0 g of Cefoperazone Sodium in 4 mL of water: the pH of the solution is between 4.5 and 6.5.

Purity—(1) Clarity and color of solution—Dissolve 1.0 g of Cefoperazone Sodium in 10 mL of water: the solution is clear and pale yellow.

(2) Heavy metals—Proceed with 1.0 g of Cefoperazone Sodium according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic—Prepare the test solution with 1.0 g of Cefoperazone Sodium according to Method 4, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.1 g of Cefoperazone Sodium in 100 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 25 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the areas of each peak by the automatic integration method. Calculate the percentages of each peak area from the sample solution to 50 times of the peak area of cefoperazone from the standard solution: the related substance I with the retention time of about 8 minutes is not more than 5.0%, the related substance II with that of about 17 minutes is not more than 1.5%, and the total of all related substances is not more than 7.0%. Use the peak areas of the related substances I and II after multiplying by their relative response factor, 0.90 and 0.75, respectively.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of cefoperazone beginning after the solvent peak.

System suitability—

Test for required detection: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of cefoperazone obtained from 25 μL of this solution is equivalent to 3.5 to 6.5% of that from 25 μL of the standard solution.

System performance: When the procedure is run with 25 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefoperazone are not less than 5000 steps and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 25 μL of the standard solution under the above operat-
Cefotaxime Sodium

セフォタキシムナトリウム

C_{16}H_{16}N_{5}NaO_{7}S_{2}: 477.45

Monosodium (6R,7R)-3-acetoxymethyl-7-[(Z)-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetylamino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [64485-93-4]

Cefotaxime Sodium contains not less than 916 µg (potency) per mg, calculated on the dried basis. The potency of Cefotaxime Sodium is expressed as mass (potency) of cefotaxime (C_{16}H_{17}N_{5}O_{7}S_{2}: 455.47).

Description

Cefotaxime Sodium occurs as white to light yellowish white crystalline powder.

It is freely soluble in water, sparingly soluble in methanol, and very slightly soluble in ethanol (95%).

Identification (1) Dissolve 2 mg of Cefotaxime Sodium in 0.01 mol/L hydrochloric acid TS to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefotaxime Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the {\textit{H}} spectrum of a solution of Cefotaxime Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 125) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>, using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits three single signals, A, B and C, at around δ 2.1 ppm, at around δ 4.0 ppm and at around δ 7.0 ppm. The ratio of the integrated intensity of each signal, A:B:C, is about 3:3:1.

(4) Cefotaxime Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

Optical rotation <2.49> [\alpha]_D^20: +58° to +64° (0.25 g calculated on the dried basis, water, 25 mL, 100 mm).

pH <2.54> The pH of a solution obtained by dissolving 1.0 g of Cefotaxime Sodium in 10 mL of water is between 4.5 and 6.5.

Purity (1) Clarity and color of solution—A solution obtained by dissolving 1.0 g of Cefotaxime Sodium in 10 mL of water is clear and light yellow.

(2) Sulfate <1.14>—Dissolve 2.0 g of Cefotaxime Sodium in 40 mL of water, add 2 mL of dilute hydrochloric acid and water to make 50 mL, shake well, and filter. Discard first 10 mL of the filtrate, and to the subsequent 25 mL of the fil-

System suitability—

System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefoperazone is not more than 2.0%.

Water <2.48> Not more than 1.0% (3 g, volumetric titration, direct titration).

Assay

Weigh accurately an amount of Cefoperazone Sodium equivalent to about 0.1 g (potency), dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately an amount of Cefoperazone RS equivalent to about 0.1 g (potency), dissolve in 5 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and add water to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q_1 and Q_2, of the peak area of cefoperazone to that of the internal standard.

Amout [µg (potency)] of cefoperazone (C_{25}H_{27}N_{9}O_{8}S_{2}) = M_5 \times Q_1/Q_2 \times 1000

M_5: Amount [µg (potency)] of Cefoperazone RS

Internal standard solution—A solution of acetanilide in a mixture of water and acetonitrile (43:7) (3 in 8000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: To 57 mL of acetic acid (100) add 139 mL of triethylamine and water to make 1000 mL. To 20 mL of this solution add 835 mL of water, 140 mL of acetonitrile and 5 mL of dilute acetic acid.

Flow rate: Adjust the flow rate so that the retention time of cefoperazone is about 10 minutes.

System suitability—

System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, the internal standard and cefoperazone are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefoperazone to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Hermetic containers.

Storage—In a cold place.
rate add water to make 50 mL. Perform the test with this solution as the test solution. Prepare the control solution as follows: To 1.0 mL of 0.005 mol/L sulfuric acid VS add 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.048%).

(3) Heavy metals \( \leq 0.07 \) — Proceed with 1.0 g of Cefotaxime Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic \( \leq 0.11 \) — Proceed with the test solution with 1.0 g of Cefotaxime Sodium according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances — Proceed with the test with 10 \( \mu L \) of the sample solution obtained in the Assay as directed under Liquid Chromatography \( \leq 2.0 \) according to the following conditions, and determine each peak area obtained from the chromatogram by the automatic integration method, and calculated the amounts of them by the area percentage method: the each peak area other than cefotaxime is not more than 1.0% and the total of these peak areas is not more than 3.0%.

**Operating conditions**

Detector, column, column temperature, mobile phase A, mobile phase B, flowing of the mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3.5 times as long as the retention time of cefotaxime beginning after the solvent peak.

**System suitability**

Test for required detectability: Measure exactly 2 mL of the standard solution, and add the mobile phase A to make exactly 100 mL. Pipet 2 mL of this solution, and add the mobile phase A to make exactly 20 mL. Confirm that the peak area of cefotaxime obtained from 10 \( \mu L \) of this solution is equivalent to 0.15 to 0.25% of that from 10 \( \mu L \) of the standard solution.

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

**Loss on drying \( \leq 2.4\text{f} \) Not more than 3.0% (1 g, 105°C, 3 hours).

**Assay** Weigh accurately an amount of Cefotaxime Sodium and Cefotaxime RS, equivalent to about 40 mg (potency), dissolve each in the mobile phase A to make exactly 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 10 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography \( \leq 2.0 \) according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of cefotaxime of these solutions.

\[
\text{Amount [} \mu g \text{ (potency)] of cefotaxime (C}_{16}H_{17}N_{5}O_{7}S_{2}) = M_S \times A_T/A_S \times 1000
\]

\( M_S \): Amount [mg (potency)] of Cefotaxime RS

**Operating conditions**

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \( \mu m \) in particle diameter).

Column temperature: A constant temperature of about 30°C.

**Mobile phase A**

To 0.05 mol/L disodium hydrogen phosphate TS add phosphoric acid to adjust the pH to 6.25. To 860 mL of this solution add 140 mL of methanol.

**Flowing of mobile phase**

Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 7</td>
<td>100</td>

**Cefotetan**

セフォテタン

\( \text{C}_{17}H_{17}N_{7}O_{8}S_{4}: 575.62 \)

\( 6R,7\text{R})-7-[4-(\text{Carbamoylcarboxymethylidene}-1,3-dithietane-2-carbonyl]amino]-7-methoxy-3-(1-\text{methyl}-1H-tetrazol-5-ylsulfanylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid \ [69712-56-7]

Cefotetan contains not less than 960 \( \mu g \) (potency) and not more than 1010 \( \mu g \) (potency) per mg, calculated on the anhydrous basis. The potency of Cefotetan is expressed as mass (potency) of cefotetan.
Cefotetan occurs as white to light yellowish white powder.

It is sparingly soluble in methanol, and slightly soluble in water and in ethanol (99.5).

Identification (1) Determine the absorption spectrum of a solution of Cefotetan RS in phosphate buffer solution for antibiotics, pH 6.5 (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \( \text{UV-Vis} \), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefotetan prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefotetan as directed in the potassium bromide disk method under Infrared Spectrophotometry \( \text{IR} \), and compare and the spectrum with the Reference Spectrum or the spectrum of Cefotetan RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 50 mg of Cefotetan in 0.5 mL of a solution of sodium hydrogen carbonate in heavy water for nuclear magnetic resonance spectroscopy (1 in 25). Determine the \(^1\)H spectrum of this solution as directed under Nuclear Magnetic Resonance Spectroscopy \( \text{NMR} \), using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A, B, C and D, at around \( \delta 3.6 \) ppm, at around \( \delta 4.0 \) ppm, at around \( \delta 5.1 \) ppm and at around \( \delta 5.2 \) ppm, respectively. The ratio of the integrated intensity of each signal, A:B:C:D, is about 3:3:1:1.

Optical rotation \( \text{OR} \) 
\[ \alpha_D^{20} = +112 \text{ to } +124^\circ \] (0.5 g calculated on the anhydrous basis, a solution of sodium hydrogen carbonate (1 in 200), 50 mL, 100 mm).

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Cefotetan in 10 mL of a solution of sodium hydrogen carbonate (1 in 30): the solution is clear, and colorless or light yellow.

(2) Heavy metals \( \text{HMT} \)—Proceed with 1.0 g of Cefotetan according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Weigh accurately about 0.1 g of Cefotetan, dissolve in a suitable amount of methanol, add exactly 2 mL of the internal standard solution and methanol to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 3 mg of 1-methyl-1H-tetrazole-5-thiol for liquid chromatography, previously dried in a desiccator (in vacuum, silica gel) for 2 hours, and add 2 mg of Cefotetan RS, calculated on the anhydrous basis, dissolve in methanol to make exactly 20 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution and methanol to make 20 mL, and use this solution as the standard solution. Perform the test with 5 \( \mu L \) of the sample solution and standard solution as directed under Liquid Chromatography \( \text{LC} \) according to the following conditions, and calculate the ratios, \( Q_H \), \( Q_M \), \( Q_{1H} \), \( Q_{2H} \), \( Q_T \), and \( Q_{2C} \), of the peak areas of 1-methyl-1H-tetrazole-5-thiol, cefotetan, lactone having the relative retention time of about 0.5 with respect to cefotetan, \( \Delta_2 \)-cefotetan, isothiazole substance having the relative retention time of about 1.3 with respect to cefotetan, each of other related substances and the total of other related substances, to the peak area of the internal standard, respectively, obtained from the sample solution, and the ratios, \( Q_{H,T} \) and \( Q_{M,T} \), of the peak areas of 1-methyl-1H-tetrazole-5-thiol and cefotetan, to the peak area of the internal standard, respectively, obtained from the standard solution. Calculate the amount of 1-methyl-1H-tetrazole-5-thiol, cefotetan lactone, \( \Delta_2 \)-cefotetan, isothiazole substance, each of other related substances and the total of other related substances from the following equations: the amount of 1-methyl-1H-tetrazole-5-thiol is not more than 0.3\%, cefotetan lactone is not more than 0.3\%, \( \Delta_2 \)-cefotetan is not more than 0.5\%, isothiazole substance is not more than 0.5\%, each of other related substances is not more than 0.2\% and the total of other related substances is not more than 0.4\%.

1-Methyl-1H-tetrazole-5-thiol (\%) 
\[ = \frac{M_{\text{H,T}}}{M_{\text{T}}} \times \frac{Q_{\text{T,H}}}{Q_{\text{T}}} \times \frac{1}{100} \]
Cefotetan lactone (\%) 
\[ = \frac{M_{\text{H,T}}}{M_{\text{T}}} \times \frac{Q_{\text{T,H}}}{Q_{\text{T}}} \times \frac{1}{100} \]
\( \Delta_2 \)-Cefotetan (\%) 
\[ = \frac{M_{\text{H,T}}}{M_{\text{T}}} \times \frac{Q_{\text{T,h}}}{Q_{\text{T}}} \times \frac{1}{100} \]
Isothiazole substance (\%) 
\[ = \frac{M_{\text{H,T}}}{M_{\text{T}}} \times \frac{Q_{\text{T,h}}}{Q_{\text{T}}} \times \frac{1}{100} \]
Each of other related substances (\%) 
\[ = \frac{M_{\text{H,T}}}{M_{\text{T}}} \times \frac{Q_{\text{T,h}}}{Q_{\text{T}}} \times \frac{1}{100} \]
Total of other related substances (\%) 
\[ = \frac{M_{\text{H,T}}}{M_{\text{T}}} \times \frac{Q_{\text{T,h}}}{Q_{\text{T}}} \times \frac{1}{100} \]

Internal standard solution—A solution of anhydrous caffeine in methanol (3 in 10,000).

Operating conditions—
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3.5 times as long as the retention time of cefotetan.

System suitability—
Test for required detectability: Measure exactly 15 mL of the standard solution, and add methanol to make exactly 100 mL. Confirm that the peak area of cefotetan obtained from 5 \( \mu L \) of this solution is equivalent to 12 to 18\% of that from 5 \( \mu L \) of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 5 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cefotetan to that of the internal standard is not more than 2.0\%.

Water \( \text{W} \) Not more than 2.5\% (1 g, volumetric titration, direct titration).

Residue on ignition \( \text{ROI} \) Not more than 0.1\% (1 g).

Isomer ratio Dissolve 10 mg of Cefotetan in 20 mL of
methanol, and use this solution as the sample solution. Perform the test with 5 μL of the sample solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of the adjacent two peaks appeared at around the retention time of 40 minutes, one having shorter retention time is l-substance and another having longer retention time is d-substance, by the area percentage method: the amount of l-substance is not less than 35% and not more than 45%.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecysilanized silica gel for liquid chromato- graphy (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: A mixture of 0.1 mol/L phosphate buffer solution, pH 7.0, water, and a solution of tetrabutylammonium hydrogensulfate in acetonitrile (1 in 150) (9:9:2).
Flow rate: Adjust the flow rate so that the retention time of l-substance is about 40 minutes.

System suitability—
System performance: When the procedure is run with 5 μL of the sample solution under the above operating conditions, l-substance and d-substance are eluted in this order with the resolution between these peaks being not less than 1.5.
System repeatability: To exactly 1 mL of the sample solution add methanol to make exactly 10 mL. When the test is repeated 6 times with 5 μL of this solution under the above operating conditions, the relative standard deviation of the peak area of l-substance is not more than 5.0%.

Assay
Weigh accurately an amount of Cefotetan and Cefotetan RS, equivalent to about 50 mg (potency), and dissolve each in phosphate buffer solution for antibiotics, pH 6.5 to make exactly 50 mL. Pipet 15 mL each of these solutions, and another having longer retention time is d-substance, by

Cefotiam Hexetil Hydrochloride

C72H73N2O8S2·2HCl·768.76

(1S)-1-Cyclohexyloxycarbonyloxyethyl (6R,7R)-7-
[2-(2-aminothiazol-4-yl)acetamidin]-3-[(2-
dimethylaminoethyl)-1H-tetrazol-5-ylsulfanyl)methyl]-
8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate
dihydrochloride

Cefotiam Hexetil Hydrochloride contains not less than 615 μg (potency) and not more than 690 μg (potency) per mg, calculated on the anhydrous basis. The potency of Cefotiam Hexetil Hydrochloride is expressed as mass (potency) of cefotiam (C18H23N9O4S3·H2O: 525.63).

Description
Cefotiam Hexetil Hydrochloride occurs as a white to light yellow powder.
It is very soluble in water, in methanol and in ethanol (95), freely soluble in dimethylsulfoxide, and slightly soluble in acetonitrile.
It dissolves in 0.1 mol/L hydrochloric acid TS.
It is hygroscopic.

Identification
(1) Determine the absorption spectrum of a solution of Cefotiam Hexetil Hydrochloride in 0.1 mol/L hydrochloric acid TS (3 in 125,000) as directed under Ultraviolet-visible Spectrophotometry <2.29>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefotiam Hexetil Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.
(2) Determine the H spectrum of a solution of Cefotiam
Hexitil Hydrochloride in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 20) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21D>, using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits two single signals, A and B, at around δ 2.8 ppm and at around δ 6.6 ppm, and a multiple signal, C, at around δ 6.9 ppm. The ratio of the integrated intensity of each signal, A:B:C, is about 6:1:1.

(3) To a solution of Cefotiam Hexitil Hydrochloride (1 in 200) add 2 mL of dilute nitric acid and 1 mL of silver nitrate TS, and mix: a white precipitate is formed.

**Optical rotation** <2.49>  [α]D¹⁰⁰ + 52° ± 6° (0.1 g calculated on the anhydrous basis, 0.1 mol/L hydrochloric acid TS, 10 mL, 100 mm).

**Purity** (1) Heavy metals <1.07>—Proceed with 2.0 g of Cefotiam Hexitil Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.17>—Prepare the test solution with 2.0 g of Cefotiam Hexitil Hydrochloride according to Method 3, and perform the test, using a solution of magnesium nitrate hexahydrate in ethanol (95%) (1 in 5) (not more than 1 ppm).

(3) Related substance 1—Weigh accurately about 50 mg of Cefotiam Hexitil Hydrochloride, and dissolve in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 50 mL. Pipet 10 mL of this solution, add a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Cefotiam Hexitil Hydrochloride RS, and dissolve in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 50 mL. Pipet 1 mL of this solution, add a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of the related substances by the following equation: the amount of the related substance having the relative retention time of about 1.2 to one of the peaks of cefotiam hexitil, which has the larger retention time, is not more than 2.0%, and each amount of the other related substances is not more than 0.5%. For this calculation, use the value of the peak area obtained by the automatic integration method of the related substance having the relative retention time of about 1.2 to one of the peaks of cefotiam hexitil, which has the larger retention time, after multiplying by its relative response factor, 0.78.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase A: A mixture of diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 2), acetonitrile and acetic acid (100) (72:28:1).
Mobile phase B: A mixture of acetonitrile, diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 2) and acetic acid (100) (60:40:1).
Flowing of the mobile phase: Adjust so that the mixing rate of the mobile phase A and the mobile phase B is changed linearly from 1:0 to 0:1 for 30 minutes.
Flow rate: 0.7 mL per minute.
Time span of measurement: As long as about 3 times of the retention time of one of the cefotiam hexitil peaks, which appears first, beginning after the solvent peak.

**System suitability**—
Test for required detectability: Measure exactly 1 mL of the standard solution, and add a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) to make exactly 50 mL. Confirm that each area of the two peaks of cefotiam hexitil obtained from 10 μL of this solution is equivalent to 1.6 to 2.4% of that from 10 μL of the standard solution.
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the resolution between the two peaks of cefotiam hexitil is not less than 2.0.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the total of the two peak areas of cefotiam hexitil is not more than 2.0%.

(4) Related substance 2—Weigh accurately about 20 mg of Cefotiam Hexitil Hydrochloride, dissolve in exactly 2 mL of methanol, add a mixture of a solution of diammonium hydrogen phosphate (79 in 20,000) and acetic acid (100) (200:3) to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Cefotiam Hydrochloride RS, and dissolve in the mobile phase to make exactly 50 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of the related substances by the following equation: the amounts of the related substances having the relative retention time of about 0.1 and 0.9 to cefotiam are not more than 1.0%, respectively, and each amount of the related substances other than the related substances having the relative retention time of about 0.1 and 0.9 to cefotiam is not more than 0.5%. For this calculation, use the value of the peak area of the related substance having the relative retention time of about 0.9 to cefotiam after multiplying by its sensitivity coefficient, 0.76.
Amount (%) of each related substance

\[ M_a = \frac{M_f}{M_i} \times \frac{A_f}{A_i} \times 4 \]

- $M_a$: Amount (g) of Cefotiam Hydrochloride RS
- $M_f$: Amount (g) of the sample
- $A_f$: Peak area of cefotiam from the standard solution
- $A_i$: Each peak area from the sample solution

**Operating conditions**

- Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
- Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
- Column temperature: A constant temperature of about 25°C.
- Mobile phase: A mixture of a solution of diammonium hydrogen phosphate (79 in 20,000), methanol and acetic acid (100) (200:10:3).
- Flow rate: Adjust the flow rate so that the retention time of cefotiam is about 15 minutes.
- Time span of measurement: As long as about 2 times of the retention time of cefotiam beginning after the solvent peak.

**System suitability**

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of cefotiam obtained from 10 μL of this solution is equivalent to 1.6 to 2.4% of that from 10 μL of the standard solution.

System performance: To 1 mL of a solution of acetaminophen in the mobile phase (1 in 50,000) add 3 mL of the internal standard, and mix well. When the procedure is run with 10 μL of this solution under the above operating conditions, acetaminophen and cefotiam are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefotiam is not more than 2.0%.

(5) Total amount of related substances—The total of the amount of related substances obtained in the Related substance 1 and the Related substance 2 is not more than 6.5%.

**Water** <2.44> Not more than 3.5% (0.1 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Isomer ratio** Proceed the test with 20 μL of the sample solution obtained in the Assay as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, $Q_i$ and $Q_o$, of the peak area of cefotiam hexetil to that of the internal standard. For this calculation, the total of the areas of the two peaks appeared closely each other at the retention time of around 10 minutes is used as the peak area of cefotiam hexetil.

Amount [μg (potency)] of cefotiam (C18H23N9O4S3)

\[ M_a = \frac{M_f}{M_i} \times \frac{A_f}{A_i} \times 1000 \]

- $M_a$: Amount [μg (potency)] of Cefotiam Hexetil Hydrochloride RS

**Internal standard solution**—A solution of benzoic acid in a mixture of diluted phosphoric acid (1 in 100) and acetonitrile (4:1) (7 in 10,000).

**Operating conditions**

- Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
- Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
- Column temperature: A constant temperature of about 25°C.
- Mobile phase: A mixture of a solution of sodium dihydrogen phosphate TS (1 in 2), acetonitrile and acetic acid (100) (72:28:1).
- Flow rate: Adjust the flow rate so that the retention time of the faster peak of cefotiam hexetil is about 9 minutes.

**System suitability**—System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the internal standard and cefotiam hexetil are eluted in this order with the resolution between the two peaks of cefotiam hexetil being not less than 2.0.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefotiam hexetil to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
Cefotiam Hydrochloride

Cefotiam Hydrochloride contains not less than 810 \( \mu g \) (potency) and not more than 890 \( \mu g \) (potency) per mg, calculated on the anhydrous basis. The potency of Cefotiam Hydrochloride is expressed as mass (potency) of cefotiam (C_{18}H_{23}N_{9}O_{4}S_{3}: 525.63).

**Description** Cefotiam Hydrochloride occurs as white to light yellow, crystals or crystalline powder. It is freely soluble in water, in methanol and in formamide, slightly soluble in ethanol (95), and practically insoluble in acetonitrile.

**Identification**

1. **Determine the absorption spectrum** of a solution of Cefotiam Hydrochloride (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry. Compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefotiam Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

2. **Determine the infrared absorption spectrum** of Cefotiam Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry. Cefotiam Hydrochloride exhibits single signals at around 2.21 \(+\) 1.11 \(\times\) 1000 ppm.

3. **Determine the \( ^1H \) spectrum** of a solution of Cefotiam Hydrochloride in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy. Use sodium 3-trimethylsilylpropansulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound; it exhibits single signals at around 3.1 ppm and at around 6.7 ppm, respectively. The ratio of integrated intensity of each signal is about 6:1. Dissolve 0.1 g of Cefotiam Hydrochloride in 5 mL of dilute nitric acid, and immediately add 1 mL of silver nitrate TS: a white precipitate is formed.

**Optical rotation** \(<2.49\> [\alpha]^{20}_D: +60 – +72° (1 g calculated on the anhydrous bases, water, 100 mL, 100 mm).

**pH** \(<2.54\>\) Dissolve 1.0 g of Cefotiam Hydrochloride in 10 mL of water: the pH of the solution is between 1.2 and 1.7.

**Purity**

1. **Clarity of solution**—Dissolve 1.0 g of Cefotiam Hydrochloride in 10 mL of water: the solution is clear, and colorless to yellow.

2. **Heavy metals** \(<1.07\>—To 1.0 g of Cefotiam Hydrochloride add 1 mL of sulfuric acid, and heat gently to carbonate. After cooling, add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10), fire the ethanol to burn, then heat gradually to incinerate. If a carbonized residue still retains, moisten the residue with a little amount of sulfuric acid, and ignite again to incinerate. After cooling, add 2 mL of hydrochloric acid to the residue, heat on a water bath to dissolve, then heat to dryness. Add 10 mL of water, and heat to dissolve. After cooling, add ammonia TS dropwise to adjust to pH 3 – 4, if necessary, filter, wash the residue on the filter with 10 mL of water, and use this solution as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution in the same manner as for preparation of the test solution (not more than 20 ppm).

3. **Arsenic** \(<1.12\>—Incinere 1.0 g of Cefotiam Hydrochloride according to Method 4. After cooling, add 10 mL of dilute hydrochloric acid to the residue, heat to dissolve on the water bath, and use this solution as the test solution. Perform the test (not more than 2 ppm).

**Water** \(<2.48\> Not more than 7.0% (0.25 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

**Assay** Weigh accurately an amount of Cefotiam Hydrochloride and Cefotiam Hydrochloride RS, equivalent to about 0.1 g (potency), and dissolve each in the mobile phase to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 10 \(\mu L\) each of the sample solution and standard solution as directed under Liquid Chromatography. To determine the peak areas, \( A_T \) and \( A_S \), of cefotiam of these solutions.

\[
M_S: \text{Amount [mg (potency)] of Cefotiam Hydrochloride RS} \\
M_T: \text{Amount [mg (potency)] of Cefotiam Hydrochloride} \\
M_S = M_T \times A_T / A_S \times 1000
\]

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.0 mm in inside diameter and 125 mm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu m\) in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To 800 mL of 0.05 mol/L disodium hydrogenphosphate TS add 0.05 mol/L potassium dihydrogenphosphate TS to adjust the pH to 7.7. To 440 mL of this solution add 60 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefotiam is about 14 minutes.

**System suitability**

System performance: Dissolve 0.04 g of orcin in 10 mL of
Cefotiam Hydrochloride for Injection

Cefotiam Hydrochloride for Injection is a preparation for injection which is dissolved before use.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of cefotiam (C₁₈H₁₉N₅O₄S₃: 525.63).

Method of Preparation

Prepare as directed under Injection, with Cefotiam Hydrochloride.

Identification

Determine the absorption spectrum of a solution of Cefotiam Hydrochloride for Injection (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 257 nm and 261 nm.

Dissolve 50 mg of Cefotiam Hydrochloride for Injection in 0.5 mL of heavy water for nuclear magnetic resonance spectroscopy, and determine the spectrum of this solution as directed under Nuclear Magnetic Resonance Spectroscopy <2.21> (1H), using sodium 3-trimethylsilyl-propanesulfonate as an internal reference compound: it exhibits a single signal A between δ 2.7 ppm and δ 3.0 ppm, and a single signal B at around δ 6.5 ppm. The ratio of the integrated intensity of each signal, A:B, is about 6:1.

pH <2.54>

The pH of a solution prepared by dissolving an amount of Cefotiam Hydrochloride for Injection, equivalent to 0.5 g (potency) according to the labeled amount, in 5 mL of water is between 5.7 and 7.2.

Purity

Clarity and color of solution—Dissolve an amount of Cefotiam Hydrochloride for Injection, equivalent to 1.0 g (potency) of Cefotiam Hydrochloride according to the labeled potency, in 10 mL of water: the solution is clear, and the absorbance of this solution, determined at 450 nm 10 minutes after dissolving as directed under Ultraviolet-visible Spectrophotometry <2.24>, is not more than 0.20.

Loss on drying <2.41>

Not more than 6.0% (0.5 g, in vacuum, 60°C, 3 hours).

Bacterial endotoxins <4.01>

Less than 0.125 EU/mg (potency).

Uniformity of dosage units <6.02>

It meets the requirement of the Mass variation test.

Foreign insoluble matter <6.06>

Perform the test according to Method 2: it meets the requirement.

Insoluble particulate matter <6.07>

Perform the test according to Method 1: it meets the requirement.

Sterility <4.06>

Perform the test according to the Membrane filtration method: it meets the requirement.

Assay

Weigh accurately the contents of not less than 10 Cefotiam Hydrochloride for Injection. Weigh accurately an amount of the content, equivalent to about 50 mg (potency) of Cefotiam Hydrochloride according to the labeled amount, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg (potency) of Cefotiam Hydrochloride RS, dissolve in the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefotiam Hydrochloride.

\[
\text{Amount [µg (potency)] of cefotiam (C}_{18}\text{H}_{19}\text{N}_5\text{O}_4\text{S}_3) = M_s \times A_1/A_S \times 1000}
\]

\(M_s: \text{Amount [µg (potency)] of Cefotiam Hydrochloride RS}

Operating conditions—

Proceed as directed in the Assay under Cefotiam Hydrochloride.

System Suitability—

Proceed as directed in the Assay under Cefotiam Hydrochloride.

Containers and storage

Containers—Hermetic containers.

Plastic containers for aqueous injections may be used.

Cefozopran Hydrochloride

Cefozopran Hydrochloride occurs as a white to light yellow powder.

Description

Cefozopran Hydrochloride occurs as a white to pale yellow, crystals or crystalline powder.

C₁₉H₁₇N₉O₅S₂·HCl: 551.99

(6R,7R)-7-[(Z)-2-(5-Amino-1,2,4-thiadiazol-3-yl)-2-(methoxyimino)acetylaminio]-3-(1H-imidazo[1,2-b]pyridazin-4-ium-1-ylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate monohydrochloride

[C13359-04-9, Cefozopran]

Cefozopran Hydrochloride contains not less than 860 µg (potency) and not more than 960 µg (potency) per mg, calculated on the anhydrous basis. The potency of Cefozopran Hydrochloride is expressed as mass (potency) of cefozopran (C₁₉H₁₇N₉O₅S₂: 515.53).

Cefozopran Hydrochloride occurs as a white to pale yellow, crystals or crystalline powder.

It is freely soluble in dimethylsulfoxide and in formamide, slightly soluble in water, in methanol and in ethanol (95), and practically insoluble in acetonitrile and diethyl ether.
Identification (1) Dissolve 0.02 g of Cefozopran Hydrochloride in 10 mL of water, add 1 mL of a solution of hydroxyalumonium chloride (1 in 10) and 2 mL of sodium hydroxide TS, allow to stand for 5 minutes, then add 3 mL of 1 mol/L hydrochloric acid TS and 3 drops of iron (III) chloride TS, and mix: a red-purple color develops.

(2) Determine the absorption spectra of solutions of Cefozopran Hydrochloride and Cefozopran Hydrochloride RS in a mixture of sodium chloride TS and methanol (3:2) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.22>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the \(^1H\) spectrum of a solution of Cefozopran Hydrochloride in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 20) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>, using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around \(\delta 3.9 \text{ ppm}\), a double signal B at around \(\delta 5.2 \text{ ppm}\), and a quartet signal C at around \(\delta 8.0 \text{ ppm}\), and the ratio of integrated intensity of each signal, A:B:C, is about 3:1:1.

(4) Dissolve 0.01 g of Cefozopran Hydrochloride in 1 mL of water and 2 mL of acetic acid (100), add 2 drops of silver nitrate TS, and mix: a white turbidity is formed.

Absorbance <2.24> \(E_{1\%}^{10}(238 \text{ nm}): 455 - 485 (50 \text{ mg calculated on the anhydrous basis, a mixture of sodium chloride TS and methanol (3:2)}; 5000 \text{ mL})

Optical rotation <2.49> \([\alpha]_D^{23} = -73 - -78^\circ (0.1 \text{ g calculated on the anhydrous basis, a mixture of sodium chloride TS and methanol (3:2)}, 10 \text{ mL, 100 mm})

Purity (1) Clarity and color of solution—Being specified separately.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Cefozopran Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic—Being specified separately.

(4) Related substances—Being specified separately.

Water <2.48> Not more than 2.5% (0.5 g, volumetric titration, direct titration. Use a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

Residue on ignition Being specified separately.

Bacterial endotoxins <4.01> Less than 0.05 EU/mg (potency).

Assay Weigh accurately an amount of Cefozopran Hydrochloride and Cefozopran Hydrochloride RS, equivalent to about 50 mg (potency), and dissolve each in the mobile phase to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 10 mL of the internal standard solution and the mobile phase to make 25 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \(Q_1\) and \(Q_2\), of the peak area of cefozopran to that of the internal standard of these solutions.

Amount [\(\mu\)g (potency)] of cefozopran (C\(_{19}\)H\(_{17}\)N\(_{9}\)O\(_{5}\)S\(_{2}\)) = \(M_5 \times Q_1/Q_2 \times 1000\)

\(M_5\): Amount [\(\mu\)g (potency)] of Cefozopran Hydrochloride RS

Internal standard solution—A solution of 2,4-dihydroxybenzoic acid in the mobile phase (1 in 1250).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Mix 0.366 g of diethylamine with water to make 1000 mL, and add 60 mL of acetonitrile and 5 mL of acetic acid (100).

Flow rate: Adjust the flow rate so that the retention time of cefozopran is about 9 minutes.

System suitability—

System performance: When the procedure is run with 10 \(\mu\)L of the standard solution under the above operating conditions, cefozopran and the internal standard are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 10 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefozopran to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Hermetic containers.

Storage—Light-resistant.

Cefozopran Hydrochloride for Injection

Cefozopran Hydrochloride for Injection is a preparation for injection which is dissolved before use.

It contains not less than 90.0% and not more than 115.0% of the labeled potency of cefozopran (C\(_{19}\)H\(_{17}\)N\(_{9}\)O\(_{5}\)S\(_{2}\): 515.53).

Method of Preparation Prepare as directed under the Injections, with Cefozopran Hydrochloride.

Description Cefozopran Hydrochloride for Injection occurs as a white to light yellow, powder or masses.

Identification (1) Determine the absorption spectrum of a solution of Cefozopran Hydrochloride for Injection (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.22>: it exhibits a maximum between 236 nm and 241 nm.

(2) To 50 mg of Cefozopran Hydrochloride for Injection add 0.8 mL of deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy, and filter after shaking, and determine the spectrum of the filtrate as directed under Nuclear Magnetic Resonance Spectroscopy <2.2>, \(^1H\),
Cefpiramide Sodium / Official Monographs

Cefpiramide Sodium

C₇H₁₅Na₂O₄S₃: 634.62

Cefpiramide Sodium contains not less than 900 μg (potency) and not more than 990 μg (potency) per mg, calculated on the anhydrous basis. The potency of Cefpiramide Sodium is expressed as mass (potency) of cefpiramide (C₂₅H₂₄N₈O₇S₂: 612.64).

Description

Cefpiramide Sodium occurs as white to yellowish white powder.

It is very soluble in dimethylsulfoxide, freely soluble in water, sparingly soluble in methanol, and slightly soluble in ethanol (95).

Identification

(1) Determine the absorption spectrum of a solution of Cefpiramide Sodium in 0.05 mol/L phosphate buffer solution, pH 7.0 (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry $<2.24>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the $^1$H spectrum of a solution of Cefpiramide Sodium in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy $<2.21>$, using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals, A, B and C, at around δ 2.3 ppm, at around δ 3.9 ppm and at around δ 8.2 ppm, respectively. The ratio of the integrated intensity of each signal, A:B:C, is about 3:1:1.

(3) Cefpiramide Sodium responds to the Qualitative Tests $<1.09>$ (1) for sodium salt.

Optical rotation $<2.49>$: [α]D$^{20}$: $-33$ $-$ $-40^\circ$ (0.2 g calculated on the anhydrous basis, 0.05 mol/L phosphate buffer solution, pH 7.0, 10 mL, 100 mm).

pH $<2.54>$ The pH of a solution obtained by dissolving 2.0 g of Cefpiramide Sodium in 20 mL of water is between 5.5 and 8.0.

Purity

(1) Clarity and color of solution—Dissolve 1.0 g of Cefpiramide Sodium in 10 mL of 0.05 mol/L phosphate buffer solution, pH 7.0: the solution is clear, and colorless or light yellow.

(2) Heavy metals $<1.077>$—Proceed with 1.0 g of Cefpiramide Sodium according to Method 2, and perform the
test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Weigh accurately about 25 mg of Cefpiramide Sodium, dissolve in 0.03 mol/L phosphate buffer solution, pH 7.5 to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of 1-methyl-1H-tetrazole-5-thiol for liquid chromatography, previously dried in a desiccator (in vacuum, silica gel) for 2 hours, and an amount of Cefpiramide RS, equivalent to about 75 mg (potency), dissolve them in 0.03 mol/L phosphate buffer solution, pH 7.5 to make exactly 100 mL. Pipet 2 mL of this solution, add 0.03 mol/L phosphate buffer solution, pH 7.5 to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 5 μL of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method. Calculate the amount of 1-methyl-1H-tetrazole-5-thiol, each of the other related substances and the total of the other related substances by the following equations: the amount of 1-methyl-1H-tetrazole-5-thiol, each of the other related substances and the total of the other related substances are not more than 1.0%, not more than 1.5% and not more than 4.0%, respectively.

Amount (%) of 1-methyl-1H-tetrazole-5-thiol (C$_7$H$_{12}$N$_4$S)

\[ \frac{M_{5}}{M_{1}} \times \frac{A_{T}}{A_{S}} \]

Amount (%) of each of other related substances

\[ \frac{M_{S}}{M_{1}} \times \frac{A_{T}}{A_{S}} \]

$M_{S}$: Amount (mg) of 1-methyl-1H-tetrazole-5-thiol

$M_{1}$: Amount [mg (potency)] of Cefpiramide RS

$A_{T}$: Peak area of 1-methyl-1H-tetrazole-5-thiol from the standard solution

$A_{S}$: Peak area of cefpiramide from the standard solution

$A_{T}$: Area of each peak other than 1-methyl-1H-tetrazole-5-thiol and cefpiramide from the sample solution

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.01 mol/L phosphate buffer solution, pH 6.8, acetonitrile, methanol and tetrahydrofuran (22:1:1:1).

Flow rate: Adjust the flow rate so that the retention time of cefpiramide is about 7 minutes.

System suitability—

Test for required detectability: Measure exactly 5 mL of the standard solution, and add 0.03 mol/L phosphate buffer solution, pH 7.5 to make exactly 50 mL. Confirm that the peak area of 1-methyl-1H-tetrazole-5-thiol obtained from 5 μL of this solution is equivalent to 8 to 12% of that from 5 μL of the standard solution.

System performance: Dissolve 25 mg of Cefpiramide RS and 7 mg of cinnamic acid in the mobile phase to make 50 mL. When the procedure is run with 5 μL of this solution under the above operating conditions, cinnamic acid and cefpiramide are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of 1-methyl-1H-tetrazole-5-thiol is not more than 2.0%.

Water <2.48> Not more than 7.0% (0.35 g, volumetric titration, direct titration).

Assay Weigh accurately an amount of Cefpiramide Sodium and Cefpiramide RS, equivalent to about 50 mg (potency), add exactly 5 mL of the internal standard solution to dissolve, then add the mobile phase to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, $Q_{T}$ and $Q_{S}$, of the peak area of cefpiramide to that of the internal standard.

Amount [μg (potency)] of cefpiramide (C$_7$H$_{12}$N$_4$O$_3$S$_3$)

\[ M_{S} \times \frac{Q_{T}}{Q_{S}} \times 1000 \]

$M_{S}$: Amount [μg (potency)] of Cefpiramide RS

Internal standard solution—A solution of 4-dimethylaminoantipyrine (1 in 100).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.01 mol/L phosphate buffer solution, pH 6.8, acetonitrile, methanol and tetrahydrofuran (22:1:1:1).

Flow rate: Adjust the flow rate so that the retention time of cefpiramide is about 7 minutes.

System suitability—

System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, cefpiramide and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cefpiramide to that of the internal standard is not more than 2.0%.

Containers and storage Containers—Tight containers.

Storage—Light-resistant, and at a temperature not exceeding 5°C.
Cefpirome Sulfate

C₂₂H₂₂N₆O₅S₂·H₂SO₄: 612.66

Cefpirome Sulfate contains not less than 760 µg (potency) per mg, calculated on the anhydrous basis. The potency of Cefpirome Sulfate is expressed as mass (potency) of cefpirome (C₂₂H₂₂N₆O₅S₂: 514.58).

Description  Cefpirome Sulfate occurs as a white to pale yellowish white crystalline powder, and has a slight, characteristic odor.

It is soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

It is hygroscopic.

Identification  (1) Dissolve 10 mg of Cefpirome Sulfate in 2 mL of water, add 3 mL of hydroxylammonium hydrochloride-ethanol TS, allow to stand for 5 minutes, add 1 mL of acidic ammonium ion (III) sulfate TS, and shake: a red-brown color develops.

(2) Dissolve 1 mg of Cefpirome Sulfate in 4 mL of water, add 1 mL of dilute hydrochloric acid while cooling in ice, add 1 mL of a freshly prepared solution of sodium nitrite (1 in 10), and allow to stand for 2 minutes. Add 1 mL of ammonium amidosulfuric acid TS while cooling in ice bath, allow to stand for 1 minute, and add 1 mL of a solution of N-1-naphthylethylene dihydrochloride (1 in 1000): a purple color develops.

(3) Take 5 mg of Cefpirome Sulfate, dissolve in 1 mL of ethanol (95) and 1 mL of water, add 100 mg of 1-chloro-2,4-dinitrobenezene, and heat on a water bath for 5 minutes. After cooling, add 2 or 3 drops of a solution of sodium hydroxide (1 in 10) and 3 mL of ethanol (95): a red-brown color develops.

(4) Determine the absorption spectra of solutions of Cefpirome Sulfate and Cefpirome Sulfate RS, equivalent to about 50 mg (potency), in 0.01 mol/L hydrochloric acid TS (1 in 50,000), as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectra: both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) Determine the ¹H spectrum of a solution of Cefpirome Sulfate in heavy water for nuclear magnetic resonance spectroscopy (1 in 25) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>, using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around δ 4.1 ppm, a double signal B at around δ 5.9 ppm, a single signal C at around δ 7.1 ppm, and a multiple signal D at around δ 7.8 ppm. The ratio of integrated intensity of each signal, A:B:C:D, is about 3:1:1:1.

A solution of Cefpirome Sulfate (1 in 250) responds to the Qualitative Tests <1.09> (1) for sulfate salt.

Absorbance  <2.24>  ε₁₃₀₄₅₆₇₈ (270 nm): 405 - 435 (50 mg calculated on the anhydrous basis, 0.01 mol/L hydrochloric acid TS, 2500 mL).

Optical rotation  <2.49>  [α]D₂⁰: −27 - −33° (50 mg calculated on the anhydrous basis, a solution prepared by addition of water to 25 mL of acetonitrile to make 50 mL, 20 mL, 100 mm).

pH  <2.54>  Dissolve 0.1 g of Cefpirome Sulfate in 10 mL of water: the pH of the solution is between 1.6 and 2.6.

Purity  (1) Clarity and color of solution—Being specified separately.

(2) Heavy metals  <1.07>—Proceed with 1.0 g of Cefpirome Sulfate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic—Being specified separately.

(4) Related substances—Being specified separately.

(5) Residual solvents—Being specified separately.

Water  <2.48>  Not more than 2.5% (0.5 g, volumetric titration, direct titration).

Residue on ignition—Being specified separately.

Bacterial endotoxins  <4.01>  Less than 0.10 EU/mg (potency).

Assay  Weigh accurately an amount of Cefpirome Sulfate and Cefpirome Sulfate RS, equivalent to about 50 mg (potency), dissolve each in water to make exactly 100 mL. Pipet 5 mL of these solutions, add each in water to make exactly 20 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 20 µL of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and Aₛ, of cefpirome of each solution.

Amount [µg (potency)] of cefpirome (C₂₂H₂₂N₆O₅S₂) = Mₛ × A₁/Aₛ × 1000

Mₛ: Amount [µg (potency)] of Cefpirome Sulfate RS

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 3.45 g of ammonium dihydrogen phosphate in 1000 mL of water, and adjust the pH to 3.3 with phosphoric acid. To 800 mL of this solution add 100 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefpirome is about 7.5 minutes.

System suitability—

System performance: When the procedure is run with 20 µL of the standard solution under the above operating con-
ditions, the number of theoretical plates of the peak of cepfi-rome is not less than 3600.

System repeatability: When the test is repeated 5 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cepfiprome is not more than 1.0%.

Containers and storage  Containers—Hermetic containers.

Storage—At a temperature between 2 and 8°C.

Cefpodoxime Proxetil

Cefpodoxime Proxetil contains not less than 706 μg (potency) and not more than 774 μg (potency) per mg, calculated on the anhydrous basis. The potency of Cefpodoxime Proxetil is expressed as mass (potency) of Cefpodoxime (C_{21}H_{27}N_{5}O_{9}S_{2}: 557.60)

Description  Cefpodoxime Proxetil occurs as a white to light brownish white powder.

It is very soluble in acetonitrile, in methanol and in chloroform, freely soluble in ethanol (99.5), and very slightly soluble in water.

Identification  (1) Determine the absorption spectrum of a solution of Cefpodoxime Proxetil in acetonitrile (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.2>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefpodoxime Proxetil RS prepared in the same manner as the sample solution; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefpodoxime Proxetil as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.2>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefpodoxime Proxetil RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the 1H spectrum of a solution of Cefpodoxime Proxetil in deuterochloroform for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.2>, using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits double signals, A and B, at around δ 1.3 ppm and at around δ 1.6 ppm, and single signals, C and D, at around δ 3.3 ppm and at around δ 4.0 ppm. The ratio of the integrated intensity of these signals, A:B:C:D, is about 2:1:1:1.

Optical rotation  <2.4> [α]_D^24: +24.0 – +31.4° (0.1 g calculated on the anhydrous basis, acetonitrile, 20 mL, 100 mm).

Purity  (1) Heavy metals <1.07>—Proceed with 1.0 g of Cefpodoxime Proxetil according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 50 mg of Cefpodoxime Proxetil in 50 mL of a mixture of water, acetonitrile and acetic acid (100) (99:99:2), and use this solution as the sample solution. Perform the test with 20 μL of the sample solution as directed under Liquid Chromatography <2.0> according to the following conditions. If necessary, perform the test in the same manner with 20 μL of the mixture of water, acetonitrile and acetic acid (100) (99:99:2) to compensate for the base line. Determine each peak area by the automatic integration method, and calculate the amounts of them by the area percentage method: the peak, having the relative retention time of about 0.8 with respect to the isomer B of cefpodoxime proxetil, is not more than 2.0%, the peak other than cefpodoxime proxetil is not more than 1.0%, and the sum of the peaks other than cefpodoxime proxetil is not more than 6.0%.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 22°C.

Mobile phase A: A mixture of water, methanol and a solution of formic acid (1 in 50) (11:8:1).

Mobile phase B: A mixture of methanol and a solution of formic acid (1 in 50) (19:1).

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 65</td>
<td>95</td>
<td>5</td>
</tr>
<tr>
<td>65 – 145</td>
<td>95 → 15</td>
<td>5 → 85</td>
</tr>
<tr>
<td>145 – 155</td>
<td>15</td>
<td>85</td>
</tr>
</tbody>
</table>

Flow rate: Adjust the flow rate so that the retention time of the isomer B of cefpodoxime proxetil is about 60 minutes.

Time span of measurement: About 2.5 times as long as the retention time of the isomer B of cefpodoxime proxetil beginning after the solvent peak.

System suitability—

Test for required detectability: Measure exactly 5 mL of the sample solution, add the mixture of water, acetonitrile and acetic acid (100) (99:99:2) to make exactly 200 mL, and use this solution as the solution for required detectability test. Pipet 2 mL of the solution for required detectability test, and add the mixture of water, acetonitrile and acetic acid (100) (99:99:2) to make exactly 100 mL. Confirm that the peak areas of the isomer A and the isomer B of ce-
Cefroxadine Hydrate / Official Monographs

Cefroxadine Hydrate contains not less than 930 μg (potency) and not more than 1020 μg (potency) per mg, calculated on the dehydrated basis. The potency of Cefroxadine Hydrate is expressed as mass (potency) of cefroxadine (C₁₆H₁₉N₃O₅S.₂H₂O: 401.43)

C₁₆H₁₉N₃O₅S.₂H₂O: 401.43

(6R,7R)-7-[(2R)-2-Amino-2-cyclohexa-1,4-dienylacetylamino]-3-methoxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid dihydrate [51762-05-1, anhydride]

Cefroxadine Hydrate occurs as pale yellowish white to light yellow, crystalline particles or powder. It is very soluble in formic acid, slightly soluble in water and in methanol, and very slightly soluble in acetonitrile and in ethanol (95).

It dissolves in 0.001 mol/L hydrochloric acid TS and in dilute acetic acid.

Identification (1) Determine the absorption spectrum of a solution of Cefroxadine Hydrate in 0.001 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefroxadine RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the 1H spectrum of a solution of Cefroxadine Hydrate in deuterated formic acid for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.27>, using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits three sharp single signals, A, B and C, at around δ 2.8 ppm, at around δ 4.1 ppm and at around δ 6.3 ppm. The ratio of the integrated intensity of each signal, A:B:C, is about 4:3:1.

Cefroxadine Hydrate

C₁₆H₁₉N₃O₅S.₂H₂O: 401.43

(6R,7R)-7-[(2R)-2-Amino-2-cyclohexa-1,4-dienylacetylamino]-3-methoxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid dihydrate [51762-05-1, anhydride]

Cefroxadine Hydrate contains not less than 930 μg (potency) and not more than 1020 μg (potency) per mg, calculated on the dehydrated basis. The potency of Cefroxadine Hydrate is expressed as mass (potency) of cefroxadine (C₁₆H₁₉N₃O₅S.₂H₂O: 401.43)

C₁₆H₁₉N₃O₅S.₂H₂O: 401.43

(6R,7R)-7-[(2R)-2-Amino-2-cyclohexa-1,4-dienylacetylamino]-3-methoxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid dihydrate [51762-05-1, anhydride]
**System suitability**—

Test for required detectability: Measure exactly 2 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of cefroxadine obtained from 40 μL of this solution is equivalent to 7 to 13% of that obtained from 40 μL of the standard solution.

System performance: Dissolve 3 mg of Cefroxadine Hydrate and 15 mg of orcin in 100 mL of the mobile phase. When the procedure is run with 40 μL of this solution under the above operating conditions, orcin and cefroxadine are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 40 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefroxadine is not more than 2.0%.

**Water**<2.48> Not less than 8.5% and not more than 12.0% (0.1 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Cefroxadine Hydrate and Cefroxadine RS, equivalent to about 50 mg (potency), dissolve each in a suitable amount of a mixture of dilute acetic acid and phosphoric acid (500:1), add exactly 5 mL of the internal standard solution and a mixture of dilute acetic acid and phosphoric acid (500:1) to make 200 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography<2.01> according to the following conditions, and calculate the ratios, Q7 and Q8, of the peak area of cefroxadine to that of the internal standard.

\[
\frac{Q_7}{Q_8} = M_5 \times \frac{S}{T} \times \frac{1000}{Q}
\]

\[
M_5: \text{Amount [mg (potency)] of Cefroxadine RS}
\]

\[
S, T: \text{Area of cefroxadine and internal standard, respectively}
\]

\[
Q: \text{Area of internal standard}
\]

**Internal standard solution**—Dissolve 1.6 g of vanillin in 5 mL of methanol, and add a mixture of dilute acetic acid and phosphoric acid (500:1) to make 100 mL.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wave-length: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of a solution of ammonium sulfate (1 in 50) and acetonitrile (97:3).

Flow rate: Adjust the flow rate so that the retention time of cefroxadine is about 10 minutes.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, cefroxadine and the internal standard are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak areas of cefroxadine to that of the internal standard is not more than 1.0%.

**Containers and storage**—Containers—Tight containers.
Cefroxadine for Syrup

シロップ用セフロキサジン

Cefroxadine for Syrup is a preparation for syrup, which is suspended before use. It contains not less than 93.0% and not more than 107.0% of the labeled potency of cefroxadine (C₁₆H₁₉N₃O₅S: 365.40).

**Method of preparation** Prepare as directed under Preparations for Syrups, with Cefroxadine Hydrate.

**Identification** Powder Cefroxadine for Syrup, if necessary. Weigh accurately an amount of Cefroxadine RS, equivalent to about 50 mg (potency), dissolve in a mixture of dilute acetic acid and phosphoric acid (500:1) to make 1 g in 10 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24\times\)Q, and determine the absorbances, \(A_T\) and \(A_S\), at 267 nm.

**Dissolution rate (%) with respect to the labeled amount of cefroxadine (C₁₆H₁₉N₃O₅S)**

\[
\frac{M_S}{M_T} = \frac{A_T}{A_S} \times \frac{1}{C} \times 450
\]

\(M_S:\) Amount [mg (potency)] of Cefroxadine RS
\(M_T:\) Amount (g) of Cefroxadine for Syrup
\(C:\) Labeled amount [mg (potency)] of cefroxadine (C₁₆H₁₉N₃O₅S) in 1 g

**Assay** Powder Cefroxadine for Syrup, if necessary, weigh accurately a portion of the powder, equivalent to about 50 mg (potency) of Cefroxadine Hydrate, add 160 mL of a mixture of dilute acetic acid and phosphoric acid (500:1), shake well for 15 minutes, add exactly 5 mL of the internal standard solution, and add a mixture of dilute acetic acid and phosphoric acid (500:1) to make 200 mL. Filter this solution through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m, and use the filtrate as the sample solution. Separately, weigh accurately an amount of Cefroxadine RS, equivalent to about 50 mg (potency), dissolve in a mixture of dilute acetic acid and phosphoric acid (500:1) to make 200 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Cefroxadine Hydrate.

\[
M_S = M_5 \times \frac{Q_T}{Q_S} \times V/200
\]

\(M_5:\) Amount [mg (potency)] of Cefroxadine RS

**Internal standard solution—Dissolve 1.6 g of vanillin in 5 mL of methanol, and add a mixture of dilute acetic acid and phosphoric acid (500:1) to make 100 mL.**

**Containers and storage** Containers—Tight containers.
Cefsulodin Sodium

セフスロジンナトリウム

C₂₂H₁₉N₄NaO₈S₂: 554.53

Cefsulodin Sodium contains not less than 900 μg (potency) and not more than 970 μg (potency) per mg, calculated on the anhydrous basis. The potency of Cefsulodin Sodium is expressed as mass (potency) of cefsulodin (C₂₂H₂₀N₄O₈S₂: 532.55).

**Description** Cefsulodin Sodium occurs as white to light yellow, crystals or crystalline powder.

It is freely soluble in water and in formamide, slightly soluble in methanol, and very slightly soluble in ethanol (95).

It is hygroscopic.

**Identification** (1) Determine the absorption spectrum of a solution of Cefsulodin Sodium (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefsulodin Sodium RS prepared in the same manner as sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefsulodin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefsulodin Sodium RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the 'H spectrum of a solution of Cefsulodin Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>, using sodium 3-trimethylsilylepropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound; it exhibits a multiple signal A between δ 7.3 ppm and δ 7.7 ppm, and double signals, B and C, at around δ 8.4 ppm and at around δ 9.1 ppm, respectively. The ratio of integrated intensity of these signals, A:B:C, is about 5:2:2.

(4) Cefsulodin Sodium responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49> [α]D: +16.5 – +20.0° (0.1 g calculated on the anhydrous basis, water, 10 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Cefsulodin Sodium in 10 mL of water: the pH of the solution is not less than 3.3 and not more than 4.8.

**Purity** (1) Clarity of solution—Dissolve 1.0 g of Cefsulodin Sodium in 10 mL of water: the solution is clear.

(2) Heavy metals <1.07>—To 1.0 g of Cefsulodin Sodium add 10 mL of a solution of magnesium nitrate hexahydrate in 10 mL of water: the solution is clear.

Determine the absorption spectrum of a solution of Cefsulodin Sodium RS prepared in heavy water for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a multiple signal A between δ 7.3 ppm and δ 7.7 ppm, and double signals, B and C, at around δ 8.4 ppm and at around δ 9.1 ppm, respectively. The ratio of integrated intensity of these signals, A:B:C, is about 5:2:2.

Measure the intensity of these signals, A:B:C, is about 5:2:2.

**Operating conditions**—Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: A mixture of a solution of ammonium sulfate (1 in 100) and acetonitrile (97:3).

Mobile phase B: A mixture of a solution of ammonium sulfate (1 in 100) and acetonitrile (92:8).

Flowing of the mobile phase: Change the mobile phase A to B at 14 minutes after the injection of sample.

Flow rate: Adjust the flow rate so that the retention time of cefsulodin is about 9 minutes.

Time span of measurement: About 4 times as long as the retention time of cefsulodin.

System suitability—

Test for required detection: Pipet 1 mL of the standard solution, add water to make exactly 10 mL. Confirm that the peak areas of isonicotinic acid amide and cefsulodin obtained from 10 μL of this solution are equivalent to 7 to 13% of those of isonicotinic acid amide and cefsulodin obtained from 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, isonicotinic acid amide and cefsulodin are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 5 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefsulodin is not more than 1.0%.

Water <2.48> Not more than 5.0% (1 g, volumetric titration, direct titration, avoiding moisture absorption of the sample, using a mixture of formamide for water determination and methanol for water determination (2:1) instead of methanol for water determination).

Assay Weigh accurately an amount of Cefsulodin Sodium and Cefsulodin Sodium RS, equivalent to about 0.1 g (potency), dissolve each in water to make exactly 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and A₅, of cefsulodin of each solution.

Amount [μg (potency)] of cefsulodin (C₂₂H₂₀N₄O₈S₂) = M₅ × A₁/A₅ × 1000

M₅: Amount [μg (potency)] of Cefsulodin Sodium RS

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of a solution of ammonium sulfate (1 in 100) and acetonitrile (97:3).

Flow rate: Adjust the flow rate so that the retention time of cefsulodin is about 9 minutes.

System suitability—

System performance: Dissolve 40 mg of isonicotinic acid amide in 25 mL of the standard solution. When the procedure is run with 10 μL of this solution under the above operating conditions, isonicotinic acid amide and cefsulodin are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 5 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of cefsulodin is not more than 1.0%.

Containers and storage Containers—Hermetic containers.

Ceftazidime Hydrate

C₂₂H₂₂N₆O₇S₂·5H₂O: 636.65

Ceftazidime Hydrate contains not less than 950 μg (potency) and not more than 1020 μg (potency) per mg, calculated on the dried basis. The potency of Ceftazidime Hydrate is expressed as mass (potency) of ceftazidime (C₂₂H₂₀N₄O₈S₂: 546.58).

Description Ceftazidime Hydrate occurs as a white to light yellowish white crystalline powder.

It is slightly soluble in water, and very slightly soluble in acetonitrile and in ethanol (95%).

Identification (1) Determine the absorption spectrum of a solution of Ceftazidime Hydrate in phosphate buffer solution, pH 6.0 (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Ceftazidime RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ceftazidime Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ceftazidime RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 0.05 g of Ceftazidime Hydrate add 5 mg of dried sodium carbonate, and add 0.5 mL of heavy water for nuclear magnetic resonance spectroscopy to dissolve. Determine the ¹H spectrum of this solution as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>, using sodium 3-trimethylsilylpropanesulfonate for nuclear magnetic resonance spectroscopy as an internal reference compound:
it exhibits single signals, A and B, at around δ 1.5 ppm and at around δ 6.9 ppm, and a multiple signal C between δ 7.9 ppm and δ 9.2 ppm. The ratio of integrated intensity of each signal, A:B:C, is about 6:1:5.

**Optical rotation** <2.49> [α]D <25> 28°–34° (0.5 g calculated on the dried bases, phosphate buffer solution, pH 6.0, 100 mL, 100 mm).

**pH** <2.54> Dissolve 0.5 g of Ceftazidime Hydrate in 100 mL of water: the pH of the solution is between 3.0 and 4.0.

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Ceftazidime Hydrate in 10 mL of a solution obtained by dissolving 5 g of anhydrous disodium hydrogenphosphate and 1 g of potassium dihydrogenphosphate in water to make 100 mL: the solution is clear, and its absorbance <2.24> at 420 nm is not more than 0.20.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Ceftazidime Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 2 ppm).

(3) Arsenic <1.12>—Prepare the test solution with 1.0 g of Ceftazidime Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances (i) Trityl-α-butyl substance and α-butyl substance—Dissolve 0.10 g of Ceftazidime Hydrate in 2 mL of diluted disodium hydrogenphosphate TS (1 in 3), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add diluted disodium hydrogenphosphate TS (1 in 3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 2 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop with a mixture of n-butyl acetate, acetic acid (100), acetic acid buffer solution, pH 4.5 and 1-butanol (16:16:13:3) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots which appear upper in position than the principal spot from the sample solution are not more intense than the spot from the standard solution.

(ii) Other related substances—Dissolve 20 mg of Ceftazidime Hydrate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 5 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine the peak height, Hf and Hs, of pyridine of each solution: the amount of free pyridine is not more than 0.3%.

\[
\text{Amount (mg) of free pyridine} = M_s \times \frac{H_f}{H_s} \times \frac{1}{1000} \\
M_s: \text{Amount (mg) of pyridine}
\]

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 5.0 g of ammonium dihydrogenphosphate in 750 mL of water, adjust to pH 3.5 with phosphoric acid, and add water to make 870 mL. To this solution add 130 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of ceftazidime is about 4 minutes.

Time span of measurement: About 3 times as long as the retention time of ceftazidime beginning after the solvent peak.

**System suitability**—
Test for required detection: Pipet 1 mL of the standard solution, add the mobile phase to make exactly 5 mL, and confirm that the peak area of ceftazidime obtained from 5 µL of this solution is equivalent to 15 to 25% of that of ceftazidime obtained from 5 µL of the standard solution.

System performance: Dissolve about 0.01 g each of Ceftazidime Hydrate and acetonitrile in 20 mL of the mobile phase. When the procedure is run with 5 µL of this solution under the above operating conditions, ceftazidime and acetonitrile are eluted in order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 5 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of ceftazidime is not more than 2.0%.

(5) Free pyridine—Weigh accurately about 50 mg of Ceftazidime Hydrate, dissolve in the mobile phase to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of pyridine, and add the mobile phase to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine the peak height, Hf and Hs, of pyridine of each solution: the amount of free pyridine is not more than 0.3%.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 2.88 g of ammonium dihydrogenphosphate in 500 mL of water, add 300 mL of acetonitrile and water to make 1000 mL, and adjust to pH 7.0 with ammonia solution (28).

Flow rate: Adjust the flow rate so that the retention time of pyridine is about 4 minutes.

**System suitability**—
Test for required detection: Confirm that the peak height of pyridine obtained from 10 µL of the standard solution is equivalent to 50% of the full scale.

System performance: Dissolve 5 mg of Ceftazidime Hydrate in 100 mL of a solution of pyridine in the mobile phase (1 in 20,000). When the procedure is run with 10 µL of this
solution under the above operating conditions, ceftazidime and pyridine are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the heights of pyridine is not more than 5.0%.

Loss on dryness <2.41> Not less than 13.0% and not more than 15.0% (0.1 g, in vacuum not exceeding 0.67 kPa, 60°C, 3 hours).

Assay Weigh accurately an amount of Ceftazidime Hydrate and Ceftazidime RS, equivalent to about 0.1 g (potency), and dissolve each in 0.05 mol/L phosphate buffer solution, pH 7.0, to make exactly 100 mL. Pipet 10 mL of each of these solutions, add exactly 5 mL of the internal standard solution, then add 0.05 mol/L phosphate buffer solution, pH 7.0 to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 5 µL each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \( Q_T \) and \( Q_S \), of the peak area of ceftazidime to that of the internal standard of each solution.

\[
\text{Amount [µg (potency)] of ceftazidime (C}_{22}\text{H}_{22}\text{N}_{6}\text{O}_{7}\text{S}_2} = M_S \times Q_T / Q_S \times 1000
\]

\( M_S \): Amount [mg (potency)] of Ceftazidime RS

Internal standard solution—A solution of dimedon in 0.05 mol/L phosphate buffer solution, pH 7.0 (11 in 10,000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 10 cm in length, packed with hexasilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 4.26 g of anhydrous disodium hydrogenphosphate and 2.72 g of potassium dihydrogenphosphate in 980 mL of water, and add 20 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of ceftazidime is about 4 minutes.

System suitability—

System performance: When the procedure is run with 5 µL of the standard solution under the above operating conditions, the internal standard and ceftazidime are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 5 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ceftazidime to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Ceftazidime for Injection

注射用セフタジム

Ceftazidime for Injection is a preparation for injection which is dissolved before use.

It contains not less than 93.0% and not more than 107.0% of the labeled amount of ceftazidime (C_{22}H_{22}N_{6}O_{7}S_{2}: 546.58).

Method of preparation Prepare as directed under Injections, with Ceftazidime Hydrate.

Description Ceftazidime for Injection is a white to pale yellowish white powder.

Identification Determine the absorption spectrum of a solution of Ceftazidime for Injection (1 in 100,000) in phosphate buffer solution, pH 6.0, as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 255 nm and 259 nm.

\[ \text{pH <2.54>} \] Dissolve an amount of Ceftazidime for Injection, equivalent to 1.0 g (potency) of Ceftazidime Hydrate according to the labeled amount, in 10 mL of water: the pH of this solution is 5.8 to 7.8.

Purity Clarity and color of solution—Dissolve 5 g of disodium hydrogen phosphate and 1 g of potassium dihydrogen phosphate in water to make 100 mL. In 10 mL of this solution dissolve an amount of Ceftazidime for Injection, equivalent to 1.0 g (potency) of Ceftazidime Hydrate according to the labeled amount: the solution is clear and colorless. Also, determine the absorption spectra of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: the absorbance at 420 nm is not more than 0.3.

Loss on drying <2.41> Not more than 14.0% (0.1 g, in vacuum not exceeding 0.67 kPa, 60°C, 3 hours).

Bacterial endotoxins <4.01> Less than 0.067 EU/mg (potency).

Uniformity of dosage units <6.02> It meets the requirement of the Mass variation test.

Foreign insoluble matter <6.06> Perform the test according to Method 2: it meets the requirement.

Insoluble particulate matter <6.07> It meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filter method: it meets the requirement.

Assay Weigh accurately the mass of the contents of not less than 10 containers of Ceftazidime for Injection. Weigh accurately an amount of Ceftazidime Hydrate, equivalent to about 0.25 g (potency), and dissolve in 0.05 mol/L phosphate buffer solution, pH 7.0, to make exactly 250 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, add more 0.05 mol/L phosphate buffer solution, pH 7.0, to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Ceftazidime RS, equivalent to about 25 mg (potency), and dissolve in 0.05 mol/L phosphate buffer solution, pH 7.0, to make exactly 25 mL. Pipet 10 mL of this so-
solution, add exactly 5 mL of the internal standard solution, then add 0.05 mol/L phosphate buffer solution, pH 7.0, to make 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefazidime Hydrate.

Amount [mg (potency)] of cefazidime (C₁₂H₁₇N₅O₇S₂) = Mₛ × Qₛ/Qₛ × 10

Mₛ: Amount [mg(potency)] of Cefazidime RS

Internal standard solution—A solution of dimedon in 0.05 mol/L phosphate buffer solution, pH 7.0 (11 in 10,000).

Containers and storage Containers—Hermetic containers.

Storage—Light-resistant.

Cefteram Pivoxil

セフテラム ピボキシル

C₂₂H₂₇N₉O₇S₂: 593.64
2,2-Dimethylpropanoyloxymethyl (6R,7R)-7-[(Z)-2-(2-aminothiazol-4-yl)-2-(methoxyimino)acetylamino]-3-(5-methyl-2H-tetrazol-2-ylmethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate

C₁₆H₁₇N₉O₅S₂: 479.49

Cefteram Pivoxil contains not less than 743 μg (potency) per mg, calculated on the anhydrous basis. The potency of Cefteram Pivoxil is expressed as mass (potency) of cefteram (C₁₆H₁₇N₉O₅S₂: 479.49).

Description Cefteram Pivoxil occurs as a white to pale yellowish white powder.

It is very soluble in acetonitrile, freely soluble in methanol, in ethanol (95) and in chloroform, and practically insoluble in water.

Identification (1) Determine the absorption spectrum of a solution of Cefteram Pivoxil in 0.05 mol/L hydrochloric acid-methanol TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the 1H spectrum of a solution of Cefteram Pivoxil in deuterated chloroform for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2.27>, using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits single signals A, B and C, at around δ 1.2 ppm, at around δ 2.5 ppm and at around δ 4.0 ppm, respectively. The ratio of the integrated intensity of these signals, A:B:C, is about 3:1:1.

Optical rotation <2.49> [α]D: +35° to +43° (0.4 g calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Cefteram Pivoxil according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cefteram Pivoxil according to Method 4, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 50 mg of Cefteram Pivoxil in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak, having the relative retention time of about 0.9 with respect to cefteram pivoxil from the sample solution is not larger than 1.25 times the peak area of cefteram pivoxil from the standard solution, the area of the peak, having the relative retention time of about 0.1 is not larger than 1/4 times the peak area of cefteram pivoxil from the standard solution, and the total area of the peaks other than cefteram pivoxil is not more than 2.75 times the peak area of cefteram pivoxil from the standard solution. For the above calculation, use the area of the peak, having the relative retention time of about 0.1, after multiplying by its relative response factor, 0.74.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of cefteram pivoxil.

System suitability—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cefteram pivoxil obtained from 10 μL of this solution is equivalent to 7 to 13% of that from 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefteram pivoxil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cefteram pivoxil is not more than 3.0%.

Water <2.49> Not more than 3.0% (0.3 g, coulometric titration).

Assay Weigh accurately an amount of Cefteram Pivoxil and Cefteram Pivoxil Mesylene Sulfonate RS, equivalent to about 40 mg (potency), dissolve each in 20 mL of diluted acetonitrile (1 in 2), add exactly 5 mL of the internal standard solution and diluted acetonitrile (1 in 2) to make 50 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Qₛ, of the peak area of cefteram pivoxil to that of the internal standard.
Cefteram Pivoxil Fine Granules

Cefteram Pivoxil Fine Granules contain not less than 90.0% and not more than 110.0% of the labeled amount of cefteram (C₁₆H₁₇N₉O₅S₂: 479.49).

Method of preparation: Prepare as directed under Granules, with Cefteram Pivoxil.

Identification: Powder Cefteram Pivoxil Fine Granules. To a portion of the powder, equivalent to 0.1 g (potency) of Cefteram Pivoxil according to the labeled amount, add 20 mL of methanol, shake well, and filter. To 1 mL of the filtrate add 0.05 mol/L hydrochloric acid-methanol TS to make 500 mL, and determine the absorption spectrum as directed under Ultraviolet-Visible Spectrophotometry <2.24> it exhibits a maximum between 262 nm and 266 nm.

Purity: Related substances—Powder Cefteram Pivoxil Fine Granules, if necessary. To a portion, equivalent to 0.1 g (potency) of Cefteram Pivoxil according to the labeled amount, add diluted acetonitrile (1 in 2) to make 100 mL, disperse the particle with the aid of ultrasonic waves, then filter, and use the filtrate as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak, having the relative retention time of about 0.9 with respect to cefteram pivoxil, is not larger than 1.75 times the peak area of cefteram pivoxil from the standard solution, the area of the peak, having the relative retention time of about 0.1, is not larger than 17/25 times the peak area of cefteram pivoxil from the standard solution, and the total area of the peaks other than cefteram pivoxil is not larger than 3.7 times the peak area of cefteram pivoxil from the standard solution. For this calculation, use the peak area for the peak having the relative retention time of about 0.1 after multiplying by its relative response factor, 0.74.

Operating conditions—
Proceed as directed in the operating conditions in the Assay under Cefteram Pivoxil.

System suitability—
Proceed as directed in the system suitability in the Assay under Cefteram Pivoxil.

Water—Not more than 0.3% (0.1 g potency), coulometric titration.

Uniformity of dosage units—The Granules in single-unit container meet the requirement of the Mass variation test.

Dissolution—Being specified separately.

Particle size—It meets the requirements of Fine granules.

Assay: Powder Cefteram Pivoxil Fine Granules, if necessary, and use as the sample. Weigh accurately an amount of the sample, equivalent to about 0.3 g (potency) of Cefteram Pivoxil, add exactly 30 mL of the internal standard solution and diluted acetonitrile (1 in 2) to make 300 mL. Disperse the particle with the aid of ultrasonic waves, then filter, and use the filtrate as the sample solution. Separately, weigh accurately about 50 mg (potency) of Cefteram Pivoxil Mesitylene Sulfonate RS, dissolve in 20 mL of diluted acetonitrile (1 in 2), add exactly 5 mL of the internal standard solution and diluted acetonitrile (1 in 2) to make 50 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of cefteram pivoxil to that of the internal standard.

\[
\frac{Q_1}{Q_2} = \frac{S_1}{S_2} \times \frac{F_1}{F_2}
\]

where, \(S_1\) and \(S_2\) are the peak area by the automatic integration method: the area of the peak, having the relative retention time of about 0.9 with respect to cefteram pivoxil, and the total area of the peaks other than cefteram pivoxil, respectively.

\[
\frac{M_s}{M_i} = \frac{Q_1}{Q_2} \times \frac{F_1}{F_2}
\]

\(M_s\): Amount [mg (potency)] of Cefteram Pivoxil (C₁₆H₁₇N₉O₅S₂) = \(M_s \times \frac{Q_1}{Q_2} \times 1000 \)

\(M_i\): Amount [mg (potency)] of Cefteram Pivoxil Mesitylene Sulfonate RS

Internal standard solution—A solution of methyl parahydroxybenzoate in diluted acetonitrile (1:2) (1 in 1000).

Operating conditions—
Proceed as directed in the operating conditions in the Assay under Cefteram Pivoxil.

System suitability—
Proceed as directed in the system suitability in the Assay under Cefteram Pivoxil.
Containers and storage  Containers—Tight containers.

Cefteram Pivoxil Tablets

セフテラム ピボキシル錠

Cefteram Pivoxil Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of cefteram (\(\text{C}_{16}\text{H}_{17}\text{N}_{9}\text{O}_{5}\text{S}_{2}: 479.49\)).

Method of preparation  Prepare as directed under Tablets, with Cefteram Pivoxil.

Identification  To a quantity of powdered Cefteram Pivoxil Tablets, equivalent to 0.1 g (potency) of Cefteram Pivoxil according to the labeled amount, add diluted acetonitrile (1 in 2) to make 100 mL. Disperse this solution with ultrasonic waves, filter, and use the filtrate as the sample solution. Separately, weigh accurately an amount of Cefteram Pivoxil Mesitylene Sulfonate RS, equivalent to about 50 mg (potency), dissolve in 20 mL of diluted acetonitrile (1 in 2), add exactly 5 mL of the internal standard solution, add diluted acetonitrile (1 in 2) to make 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefteram Pivoxil.

Amount [mg (potency)] of cefteram (\(\text{C}_{16}\text{H}_{17}\text{N}_{9}\text{O}_{5}\text{S}_{2}\))

\[ M_s \times \frac{Q_1}{Q_3} \times \frac{1}{50} \]

\( M_s \): Amount [mg (potency)] of Cefteram Pivoxil Mesitylene Sulfonate RS

Internal standard solution  A solution of methyl parahydroxybenzoate in diluted acetonitrile (1 in 2) (1 in 1000).

Dissolution  When the test is performed at 75 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Cefteram Pivoxil Tablets is not less than 75%.

Start the test with 1 tablet of Cefteram Pivoxil Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m. Discard the first 10 mL of the filtrate, pipet 10 mL of the subsequent filtrate, add water to make exactly \(V\) mL so that each mL contains about 22 \(\mu\)g (potency) of Cefteram Pivoxil. Disperse this solution with ultrasonic waves, filter through a membrane filter with pore size of not exceeding 0.45 \(\mu\)m, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution.

Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.20>.

\[ \text{Absorbance} = A_T - A_S \]

For this calculation, use the area of the peak, having the relative retention time of about 0.1 with respect to cefteram pivoxil, obtained from the sample solution. The area of the peak is not larger than 1.75 times the peak area of cefteram pivoxil from the standard solution, and the area of the peak, having the relative retention time of about 0.1 is not larger than 17/25 times the peak area of cefteram pivoxil from the standard solution. Furthermore, the total area of the peaks other than cefteram pivoxil is not larger than 3.7 times the peak area of cefteram pivoxil from the standard solution. For this calculation, use the area of the peak, having the relative retention time of about 0.1 with respect to cefteram pivoxil, after multiplying by the relative response factor, 0.74.

Operating conditions—

Proceed as directed in the operating conditions in the Purity (3) under Cefteram Pivoxil.

System suitability—

Proceed as directed in the system suitability in the Purity (3) under Cefteram Pivoxil.

Water  Not more than 4.0% (a quantity equivalent to 0.2 g potency) of powdered Cefteram Pivoxil Tablets, volumetric titration, direct titration).

Uniformity of dosage units  Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Cefteram Pivoxil Tablets add exactly 5 mL of the internal standard solution per 50 mg (potency) of Cefteram Pivoxil, and add diluted acetonitrile (1 in 2) to make \(V\) mL so that each mL contains about 1 mg (potency) of Cefteram Pivoxil. Disperse this solution with ultrasonic waves, filter through a membrane filter with pore size not exceeding 0.45 \(\mu\)m, discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately an amount of Cefteram Pivoxil Mesitylene Sulfonate RS, equivalent to about 50 mg (potency), dissolve in 20 mL of diluted acetonitrile (1 in 2), add exactly 5 mL of the internal standard solution, add diluted acetonitrile (1 in 2) to make 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefteram Pivoxil.

Amount [mg (potency)] of cefteram (\(\text{C}_{16}\text{H}_{17}\text{N}_{9}\text{O}_{5}\text{S}_{2}\))

\[ M_t \times \frac{Q_1}{Q_3} \times \frac{1}{50} \]

\( M_t \): Amount [mg (potency)] of Cefteram Pivoxil Mesitylene Sulfonate RS

C: Labeled amount [mg (potency)] of cefteram (\(\text{C}_{16}\text{H}_{17}\text{N}_{9}\text{O}_{5}\text{S}_{2}\)) in 1 tablet

Assay  To a number of tablet of Cefteram Pivoxil Tablets, equivalent to about 1.0 g (potency) of Cefteram Pivoxil, add 120 mL of diluted acetonitrile (1 in 2), disperse with ultrasonic waves, and add diluted acetonitrile (1 in 2) to make exactly 200 mL. Centrifuge this solution, pipet 10 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, add diluted acetonitrile (1 in 2) to make 50 mL, filter through a membrane filter with pore size not exceeding 0.45 \(\mu\)m, discard the first 3 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately an amount of Cefteram Pivoxil Mesitylene Sulfonate RS, equivalent to about 50 mg (potency), dissolve in
20 mL of diluted acetonitrile (1 in 2), add exactly 5 mL of the internal standard solution, add diluted acetonitrile (1 in 2) to make 50 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Cefteram Pivoxil.

Amount [mg (potency)] of cefteram (C16H17N9O5S2) = M5 × Qf/Q5 × 20

M5: Amount [mg (potency)] of Cefteram Pivoxil Mesylate

Internal standard solution—A solution of methyl parahydroxybenzoate in diluted acetonitrile (1 in 2) (1 in 1000).

Containers and storage—Containers—Tight containers. Storage—Light-resistant.

Ceftibuten Hydrate

Ceftibuten Hydrate occurs as a white to pale yellowish white crystalline powder.

It is freely soluble in N,N-dimethylformamide and in dimethyl sulfoxide, and practically insoluble in water, in ethanol (95) and in diethyl ether.

Identification

(1) Determine the absorption spectrum of a solution of Cefteram Hydrate in 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0 (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum; both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefteram Hydrate as directed in the paste method under same wavelengths.

(3) Determine the \(^1\)H spectrum of a solution of Cefteram Hydrate in deuterated dimethyl sulfoxide for nuclear magnetic resonance spectroscopy (1 in 30), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.24>: it exhibits double signals A and B, at around \(\delta\) 3.2 ppm and at around \(\delta\) 5.1 ppm, a quartet signal C, at around \(\delta\) 5.8 ppm, and a single signal D, at around \(\delta\) 6.3 ppm. The ratio of integrated intensity of each signal except the signal at around \(\delta\) 3.2 ppm, B:C:D is about 1:1:1.

Optical rotation <2.49>  \([\alpha]_D^2\) = +135° to +155° (0.3 g calculated on the anhydrous basis, 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0, 50 mL, 100 mm).

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Cefteram Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Being specified separately.

Water <2.48> Not less than 8.0% and not more than 13.0% (0.2 g, volumetric titration, direct titration. Use a mixture of pyridine for water determination and ethylene glycol for water determination (5:1) instead of methanol for water determination).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay—Weigh accurately an amount of Cefteram Hydrate and Cefteram Hydrochloride RS, equivalent to about 10 mg (potency), dissolve each in 36 mL of 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0, and add exactly 4 mL of the internal standard solution, shake, and use these solutions as the sample solution and standard solution. Perform the test with 5 mL of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Qf and Qs, of the peak area of cefteram to that of the internal standard. Keep the sample solution and the standard solution at 5°C or below and use within 2 hours.

Amount [mg (potency)] of cefteram (C16H17N9O5S2) = M5 × Qf/Qs × 1000

M5: Amount [mg (potency)] of Cefteram Pivoxil Mesylate

Internal standard solution—A solution of methyl \(p\)-hydroxybenzoate in acetonitrile (3 in 4000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 263 nm).

Column: A stainless steel column 4 mm in inside diameter and 20 cm in length, packed with octadecylsilylated silica gel for liquid chromatography (7 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.005 mol/L \(n\)-decyl trimethylammonium bromide TS and acetonitrile (4:1).

Flow rate: Adjust the flow rate so that the retention time of cefteram is about 10 minutes.

System suitability—

System performance: Dissolve 5 mg of Cefteram Hydrate in 1 mol/L Hydrochloric acid TS to make 50 mL, and allow to stand for 4 hours at room temperature. To 10 mL of this solution add 0.1 mol/L phosphate buffer solution for antibiotics, pH 8.0 to make 25 mL. When the procedure is run with 5 \(\mu\)L of this solution under the above operating conditions, trans-isomer and cefteram are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times
with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of cefditoren to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers. Storage—Light-resistant, and not exceeding 5°C.

Ceftizoxime Sodium

セフチゾキシムナトリウム

C\textsubscript{13}H\textsubscript{12}N\textsubscript{5}NaO\textsubscript{5}S\textsubscript{2}: 405.38
Monosodium (6R,7R)-7-[(Z)-2-(2-aminothiazol-4-yl)-2-(methoxylimino)acetylamino]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate [68401-82-1]

Ceftizoxime Sodium contains not less than 925 μg (potency) and not more than 965 μg (potency) per mg, calculated on the anhydrous basis. The potency of Ceftizoxime Sodium is expressed as mass (potency) of cefizoxime (C\textsubscript{13}H\textsubscript{13}N\textsubscript{5}O\textsubscript{5}S\textsubscript{2}: 383.40).

Description Ceftizoxime Sodium occurs as a white to light yellow, crystals or crystalline powder. It is very soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol (95).

Identification (1) Determine the absorption spectrum of a solution of Ceftizoxime Sodium (1 in 63,000) as directed under Ultraviolet-visible Spectrophotometry <2,24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ceftizoxime Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2,25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the "H spectrum of a solution of Ceftizoxime Sodium in heavy water for nuclear magnetic resonance spectroscopy (1 in 10) as directed under Nuclear Magnetic Resonance Spectroscopy <2,21>, using sodium 3-trimethylsilylpropionate-\textsubscript{d\textsubscript{4}} for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a single signal A at around δ 4.0 ppm, a multiple signal B around δ 6.3 ppm, and a single signal C at around δ 7.0 ppm. The ratio of integrated intensity of each signal, A:B:C, is about 3:1:1.

(4) Ceftizoxime Sodium responds to the Qualitative Tests <1,09> (1) for sodium salt.

Optical rotation <2,49> [α]\textsubscript{D}\textsuperscript{20} +125 – +145° (0.25 g calculated on the anhydrous bases, water, 25 mL, 100 mm).

pH <2,54> Dissolve 1.0 g of Ceftizoxime Sodium in 10 mL of water: the pH of the solution is between 6.0 and 8.0.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Ceftizoxime Sodium in 10 mL of water: the solution is clear, and colorless to light yellow.

(2) Heavy metals <1,07>—Proceed with 2.0 g of Ceftizoxime Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1,11>—Prepare the test solution with 2.0 g of Ceftizoxime Sodium according to Method 3, and perform the test (not more than 1 ppm).

(4) Related substances—Dissolve 0.11 g of Ceftizoxime Sodium in 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the sample solution. Perform the test with 5 μL of the sample solution as directed under Liquid Chromatography <2,01> according to the following conditions, and determine the areas of each peak by the automatic integration method: each peak area other than cefizoxime is not more than 0.5% of the peak area of cefizoxime, and the total peak areas other than cefizoxime is not more than 1.0% of that of cefizoxime.

Operating conditions—

Detector, column, and column temperature: Proceed as directed in the operating conditions in the Assay.

Mobile phase: Dissolve 2.31 g of disodium hydrogen-phosphate dodecahydrate and 1.42 g of citric acid monohydrate in 1000 mL of water, adjust to pH 3.6 with diluted phosphoric acid (1 in 10) or dilute sodium hydroxide TS. To 200 mL of this solution add 10 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of cefizoxime is about 12 minutes.

Time span of measurement: About 5 times as long as the retention time of cefizoxime beginning after the solvent peak.

System suitability—

Test for required detection: Pipet 1 mL of the sample solution, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL, and use this solution as the solution for test for required detection. Pipet 1 mL of the solution, add 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 10 mL, and confirm that the peak area of cefizoxime obtained from 5 μL of this solution is equivalent to 7 to 13% of that of cefizoxime obtained from 5 μL of the solution for test for required detection.

System performance: Dissolve about 10 mg of Ceftizoxime RS in 100 mL of 0.1 mol/L phosphate buffer solution, pH 7.0, and use this solution as the solution for system suitability test. When the procedure is run with 5 μL of this solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cefizoxime are not less than 4000 steps and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 5 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of cefizoxime is not more than 2.0%.

Water <2,48> Not more than 8.5% (0.4 g, volumetric titration, direct titration).

Assay Weigh accurately an amount of Ceftizoxime Sodium and Ceftizoxime RS, equivalent to about 0.1 g (potency), and dissolve each in 0.1 mol/L phosphate buffer solution, pH 7.0 to make exactly 20 mL. Pipet 2 mL each of these solutions, add exactly 10 mL of the internal standard solution,
then add 0.1 mol/L phosphate buffer solution, pH 7.0 to make 20 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 5 μL of each of these solutions as directed under Liquid Chromatography <2.06> according to the following conditions, and calculate the ratios, \( Q_z \) and \( Q_b \), of the peak area of ceftriaxone to that of the internal standard of each solution.

\[
\text{Amount} [\text{μg (potency)}] \text{ of ceftriaxone (C}_{18}\text{H}_{18}\text{N}_8\text{O}_7\text{S}_3] = M_z \times Q_z / Q_b \times 1000
\]

\( M_z \): Amount [mg (potency)] of Ceftriaxone RS

**Internal standard solution**—A solution of 3-hydroxybenzoic acid in 0.1 mol/L phosphate buffer solution, pH 7.0 (3 in 500).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 2.31 g of disodium hydrogenphosphate dodecahydrate and 1.42 g of citric acid monohydrate in 1000 mL of water, and adjust to pH 3.6 with diluted phosphoric acid (1 in 10) or dilute sodium hydroxide TS. To 450 mL of this solution add 50 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of ceftriaxone is about 4 minutes.

**System suitability**—
System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, ceftriaxone and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.0 and the symmetry factor of each peak is not more than 1.0%.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ceftriaxone to that of the internal standard is not more than 1.0%.

**Containers and storage**—
Containers—Tight containers.
Storage—Light-resistant.

**Ceftriaxone Sodium Hydrate**

Ceftriaxone Sodium Hydrate contains not less than 905 μg (potency) and not more than 935 μg (potency) per mg, calculated on the anhydrous basis. The potency of Ceftriaxone Sodium Hydrate is expressed as mass (potency) of ceftriaxone (C18H18N8O7S3: 554.58).

**Description**
Ceftriaxone Sodium Hydrate occurs as a white to yellowish white crystalline powder. It is freely soluble in water and in dimethylsulfoxide, sparingly soluble in methanol, very slightly soluble in ethanol (99.5), and practically insoluble in acetonitrile.

**Identification** (1) Determine the absorption spectrum of a solution of Ceftriaxone Sodium Hydrate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Ceftriaxone Sodium RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the \(^1\)H spectrum of a solution of Ceftriaxone Sodium Hydrate in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 10), using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound, as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>:
It exhibits single signals, A, B, C and D, at around δ 3.5 ppm, at around δ 3.8 ppm, at around δ 6.7 ppm and at around δ 7.2 ppm, respectively. The ratio of integrated intensity of each signal, A: B: C: D, is about 3:3:1:2. When the signal at around δ 3.5 ppm overlaps with the signal of water, perform the measurement in the probe kept at about 50°C.

(3) Ceftriaxone Sodium Hydrate responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49> [α]D: -153 – -170° (50 mg calculated on the anhydrous basis, water, 2.5 mL, 20 mm).

**pH** <2.54> Dissolve 0.6 g of Ceftriaxone Sodium Hydrate in 5 mL of water: the pH of the solution is between 6.0 and 8.0.

**Purity** (1) Clarity and color of solution—Dissolve 0.6 g of Ceftriaxone Sodium Hydrate in 5 mL of water: the solution is clear and light yellow.
(2) Heavy metals $< 0.07$—Proceed with 1.0 g of Ceftriaxone Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic $< 0.1$—Prepare the test solution with 1.0 g of Ceftriaxone Sodium Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances 1—Dissolve 20 mg of Ceftriaxone Sodium Hydrate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of water and acetonitrile for liquid chromatography (11:9) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography $< 2.01$ according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of the impurity 1 having the relative retention time of about 0.5 and the impurity 2 having the relative retention time of about 1.3 to ceftriaxone from the sample solution are not larger than the peak area of ceftriaxone from the standard solution. In this case, these peak areas for the impurity 1 and the impurity 2 are used after multiplying by each relative response factors 0.9 and 1.2, respectively.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilsanized silica gel for liquid chromatography (10 $\mu$m particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 5.796 g of anhydrous disodium hydrogen phosphate and 3.522 g of potassium dihydrogen phosphate in water to make exactly 1000 mL, and use this solution as the solution A. Separately, dissolve 20.256 g of citric acid monohydrate and 7.840 g of sodium hydroxide in water to make exactly 1000 mL, and use this solution as the solution B. Dissolve 4.00 g of tetra-n-heptylammonium bromide in 450 mL of acetonitrile for liquid chromatography, add 55 mL of the solution A, 5 mL of the solution B and 490 mL of water.
Flow rate: Adjust the flow rate so that the retention time of ceftriaxone is about 7 minutes.
Time span of measurement: About 2 times as long as the retention time of ceftriaxone.

System suitability—
Test for required detectability: Measure exactly 5 mL of the sample solution, add a mixture of water and acetonitrile for liquid chromatography (11:9) to make exactly 200 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add a mixture of water and acetonitrile for liquid chromatography (11:9) to make exactly 100 mL. Confirm that the peak area of ceftriaxone obtained from 10 $\mu$L of this solution is equivalent to 0.9 to 1.1% of that from 10 $\mu$L of the solution for system suitability test.

System performance: Dissolve 10 mg of Ceftriaxone Sodium Hydrate in a mixture of water and acetonitrile for liquid chromatography (11:9) to make 5 mL, add 5 mL of a solution of diethyl terephthalate in a mixture of water and acetonitrile for liquid chromatography (11:9) (9 in 5000), and add a mixture of water and acetonitrile for liquid chromatography (11:9) to make 200 mL. When the procedure is run with 10 $\mu$L of this solution under the above operating conditions, ceftriaxone and diethyl terephthalate are eluted in this order, with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10 $\mu$L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of ceftriaxone is not more than 1.0%.

(5) Related substances 2—Dissolve 10 mg of Ceftriaxone Sodium Hydrate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of acetonitrile for liquid chromatography and water (23:11) to make exactly 100 mL, and use this solution as standard solution. Perform the test with exactly 10 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography $< 2.01$ according to the following conditions, and determine each peak area by the automatic integration method: the each peak area of the impurities which appear after the peak of ceftriaxone from the sample solution is not larger than the peak area of ceftriaxone from the standard solution, and the total peak area of these impurities is not larger than 2.5 times of the peak area from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilsanized silica gel for liquid chromatography (10 $\mu$m particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 5.796 g of anhydrous disodium hydrogen phosphate and 3.522 g of potassium dihydrogen phosphate in water to make exactly 1000 mL, and use this solution as the solution A. Separately, dissolve 20.256 g of citric acid monohydrate and 7.840 g of sodium hydroxide in water to make exactly 1000 mL, and use this solution as the solution B. Dissolve 4.00 g of tetra-n-heptylammonium bromide in 450 mL of acetonitrile for liquid chromatography, add 55 mL of the solution A, 5 mL of the solution B and 490 mL of water.
Flow rate: Adjust the flow rate so that the retention time of ceftriaxone is about 3 minutes.
Time span of measurement: About 10 times as long as the retention time of ceftriaxone.

System suitability—
Test for required detectability: Measure exactly 5 mL of the sample solution, add a mixture of water and acetonitrile for liquid chromatography (11:9) to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add a mixture of water and acetonitrile for liquid chromatography (11:9) to make exactly 100 mL. Confirm that the peak area of ceftriaxone obtained from 10 $\mu$L of this solution is equivalent to 0.9 to 1.1% of that from 10 $\mu$L of the solution for system suitability test.

System performance: Dissolve 10 mg of Ceftriaxone Sodium Hydrate in a mixture of acetonitrile for liquid chromatography and water (23:11) to make exactly 5 mL, add 5 mL of a solution of diethyl terephthalate in a mixture of water and acetonitrile for liquid chromatography (11:9) (9 in 5000), and add a mixture of water and acetonitrile for liquid chromatography (11:9) to make 5 mL, add 5 mL of a solution of diethyl terephthalate in a mixture of water and acetonitrile for liquid chromatography (11:9) (9 in 5000), and add a mixture of water and acetonitrile for liquid chromatography (11:9) to make 200 mL. When the procedure is run with 10 $\mu$L of this solution under the above operating conditions, ceftriaxone and diethyl terephthalate are eluted in this order, with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10 $\mu$L of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of ceftriaxone is not more than 1.0%.
and add a mixture of acetonitrile for liquid chromatography and water (23:11) to make 200 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, ceftriaxone and diethyl terephthalate are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of ceftriaxone is not more than 1.0%.

Water <2.48> Not less than 8.0% and not more than 11.0% (0.15 g, volumetric titration, direct titration).

Assay Weigh accurately an amount of Ceftriaxone Sodium Hydrate and Ceftriaxone Sodium RS, equivalent to about 0.1 g (potency), dissolve each in a mixture of water and acetonitrile for liquid chromatography (11:9) to make exactly 50 mL. Pipet 5 mL of each solution, add exactly 5 mL of the internal standard solution and a mixture of water and acetonitrile for liquid chromatography (11:9) to make 200 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL of each of these solutions as directed under Liquid Chromatography (11:9) (9 in 5000).

Internal standard solution—A solution of diethyl terephthalate in a mixture of water and acetonitrile for liquid chromatography (11:9) (9 in 5000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Dissolve 4.00 g of tetra-n-heptylammonium bromide in 450 mL of acetonitrile for liquid chromatography, and add 490 mL of water, 55 mL of solution A, and 5 mL of solution B.

Flow rate: Adjust the flow rate so that the retention time of ceftriaxone is about 7 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, ceftriaxone and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ceftriaxone to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Cefuroxime Axetil

セフロキシム アキセチル

Cefuroxime Axetil contains not less than 800 μg (potency) and not more than 850 μg (potency) per mg, calculated on the anhydrous basis and corrected by the amount of acetone. The potency of Cefuroxime Axetil is expressed as mass (potency) of cefuroxime (C_{16}\text{H}_{16}\text{N}_{4}\text{O}_{8}\text{S}; 424.39).

Description Cefuroxime Axetil occurs as white to yellowish white, non-crystalline powder.

It is freely soluble in dimethylsulfoxide, soluble in methanol, sparingly soluble in ethanol (95), and very slightly soluble in water.

Identification (1) Determine the absorption spectrum of a solution of Cefuroxime Axetil in methanol (3 in 200, 000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cefuroxime Axetil RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cefuroxime Axetil as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cefuroxime Axetil RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Determine the 1H spectrum of a solution of Cefuroxime Axetil in deuterated dimethylsulfoxide for nuclear magnetic resonance spectroscopy (1 in 20) as directed under Nuclear Magnetic Resonance Spectroscopy <2.21>, using tetramethylsilane for nuclear magnetic resonance spectroscopy as an internal reference compound: it exhibits a double signal or a pair of double signals A at around δ 2.25 ppm, a pair of single signals B at around δ 2.1 ppm, and a single signal C at around δ 3.9 ppm. The ratio of the integrated intensity of each signal, A:B:C, is about 1:1:1.

Optical rotation <2.49> [α]_{D}^{20}: +41 to +47° (0.5 g, methanol, 50 mL, 100 mm).

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of
Cefuroxime Axetil according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11>—Put 1.0 g of Cefuroxime Axetil in a crucible, add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10), burn the ethanol, then make gradually to incinerate. If a carbonized substance remains, moisten with a small amount of nitric acid, and ignite to incinerate. Cool, add 10 mL of dilute hydrochloric acid to the residue, dissolve by warming on a water bath, and perform the test using this solution as the test solution (not more than 2 ppm).

(3) Related substance—Dissolve 25 mg of Cefuroxime Axetil in 4 mL of methanol, add a solution of ammonium dihydrogen phosphate (23 in 1000) to make 10 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add 40 mL of methanol and a solution of ammonium dihydrogen phosphate (23 in 1000) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 2 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than cefuroxime axetil obtained from the sample solution is not larger than 1.5 times the sum area of two peaks of cefuroxime axetil obtained from the standard solution, and the sum area of the peaks other than cefuroxime axetil is not larger than 4 times the sum area of two peaks of cefuroxime axetil from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the assay.

Time span of measurement: About 3 times as long as the retention time of the peak having the larger retention time of the two peaks of cefuroxime axetil beginning after the solvent peak.

**System suitability**—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add 4 mL of methanol and a solution of ammonium dihydrogen phosphate (23 in 1000) to make exactly 10 mL. Confirm that the sum area of the two peaks of cefuroxime axetil obtained from 2 μL of this solution is equivalent to 7 to 13% of that obtained from 2 μL of the standard solution.

System performance: Proceed as directed in the system suitability in the assay.

System repeatability: When the test is repeated 6 times with 2 μL of the standard solution under the above operating conditions, the relative standard deviation of the sum area of the two peaks of cefuroxime axetil is not more than 2.0%.

(4) Acetone—Weigh accurately about 1 g of Cefuroxime Axetil, add exactly 0.2 mL of the internal standard solution and dimethylsulfoxide to make 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.5 g of acetone, and add dimethylsulfoxide to make exactly 100 mL. Pipet 0.2 mL of this solution, add exactly 0.2 mL of the internal standard solution and dimethylsulfoxide to make exactly 10 mL, and use this solution as the standard solution. Perform the test with 1 μL each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions, determine each peak area by the automatic integration method, and calculate the ratios, Qt and Qs, of the peak area of acetone to that of the internal standard: the amount of acetone is not more than 1.3%.

Amount (%) of acetone = \( M_t/M_s \times Q_t/Q_s \times 1/5 \)

**Internal standard solution**—A solution of 1-propanol in dimethylsulfoxide (1 in 200).

**Operating conditions**—

Detector: A hydrogen flame-ionization detector.

Column: A glass column 3 mm in inside diameter and 2 m in length, packed with siliceous earth for gas chromatography coated with a mixture of polyethylene glycol 600 for gas chromatography and polyethylene glycol 1500 for gas chromatography (1:1) in the ratio of 20% (125 – 150 μm in particle diameter).

Column temperature: A constant temperature of about 90°C.

Temperature of injection port: A constant temperature of about 115°C.

Carrier gas: Nitrogen.

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 4 minutes.

**System suitability**—

System performance: When the procedure is run with 1 μL of the standard solution under the above operating conditions, acetone and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 1 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of acetone to that of the internal standard is not more than 5.0%.

**Water** <2.48> Not more than 2.0% (0.4 g, volumetric titration, direct titration).

**Residue on ignition** <2.44> Not more than 0.2% (0.5 g).

**Isomer ratio** Perform the test with 10 μL of the sample solution obtained in the assay as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the area, \( A_s \), of the peak having the smaller retention time and the area, \( A_b \), of the peak having the bigger retention time of the two peaks of cefuroxime axetil: \( A_s/(A_s + A_b) \) is between 0.48 and 0.55.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the assay.

**System suitability**—

System performance, and system repeatability: Proceed as directed in the system suitability in the assay.

**Assay** Weigh accurately an amount of Cefuroxime Axetil and Cefuroxime Axetil RS, equivalent to about 50 mg (potency), and dissolve each in methanol to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 5 mL of the internal standard solution, 5 mL of methanol and a solution of ammonium dihydrogen phosphate (23 in 1000) to make 50 mL, and use these solutions as the sample solution
and standard solution. Perform the test with 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the sum area of the two peaks of cefuroxime axetil to the peak area of the internal standard.

Amount [μg (potency)] of cefuroxime (C₁₆H₁₆N₄O₈S)  
\[ M = \frac{A}{Q₁/ Q₂} \times 1000 \]

M₂: Amount [mg (potency)] of Cefuroxime Axetil RS

**Internal standard solution**—A solution of acetanilide in methanol (27 in 5000).

**Operating conditions**—
- Detector: An ultraviolet absorption photometer (wavelength: 278 nm).
- Column: A stainless steel column 4.6 mm in inside diameter and 20 cm in length, packed with trimethylsilylized silica gel for liquid chromatography (5 μm in particle diameter).
- Column temperature: A constant temperature of about 25°C.
- Mobile phase: A mixture of a solution of ammonium dihydrogen phosphate (23 in 1000) and methanol (5:3).
- Flow rate: Adjust the flow rate so that the retention time of the peak having the smaller retention time of the two peaks of cefuroxime axetil is about 8 minutes.

**System suitability**—
- System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and cefuroxime axetil are eluted in this order with the resolution between the two peaks of cefuroxime axetil being not less than 1.5.
- System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the sum area of the two peaks of cefuroxime axetil to the peak area of the internal standard is not more than 1.0%.

**Containers and storage**—Tight containers.
- Storage—Light-resistant.

**Cellacefate**

**Cellulose Acetate Phthalate**

セラセフェート

[9004-38-0]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbols (• •).

Cellacefate is a reaction product of phthalic anhydride and partially acetylated cellulose.

Cellacefate, calculated on the anhydrous and free acid-free basis, contains not less than 21.5% and not more than 26.0% of acetyl group (-COCH₃: 43.04), and not less than 30.0% and not more than 36.0% of carboxybenzoyl group (-COC₆H₄COOH: 149.12).

**Description**—Cellacefate occurs as a white powder or grain. It is freely soluble in acetone, and practically insoluble in water, in methanol and in ethanol (99.5).

**Identification**—Determine the infrared absorption spectrum of Cellacefate directly in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum of Cellacefate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Viscosity**—Weigh accurately a quantity of Cellacefate, equivalent to 15 g calculated on the anhydrous basis, dissolve in 85 g of a mixture of acetone and water (249: 1 in mass), and perform the test with this solution at 25 ± 0.2°C as directed in Method 1 to obtain the kinematic viscosity ν. Separately, determine the density, ρ, of Cellacefate as directed under Determination of Specific Gravity and Density <2.50>, and calculate the viscosity, η, as \[ η = ρ ν \] not less than 45 mPa·s and not more than 90 mPa·s.

**Purity**—
- (1) Heavy metals <1.07>—Proceed with 2.0 g of Cellacefate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).
- (2) Free acids—Weigh accurately about 3 g of Cellacefate, put in a glass-stopped conical flask, add 100 mL of diluted methanol (1 in 2), stopper tightly, and filter after shaking for 2 hours. Wash both the flask and residue with two 10-mL portions each of diluted methanol (1 in 2), combine the washes to the filtrate, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform the blank determination with 120 mL of diluted methanol (1 in 2), and make any necessary correction.

\[ \text{Amount (％) of free acids} = 0.8306A/M \]

A: amount (mL) of 0.1 mol/L sodium hydroxide VS consumed  
M: amount (g) of the test sample, calculated on the anhydrous basis

The amount of free acids is not more than 3.0%, calculated as phthalic acid (C₈H₆O₄: 166.13).

**Water**—Not more than 5.0% (1 g, volumetric titration, direct titration, using a mixture of ethanol (99.5) and dichloromethane (3: 2) instead of methanol for Karl Fischer method).

**Residue on ignition**—Not more than 0.1% (1 g).

**Assay**—Weigh accurately about 1 g of Cellacefate, dissolve in 50 mL of a mixture of ethanol (95) and acetone (3: 2), and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination, and make any necessary correction.

\[ \text{Content (％) of carboxybenzoyl group (C₆H₄O₂)} = \frac{1.491 \times A - 1.795 \times B}{100 - B} \times 100 \]

A: Amount (mL) of 0.1 mol/L sodium hydroxide VS consumed  
B: Amount (％) of free acids obtained in the Purity (2)
Free acids

\( M \): Amount (g) of the test sample, calculated on the anhydrous basis

(2) Acetyl group—Weigh accurately about 0.1 g of Cellulose, put in a glass-stoppered conical flask, add exactly 25 mL of 0.1 mol/L sodium hydroxide VS, and boil for 30 minutes under a reflux condenser. After cooling, add 5 drops of phenolphthalein TS, and titrate 2.50° with 0.1 mol/L hydrochloric acid VS. Perform a blank determination.

Content (%) of free acids and bound acetyl group (C\(_{2}H_{3}O\))
\[
A: \text{Amount (mL) of 0.1 mol/L sodium hydroxide VS consumed, corrected by the blank determination}
\]
\[
M: \text{Amount (g) of the test sample, calculated on the anhydrous basis}
\]
Content (%) of acetyl group (C\(_{2}H_{3}O\))
\[
= 100 \times \left( \frac{P - 0.5182B}{100 - B} \right) - 0.5772C
\]

B: Amount (%) of free acids obtained in the Purity (2) Free acids
C: Content (%) of carboxybenzoyl group
P: Content (%) of free acids and bound acetyl group (C\(_{2}H_{3}O\))

Containers and storage—Containers—Tight containers.

Microcrystalline Cellulose

結晶セルロース

[9004-34-6, cellulose]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbols (• •).

Microcrystalline Cellulose is purified, partially depolymerized α-cellulose, obtained as a pulp from fibrous plant material, with mineral acids.

• The label indicates the mean degree of polymerization, loss on drying, and bulk density values with the range.

• Description Microcrystalline Cellulose occurs as a white crystalline powder having fluidity.

It is practically insoluble in water, in ethanol (95%) and in diethyl ether.

It swells with sodium hydroxide TS on heating.

Identification (1) Dissolve 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water, add 0.5 g of iodine, and shake for 15 minutes. Place about 10 mg of Microcrystalline Cellulose on a watch glass, and disperse in 2 mL of this solution: the substance develops a blue-violet color.

• (2) Sieve 20 g of Microcrystalline Cellulose for 5 minutes on an air-jet sieve equipped with a screen (No.391, 200 mm in inside diameter) having 38-μm openings. If more than 5% is retained on the screen, mix 30 g of Microcrystalline Cellulose with 270 mL of water; otherwise, mix 45 g with 255 mL of water. Perform the mixing for 5 minutes in a high-speed (18,000 revolutions per minute or more) power blender. Transfer 100 mL of the dispersion to a 100-mL graduated cylinder, and allow to stand for 3 hours: a white, opaque, bubble-free dispersion, which does not form a supernatant liquid at the surface, is obtained.

(3) Transfer 1.3 g of Microcrystalline Cellulose, accurately weighed, to a 125-mL conical flask, and add exactly 25 mL each of water and 1 mol/L cupriethylenediamine TS. Immediately purge the solution with nitrogen, insert the stopper, and shake on a suitable mechanical shaker to dissolve. Perform the test with a suitable amount of this solution, taken exactly, according to Method 1 under Viscosity Determination 2.53 by using a capillary viscometer having the viscosity constant (K) of approximately 0.03, at 25 ± 0.1°C, and determine the kinematic viscosity, \( v \). Separately, perform the test with a mixture of exactly 25 mL each of water and 1 mol/L cupriethylenediamine TS in the same manner as above, using a capillary viscometer having K of approximately 0.01, and determine the kinematic viscosity, \( v_{0} \).

Calculate the relative viscosity, \( \eta_{rel} \), of Microcrystalline Cellulose by the formula:

\[
\eta_{rel} = \frac{v}{v_{0}}
\]

Obtain the product, [\( \eta \)] of intrinsic viscosity [\( \eta \)(mL/g)] and concentration C (g/100 mL) from the value \( \eta_{rel} \) of the Table. When calculate the degree of polymerization, \( P \), by the following formula, \( P \) is not more than 350 • and within the labeled range.

\[
P = \left( \frac{95}{\eta} \right) C / M_{r}
\]

\( M_{r} \): Amount (g) of the sample, calculated on the dried basis

pH \(< 2.54\): Shake 5.0 g of Microcrystalline Cellulose with 40 mL of water for 20 minutes, and centrifuge: the pH of the supernatant liquid is between 5.0 and 7.5.

Purity • (1) Heavy metals \(< 0.07\)—Proceed with 2.0 g of Microcrystalline Cellulose according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm). •

(2) Water-soluble substances—Shake 5.0 g of Microcrystalline Cellulose with 80 mL of water for 10 minutes, filter with the aid of vacuum through a filter paper for quantitative analysis (5C) into a vacuum flask. Evaporate the clear filtrate in a tared evaporating dish to dryness without charring, dry at 105°C for 1 hour, cool in a desiccator, and weigh: the difference between the mass of the residue and the...
600

Microcrystalline Cellulose / Official Monographs

mass obtained from a blank determination does not exceed
12.5 mg.
(3) Diethyl ether-soluble substances—Place 10.0 g of
Microcrystalline Cellulose in a column having an internal diameter of about 20 mm, and pass 50 mL of peroxide-free
diethyl ether through the column. Evaporate the eluate to
dryness in a previously dried and tared evaporation dish.

JP XVI

Dry the residue at 1059
C for 30 minutes, allow to cool in a
desiccator, and weigh: the difference between the mass of
the residue and the mass obtained from a blank determination does not exceed 5.0 mg.
Conductivity <2.51> Perform the test as directed in the
Conductivity Measurement with the supernatant liquid ob-

tained in the pH as the sample solution, and determine the conductivity at 25 ± 0.1°C. Determine in the same way the conductivity of water used for the preparation of the sample solution: the difference between these conductivities is not more than 75 μS cm⁻¹.

**Loss on drying** Not more than 7.0% and within a range as specified on the label (1 g, 105°C, 3 hours).

**Residue on ignition** Not more than 0.1% (2 g).

**Bulk density** (i) Apparatus—Use a volumeter shown in the figure. Put a No.8.6 sieve (2000 μm) on the top of the volumeter. A funnel is mounted over a baffle box, having four glass baffle plates inside which the sample powder slides as it passes. At the bottom of the baffle box is a funnel that collects the powder, and allows it to pour into a sample.
receiving cup mounted directly below it.

(ii) Procedure—Weigh accurately the mass of a brass or stainless steel cup, which has a capacity of 25.0 ± 0.05 mL and an inside diameter of 30.0 ± 2.0 mm, and put the cup directly below the funnel of the volumeter. Slowly pour Microcrystalline Cellulose 5.1 cm height from the upper part of the powder funnel through the sieve, at a rate suitable to prevent clogging, until the cup overflows. If the clogging occurs, take out the sieve. Level the excess powder with the aid of a slide glass, weigh the filled cup, and weigh accurately the content of the cup, and then calculate the bulk density by the following expression: the bulk density is within the labeled specification.

\[
\text{Bulk density (g/cm}^3\text{)} = \frac{A}{25}
\]

\(A: \text{Measured mass (g) of the content of the cup}\)

*Microbial limit* \(<4.0\)—The acceptance criteria of TAMC and TYMC are \(10^3\) CFU/g and \(10^2\) CFU/g, respectively. *Escherichia coli*, *Salmonella*, *Pseudomonas aeruginosa* and *Staphylococcus aureus* are not observed.

*Containers and storage* Containers—Tight containers.

**Powdered Cellulose**

粉末セルロース

[9004-34-6, Cellulose]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the text that are not harmonized are marked with symbols (*) and ( ).

Powdered Cellulose is a purified, mechanically disintegrated alpha cellulose obtained as a pulp, *after partial hydrolysis as occasion demands*, from fibrous plant materials.

The label indicates the mean degree of polymerization value with a range.

*Description* Powdered Cellulose occurs as a white powder.

It is practically insoluble in water, in ethanol (95) and in diethyl ether.

Identification (1) Dissolve 20 g of zinc chloride and 6.5 g of potassium iodide in 10.5 mL of water, add 0.5 g of iodine, and shake for 15 minutes. Place about 10 mg of Powdered Cellulose on a watch glass, and disperse in 2 mL of this solution: the substance develops a blue-violet color.

(2) Mix 30 g of Powdered Cellulose with 270 mL of water in a high-speed (18,000 revolutions per minute or more) blender for 5 minutes, transfer 100 mL of the dispersion to a 100-mL graduated cylinder, and allow to stand for 1 hour: a supernatant liquid appears above the layer of the cellulose.

(3) Transfer 0.25 g of Powdered Cellulose, accurately weighed, to a 125-mL conical flask, add exactly 25 mL of each of water and 1 mol/L cupriethylenediamine TS, and proceed as directed in the Identification (3) under Microcrystalline Cellulose. The mean degree of polymerization, \( \bar{P} \), is not less than 440 and is within the labeled specification.

**Celmoleukin (Genetical Recombination)**

セルモロイキン（遺伝子組換え）

\[
\text{Celmoleukin} \leftrightarrow \text{Celmoleukin (Genetical Recombination)}
\]

\[
\text{C}_{693}\text{H}_{1118}\text{N}_{178}\text{O}_{203}\text{S}_{7}: 15415.82
\]

The desired product of Celmoleukin (Genetical Recombination) is a protein consisting of 133 amino acid residues manufactured by *E. coli* through expression of human interleukin-2 cDNA. It is a solution having a T-lymphocyte activating effect. It contains not less than 0.5 and not more than 1.5
mg of protein per mL, and 1 mg of this protein contains potency not less than 8.0 × 10^6 units.

**Description** Celmoleukin (Genetical Recombination) occurs as a colorless, clear liquid.

**Identification (1)** To 1 mL of Celmoleukin (Genetical Recombination) add 0.05 mL of diluted copper (II) sulfate TS (1 in 10), shake, add 0.9 g of potassium hydroxide, and shake. When 0.3 mL of ethanol (99:5) is added to this solution and shaken, the ethanol layer exhibits a violet color.

(2) Based on the results of the Assay (1), place an amount of Celmoleukin (Genetical Recombination) equivalent to about 50 μg of protein in two hydrolysis tubes, and evaporate to dryness under vacuum. To one of the tubes add 100 μL of a mixture of diluted hydrochloric acid (59 → 125), mercapto acetic acid and phenol (100:10:1), and shake. Place this hydrolysis tube in a vial and humidify the inside of the vial with 200 μL of the mixture of diluted hydrochloric acid (59 → 125), mercapto acetic acid and phenol (100:10:1). Replace the vial interior with inert gas or reduce the pressure, and heat for 24 hours at about 115°C. After drying under vacuum, dissolve in 0.5 mL of 0.02 mol/L hydrochloric acid TS, and use this solution as the sample solution (1). To the other hydrolysis tube, add 100 μL of ice cold performic acid, oxidize for 1.5 hours on ice, add 50 μL of hydrobromic acid, and dry under vacuum. Add 200 μL of water, repeat the dry under vacuum procedure two more times, place the hydrolysis tube in a vial, and humidify the inside of the vial with 200 μL of diluted hydrochloric acid (59 → 125). Replace the vial interior with inert gas or reduce the pressure, and heat for 24 hours at about 115°C. After drying under vacuum, dissolve in 0.5 mL of 0.02 mol/L hydrochloric acid TS, and use this solution as the sample solution (2). Separately, accurately weigh 60 mg of L-aspartic acid, 100 mg of L-glutamic acid, 17 mg of L-alanine, 23 mg of L-methionine, 21 mg of L-tyrosine, 24 mg of L-histidine hydrochloride monohydrate, 58 mg of L-threonine, 22 mg of L-proline, 14 mg of L-cystine, 45 mg of L-isoleucine, 37 mg of L-phenylalanine, 32 mg of L-arginine hydrochloride, 32 mg of L-serine, 6 mg of glycine, 18 mg of L-valine, 109 mg of L-leucine, 76 mg of L-lysine hydrochloride, and 8 mg of L-tryptophan, add 0.1 mol/L hydrochloric acid TS to dissolve to make 500 mL, add 40 μL of this solution to two hydrolysis tubes, and evaporate to dryness under vacuum to make the standard solutions calculate the molar number of the amino acids contained in 1 mL of the sample solutions. Further-

**Operating conditions—**

**System suitability**—

System performance: Add 2 μL of 2-mercaptoethanol to 100 μL of celmoleukin for liquid chromatography, leave for 2 hours at 37°C, and then run this solution under the above conditions. Under these conditions, celmoleukin and its reduced form are eluted in this order with the resolution between these peaks being not less than 1.5.

(4) Add 100 μL of protein digestive enzyme TS to 100 μL of Celmoleukin (Genetical Recombination), shake, leave standing for 18 to 24 hours at 37°C, and then add 2 μL of 2-mercaptoethanol. Leave for a further 30 minutes at 37°C, and add 5 μL of trifluoroacetic acid solution (1 in 10). This is the sample solution. Separately, process celmoleukin for liquid chromatography using the same method. This is the standard solution. Perform the test using 50 μL of each both the sample and standard solutions as directed under Liquid Chromatography to compare the chromatograms obtained from the sample and standard solutions, the retention times for the sample and standard solutions are identical, and the peak heights are similar.

**Flow:** Adjust so that the retention time of celmoleukin is about 70 minutes.
moleukin to hole B. Add 50 μL of culture medium for celmoleukin to another hole (hole C). After shaking the microtest plate, warm for 30 minutes to 2 hours at 37°C in air containing 5% carbon dioxide. Next, add to each hole 50 μL of culture medium for celmoleukin containing the interleukin-2 dependent mouse natural killer cells NKC3 and culture for 16 to 24 hours at 37°C. Add 3-(4,5-dimethylthiazole-2-yl)-2,5-diphenyl-2H-tetrazolium bromide TS, culture for 4 to 6 hours at 37°C, and add sodium lauryl sulfate TS and leave for 24 to 48 hours. When the absorbance at 590 nm of the solution in each hole is measured as directed under Ultraviolet-visible Spectrophotometry (<2.24>, the difference in absorbance between the solutions from holes A and C is not more than 3% of the difference in absorbance between the solutions from holes B and C.

**pH 2.54–4.5–5.5**

**Purity (1)** Host cell-derived protein—Prepare a sample solution by the accurate two times stepwise dilution of Celmoleukin (Genetical Recombination) with phosphate buffer-sodium chloride TS (hereinafter referred to as PBS) containing bovine serum. Prepare a series of 5 standard solutions by accurately diluting E. coli protein (hereinafter referred to as ECP) over a range of 0.25 to 6 ng per mL with PBS containing bovine serum. Pipet 100 μL of goat anti-ECP antibody TS into each hole of a flat-bottomed microtest plate, leave for 16 to 24 hours at 4°C, and then remove the liquid. Wash three times with PBS, add 200 μL of PBS containing bovine serum albumin, leave for at least 3 hours at room temperature, and then wash three more times with PBS. Pipet 100 μL of the sample solution and each standard solution into each hole, leave for 16 to 24 hours at 4°C, and then wash 5 times with PBS. Add 100 μL of peroxidase-labeled rabbit anti-ECP antibody Fab’ TS, leave for at least 4 hours at room temperature, and wash 5 times with PBS. Next, add 100 μL of substrate buffer for celmoleukin, allow to react for 5 to 25 minutes at room temperature in a dark place, and then add 100 μL of diluted sulfuric acid (3 in 25). Measure the absorbances of these flat-bottomed microtest plates by Ultraviolet-visible Spectrophotometry (<2.24> at a wavelength of 492 nm. Separately, using 100 μL of PBS containing bovine serum, perform a blank test using the same method and correct. Determine the absorbance of each standard solution, prepare a calibration curve, calculate the amount of ECP per mL of the sample solution, and multiply by the sample solution dilution factor. When determining the concentration of ECP per mg of protein in the sample solution, there is not more than 0.02% (0.2 μg/mg of protein).

(2) Polymers—Dilute (at least 4 steps) the sample solution prepared in the Identification (3) with buffer solution for celmoleukin so that the protein content is within the range of about 2 to 32 μg per mL to prepare a series of standard solutions. Pipet 20 μL of the sample solution or each of the standard solutions into the stacking gel well, and perform vertical uncoupled buffer SDS-polyacrylamide gel electrophoresis followed by immersion in Coomassie staining TS. Each electrophoretic band is stained blue. Next, determine the peak area of the electrophoretic bands obtained from each standard solution using a densitometer and calculate the protein content using the calibration curve mentioned above. When determining the polymer proteins derived from celmoleukin, other than celmoleukin monomer, the amount is not more than 2% in relation to the total protein.

(3) Related substances—Perform the test with 10 μL each of Celmoleukin (Genetical Recombination) and 0.01 mol/L acetic acid buffer solution, pH 5.0, as directed under Liquid Chromatography (<2.07> under the following conditions, and measure the area of each peak by an automatic integration method. When the amount of related substances other than celmoleukin is calculated by the area percent method, the total amount is not more than 5%.

**Operating conditions—**

Column: Stainless steel tube with an inside diameter of 4 mm and a length of 30 cm packed with octadecylsilanized silica gel for liquid chromatography (particle size: 5 μm).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: A solution of trifluoroacetic acid in a mixture of acetic acid and water (3:2) (1 in 1000).

Mobile phase B: A solution of trifluoroacetic acid in a mixture of acetic acid and water (13:7) (1 in 1000).

Mobile phase flow: The concentration gradient is controlled by changing the ratio of mobile phases A and B as shown in the table below.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 60</td>
<td>70 → 10</td>
<td>30 → 90</td>
</tr>
</tbody>
</table>

Flow: Adjust so that the retention time of celmoleukin is about 50 minutes.

Time span of measurement: About 1.3 times as long as the retention time of celmoleukin beginning after the solvent peak.

**System suitability—**

Test for required detectability: Measure exactly 0.5 mL of Celmoleukin (Genetical Recombination), and add 0.01 mol/L acetic acid buffer solution, pH 5.0, to make exactly 50 mL. Confirm that the celmoleukin peak area obtained from 10 μL of this solution is 0.9 to 1.1% of the peak area obtained from 10 μL of Celmoleukin (Genetical Recombination).

System performance: Add 2 μL of 2-mercaptoethanol to 100 μL of Celmoleukin (Genetical Recombination), leave for 2 hours at 37°C, and then run this solution under the above conditions. Celmoleukin and its reduced form are eluted in this order with the resolution between these peaks being not less than 3.0.

**Ammonium acetate** Measure exactly 0.1 mL of Celmoleukin (Genetical Recombination), and add water to make exactly 10 mL. This is the sample solution. Separately, accurately weigh about 0.1 g of ammonium chloride, and add water to make exactly 100 mL. Measure exactly 5 mL of this solution, and add water to make exactly 100 mL. This is the standard stock solution. Measure exactly 3 mL of the standard stock solution, and add water to make exactly 50 mL. This is the standard solution. Perform the test with exactly 25 μL each of the sample solution and standard solution as directed under Liquid Chromatography (<2.07> according to the following conditions. When determining the area of the
ammonium ion peak $A_1$ and $A_S$, Celmoleukin (Genetical Recombination) contains from 0.28 to 0.49 mg of ammonium acetate per mL.

Amount (mg) of ammonium acetate (CH₃COONH₄) per mL = $A_1/A_S \times M_S \times 0.003 \times 1.441$

$M_S$: Amount (mg) of ammonium chloride

0.003: Dilution correction coefficient

1.4410: Molecular weight conversion coefficient for converting ammonium chloride to ammonium acetate

Operating conditions—

Detector: Electronic conductivity detector.

Column: Resin column with an inside diameter of 5 mm and a length of 25 cm packed with weakly acidic ion exchange resin for liquid chromatography (particle size: 5.5 μm).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Diluted 0.1 mol/L methanesulfonic acid TS (3 in 10).

Flow: Adjust the flow so that the retention time of ammonium is about 8 minutes.

System suitability—

System performance: Measure exactly 1 mL of Standard Sodium Stock Solution and 0.2 mL of Standard Potassium Stock Solution, and then add water to make exactly 100 mL. Measure exactly 5 mL of this solution and 3 mL of Standard Ammonium Solution, and then add water to make exactly 50 mL. When 25 μL of this solution is run under the above conditions, sodium, ammonium and potassium are eluted in this order with the resolution between the peaks of sodium and ammonium being not less than 3.0.

System repeatability: When the test is repeated 5 times with 25 μL of the standard solution under the above conditions, the relative standard deviation of the ammonium peak area is not more than 10%.

Bacterial endotoxins <4.06> Less than 100 EU/mL.

Sterility <4.06> Perform the test according to the Direct method: it meets the requirement. In the test, add 0.5 mL of Celmoleukin (Genetical Recombination) to 8 test tubes and 1.0 mL of Celmoleukin (Genetical Recombination) to 8 test tubes containing 15 mL of thiglycyl acid I for sterility test, as well as 1.0 mL of Celmoleukin (Genetical Recombination) to 8 test tubes containing 15 mL of soybean-casein digest medium.

Assay (1) Total protein content—Measure accurately 1 mL of Celmoleukin (Genetical Recombination) and add water to make exactly 10 mL. This is the sample solution. Separately, weigh accurately about 50 mg of bovine serum albumin for assay in water to prepare standard dilution solutions of 50, 100, and 150 μg/mL. Measure exactly 1 mL of the sample solution and each standard dilution solution, add exactly 2.5 mL of alkaline copper TS for protein content determination, shake, and leave for 15 minutes. Next, add exactly 2.5 mL of water and 0.5 mL of dilute Folin’s TS, and leave for 30 minutes at 37°C. Measure the absorbances of these solutions at 750 nm as directed under Ultraviolet-visible Spectrophotometry <2,24>, using 1 mL of water processed in the same way as control. Using the calibration curve prepared from the absorbance of the standard dilution solution, calculate the protein content of Celmoleukin (Genetical Recombination).

(2) Specific activity—Measure exactly 0.1 mL of Celmoleukin (Genetical Recombination) and add exactly 0.9 mL of culture medium for clemoleukin to make the sample solution. Separately, take one Interleukin-2 RS and add exactly 1 mL of water to dissolve. This is the standard solution. Accurately serially dilute the sample and standard solutions in two-fold steps with culture medium for clemoleukin, and add equal volumes of interleukin-2 dependent mouse natural killer NKC3 cells to the serially diluted solutions. The control solution is a mixture of equal volumes of interleukin-2 dependent mouse natural killer NKC3 and culture medium for clemoleukin. Incubate these solutions for 16 to 24 hours at 37°C. Following this, add a volume of 3(4,5-dimethylthiazole-2-yl)-2,5-diphenyl-2H-tetrazolium bromide TS that is 1/5 that of the volume of culture medium for clemoleukin, incubate for 4 to 6 hours at 37°C, add a volume of sodium lauryl sulfate TS equivalent to the volume of the culture medium for clemoleukin, and leave for 24 to 48 hours. After eluting the blue-colored pigment generated, perform the test on these solutions as directed under Ultraviolet-visible Spectrophotometry <2,24>, and measure the absorbance at 590 nm. Taking the absorbance obtained when 1000 to 2000 units of clemoleukin per mL are added as 100% and the absorbance of the control solution as 0%, determine the dilution factor (A) of the Interleukin-2 RS that shows an absorbance of 50% and dilution factor of Celmoleukin (Genetical Recombination) (B). Multiply the B/A value by the unit number of the Interleukin-2 RS to calculate the biological activity of 1 mL of Celmoleukin (Genetical Recombination). Calculate the ratio of biological activity in relation to protein content determined in the total protein content test.

Containers and storage Containers—Sterilized, tight containers.

Storage—Store at −20°C or lower.

Cetanol セタノール

Cetanol is a mixture of solid alcohols, and consists chiefly of C₁₆H₃₁O: 242.44.

Description Cetanol occurs as unctuous, white flakes, granules, or masses. It has a faint, characteristic odor. It is tasteless.

It is very soluble in pyridine, freely soluble in ethanol (95), in ethanol (99.5) and in diethyl ether, very slightly soluble in acetic anhydride, and practically insoluble in water.

Melting point <1.13> 47–53°C Prepare the sample according to Method 2, then attach tightly a capillary tube to the bottom of the thermometer by means of a rubber band or by any suitable means, and make the bottom of the capillary tube equal in position to the lower end of the thermometer. Insert this thermometer into a test tube 17 mm in inside diameter and about 170 mm in height, fasten the thermometer with cork stopper so that the lower end of the thermometer is about 25 mm distant from the bottom of the test tube. Suspend the test tube in a beaker containing water, and heat the beaker with constant stirring until the temperature rises
Cetirizine Hydrochloride

C₂₁H₂₅ClN₂O₃·2HCl: 461.81
2-((2-(4-[[RS]-4-Chlorophenyl][phenyl]methyl)piperazin-1-yl)ethoxy)acetic acid dihydrochloride

Cetirizine Hydrochloride, when dried, contains not less than 99.0% and not more than 101.0% of C₂₁H₂₅ClN₂O₃·2HCl.

Description Cetirizine Hydrochloride occurs as a white crystalline powder.

It is very soluble in water, and slightly soluble in ethanol (99.5).

It dissolves in 0.1 mol/L hydrochloric acid TS.

A solution of Cetirizine Hydrochloride (1 in 10) shows no optical rotation.

Identification (1) Determine the absorption spectrum of a solution of Cetirizine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Determine the infrared absorption spectrum of Cetirizine Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25S>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Cetirizine Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> for chloride.

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Cetirizine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 0.10 g of Cetirizine Hydrochloride in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area of each solution by the automatic integration method: the area of each peak other than cetirizine obtained from the sample solution is not larger than the peak area of cetirizine from the standard solution. Furthermore, the total area of the peaks other than cetirizine is not larger than 2.5 times the peak area of cetirizine from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 4.0 mm in inside diameter and 25 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of acetonitrile and diluted 0.5 mol/L sulfuric acid TS (2 in 25) (47:3).

Flow rate: Adjust the flow rate so that the retention time of cetirizine is about 9 minutes.

Time span of measurement: About 3 times as long as the retention time of cetirizine, beginning after the solvent peak.

System suitability—

Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cetirizine obtained from 10 μL of this solution is equivalent to 35 to 65% of that from 10 μL of the standard solution.

System performance: Dissolve 20 mg of Cetirizine Hydrochloride in the mobile phase to make 100 mL. To 5 mL of this solution, add 3 mL of a solution of aminopyrine in the mobile phase (1 in 2500), and adjust the mobile phase to make 20 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, cetirizine and aminopyrine are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cetirizine is not more than 2.0%.

Loss on drying <2.4f> Not more than 0.5% (1 g, in vacuum, 60°C, 3 hours).

Residue on ignition <2.4f> Not more than 0.2% (1g).

Assay Weigh accurately about 0.1 g of Cetirizine Hydrochloride, previously dried, dissolve in 70 mL of a mixture of acetone and water (7:3), and titrate <2.5d> to the second equivalence point with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 15.39 mg of C₂₁H₂₅ClN₂O₃·2HCl
Containers and storage  Containers—Well-closed containers.

Cetirizine Hydrochloride Tablets

Cetirizine Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of cetirizine hydrochloride (C21H25ClN2O3·2HCl: 461.81).

Method of preparation  Prepare as directed under Tablets, with Cetirizine Hydrochloride.

Identification  To a quantity of powdered Cetirizine Hydrochloride Tablets, equivalent to 10 mg of Cetirizine Hydrochloride according to the labeled amount, add about 70 mL of 0.1 mol/L hydrochloric acid TS, shake, add 0.1 mol/L hydrochloric acid TS to make 100 mL, and filter. To 4 mL of the filtrate add 0.1 mol/L hydrochloric acid TS to make 25 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.2.4): it exhibits a maximum between 230 nm and 234 nm.

Uniformity of dosage units  Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Take 1 tablet of Cetirizine Hydrochloride Tablets, add 4V/5 mL of sodium 1-heptanesulfonate solution (1 in 5000) adjusted to pH 3.0 with 0.5 mol/L sulfuric acid TS, shake, add ultrasonic waves for 20 minutes, adjust the volume to exactly V mL, by adding sodium 1-heptanesulfonate solution (1 in 5000) adjusted to pH 3.0 with 0.5 mol/L sulfuric acid TS, so that each mL contains about 0.2 mg of cetirizine hydrochloride (C21H25ClN2O3·2HCl), and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 3 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add exactly 2 mL of the internal standard solution, add acetonitrile to make exactly 10 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

\[
M_5 = M_s \times \frac{Q_t}{Q_s} \times \frac{S}{100}
\]

Amount (mg) of cetirizine hydrochloride
(C21H25ClN2O3·2HCl)

M5: Amount (mg) of cetirizine hydrochloride for assay

Internal standard solution—A solution of propyl parahydroxybenzoate in the mobile phase (1 in 1000).

Operating conditions—

System suitability—

Mobile phase: A mixture of a solution of sodium 1-heptanesulfonate (1 in 2900) and acetonitrile (29:21), adjusted to pH 3.0 with 0.5 mol/L sulfuric acid TS.

Flow rate: Adjust the flow rate so that the retention time of cetirizine is about 5 minutes.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, cetirizine and the internal standard are eluted in this order with the resolution between these peaks being not less than 7.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cetirizine to that of the internal standard is not more than 1.0%.

Containers and storage  Containers—Well-closed containers.
Cetraxate Hydrochloride

セトラキサート塩酸塩

\[ \text{Cetrazate Hydrochloride} \]

\[
\text{C}_{17}\text{H}_{23}\text{NO}_4\text{HCl}: 341.83
\]

3-\{4-\{4-\{2,4,6-\text{Triaminophenyl}\}propionic acid\}\}monohydrochloride

[27724-96-5]

Cetraxate Hydrochloride, when dried, contains not less than 98.5% of \( \text{C}_{17}\text{H}_{23}\text{NO}_4\text{HCl} \).

**Description**

Cetraxate Hydrochloride occurs as white crystals or crystalline powder.

It is soluble in methanol, sparingly soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 236°C (with decomposition).

**Identification**

(1) Determine the absorption spectrum of a solution of Cetraxate Hydrochloride in methanol (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 0.5 g of Cetraxate Hydrochloride in 5 mL of a mixture of water and 2-propanol (1:1) by warming, cool to below 25°C. Filter, dry the formed crystals in vacuum for 4 hours, and further dry at 105°C for 1 hour. Determine the infrared absorption spectrum of the dried matter as directed in the potassium chloride disk method under Infrared Spectroscopy <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Cetraxate Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> (2) for chloride.

**Purity**

(1) Heavy metals <1.07>—Proceed with 2.0 g of Cetraxate Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Cetraxate Hydrochloride according to Method 3, and perform the test with a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 5) (not more than 2 ppm).

(3) cis Isomer—Dissolve 0.10 g of Cetraxate Hydrochloride in 10 mL of water, and use this solution as the sample solution. To exactly 5 mL of the sample solution add water to make exactly 100 mL. To exactly 2 mL of this solution add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak which has a retention time 1.3 to 1.6 times that of cetraxate from the sample solution is not larger than the peak area of cetraxate from the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Adjust the pH of a mixture of water, methanol, and 0.5 mol/L ammonium acetate TS (15:10:4) to 6.0 with acetic acid (31).

Flow rate: Adjust the flow rate so that the retention time of cetraxate is about 10 minutes.

**System suitability**

System performance: Dissolve 0.02 g of Cetraxate Hydrochloride and 0.01 g of phenol in 100 mL of water. To 2 mL of this solution add water to make 20 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, cetraxate and phenol are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cetraxate is not more than 2.0%.

(4) 3-(\{p-Hydroxyphenyl\}\)propionic acid—To 0.10 g of Cetraxate Hydrochloride add exactly 2 mL of the internal standard solution and methanol to make 10 mL, and use this solution as the sample solution. Separately, dissolve 25 mg of 3-(\{p-hydroxyphenyl\}\)propionic acid in methanol to make exactly 100 mL. To exactly 2 mL of this solution add exactly 2 mL of the internal standard solution and methanol to make 10 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \( Q_T \) and \( Q_S \), of the peak area of 3-(\{p-hydroxyphenyl\}\)propionic acid to that of the internal standard: \( Q_T \) is not larger than \( Q_S \).

**Internal standard solution**

A solution of caffeine in methanol (1 in 4000).

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Adjust the pH of a mixture of water, methanol, and 0.5 mol/L ammonium acetate TS (15:5:2) to 5.5 with acetic acid (31).

Flow rate: Adjust the flow rate so that the retention time of 3-(\{p-hydroxyphenyl\}\)propionic acid is about 7 minutes.

**System suitability**

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, 3-(\{p-hydroxyphenyl\}\)propionic acid and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of 3-(\{p-hydroxyphenyl\}\)propionic acid to that
of the internal standard is not more than 1.0%.

(5) Related substances—Dissolve 0.10 g of Cetraxate Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 µL of each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and acetic acid (100:20:4:3) to a distance of about 10 cm, and air-dry the plate. Spray evenly ninhydrin TS on the plate, and heat at 90°C for 10 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (0.5 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Cetraxate Hydrochloride, previously dried, dissolve in 100 mL of water, and adjust the pH of this solution to between 7.0 and 7.5 with dilute sodium hydroxide TS. To this solution add 10 mL of chloroform, previously dried, dissolve in 100 mL of water, and make the test with this solution. Prepare the control solution as follows: To 0.10 mL of 0.01 mol/L hydrochloric acid VS add 30 mL of methanol, 10 mL of dilute nitric acid and water to make 50 mL (not more than 0.1%).

Each mL of 0.1 mol/L sodium hydroxide VS = 34.18 mg of C₂₄H₄₀O₄·3·H₂O·HCl

**Containers and storage** Containers—Tight containers.

---

**Chenodeoxycholic Acid**

ケノデオキシコール酸

C₂₄H₄₀O₄: 392.57
3α,7α-Dihydroxy-5β-cholan-24-oic acid

[778-25-9]

Chenodeoxycholic Acid, when dried, contains not less than 98.0% and not more than 101.0% of C₂₄H₄₀O₄.

**Description** Chenodeoxycholic Acid occurs as white, crystals, crystalline powder or powder. It is freely soluble in methanol and in ethanol (99.5), soluble in acetone, and practically insoluble in water.

**Identification** Determine the infrared absorption spectrum of Chenodeoxycholic Acid, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> [α]D²⁰: +11.0 – +13.0° (after drying, 0.4 g, ethanol (99.5), 20 mL, 100 nm).

**Melting point** <2.60> 164 – 169°C

**Purity**

(1) Chloride <1.02>—Dissolve 0.36 g of Chenodeoxycholic Acid in 30 mL of methanol, add 10 mL of dilute nitric acid and water to make 50 mL, and perform the test with this solution. Prepare the control solution as follows: To 1.0 mL of 0.01 mol/L hydrochloric acid VS add 30 mL of methanol, 10 mL of dilute nitric acid and water to make 50 mL (not more than 0.1%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Chenodeoxycholic Acid according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Barium—To 2.0 g of Chenodeoxycholic Acid add 100 mL of water, and boil for 2 minutes. To this solution add 2 mL of hydrochloric acid, boil for 2 minutes, filter after cooling, and wash the filter with water until to get 100 mL of the filtrate. To 10 mL of the filtrate add 1 mL of dilute sulfuric acid: no turbidity is appeared.

(4) Related substances—Dissolve 0.20 g of Chenodeoxycholic Acid in a mixture of acetone and water (9:1) to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 10 mg of lithocholic acid for thin-layer chromatography in the mixture of acetone and water (9:1) to make exactly 10 mL. Pipet 2 mL of this solution, add the mixture of acetone and water (9:1) to exactly 100 mL, and use this solution as the standard solution (1). Separately, dissolve 10 mg of ursodeoxycholic acid in the mixture of acetone and water (9:1) to make exactly 100 mL, and use this solution as the standard solution (2). Separately, dissolve 10 mg of cholic acid for thin-layer chromatography in the mixture of acetone and water (9:1) to make exactly 100 mL, and use this solution as the standard solution (3). Pipet 1 mL of the sample solution, and add the mixture of acetone and water (9:1) to make exactly 20 mL. Pipet 0.5 mL, 1 mL, 2 mL, 3 mL and 5 mL of this solution, add the mixture of acetone and water (9:1) to each of them to make exactly 50 mL, and designate these solutions as standard solution A, standard solution B, standard solution C, standard solution D and standard solution E, respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 µL of each of the sample solution, standard solutions (1), (2), (3) and standard solutions A, B, C, D and E on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 4-methyl-2-pentanone, toluene and formic acid (16:6:1) to a distance of about 15 cm, air-dry the plate, and further dry at 120°C for 30 minutes. Immediately, spray evenly a solution of phosphomolybdic acid n-hydrate in ethanol (95) (1 in 5) on the plate, and heat at 120°C for 2 to 3 minutes: the spot corresponding to the spot with the standard solution (1) is not more intense than the spot with the standard solution (1), the spot corresponding to the spot with the standard solution (2) is not more intense than the spot with the standard solution (2), and the spot corresponding to the spot with the standard solution (3) is not more intense than the spot with the standard solution (3).

As compared to the spots with the standard solutions A, B, C, D and E, the spots other than the principal spot and other than the spots mentioned above are not more intense than the spot with the standard solution E, and the total
Chloral Hydrate / Official Monographs

amount of them is not more than 1.5%.

Loss on drying <2.41> Not more than 1.5% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Chenodeoxycholic Acid, previously dried, dissolve in 40 mL of ethanol (95) and 20 mL of water, and titrate <2.50> with 0.1 mol/L sodium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 165.4 mg of C_2H_3Cl_3O_2

Containers and storage Containers—Tight containers.

Chloral Hydrate

Chloramphenicol

C_11H_12Cl_2N_2O_5: 323.13
2,2-Dichloro-N-{[(1R,2R)-1,3-dihydroxy-1-(4-nitrophenyl)propan-2-yl]acetamide
[56-75-7]

Chloramphenicol contains not less than 980 μg (potency) and not more than 1020 μg (potency) per mg, calculated on the dried basis. The potency of Chloramphenicol is expressed as mass (potency) of chloramphenicol (C_11H_12Cl_2N_2O_5).

Description Chloramphenicol occurs as white to yellowish white, crystals or crystalline powder. It is freely soluble in methanol and in ethanol (99.5), and slightly soluble in water.

Identification (1) Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Chloramphenicol RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Chloramphenicol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Chloramphenicol RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]_D^20 + 18.5 – + 21.5° (1.25 g, ethanol (99.5), 25 mL, 100 mm).

Melting point <2.60> 150 – 155°C

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Chloramphenicol according to Method 2, and perform the test. Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 25 ppm).

(2) Arsenic <1.1D>—Prepare the test solution with 2.0 g of Chloramphenicol according to Method 4, and perform the test (not more than 1 ppm).

(3) Related substances—Dissolve 0.10 g of Chloramphenicol in 10 mL of methanol, and use this solution as the
sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution (1). Pipet 10 mL of the standard solution (1), add methanol to make exactly 20 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.03>.

These solutions, add water to make exactly 100 mL, and use these solutions as the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography, develop the plate with a mixture of chloroform, methanol and acetic acid (100) (79:14:7) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot and the spot on the original obtained from the sample solution are not more intense than the spot from the standard solution (1), and the total amount of these spots is not more than 2.0%.

Loss on drying <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately an amount of Chloramphenicol and Chloramphenicol RS, equivalent to about 0.1 g (potency), dissolve each in 20 mL of methanol, and add water to make exactly 100 mL. Pipet 20 mL each of these solutions, and add water to make exactly 100 mL. Pipet 10 mL each of these solutions, add water to make exactly 100 mL, and use these solutions as the sample solution and standard solution. Determine the absorbances, $A_1$ and $A_2$, at 278 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Amount [µg (potency)] of C11H12Cl2N2O5

$$M_g = M_5 	imes A_1/A_2 	imes 1000$$

$M_5$: Amount [mg (potency)] of Chloramphenicol RS

Containers and storage Containers—Tight containers.

Chloramphenicol Palmitate

Chloramphenicol Palmitate contains not less than 558 µg (potency) and not more than 587 µg (potency) per mg, calculated on the dried basis. The potency of Chloramphenicol Palmitate is expressed as mass (potency) of chloramphenicol (C11H12Cl2N2O5: 323.13).

Description Chloramphenicol Palmitate occurs as a white to grayish white, crystalline powder. It is freely soluble in acetone, sparingly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

Identification (1) Determine the absorption spectrum of a solution of Chloramphenicol Palmitate in ethanol (99.5) (1 in 33,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Chloramphenicol Palmitate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Dissolve 5 mg each of Chloramphenicol Palmitate and Chloramphenicol Palmitate RS in 1 mL of acetone, and use these solutions as the sample solution and the standard solution. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.03>. Spot 5 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetone and cyclohexane (1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot obtained from the sample solution has the same Rf value as the spot from the standard solution.

Optical rotation <2.49> $[\alpha]_2^2$: $+21 - +25^\circ$ (1 g calculated on the dried basis, ethanol (99.5), 20 mL, 100 mm).

Melting point <2.60> 91 - 96°C

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Chloramphenicol Palmitate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Chloramphenicol Palmitate according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 50 mg of Chloramphenicol Palmitate in 50 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. The test should be performed within 30 minutes after the sample solution and standard solution are prepared. Determine each peak area by the automatic integration method: the total area of the peaks other than the peak of chloramphenicol palmitate from the sample solution is not larger than 3.5 times the peak area of chloramphenicol palmitate from the standard solution. For this calculation, use the peak areas for chloramphenicol, having the relative retention time of about 0.5 with respect to chloramphenicol palmitate, and for chloramphenicol dipalmitate, having the relative retention time of about 5.0 with respect to chloramphenicol palmitate, after multiplying by their relative response factors, 0.5 and 1.4, respectively.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 270 nm).

Column: A stainless steel column 6.0 mm in inside diameter and 15 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 20°C.

Mobile phase: Methanol.
Flow rate: Adjust the flow rate so that the retention time of chloramphenicol palmitate is about 5 minutes.

Time span of measurement: About 6 times as long as the retention time of chloramphenicol palmitate.

System suitability—
Test for required detectability: Dissolve 50 mg of Chloramphenicol Palmitate in 50 mL of methanol. Pipet 1 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 5 mL of the solution for system suitability test, and add methanol to make exactly 50 mL. Confirm that the peak area of chloramphenicol palmitate obtained from 20 μL of this solution is equivalent to 7 to 13% of that obtained from 20 μL of the solution for system suitability test.

System performance: When the procedure is run with 20 μL of the solution for system suitability test under the above operating conditions, the number of theoretical plates of the peak of chloramphenicol palmitate is not less than 5000.

System repeatability: When the test is repeated 6 times with 20 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of chloramphenicol palmitate is not more than 1.0%.

Loss on drying <2.41> Not more than 1.0% (1 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

Assay Weigh accurately an amount of Chloramphenicol Palmitate and Chloramphenicol Palmitate RS, equivalent to about 37 mg (potency), dissolve each in 40 mL of methanol and exactly 1 mL of acetic acid (100), and add methanol to make exactly 50 mL. Pipet 10 mL each of these solutions, and exactly 1 mL of acetic acid (100), and add methanol to make about 37 mg (potency), dissolve each in 40 mL of methanol.

Chloramphenicol Sodium Succinate
クロラムフェニコールコハク酸エステルナトリウム

C₁₅H₁₅Cl₂N₂NaO₈: 445.18
Monosodium (2R,3R)-2-(dichloroacetyl)amino-3-hydroxy-3-(4-nitrophenyl)propan-1-yl succinate [982-57-0]

Chloramphenicol Sodium Succinate contains not less than 711 μg (potency) per mg, calculated on the anhydrous basis. The potency of Chloramphenicol Sodium Succinate is expressed as mass (potency) of chloramphenicol (C₁₁H₁₂Cl₂N₂O₅: 323.13).

Description Chloramphenicol Sodium Succinate occurs as white to yellowish white, crystals or crystalline powder.

It is very soluble in water, and freely soluble in methanol and in ethanol (99.5).

It is hygroscopic.

Identification (1) Determine the absorption spectrum of a solution of Chloramphenicol Sodium Succinate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Chloramphenicol Sodium Succinate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Chloramphenicol Sodium Succinate responds to the Qualitative Tests <1.09> (1) for sodium salt.

Optical rotation <2.49> [α]D₉₀: + 5 – + 8° (1.25 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

pH <2.54> The pH of a solution obtained by dissolving 1.4 g of Chloramphenicol Sodium Succinate in 5 mL of water is between 6.0 and 7.0.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Chloramphenicol Sodium Succinate in 10 mL of water: the solution is clear and colorless to yellowish.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Chloramphenicol Sodium Succinate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.10>—Prepare the test solution with 1.0 g of Chloramphenicol Sodium Succinate according to Method 1, and perform the test (not more than 2 ppm).
**Chlordiazepoxide**

クロルジアゼポキシド

C₁₆H₁₄ClN₃O: 299.75
7-Chloro-2-methylamino-5-phenyl-3H-1,4-benzodiazepin-4-oxide
[58-25-3]

Chlordiazepoxide, when dried, contains not less than 98.5% of C₁₆H₁₄ClN₃O.

**Description** Chlordiazepoxide occurs as white to light yellow crystals or crystalline powder.

It is freely soluble in acetate acid (100), sparingly soluble in ethanol (95), very slightly soluble in diethyl ether, and practically insoluble in water.

It dissolves in dilute hydrochloric acid.

It is gradually affected by light.

Melting point: about 240°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Chlordiazepoxide in 0.1 mol/L hydrochloric acid TS (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of Chlordiazepoxide RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Determine the infrared absorption spectra of Chlordiazepoxide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Chlordiazepoxide RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Proceed with Chlordiazepoxide as directed under Flame Coloration Test <1.40> (2), and perform the test: a green color develops.

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Chlordiazepoxide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.20 g of Chlordiazepoxide in exactly 10 mL of a mixture of methanol and ammonia TS (97:3), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of methanol and ammonia TS (97:3) to make exactly 200 mL, and use this solution as the standard solution (2). Perform the test with the these solutions as directed under Thin-layer Chromatography <2.03>. Spot 25 μL of the sample solution and 5 μL each of the standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and ethanol (99:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (1). Spray evenly a solution of sodium nitrite in 1 mol/L hydrochloric acid TS (1 in 100) on the plate, allow to stand for 1 minute, and spray evenly N-(1-naphthyl)-N'-diethylthelyenediamine oxalate-acetone TS on the plate: the spots from the sample solution are not more intense than the spots from the standard solution (2).

**Loss on drying** <2.49> Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Chlordiazepoxide, previously dried, and dissolve in 50 mL of acetic acid (100). Titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the supernatant liquid changes from purple through blue-purple to blue (indicator: 3 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 29.98 mg of C₁₆H₁₄ClN₃O

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Chlordiazepoxide Powder**

クロルジアゼポキシド散

Chlordiazepoxide Powder contains not less than 93.0% and not more than 107.0% of the labeled amount of chlordiazepoxide (C₁₆H₁₄ClN₃O: 299.75).
Method of preparation  Prepare as directed under Granules or Powders, with Chlordiazepoxide.

Identification (1) Weigh a portion of Chlordiazepoxide Powder, equivalent to 0.01 g of Chlordiazepoxide according to the labeled amount, add 100 mL of 0.1 mol/L hydrochloric acid TS, shake, and filter. To 5 mL of the filtrate add 0.1 mol/L hydrochloric acid TS to make 100 mL, and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry. If it exhibits maxima between 244 nm and 248 nm and between 306 nm and 310 nm, and a minimum between 288 nm and 292 nm.

(2) Weigh a portion of Chlordiazepoxide Powder, equivalent to 0.02 g of Chlordiazepoxide according to the labeled amount, add 10 mL of methanol, shake for 5 minutes, then filter by suction through a glass filter (G4), evaporate the filtrate with the aid of a current of air to dryness, and dry the residue in vacuum at 60°C for 1 hour. Determine the infrared absorption spectrum of the residue as directed in the potassium bromide disk method under Infrared Spectrophotometry. It exhibits absorption at the wave numbers of about 1625 cm⁻¹, 1465 cm⁻¹, 1265 cm⁻¹, 850 cm⁻¹ and 765 cm⁻¹.

Purity  Conduct this procedure without exposure to daylight, using light-resistant vessels. To a portion of Chlordiazepoxide Powder, equivalent to 50 mg of Chlordiazepoxide according to the labeled amount, add exactly 5 mL of a mixture of methanol and ammonia TS (97:3), shake, and centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 50 mg of Chlordiazepoxide RS in a mixture of methanol and ammonia TS (97:3) to make exactly 50 mL, and use this solution as the standard solution (1). Dissolve 5.0 mg of 2-amino-5-chlorobenzophenone for thin-layer chromatography in methanol to make exactly 200 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography. Spot 25 μL of the sample solution and 10 μL each of the standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Proceed as directed in the Purity (2) under Chlordiazepoxide.

Assay  Conduct this procedure without exposure to daylight, using light-resistant vessels. Weigh accurately a quantity of Chlordiazepoxide Powder, equivalent to about 0.1 g of chlordiazepoxide (C₁₅H₁₄ClN₃O), transfer to a glass-stoppered flask, wet with exactly 10 mL of water, add exactly 90 mL of methanol, stopper, shake vigorously for 15 minutes, and centrifuge. Pipet 10 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of Chlordiazepoxide RS, previously dried in a desiccator (in vacuum, phosphorus (V) oxide, 60°C) for 4 hours, and dissolve in exactly 10 mL of water and 90 mL of methanol. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and calculate the ratios, Q₁ and Q₀, of the peak area of chlordiazepoxide to that of the internal standard.

Amount (mg) of chlordiazepoxide (C₁₅H₁₄ClN₃O) = Mₛ × Q₁/Q₀

Mₛ: Amount (mg) of Chlordiazepoxide RS

Internal standard solution—A solution of isobutyl salicylate in methanol (1 in 20).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of methanol and 0.02 mol/L ammonium dihydrogen phosphate TS (7:3).
Flow rate: Adjust the flow rate so that the retention time of chlordiazepoxide is about 5 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, chlordiazepoxide and the internal standard are eluted in this order with the resolution between these peaks being not less than 9.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of chlordiazepoxide to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Light-resistant.

Chlordiazepoxide Tablets

クロルジアゼポキシド錠

Chlordiazepoxide Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of chlordiazepoxide (C₁₅H₁₄ClN₃O: 299.75).

Method of preparation  Prepare as directed under Tablets, with Chlordiazepoxide.

Identification (1) Weigh a portion of powdered Chlordiazepoxide Tablets, equivalent to 0.01 g of Chlordiazepoxide according to the labeled amount, add 100 mL of 0.1 mol/L hydrochloric acid TS, shake, and filter. To 5 mL of the filtrate add 0.1 mol/L hydrochloric acid TS to make 100 mL, and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry. If it exhibits maxima between 244 nm and 248 nm and between 306 nm and 310 nm, and a minimum between 288 nm and 292 nm.

(2) Weigh a portion of powdered Chlordiazepoxide Tablets, equivalent to 0.01 g of Chlordiazepoxide according to the labeled amount, add 10 mL of diethyl ether, shake vigorously, and centrifuge. Evaporate 5 mL of the supernatant liquid by warming on a water bath to dryness. Determine the infrared absorption spectrum of the residue as directed in the potassium bromide disk method under Infrared Spectrophotometry. It exhibits absorption at the wave numbers of about 1625 cm⁻¹, 1465 cm⁻¹, 1265 cm⁻¹, 850 cm⁻¹ and 765 cm⁻¹.
Purity  Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. To a portion of powdered Chlordiazepoxide Tablets, equivalent to 50 mg of Chlordiazepoxide according to the labeled amount, add exactly 5 mL of a mixture of methanol and ammonia TS (97:3), shake, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 50 mg of Chlordiazepoxide RS in a mixture of methanol and ammonia TS (97:3) to make exactly 50 mL, and use this solution as the standard solution (1). Dissolve 5.0 mg of 2-amino-5-chlorobenzophenone for thin-layer chromatography in methanol to make exactly 200 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography 2.03. Spot 25 μL of the sample solution and 10 μL each of the standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Proceed as directed in the Purity (2) under Chlordiazepoxide.

Uniformity of dosage units 6.02 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Conduct this procedure using light-resistant vessels. To 1 tablet of Chlordiazepoxide Tablets add 1 mL of water, shake to disintegrate the tablet, then add 20 mL of methanol, shake, add methanol to make exactly 25 mL, and filter through a membrane filter with a pore size not exceeding 0.5 μm. Discard the first 5 mL of the filtrate, take exactly V mL of the subsequent filtrate equivalent to about 2 mg of chlordiazepoxide (C₁₆H₁₄ClN₃O), transfer to a glass-stoppered flask, add 10 mL of water, and shake well to disintegrate. Add 60 mL of methanol, shake well, add methanol to make exactly 100 mL, and centrifuge. Pipet 10 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Chlordiazepoxide RS, previously dried in a desiccator (in vacuum, phosphorus (V) oxide, 60°C) for 4 hours, dissolve in 1 mL of water and a suitable amount of methanol, add exactly 5 mL of the internal standard solution, add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.08 according to the following conditions, and calculate the ratios, Q₁ and Q₅, of the peak area of chlordiazepoxide to that of the internal standard.

\[
M₅ = \frac{M_s \times Q_5}{Q_s \times V} 
\]

M₅: Amount (mg) of Chlordiazepoxide RS

Internal standard solution—A solution of isobutyl salicylate in methanol (1 in 20).

Dissolution 6.10 When the test is performed at 100 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 60 minutes of Chlordiazepoxide Tablets is not less than 70%.

Start the test with 1 tablet of Chlordiazepoxide Tablets, withdraw not less than 30 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 μm. Discard the first 10 mL of the filtrate, pipet the subsequent V mL, add the dissolution medium to make exactly V mL so that each mL contains about 3.7 μg of chlordiazepoxide (C₁₆H₁₄ClN₃O) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 12 mg of chlordiazepoxide for assay, previously dried in a desiccator (in vacuum, phosphorus (V) oxide, 60°C) for 4 hours, and dissolve in the dissolution medium to make exactly 200 mL. Pipet 3 mL of this solution, add the dissolution medium to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A₄ and A₅, of the sample solution and standard solution at 260 nm as directed under Ultraviolet-visible Spectrophotometry 2.24.

Dissolution rate (%) with respect to the labeled amount of chlordiazepoxide (C₁₆H₁₄ClN₃O)

\[
M_s = M \times \frac{A_4}{A_5} \times \frac{V}{V} \times \frac{1}{C} \times \frac{27}{2} 
\]

Mₕ: Amount (mg) of chlordiazepoxide for assay.

C: Labeled amount (mg) of chlordiazepoxide (C₁₆H₁₄ClN₃O) in 1 tablet.

Assay Conduct this procedure without exposure to daylight, using light-resistant vessels. Weigh accurately a quantity of Chlordiazepoxide Tablets, equivalent to about 0.1 g of chlordiazepoxide (C₁₆H₁₄ClN₃O), transfer to a glass-stoppered flask, add 10 mL of water, and shake well to disintegrate. Add 60 mL of methanol, shake well, add methanol to make exactly 100 mL, and centrifuge. Pipet 10 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Chlordiazepoxide RS, previously dried in a desiccator (in vacuum, phosphorus (V) oxide, 60°C) for 4 hours, dissolve in 1 mL of water and a suitable amount of methanol, add exactly 5 mL of the internal standard solution, add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.08 according to the following conditions, and calculate the ratios, Q₁ and Q₅, of the peak area of chlordiazepoxide to that of the internal standard.

\[
M₅ = \frac{M_s \times Q_5}{Q_s \times 10} 
\]

M₅: Amount (mg) of Chlordiazepoxide RS

Internal standard solution—A solution of isobutyl salicylate in methanol (1 in 20).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol and 0.02 mol/L ammonium dihydrogen phosphate TS (7:3).

Flow rate: Adjust the flow rate so that the retention time of chlordiazepoxide is about 5 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, chlordiazepoxide and the internal standard are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of chlordiazepoxide to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.
Chlorhexidine Gluconate Solution

クロルヘキシジングルコン酸塩液

Chlorhexidine Gluconate Solution is a solution of digluconate of chlorhexidine.

It contains not less than 19.0 w/v% and not more than 21.0 w/v% of chlorhexidine gluconate (C22H30Cl2N10.2C6H12O7: 897.76).

Description Chlorhexidine Gluconate Solution is a clear, colorless or pale yellow liquid. It is odorless, and has a bitter taste.

It is miscible with water and with acetic acid (100). 1 mL of Chlorhexidine Gluconate Solution is miscible with not more than 5 mL of ethanol (99.5) and with not more than 3 mL of acetone. By further addition of each of these solvents, a white turbidity is formed.

It is gradually colored by light.

Specific gravity d20 1.06 - 1.07

Identification (1) To 0.05 mL of Chlorhexidine Gluconate Solution add 5 mL of methanol, 1 mL of bromine TS and 1 mL of 8 mol/L sodium hydroxide TS: a deep red color is produced.

(2) To 0.5 mL of Chlorhexidine Gluconate Solution add 10 mL of water and 0.5 mL of copper (II) sulfate TS: a white precipitate is formed. Heat to boiling: the precipitate changes to light purple.

(3) To 10 mL of Chlorhexidine Gluconate Solution add 5 mL of water, cool on ice, and add 5 mL of sodium hydroxide TS dropwise with stirring: a white precipitate is formed. Collect the precipitate by filtration, wash with water, recrystallize from diluted ethanol (95) (7 in 10), and dry at 105°C for 30 minutes: the crystals thus obtained melt <2.60> between 130°C and 134°C.

(4) Neutralize the filtrate obtained in (3) with 5 mol/L hydrochloric acid TS. To 5 mL of this solution add 0.65 mL of acetic acid (100) and 1 mL of freshly distilled phenylhydrazine, and heat on a water bath for 30 minutes. After cooling, scratch the inner wall of the vessel with a glass rod to induce crystallization. Collect the crystals, dissolve in 10 mL of hot water, add a small amount of activated charcoal, and filter. Cool the filtrate, scratch the inner side of the vessel, collect the formed crystals, and dry: the crystals thus obtained melt <2.60> at about 195°C (with decomposition).

pH <2.5> To 5.0 mL of Chlorhexidine Gluconate Solution add water to make 100 mL: the pH of the solution is between 5.5 and 7.0.

Purity 4-Chloroaniline—To 2.0 mL of Chlorhexidine Gluconate Solution add water to make exactly 100 mL. Pipet 5 mL of the solution, and add 20 mL of water and 5 mL of 1 mol/L hydrochloric acid TS. Add 0.3 mL of sodium nitrite TS, shake, and allow to stand for 2 minutes. Add 4 mL of ammonium amidosulfate TS, and then allow to stand for 1 minute. Add 5 mL of N-(1-naphthyl)-N'-diethylethlenediamine oxalate-acetone TS, allow to stand for 10 minutes, add 1 mL of ethanol (95), and then add water to make 50 mL: the color of the solution is not more intense than the following control solution.

Control solution: Dissolve 20 mg of 4-chloroaniline in 10 mL of 1 mol/L hydrochloric acid TS, and add water to make exactly 100 mL. Pipet 5 mL of the solution, and add water to make exactly 100 mL. Pipet 5 mL of the solution, add 20 mL of water and 5 mL of 1 mol/L hydrochloric acid TS, and proceed as directed for the preparation of the sample solution.

Residue on ignition <2.4> Not more than 0.1% (2 g, after evaporation).

Assay Pipet 2 mL of Chlorhexidine Gluconate Solution, evaporate to dryness on a water bath, dissolve the residue in 60 mL of acetic acid for nonaqueous titration, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 22.44 mg of C22H30Cl2N10.2C6H12O7

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Chlorhexidine Hydrochloride

クロルヘキシジン塩酸塩

Chlorhexidine Hydrochloride occurs as a white, crystalline powder. It is odorless, and has a bitter taste.

It is soluble in formic acid, slightly soluble in methanol and in warm methanol, and practically insoluble in water, in ethanol (95) and in diethyl ether. It is gradually colored by light.

Identification (1) Dissolve 0.01 g of Chlorhexidine Hydrochloride in 50 mL of methanol by warming, and add 1 mL of bromine TS and 1 mL of 8 mol/L sodium hydroxide TS: a deep red color is produced.

(2) Dissolve 0.3 g of Chlorhexidine Hydrochloride in 10 mL of 6 mol/L hydrochloric acid TS, cool in ice, and add 10 mL of 8 mol/L sodium hydroxide TS dropwise with stirring: a white precipitate is produced. Collect the precipitate, wash with water, recrystallize from diluted ethanol (95) (7 in 10), and dry at 105°C for 30 minutes: the crystals so obtained melt <2.60> between 130°C and 134°C.

(3) Dissolve 0.1 g of Chlorhexidine Hydrochloride in 50 mL of dilute nitric acid: the solution responds to the Qualitative Tests <1.09> for chloride.

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Chlorhexidine Hydrochloride according to Method 2, and
perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

2. Arsenic (1.11)—To 1.0 g of Chlorhexidine Hydrochloride in a crucible add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10), fire the ethanol (95) to burn, and heat gradually to incinerate. If a carbonized substance remains, moisten with a small amount of nitric acid, and ignite to incinerate. Cool, add 10 mL of dilute hydrochloric acid to the residue, dissolve by warming on a water bath, use this solution as the test solution, and perform the test (not more than 2 ppm).

3. p-Chloroaniline—Dissolve 0.10 g of Chlorhexidine Hydrochloride in 2 mL of formic acid, and add 15 mL of 1 mol/L hydrochloric acid TS and 20 mL of water immediately. Add 0.3 mL of sodium nitrite TS, shake, and allow to stand for 2 minutes. Add 4 mL of ammonium amidosulfate TS, and then allow to stand for 1 minute. Add 5 mL of N-(1-naphthyl)-N’-diethylthelyenediamine oxalate-acetone TS, allow to stand for 10 minutes, and add 1 mL of ethanol (95) and water to make 50 mL: the solution has no more color than the following control solution.

Control solution: Dissolve 20 mg of 4-chloroaniline in 10 mL of 1 mol/L hydrochloric acid TS, and add water to make exactly 100 mL. Pipet 5 mL of the solution, and add water to make exactly 100 mL. To 2.0 mL of the solution add 2 mL of formic acid, 15 mL of 1 mol/L hydrochloric acid TS and 20 mL of water, and proceed in the same manner.

Loss on drying (2.41)—Not more than 2.0% (1 g, 130°C, 2 hours).

Residue on ignition (2.44)—Not more than 0.1% (1 g).

Assay Weigh accurately about 0.2 g of Chlorhexidine Hydrochloride, previously dried, dissolve in 2.0 mL of formic acid, add 60 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 14.46 mg of C22H30Cl2N10.2HCl

Containers and storage Containers—Tight containers.

Storage—Light-resistant, and in a cold place.

Chlorinated Lime

サラシ粉

Chlorinated Lime contains not less than 30.0% of available chlorine (Cl: 35.45).

Description Chlorinated Lime occurs as a white powder. It has a chlorine-like odor.

It dissolves partially in water. The solution changes red litmus paper to blue, then gradually decolorizes.

Identification (1) To Chlorinated Lime add dilute hydrochloric acid: a gas, which has the odor of chlorine, evolves, and the gas changes moistened starch-potassium iodide paper to blue.

2. Shake 1 g of Chlorinated Lime with 10 mL of water, and filter: the filtrate responds to the Qualitative Tests (1.00) (2) and (3) for calcium salt.

Assay Weigh accurately about 5 g of Chlorinated Lime, transfer to a mortar, and triturate thoroughly with 50 mL of water. Transfer to a 500-mL volumetric flask with the aid of water, and add water to make 500 mL. Mix well, immediately take exactly 50 mL of the mixture in an iodine flask, add 10 mL of potassium iodide TS and 10 mL of dilute hydrochloric acid, and titrate with 0.1 mol/L sodium thiosulfate VS (indicator: 3 mL of starch TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS
= 3.545 mg of Cl

Containers and storage Containers—Tight containers.

Storage—Light-resistant, and in a cold place.

Chlormadinone Acetate

クロルマジノン酢酸エステル

C23H29ClO4· 404.93
6-Chloro-3,20-dioxopregna-4,6-dien-17-yl acetate
[302-22-7]

Chlormadinone Acetate, when dried, contains not less than 98.0% of C23H25ClO4.

Description Chlormadinone Acetate occurs as white to light yellow crystals or crystalline powder. It is odorless.

It is freely soluble in chloroform, soluble in acetonitrile, slightly soluble in ethanol (95) and in diethyl ether, and practically insoluble in water.

Identification (1) Dissolve 2 mg of Chlormadinone Acetate in 1 mL of ethanol (95), and add 1 mL of 1,3-dinitrobenzene TS and 1 mL of a solution of potassium hydroxide (1 in 5): a red-purple color develops.

2. To 0.05 g of Chlormadinone Acetate add 2 mL of potassium hydroxide-ethanol TS, and boil on a water bath for 5 minutes. After cooling, add 2 mL of diluted sulfuric acid (2 in 7), and boil gently for 1 minute: the odor of ethyl acetate is perceptible.

3. Determine the infrared absorption spectrum of Chlormadinone Acetate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Chlormadinone Acetate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

4. Perform the test with Chlormadinone Acetate as directed under Flame Coloration Test (1.04) (2): a green color appears.

Optical rotation (2.49) [α]D: −10.0° to −14.0° (after drying, 0.2 g, acetonitrile, 10 mL, 100 mm).

Melting point (2.60) 211–215°C
Purity (1) Heavy metals \(<1.07\>— Proceed with 1.0 g of Chlormadinone Acetate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic \(<1.17\>— Prepare the test solution with 1.0 g of Chlormadinone Acetate according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 20 mg of Chlormadinone Acetate in 10 mL of acetonitrile, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetonitrile to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\> according to the following conditions, and determine each peak area by the automatic integration method: the total area of peaks other than the peak of chlormadinone acetate from the sample solution is not larger than the peak area of chlormadinone acetate from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 236 nm).
Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadeysilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: A mixture of acetonitrile and water (13:7).
Flow rate: Adjust the flow rate so that the retention time of chlormadinone acetate is about 10 minutes.
Time span of measurement: About 1.5 times as long as the retention time of chlormadinone acetate beginning after the solvent peak.
System suitability—
Test for required detection: To exactly 5 mL of the standard solution add acetonitrile to make exactly 50 mL. Confirm that the peak area of chlormadinone acetate obtained from 10 \(\mu\)L of this solution is equivalent to 7 to 13% of that of chlormadinone acetate obtained from 10 \(\mu\)L of the standard solution.
System performance: Dissolve 8 mg of Chlormadinone Acetate and 2 mg of butyl parahydroxybenzoate in 100 mL of acetonitrile. When the procedure is run with 10 \(\mu\)L of this solution under the above operating conditions, butyl parahydroxybenzoate and chlormadinone acetate are eluted in this order with the resolution between these peaks being not less than 8.
System repeatability: When the test is repeated 6 times with 10 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of chlormadinone acetate is not more than 1.0%.

Loss on drying \(<2.41\> Not more than 0.5% (0.5 g, in vacuum, phosphorus (V) oxide, 4 hours).
Residue on ignition \(<2.44\> Not more than 0.1% (0.5 g).
Assay Weigh accurately about 20 mg each of Chlormadinone Acetate and Chlormadinone Acetate RS, previously dried, and dissolve in ethanol (95) to make exactly 100 mL. Pipet 5 mL each of these solutions, to each add ethanol (95) to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry \(<2.24\>, and determine the absorbances, \(A_T\) and \(A_S\), at 285 nm.

\[
\text{Amount (mg) of C}_2\text{H}_9\text{ClO}_4 = M_S \times \frac{A_T}{A_S}
\]

\(M_S\): Amount (mg) of Chlormadinone Acetate RS

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Chlorobutanol

\(\text{クロロブタノール}\)

\(\text{CH}_3\text{Cl}_3\text{H}_7\text{O}\): 177.46
1,1,1-Trichloro-2-methylpropan-2-ol
[57-15-8]

Chlorobutanol contains not less than 98.0% of \(\text{C}_3\text{H}_7\text{Cl}_3\text{O}\), calculated on the anhydrous basis.

Description Chlorobutanol occurs as colorless or white crystals. It has a camphoraceous odor. It is very soluble in methanol, in ethanol (95) and in diethyl ether, and slightly soluble in water. It slowly volatilizes in air. Melting point: not lower than about 76°C.

Identification (1) To 5 mL of a solution of Chlorobutanol (1 in 200) add 1 mL of sodium hydroxide TS, then slowly add 3 mL of iodine TS: a yellow precipitate is produced and the odor of iodoform is perceptible.

(2) To 0.1 g of Chlorobutanol add 5 mL of sodium hydroxide TS, shake well the mixture, add 3 to 4 drops of aniline, and warm gently: the disagreeable odor of phenyl isocyanide (poisonous) is perceptible.

Purity (1) Acidity—Shake thoroughly 0.10 g of the powder of Chlorobutanol with 5 mL of water: the solution is neutral.

(2) Chloride \(<1.07\>— Dissolve 0.5 g of Chlorobutanol in 25 mL of dilute ethanol, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS by adding 25 mL of dilute ethanol, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.071%).

Water \(<2.45\> Not more than 6.0% (0.2 g, volumetric titration, direct titration).

Residue on ignition \(<2.44\> Not more than 0.1% (1 g).

Assay Transfer about 0.1 g of Chlorobutanol, accurately weighed, to a 200-mL conical flask, and dissolve in 10 mL of ethanol (95). Add 10 mL of sodium hydroxide TS, boil under a reflux condenser for 10 minutes, cool, add 40 mL of dilute nitric acid and exactly 25 mL of 0.1 mol/L silver nitrate VS, and shake well. Add 3 mL of nitrobenzene, and shake vigorously until the precipitate is coagulated. Titrate \(<2.50\> the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III))
Chlorphenesin Carbamate

**Description** Chlorphenesin Carbamate occurs as white crystals or a crystalline powder. It is freely soluble in methanol, in ethanol (95) and in pyridine, and slightly soluble in water. A solution of Chlorphenesin Carbamate in ethanol (95) (1 in 20) shows no optical rotation.

**Identification**

1. Determine the absorption spectrum of a solution of Chlorphenesin Carbamate in ethanol (95) (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.
2. Determine the infrared absorption spectrum of Chlorphenesin Carbamate, as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.
3. Perform the test with Chlorphenesin Carbamate as directed under Flame Coloration Test (1.04) (2): a green color appears.

**Melting point** 2.60 88 – 91°C

**Purity**

1. Heavy metals (1.07)—Dissolve 2.0 g of Chlorphenesin Carbamate in 20 mL of ethanol (95), and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 20 mL of ethanol (95), 2 mL of dilute acetic acid and water to make 50 mL (not more than 10 ppm).
2. Arsenic (1.17)—Prepare the test solution with 1.0 g of Chlorphenesin Carbamate according to Method 3, and perform the test (not more than 2 ppm).
3. Chlorphenesin-2-carbamate—Dissolve 0.10 g of Chlorphenesin Carbamate in 20 mL of a mixture of hexane for liquid chromatography and 2-propanol (7:3), and use this solution as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography (2.27) according to the following conditions. Determine the peak area, A, of chlorphenesin carbamate and the peak area, A, of chlorphenesin-2-carbamate by the automatic integration method: the ratio, A/A , is not more than 0.007.

**Operating conditions**

- Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
- Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).
- Column temperature: A constant temperature of about 40°C.
- Mobile phase: A mixture of hexane for liquid chromatography, 2-propanol and acetic acid (100) (700:300:1).
- Flow rate: Adjust the flow rate so that the retention time of chlorphenesin carbamate is about 9 minutes.

**System suitability**

- Test for required detection: Pipet 1 mL of the sample solution, add a mixture of hexane for liquid chromatography and 2-propanol (7:3) to make exactly 100 mL, and use this solution as the solution for system suitability test. To exactly 5 mL of the solution for system suitability test add the mixture of hexane for liquid chromatography and 2-propanol (7:3) to make exactly 10 mL. Confirm that the peak area of chlorphenesin carbamate obtained from 10 μL of this solution is equivalent to 40 to 60% of that of chlorphenesin carbamate obtained from 10 μL of the solution for system suitability test.
- System performance: Dissolve 0.1 g of Chlorphenesin Carbamate in 50 mL of methanol. To 25 mL of this solution add 25 mL of dilute sodium hydroxide TS, and warm at 60°C for 20 minutes. To 20 mL of this solution add 5 mL of 1 mol/L hydrochloric acid TS, shake well with 20 mL of ethyl acetate, and allow to stand to separate the upper layer. When the procedure is run with 10 μL of this layer under the above operating conditions, chlorphenesin, chlorphenesin carbamate and chlorphenesin-2-carbamate are eluted in this order, with the relative retention times of chlorphenesin and chlorphenesin-2-carbamate with respect to chlorphenesin carbamate being about 0.7 and about 1.2, respectively, and with the resolution between the peaks of chlorphenesin and chlorphenesin carbamate being not less than 2.0.
- System repeatability: When the test is repeated 6 times with 10 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak areas of chlorphenesin carbamate is not more than 2.0%.

(4) Related substances—Dissolve 0.10 g of Chlorphenesin Carbamate in 10 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 20 mL. Pipet 2 mL of this solution, add ethanol (95) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.07). Spot 50 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and ammonia solution (28) (17:2:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 20 minutes: the spot other than the principal spot from the sample solution is not more than one, and it is not more intense than the spot from the standard solution.
Chlorphenesin Carbamate Tablets

Chlorphenesin Carbamate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of chlorphenesin carbamate (C_{10}H_{12}ClNO_{4}: 245.66).

Method of preparation Prepare as directed under Tablets, with Chlorphenesin Carbamate.

Identification To a quantity of powdered Chlorphenesin Carbamate Tablets, equivalent to 0.15 g of Chlorphenesin Carbamate according to the labeled amount, add 60 mL of ethanol (95), treat with ultrasonic waves, and add ethanol (95) to make 100 mL. Centrifuge 20 mL of this solution, add ethanol (95) to 1 mL of the supernatant liquid to make 100 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 226 nm and 230 nm, between 279 nm and 283 nm, and between 286 nm and 290 nm.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirements of the Content uniformity test.

To 1 tablet of Chlorphenesin Carbamate Tablets add 10 mL of water to disintegrate the tablet, add 70 mL of a mixture of water and methanol (1:1), treat with ultrasonic waves for 15 minutes with occasional stirring, then add the mixture of water and methanol (1:1) to make exactly 100 mL. Centrifuge this solution, pipet V mL of the supernatant liquid equivalent to about 2.5 mg of chlorphenesin carbamate (C_{10}H_{12}ClNO_{4}), add the mixture of water and methanol (1:1) to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of chlorphenesin carbamate for assay, previously dried in a desiccator (in vacuum, silica gel) for 4 hours, and dissolve in the mixture of water and methanol (1:1) to make exactly 50 mL. Pipet 2 mL of this solution, add the mixture of water and methanol (1:1) to make exactly 20 mL, and use this solution as the standard solution. Determine the absorbances at 280 nm, A_{s} and A_{y}, of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
\text{Amount (mg) of chlorphenesin carbamate (C}_{10}\text{H}_{12}\text{ClNO}_{4}\] = \(M_{5} \times A_{S} / A_{y} \times 1/V \times 5\)

\(M_{5}\): Amount (mg) of chlorphenesin carbamate for assay

Dissolution <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Chlorphenesin Carbamate Tablets is not less than 85%.

Start the test with 1 tablet of Chlorphenesin Carbamate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m. Discard the first 10 mL of the filtrate, pipet \(V\) mL of the subsequent filtrate, add water to make exactly \(V\) mL so that each mL contains about 0.14 mg of chlorphenesin carbamate (C_{10}H_{12}ClNO_{4}) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of chlorphenesin carbamate for assay, previously dried in a desiccator (in vacuum, silica gel) for 4 hours, dissolve in 1 mL of methanol, and add water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Determine the absorbances, \(A_{s}\) and \(A_{S}\), at 278 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
\text{Dissolution rate (\%)} = \frac{M_{5} \times A_{S} / A_{y} \times 1/V \times 450}{C}\]

\(M_{5}\): Amount (mg) of chlorphenesin carbamate for assay

C: Labeled amount (mg) of chlorphenesin carbamate (C_{10}H_{12}ClNO_{4}) in 1 tablet

Assay Weigh accurately the mass of not less than 20 Chlorphenesin Carbamate Tablets, and powder them in an agate mortar. Weigh accurately a portion of the powder, equivalent to about 0.25 g of chlorphenesin carbamate (C_{10}H_{12}ClNO_{4}), add 30 mL of ethyl acetate, disperse using ultrasonic waves, then add ethyl acetate to make exactly 50 mL. Centrifuge 20 mL of this solution, pipet 2 mL of the supernatant liquid, add exactly 2 mL of the internal standard solution, add ethyl acetate to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.1 g of chlorphenesin carbamate for assay, previously dried in a desiccator (in vacuum, silica gel) for 4 hours, and dissolve in ethyl acetate to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 2 mL of the internal standard solution, then add ethyl acetate to make 20 mL, and use this solution as the standard solution. Perform the test with 10 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, \(Q_{T}\) and \(Q_{S}\), of the peak area of chlorphenesin carbamate to that of the internal standard.

\[
\text{Amount (mg) of chlorphenesin carbamate (C}_{10}\text{H}_{12}\text{ClNO}_{4}\] = \(M_{5} \times Q_{T} / Q_{S} \times 5/2\)

\(M_{5}\): Amount (mg) of chlorphenesin carbamate for assay

Internal standard solution—A solution of ethenzamide in...
ethyl acetate (1 in 400).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: A mixture of hexane for liquid chromatography, 2-propanol and acetic acid (100:700:300:1).
Flow rate: Adjust the flow rate so that the retention time of chlorphenesin carbamate is about 9 minutes.

System suitability—
System performance: Proceed as directed in the system suitability in the Purity (3) under Chlorphenesin Carbamate.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of chlorphenesin carbamate to that of the internal standard is not more than 1.5%.

Containers and storage Containers—Well-closed containers.

Chlorpheniramine and Calcium Powder
クロフェニラミン・カルシウム散

Chlorpheniramine and Calcium Powder contains not less than 0.27% and not more than 0.33% of chlorpheniramine maleate (C_{16}H_{19}ClN_{2}·C_{4}H_{4}O_{4}: 390.86).

Method of preparation
Chlorpheniramine Maleate 3 g
Dibasic Calcium Phosphate Hydrate 800 g
Starch, Lactose Hydrate, or their mixture a sufficient quantity

Prepare as directed under Powders, with the above ingredients.

Description Chlorpheniramine and Calcium Powder occurs as a white powder.

Identification (1) Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 263 nm and 267 nm (chlorpheniramine maleate).

(2) To 0.5 g of Chlorpheniramine and Calcium Powder add 10 mL of dilute hydrochloric acid, shake well, and filter: the filtrate responds to the Qualitative Tests <1.09> (3) for calcium salt.

(3) To 0.5 g of Chlorpheniramine and Calcium Powder add 10 mL of dilute nitric acid, shake well, and filter: the filtrate responds to the Qualitative tests <1.09> (2) for phosphate.

(4) Shake 1 g of Chlorpheniramine and Calcium Powder with 5 mL of methanol, filter, and use the filtrate as the sample solution. Separately, dissolve 0.01 g of Chlorpheniramine Maleate RS in 17 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.02>. Spot 10 μL each of the sample solution and standard solution on the plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, acetone and ammonia solution (28) (73:15:10:2) to a distance of about 10 cm. Air-dry the plate, and examine under ultraviolet light (main wavelength: 254 nm): the spots from the sample solution and from the standard solution show the same RT value.

Spray evenly Dragendorff’s TS for spraying upon the plate: the spot from the standard solution and the corresponding spot from the sample solution reveal an orange color.

Assay Weigh accurately about 0.5 g of Chlorpheniramine and Calcium Powder, transfer to a 30-mL glass-stoppered centrifuge tube, add 20 mL of 0.05 mol/L sulfuric acid VS, shake for 5 minutes, centrifuge, and collect the supernatant liquid. Add 20 mL of 0.05 mol/L sulfuric acid VS to the residue, and proceed twice in the same manner mentioned above. Transfer all the supernatant liquid to a 200-mL separator, add 30 mL of diethyl ether, shake, and allow to stand for 5 minutes. Filter the water layer through dry filter paper into another separator. Extract the diethyl ether layer with two 10-mL portions of 0.05 mol/L sulfuric acid VS, filter the extracts into the preceding separator containing the water layer. Wash the filter paper with 5 mL of 0.05 mol/L sulfuric acid VS, combine the washings with the water layer in the preceding separator, and add 10 mL of ammonia TS. Extract with two 50-mL portions of diethyl ether, combine the diethyl ether layer, wash with 20 mL of water, and extract the diethyl ether layer with two 20-mL and 5-mL portions of 0.25 mol/L sulfuric acid VS. Combine all the extracts, add 0.25 mol/L sulfuric acid VS to make exactly 50 mL, and use this solution as the sample solution. Separately, dissolve about 75 mg of Chlorpheniramine Maleate RS, previously dried at 105°C for 3 hours and accurately weighed, in 10 mL of 0.05 mol/L sulfuric acid VS, and add 0.05 mol/L sulfuric acid VS to make exactly 100 mL. Pipet 2 mL of the solution into a 200-mL separator, add 58 mL of 0.05 mol/L sulfuric acid VS and 30 mL of diethyl ether, and shake. Proceed in the same manner as the sample solution, and use this solution as the standard solution. Determine the absorbances, A_T and A_S, of the sample solution and the standard solution at 265 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using 0.25 mol/L sulfuric acid VS as the blank.

Amount (mg) of chlorpheniramine maleate (C_{16}H_{19}ClN_{2}·C_{4}H_{4}O_{4})

\[ M_S = M_f \times A_T / A_S \times 1 / 50 \]

M_S: Amount (mg) of Chlorpheniramine Maleate RS

Containers and storage Containers—Well-closed containers.
Chlorpheniramine Maleate
クロルフェニラミンメチル酸塩

C₁₆H₁₉ClN₂.C₄H₄O₄: 390.86
(3RS)-3-(4-Chlorophenyl)-N,N-dimethyl-3-pyridin-2-ylpropylamine monomaleate
[113-92-8]

Chlorpheniramine Maleate, when dried, contains not less than 98.0% and not more than 101.0% of dl-chlorpheniramine maleate (C₁₆H₁₉ClN₂.C₆H₄O₄).

Description Chlorpheniramine Maleate occurs as white, fine crystals.

It is very soluble in acetic acid (100), freely soluble in water and in methanol, and soluble in ethanol (99.5).

It dissolves in dilute hydrochloric acid.

A solution of Chlorpheniramine Maleate (1 in 20) shows no optical rotation.

Identification (1) Determine the absorption spectrum of a solution of Chlorpheniramine Maleate in 0.1 mol/L hydrochloric acid TS (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry 2.2.A, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Chlorpheniramine Maleate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Chlorpheniramine Maleate, previously dried, as directed in the paste method under Infrared Spectrophotometry 2.2.B, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Chlorpheniramine Maleate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 0.10 g of Chlorpheniramine Maleate in 5 mL of methanol, and use this solution as the sample solution. Separately, dissolve 56 mg of maleic acid in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Liquid Chromatography 2.0.F according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than maleic acid and chlorpheniramine obtained with the sample solution is not larger than 2/3 the peak area of chlorpheniramine with the standard solution, and the total area of the peaks other than maleic acid and chlorpheniramine is not larger than the peak area of chlorpheniramine with the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 8.57 g of ammonium dihydrogen phosphate and 1 mL of phosphoric acid in water to make 1000 mL. To 800 mL of this solution add 200 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of chlorpheniramine is about 11 minutes.

Time span of measurement: About 4 times as long as the retention time of chlorpheniramine beginning after the solvent peak.

System suitability—

Test for required detectability: To exactly 2.5 mL of the standard solution add the mobile phase to make exactly 25 mL. Confirm that the peak area of chlorpheniramine obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the standard solution.

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of chlorpheniramine are not less than 4000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of chlorpheniramine is not more than 4.0%.

Loss on drying 2.4.F Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition 2.4.G Not more than 0.1% (1 g).

Assay Dissolve about 0.4 g of Chlorpheniramine Maleate, previously dried and accurately weighed, in 20 mL of acetic acid (100). Titrate 2.5.D with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through
Chlorpheniramine Maleate Injection

Chlorpheniramine Maleate Injection is an aqueous solution for injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of dl-chlorpheniramine maleate (C₁₆H₁₉ClN₂.C₄H₄O₄: 390.86).

Method of preparation
Prepare as directed under Injections, with Chlorpheniramine Maleate.

Description
Chlorpheniramine Maleate Injection is a clear, colorless liquid.

pH: 4.5 - 7.0

Identification
Take a volume of Chlorpheniramine Maleate Injection, equivalent to 25 mg of Chlorpheniramine Maleate according to the labeled amount, add 5 mL of dilute sodium hydroxide TS, and extract with 20 mL of hexane. Wash the hexane layer with 10 mL of water, shake with 0.5 g of anhydrous sodium sulfate for several minutes, and filter. Evaporate the filtrate in a water bath at 50°C under a reduced pressure, and determine the infrared absorption spectrum of the residue as directed in the liquid film method under Infrared Spectrophotometry (2.25); it exhibits absorption at the wave numbers of about 2940 cm⁻¹, 2810 cm⁻¹, 2770 cm⁻¹, 1589 cm⁻¹, 1491 cm⁻¹, 1470 cm⁻¹, 1434 cm⁻¹, 1091 cm⁻¹ and 1015 cm⁻¹.

Bacterial endotoxins (4.01)
Less than 8.8 EU/mg.

Extractable volume (6.05)
It meets the requirement.

Foreign insoluble matter (6.06)
Perform the test according to Method 1; it meets the requirement.

Insoluble particulate matter (6.07)
Perform the test according to Method 1; it meets the requirement.

Sterility (4.06)
Perform the test according to the Membrane filtration method; it meets the requirement.

Assay
Transfer an exactly measured volume of Chlorpheniramine Maleate Injection, equivalent to about 3 mg of chlorpheniramine maleate (C₁₆H₁₉ClN₂.C₄H₄O₄), to a 100-mL separator, add 20 mL of water and 2 mL of sodium hydroxide TS, and extract with two 50-mL portions of diethyl ether. Determine the absorbances A₁ and A₂ of the sample solution and standard solution at a wavelength of the maximum absorbance at about 265 nm as directed under Ultraviolet-visible Spectrophotometry (2.24).

\[
\text{Amount (mg) of chlorpheniramine maleate} = M_S \times \frac{A_1}{A_2} \times \frac{1}{10}
\]

Containers and storage
Containers—Tight containers. Storage—Light-resistant.

Chlorpheniramine Maleate Powder

Chlorpheniramine Maleate Powder contains not less than 93.0% and not more than 107.0% of the labeled amount of dl-chlorpheniramine maleate (C₁₆H₁₉ClN₂.C₄H₄O₄: 390.86).

Method of preparation
Prepare as directed under Granules or Powders, with Chlorpheniramine Maleate.

Identification
Weigh a portion of Chlorpheniramine Maleate Powder, equivalent to 50 mg of Chlorpheniramine Maleate according to the labeled amount, shake with 40 mL of 0.1 mol/L hydrochloric acid TS, and filter. Transfer the filtrate to a separator, and wash with 40 mL of hexane. Add 10 mL of sodium hydroxide TS, and extract with 20 mL of hexane. Wash the hexane layer with 5 mL of water. Centrifuge, if necessary, shake the hexane extract with 0.5 g of anhydrous sodium sulfate for several minutes, and filter. Evaporate the filtrate in a water bath at about 50°C under reduced pressure, and determine the infrared absorption spectrum of the residue as directed in the liquid film method under Infrared Spectrophotometry (2.25); it exhibits absorption at the wave number of about 2940 cm⁻¹, 2810 cm⁻¹, 2770 cm⁻¹, 1589 cm⁻¹, 1491 cm⁻¹, 1470 cm⁻¹, 1434 cm⁻¹, 1091 cm⁻¹ and 1015 cm⁻¹.

Bacterial endotoxins

Less than 8.8 EU/mg.

Extractable volume
It meets the requirement.

Foreign insoluble matter
Perform the test according to Method 1; it meets the requirement.

Insoluble particulate matter
Perform the test according to Method 1; it meets the requirement.

Sterility
Perform the test according to the Membrane filtration method; it meets the requirement.

Assay
Weigh accurately an amount of Chlorpheniramine Maleate Powder, equivalent to about 4 mg of chlorpheniramine maleate (C₁₆H₁₉ClN₂.C₄H₄O₄), add 70 mL of the internal standard solution, shake for 15 minutes, then add the internal standard solution to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Chlorpheniramine Maleate RS, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 200 mL. Pipet 20 mL of this solution, transfer to a 100-mL separator, add 2 mL of sodium hydroxide TS, and extract with two 50-mL portions of diethyl ether. Proceed in the same manner as for the preparation of the sample solution, and use the solution so obtained as the standard solution. Determine the absorbances A₁ and A₂ of the sample solution and standard solution at a wavelength of the maximum absorbance at about 265 nm as directed under Ultraviolet-visible Spectrophotometry (2.24).

\[
\text{Amount (mg) of chlorpheniramine maleate} = M_S \times \frac{A_1}{A_2} \times \frac{1}{10}
\]

Containers and storage
Containers—Hermetic containers. Storage—Light-resistant.
that of the internal standard.

\[
\text{Amount (mg) of chlorpheniramine maleate} \\

\]

\(M_s\): Amount (mg) of Chlorpheniramine Maleate RS

**Internal standard solution**—To 7 mL of a solution of methyl parahydroxybenzoate in methanol (1 in 1000) add water to make 1000 mL.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 265 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilaized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 1 g of sodium 1-heptane sulfonate in 900 mL of water, add 10 mL of acetic acid (100) and water to make 1000 mL. To 650 mL of this solution add 350 mL of acetonitrile.
Flow rate: Adjust the flow rate so that the retention time of chlorpheniramine is about 8 minutes.

**System suitability**—
System performance: When the procedure is run with 30 \(\mu\)L of the standard solution under the above operating conditions, chlorpheniramine and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.0.
System repeatability: When the test is repeated 6 times with 30 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of chlorpheniramine to that of the internal standard is not more than 1.0%.

**Containers and storage**
Containers—Tight containers.

### Chlorpheniramine Maleate Tablets

クロルフェニラミン マレイン酸塩錠

Chlorpheniramine Maleate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of dl-chlorpheniramine maleate \((C_{16}H_{19}ClN_{2}.C_{4}H_{4}O_{4})\) in tablet

**Method of preparation**
Prepare as directed under Tablets, with Chlorpheniramine Maleate.

**Identification**
Weigh a portion of powdered Chlorpheniramine Maleate Tablets, equivalent to 50 mg of Chlorpheniramine Maleate according to the labeled amount, shake with 40 mL of 0.1 mol/L hydrochloric acid TS, and filter. Transfer the filtrate to a separator, and wash with 40 mL of hexane. Add 10 mL of sodium hydroxide TS, and extract with 20 mL of hexane. Wash the hexane layer with 5 mL of water. Centrifuge, if necessary, shake the hexane extract with 0.5 g of anhydrous sodium sulfate for several minutes, and filter. Evaporate the filtrate in a water bath at about 50°C under a reduced pressure, and determine the infrared absorption spectrum of the residue as directed in the liquid film method under Infrared Spectrophotometry \(<2.25>\); it exhibits absorption at the wave numbers of about 2940 cm\(^{-1}\), 2810 cm\(^{-1}\), 2770 cm\(^{-1}\), 1589 cm\(^{-1}\), 1491 cm\(^{-1}\), 1470 cm\(^{-1}\), 1434 cm\(^{-1}\), 1091 cm\(^{-1}\) and 1015 cm\(^{-1}\).

**Uniformity of dosage unit** \(<6.02>\) Perform the test according to the following method: it meets the requirement of the Content uniformity test.
To 1 tablet of Chlorpheniramine Maleate Tablets add 10 mL of water, shake to disintegrate the tablet, then add water to make exactly \(V\) mL of a solution containing about 80 \(\mu\)g of chlorpheniramine maleate \((C_{16}H_{19}ClN_{2}.C_{4}H_{4}O_{4})\) per mL, and filter through a membrane filter with pore size of not more than 0.5 \(\mu\)m. Pipet 5 mL of the filtrate, add exactly 2.5 mL of the internal standard solution, add water to make 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Chlorpheniramine Maleate RS, previously dried at 105°C for 3 hours, and add water to make exactly 100 mL. Pipet 20 mL of this solution, add exactly 25 mL of the internal standard solution, add water to make 100 mL, and use this solution as the standard solution. Perform the test with 30 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01>\) according to the conditions described in the Assay, and calculate the ratios, \(Q_1\) and \(Q_2\), of the peak area of chlorpheniramine to that of the internal standard.

\[
\text{Amount (mg) of chlorpheniramine maleate} \\
(C_{16}H_{19}ClN_{2}.C_{4}H_{4}O_{4}) = M_s \times \frac{Q_1}{Q_s} \times \frac{V}{250}
\]

\(M_s\): Amount (mg) of Chlorpheniramine Maleate RS

**Internal standard solution**—To 7 mL of a solution of methyl parahydroxybenzoate (1 in 250) add water to make 1000 mL.

**Dissolution** \(<6.10D>\) When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Chlorpheniramine Maleate Tablets is not less than 75%.
Start the test with 1 tablet of Chlorpheniramine Maleate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m. Discard the first 10 mL of the filtrate, pipet \(V\) mL of the subsequent filtrate, add water to make exactly \(V\) mL so that each mL contains about 4.4 \(\mu\)g of chlorpheniramine maleate \((C_{16}H_{19}ClN_{2}.C_{4}H_{4}O_{4})\) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 22 mg of Chlorpheniramine Maleate RS, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01>\), and determine the peak areas, \(A_T\) and \(A_S\), of chlorpheniramine of both solutions.

Dissolution rate (%) with respect to the labeled amount of chlorpheniramine maleate \((C_{16}H_{19}ClN_{2}.C_{4}H_{4}O_{4})\)

\[
= \frac{M_s \times \frac{1}{5} \times \frac{1}{V} \times \frac{1}{C} \times 18}{C_{\text{table}}} \times 100
\]

\(M_s\): Amount (mg) of Chlorpheniramine Maleate RS

**C**: Labeled amount (mg) of chlorpheniramine maleate \((C_{16}H_{19}ClN_{2}.C_{4}H_{4}O_{4})\) in 1 tablet
Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 265 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 1 g of sodium 1-heptane sulfonate in 900 mL of water, add 10 mL of acetic acid (100), and add water to make 1000 mL. To 650 mL of this solution add 350 mL of acetonitrile.
Flow rate: Adjust the flow rate so that the retention time of chlorpheniramine is about 8 minutes.

System suitability—
System performance: When the procedure is run with 50 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of chlorpheniramine are not less than 2000 and not more than 2.5, respectively.
System repeatability: When the test is repeated 6 times with 50 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of chlorpheniramine is not more than 2.0%.

Assay
Weigh accurately the mass of not less than 20 Chlorpheniramine Maleate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 4 mg of chlorpheniramine maleate (C₁₆H₁₉ClN₂·C₄H₄O₄), add 70 mL of the internal standard solution to make exactly 100 mL, filter through a membrane filter with pore size of not more than 0.5 μm, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Chlorpheniramine Maleate RS, previously dried at 105°C for 3 hours, and add the internal standard prepared to make exactly 100 mL. Pipet 20 mL of this solution, and use this solution as the standard solution. Perform the test with 30 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.2D) according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of chlorpheniramine to that of the internal standard.

\[
M_S = \frac{Q_1}{Q_2} \times M_s \times \frac{1}{5}
\]

Flow rate: Adjust the flow rate so that the retention time of chlorpheniramine is about 8 minutes.

System suitability—
System performance: When the procedure is run with 30 μL of the standard solution under the above operating conditions, the internal standard and chlorpheniramine are eluted in this order with the resolution between these peaks being not less than 2.0.
System repeatability: When the test is repeated 6 times with 30 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of chlorpheniramine to that of the internal standard is not more than 1.0%.

Containers and storage
Containers—Tight containers.

\[\text{d-Chlorpheniramine Maleate}\]

\[d-\text{クロルフェニラミンマレイン酸塩}\]

\[
\text{C}_{16}\text{H}_{16}\text{ClN}_2\cdot\text{C}_9\text{H}_6\text{O}_4; \quad 390.86
\]

(3S)-3-(4-Chlorophenyl)-N,N-dimethyl-3-pyridin-2-ylpropylamine monomaleate

[2438-32-6]

\[\text{d-Chlorpheniramine Maleate, when dried, contains not less than 99.0% and not more than 101.0% of C}_{16}\text{H}_{19}\text{ClN}_2\cdot\text{C}_9\text{H}_6\text{O}_4.\]

Description
\[\text{d-Chlorpheniramine Maleate occurs as a white, crystalline powder.}\]

It is very soluble in water, in methanol and in acetic acid (100), and freely soluble in \(N, N\)-dimethylformamide and in ethanol (99.5). It dissolves in dilute hydrochloric acid.

Identification
(1) Determine the absorption spectrum of a solution of \textit{d-Chlorpheniramine Maleate} in 0.1 mol/L hydrochloric acid TS (3 in 100,000) as directed under Ultraviolet-visible Spectrophotometry (2.2D), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of \textit{d-Chlorpheniramine Maleate}, previously dried, as directed in the paste method under Infrared Spectrophotometry (2.2D), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavenumbers.

(3) Dissolve 0.10 g of \textit{d-Chlorpheniramine Maleate} in 5 mL of methanol, and use this solution as the sample solution. Separately, dissolve 56 mg of maleic acid in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.2D). Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of diethyl ether, methanol, acetic acid (100) and water.
Chlorpromazine Hydrochloride / Official Monographs

(70:20:7:3) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): a spot among two of the spots obtained with the sample solution shows the same intense to the spot with the standard solution, and its Rf value is about 0.4.

Optical rotation \( \angle \sigma^\circ; +39.5 - +43.0^\circ \) (after drying, 0.5 g, \( N,N \)-dimethylformamide, 10 mL, 100 nm).

pH \( \angle 2.5 \rightarrow \) Dissolve 1.0 g of \( \text{d-Chlorpheniramine Maleate} \) in 100 mL of freshly boiled and cooled water: the pH of this solution is between 4.0 and 5.0.

Melting point \( \angle 2.60 \) 111 - 115°C

Purity (1) Clarity and color of solution—Dissolve 1.0 g of \( \text{d-Chlorpheniramine Maleate} \) in 50 mL of water: the solution is clear and colorless.

(2) Heavy metals \( \angle 1.07 \rightarrow \) Proceed with 1.0 g of \( \text{d-Chlorpheniramine Maleate} \) according to Method 4 and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.10 g of \( \text{d-Chlorpheniramine Maleate} \) in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography \( \angle 2.01 \) according to the following conditions, and determine each peak area by the automatic integration method: the peak area other than maleic acid and \( \text{d-Chlorpheniramine} \) obtained with the sample solution is not larger than 2/3 times the peak area of \( \text{d-Chlorpheniramine} \) with the standard solution, and the total area of these peaks is not larger than the peak area of \( \text{d-Chlorpheniramine} \) with the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wave-length: 225 nm).
Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 \( \mu \text{m} \) in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 8.57 g of ammonium dihydrogen phosphate and 1 mL of phosphoric acid in water to make 1000 mL. To 800 mL of this solution add 200 mL of acetonitrile.
Flow rate: Adjust the flow rate so that the retention time of \( \text{d-Chlorpheniramine} \) is about 11 minutes.
Time span of measurement: About 4 times as long as the retention time of \( \text{d-Chlorpheniramine} \) beginning after the solvent peak.

System suitability—
Test for required detectability: To exactly 2.5 mL of the standard solution add the mobile phase to make exactly 25 mL. Confirm that the peak area of \( \text{d-Chlorpheniramine} \) obtained with 20 \( \mu L \) of this solution is equivalent to 7 to 13% of that with 20 \( \mu L \) of the standard solution.
System performance: When the procedure is run with 20 \( \mu L \) of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of \( \text{d-Chlorpheniramine} \) are not less than 4000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of \( \text{d-Chlorpheniramine} \) is not more than 4.0%.

Loss on drying \( \angle 2.41 \) Not more than 0.5% (1 g, 65°C, 4 hours).

Residue on ignition \( \angle 2.44 \) Not more than 0.1% (1 g).

Assay Weigh accurately about 0.3 g of \( \text{d-Chlorpheniramine Maleate} \), previously dried, and dissolve in 20 mL of acetic acid (100). Titrate \( \angle 2.50 \) with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue-green to green (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 19.54 mg of \( C_{16}H_{19}ClN_2C_4H_4O_4 \).

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Chlorpromazine Hydrochloride

クロルプロマジン塩酸塩

\( \text{C}_{17}\text{H}_{19}\text{ClN}_2\text{S.HCl} \): 355.33
3-(2-Chloro-10\( \text{H} \)-phenothiazin-10-yl)-\( N,N \)-dimethylpropylamine monohydrochloride [69-09-0]

Chlorpromazine Hydrochloride, when dried, contains not less than 99.0% of \( \text{C}_{17}\text{H}_{19}\text{ClN}_2\text{S.HCl} \).

Description Chlorpromazine Hydrochloride occurs as a white to pale yellow, crystalline powder. It is odorless, or has a faint, characteristic odor.

It is very soluble in water, freely soluble in ethanol (95) and in acetic acid (100), sparingly soluble in acetic anhydride, and practically insoluble in diethyl ether.

It is gradually colored by light.

Identification (1) To 5 mL of a solution of Chlorpromazine Hydrochloride (1 in 1000) add 1 drop of iron (III) chloride TS: a red color develops.

(2) Dissolve 0.1 g of Chlorpromazine Hydrochloride in 20 mL of water and 3 drops of dilute hydrochloric acid, add 10 mL of 2,4,6-trinitrophenol TS, and allow to stand for 5 hours. Collect the resulting precipitate, wash with water, recrystallize from a small portion of acetone, and dry at 105°C for 1 hour: the crystals so obtained melt \( \angle 2.60 \) between 175°C and 179°C.

(3) Dissolve 0.5 g of Chlorpromazine Hydrochloride in 5 mL of water, add 2 mL of ammonia TS, and heat on a water bath for 5 minutes. Cool, filter, and render the filtrate acidic with dilute nitric acid: the solution responds to the Qualita-
Chlorpromazine Hydrochloride Injection

クロルプロマジン塩酸塩注射液

Chlorpromazine Hydrochloride Injection is an aqueous solution for injection. It contains not less than 95.0% and not more than 105.0% of the labeled amount of chlorpromazine hydrochloride (C₁₇H₁₉ClN₂S.HCl: 355.33).

Method of preparation Prepare as directed under Injections, with Chlorpromazine Hydrochloride.

Identification (1) Proceed with a volume of Chlorpromazine Hydrochloride Injection, equivalent to 5 mg of Chlorpromazine Hydrochloride according to the labeled amount, as directed in the Identification (1) under Chlorpromazine Hydrochloride.

(2) Proceed with a volume of Chlorpromazine Hydrochloride Injection, equivalent to 0.1 g of Chlorpromazine Hydrochloride according to the labeled amount, as directed in the Identification (2) under Chlorpromazine Hydrochloride.

Extractable volume <6.05> It meets the requirement.

Foreign insoluble matter <6.06> Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter <6.07> It meets the requirement.

Sterility <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

Chlorpromazine Hydrochloride Tablets

クロルプロマジン塩酸塩錠

Chlorpromazine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of chlorpromazine hydrochloride (C₁₇H₁₉ClN₂S.HCl: 355.33).

Method of preparation Prepare as directed under Tablets, with Chlorpromazine Hydrochloride.

Identification (1) Shake a quantity of powdered Chlorpromazine Hydrochloride Tablets, equivalent to 0.2 g of Chlorpromazine Hydrochloride according to the labeled amount, with 40 mL of 0.1 mol/L hydrochloric acid TS, and filter. To 1 mL of the filtrate add 4 mL of water and 1 drop of iron (III) chloride TS: a red color develops.

(2) To 20 mL of the filtrate obtained in (1) add 10 mL of 2,4,6-trinitrophenol TS dropwise, and proceed as directed in the Identification (2) under Chlorpromazine Hydrochloride.

Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Conduct this procedures using light-resistant vessels. To 1
tablet of Chlorpromazine Hydrochloride Tablets add an amount of a mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) so that each mL contains about 0.83 mg of chlorpromazine hydrochloride \((C_{17}H_{19}ClN_2S.HCl)\), treat with the ultrasonic waves for 5 minutes, then shake vigorously for 20 minutes, and add the mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) to make exactly \(V\) mL so that each mL contains about 0.45 mg of chlorpromazine hydrochloride \((C_{17}H_{19}ClN_2S.HCl)\). Filter through a membrane filter with a pore size not exceeding 0.8 \(\mu\)m. Discard the first 10 mL of the filtrate, pipet the subsequent filtrate, add exactly 5 mL of the internal standard solution, then add the mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) to make exactly 25 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

\[
\text{Amount (mg) of chlorpromazine hydrochloride} \quad (C_{17}H_{19}ClN_2S.HCl) = M_S \times Q_T / Q_s \times V / 50
\]

\(M_S\): Amount (mg) of chlorpromazine hydrochloride for assay

**Internal standard solution**—A solution of ethyl parahydroxybenzoate in the mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) (1 in 4500).

**Dissolution**<6.10> When the test is performed at 75 revolutions per minute according to the Paddle method, use 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 60 minutes of Chlorpromazine Hydrochloride Tablets is not less than 75%.

Start the test with 1 tablet of Chlorpromazine Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 \(\mu\)m. Discard the first 10 mL of the filtrate, pipet the subsequent \(V\) mL, add the dissolution medium to make exactly \(V\) mL so that each mL contains about 5.6 \(\mu\)g of chlorpromazine hydrochloride \((C_{17}H_{19}ClN_2S.HCl)\) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 90 mg of chlorpromazine hydrochloride for assay, previously dried at 105°C for 2 hours, and dissolve in the mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution and the mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) to make 25 mL, and use this solution as the standard solution. Perform the test with 10 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2,01> according to the following conditions, and calculate the ratios, \(Q_T\) and \(Q_s\), of the peak area of chlorpromazine to that of the internal standard.

\[
\text{Amount (mg) of chlorpromazine hydrochloride} \quad (C_{17}H_{19}ClN_2S.HCl) = M_S \times Q_T / Q_s \times 2
\]

\(M_S\): Amount (mg) of chlorpromazine hydrochloride for assay

**Internal standard solution**—A solution of ethyl parahydroxybenzoate in a mixture of diluted phosphoric acid (1 in 500) and ethanol (99.5) (1:1) (1 in 4500).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 256 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of diluted 0.05 mol/L sodium dihydrogen phosphate TS (1 in 2) and acetonitrile (27:13).
Flow rate: Adjust the flow rate so that the retention time of chlorpromazine is about 15 minutes.

**System suitability**—
System performance: When the procedure is run with 10 \(\mu\)L of the standard solution under the above operating conditions, the internal standard and chlorpromazine are eluted in this order with the resolution between these peaks being not less than 10.
System repeatability: When the test is repeated 6 times with 10 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of chlorpromazine to that of the internal standard is not more than 1.0%.

**Containers and storage**—Containers—Tight containers.
Storage—Light-resistant.
Chlorpropamide

クロルプロパミド

\[ \text{C}_{10}\text{H}_{13}\text{ClN}_{2}\text{O}_{3}\text{S}: 276.74} \]

4-Chloro-N-(propylcarbamoyl)benzenesulfonamide [94-20-2]

Chlorpropamide, when dried, contains not less than 98.0% of \( \text{C}_{10}\text{H}_{13}\text{ClN}_{2}\text{O}_{3}\text{S} \).

**Description** Chlorpropamide occurs as white, crystals or crystalline powder.

It is freely soluble in methanol and in acetone, soluble in ethanol (95), and slightly soluble in diethyl ether, and practically insoluble in water.

**Identification** (1) Dissolve 0.08 g of Chlorpropamide in 50 mL of methanol. To 1 mL of the solution add 0.01 mol/L hydrochloric acid TS to make 200 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Determine the infrared absorption spectrum of Chlorpropamide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.03). Spot 5 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of cyclohexane, 3-methyl-1-butanol, methanol and ammonia solution (28) (15:10:5:1) to a distance of about 10 cm, and air-dry the plate. After drying the plate at 100°C for 1 hour, spray evenly sodium hypochlorite TS on the plate, and air-dry for 15 minutes. Then spray evenly potassium iodide-starch TS on the plate: the spot from the sample solution equivalent to the spot from the standard solution (2) is not more intense than the spot from the standard solution (2), and the spots other than the spot mentioned above and other than the principal spot is not more intense than the spot from the standard solution (1).

**Loss on drying** (2.41) Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** (2.44) Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.5 g of Chlorpropamide, previously dried, dissolve in 30 mL of neutralized ethanol, and add 20 mL of water. Titrate with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS).

\[ \text{Each mL of 0.1 mol/L sodium hydroxide VS} = 27.67 \text{mg of C}_{10}\text{H}_{13}\text{ClN}_{2}\text{O}_{3}\text{S} \]

**Containers and storage** Containers—Well-closed containers.

Chlorpropamide Tablets

クロルプロパミド錠

Chlorpropamide Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of chlorpropamide (\( \text{C}_{10}\text{H}_{13}\text{ClN}_{2}\text{O}_{3}\text{S}: 276.74 \)).

**Method of preparation** Prepare as directed under Tablets, with Chlorpropamide.

**Identification** Take a quantity of powdered Chlorpropamide Tablets, equivalent to 0.08 g of Chlorpropamide according to the labeled amount, add 50 mL of methanol, shake, and filter. To 1 mL of the filtrate add 0.01 mol/L hydrochloric acid TS to make 200 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24): it exhibits a maximum between 231 nm and 235 nm.

**Uniformity of dosage units** (6.02) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Chlorpropamide Tablets add 75 mL of the mobile phase, treat with the ultrasonic waves for 20 minutes with occasional strong shaking, then add the mobile phase to make exactly 100 mL so that each mL contains about 2.5 mg of Chlorpropamide. Centrifuge the solution, pipet 2 mL of the supernatant liquid, and add the mobile phase to make exactly
100 mL, and use this solution as the sample solution. Then, proceed as directed in the Assay.

\[
M_S: \text{Amount (mg) of chlorpropamide for assay}
\]

\[
\text{Amount (mg) of chlorpropamide (C_{10}H_{13}ClN_2O_3S)} = M_S \times A_I/A_S \times V/V_{20}
\]

**Dissolution**

When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 45 minutes of Chlorpropamide Tablets is not less than 70%.

Start the test with 1 tablet of Chlorpropamide Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 μm. Discard the first 10 mL of the filtrate, pipet the subsequent 20 mL of the filtrate, add the dissolution medium to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 0.05 g of chlorpropamide for assay, previously dried at 105°C for 3 hours, dissolve in 10 mL of methanol, and add water to make exactly 50 mL. Pipet 1 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \( A_I \) and \( A_S \), of the sample solution and standard solution at 232 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
\text{Dissolution rate } (\%) = \frac{M_S \times A_I/A_S \times V/V_{20}}{0.05} \times 100
\]

**Assay**

Weigh accurately and powder not less than 20 Chlorpropamide Tablets. Weigh accurately a quantity of the powder, equivalent to about 50 mg of chlorpropamide (C_{10}H_{13}ClN_2O_3S), add 75 mL of the mobile phase, shake for 10 minutes, and add the mobile phase to make exactly 100 mL. Centrifuge this solution, pipet 10 mL of the supernatant liquid, and add water to make exactly 100 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of chlorpropamide for assay, previously dried at 105°C for 3 hours, dissolve in 10 mL of methanol, and add water to make exactly 50 mL. Pipet 1 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Determine the peak areas, \( A_I \) and \( A_S \), of chlorpropamide of the sample solution and standard solution.

\[
\text{Amount (mg) of chlorpropamide (C_{10}H_{13}ClN_2O_3S)} = M_S \times A_I/A_S \times V/V_{20}
\]

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecysililated silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of diluted acetic acid (100) (1 in 100) and acetonitrile (1:1).

Flow rate: Adjust the flow rate so that the retention time of chlorpropamide is about 5 minutes.

**System suitability—**

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of chlorpropamide are not less than 1500 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of chlorpropamide is not more than 1.5%.

**Containers and storage**

Containers—Well-closed containers.

---

**Cholera Vaccine**

コレラワクチン

Cholera Vaccine is a liquid for injection containing inactivated Vibrio cholerae of the Ogawa and Inaba strains.

Monotypic products may be manufactured, if necessary.

It conforms to the requirements of Cholera Vaccine in the Minimum Requirements for Biological Products.

**Description**

Cholera Vaccine is a white-turbid liquid.

---

**Cholecalciferol**

Vitamin D3

コレカルシフェロール

Cholecalciferol occurs as white crystals. It is odorless.

\[ \text{C}_{27}\text{H}_{44}\text{O}: 384.64 \]  
\[ (35,5Z,7E)-9,10-\text{Secocholesta}-5,7,10(19)-\text{trien}-3-\text{ol} \]  
\[ \{67-97-0\} \]

Cholecalciferol contains not less than 97.0% and not more than 103.0% of C_{27}H_{44}O.
It is freely soluble in ethanol (95), in chloroform, in diethyl ether and in isooctane, and practically insoluble in water.

Melting point: 84 – 88°C. Transfer Cholecalciferol to a capillary tube, and dry for 3 hours in a desiccator (in vacuum at a pressure not exceeding 2.67 kPa). Immediately fireseal the capillary tube, put it in a bath fluid, previously heated to a temperature about 10°C below the expected melting point, and heat at a rate of rise of about 3°C per minute, and read the melting point.

Identification (1) Dissolve 0.5 mg of Cholecalciferol in 5 mL of chloroform, add 0.3 mL of acetic anhydride and 0.1 mL of sulfuric acid, and shake: a red color is produced, and rapidly changes through purple and blue to green.

(2) Determine the infrared absorption spectrum of Cholecalciferol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cholecalciferol RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Absorbance $\angle 2.24 \angle E_{1\text{cm} \text{mL}}^{10\text{mg}}$ (265 nm): 450 – 490 (10 mg, ethanol (95), 1000 mL).

Optical rotation $\angle 2.49 \angle [\alpha]_{D}^{20} + 103 + 112\degree$ (50 mg, ethanol (95), 10 mL, 100 mm). Prepare the solution without delay, using Cholecalciferol from a container opened not longer than 30 minutes, previously, and determine the rotation within 30 minutes after the solution has been prepared.

Purity 7-Dehydrocholesterol—Dissolve 10 mg of Cholecalciferol in 2.0 mL of diluted ethanol (95) (9 in 10), add a solution prepared by dissolving 20 mg of digitonin in 2.0 mL of diluted ethanol (95) (9 in 10), and allow the mixture to stand for 18 hours: no precipitate is formed.

Assay Proceed with the operation avoiding contact with air or other oxidizing agents and using light-resistant containers. Dissolve separately about 30 mg each of Cholecalciferol and Cholecalciferol RS, accurately weighed, in isooctane to make exactly 50 mL. Pipet 10 mL each of these solutions, add 3 mL each of the internal standard solution, then add the mobile phase to make 50 mL, and use these solutions as the standard solution and the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography $\angle 2.0 \angle$ according to the following conditions, and calculate the ratios, $Q_{T}$ and $Q_{S}$, of the peak area of cholecalciferol to that of the internal standard.

Amount (mg) of $C_{27}H_{46}O = M_{S} \times Q_{T}/Q_{S}$

$M_{S}$: Amount (mg) of Cholecalciferol RS

Internal standard solution—A solution of dimethyl phthalate in isooctane (1 in 100).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column about 4 mm in inside diameter and 10 to 30 cm in length, packed with silica gel for liquid chromatography (5 to 10 μm in particle diameter).
Column temperature: Ordinary temperature.
Mobile phase: A mixture of hexane and n-amylalcohol (997:3).

Flow rate: Adjust the flow rate so that the retention time of cholecalciferol is about 25 minutes.

Selection of column: Dissolve 15 mg of Cholecalciferol RS in 25 mL of isooctane. Transfer this solution to a flask, heat under a reflux condenser in an oil bath for 2 hours, and cool to room temperature rapidly. Transfer this solution to a quartz test tube, and irradiate under a short-wave lamp (main wavelength: 254 nm) and a long-wave lamp (main wavelength: 365 nm) for 3 hours. To this solution add the mobile phase to make 50 mL. Proceed with 10 μL of this solution under the above operating conditions. Use a column with the ratios of the retention time of previtamin D$_{3}$, trans-vitamin D$_{3}$ and tachysterol$_{3}$ to that of cholecalciferol being about 0.5, about 0.6 and about 1.1, respectively, and with resolution between previtamin D$_{3}$ and trans-vitamin D$_{3}$, and that between cholecalciferol and tachysterol$_{3}$ being not less than 1.0.

Containers and storage Containers—Hermetic containers.
Storage—Light-resistant, under nitrogen atmosphere, and in a cold place.

Cholesterol

**Cholecalciferol**

*C_{27}H_{46}O: 386.65 Cholest-5-en-3β-ol [57-88-5]

**Description**

Cholesterol occurs as white to pale yellow crystals or granules. It is odorless, or has a slight odor. It is tasteless.

It is freely soluble in chloroform and in diethyl ether, soluble in 1,4-dioxane, sparingly soluble in ethanol (99.5), and practically insoluble in water.

It gradually changes to a yellow to light yellow-brown color by light.

Identification (1) Dissolve 0.01 g of Cholesterol in 1 mL of chloroform, add 1 mL of sulfuric acid, and shake: a red color develops in the isooctane layer, and the sulfuric acid layer shows a green fluorescence.

(2) Dissolve 5 mg of Cholesterol in 2 mL of chloroform, add 1 mL of acetic anhydride and 1 drop of sulfuric acid, and shake: a red color is produced, and it changes to green through blue.

Optical rotation $\angle 2.49 \angle [\alpha]_{D}^{20} = -34 – -38\degree$ (after drying, 0.2 g, 1,4-dioxane, 10 mL, 100 mm).

Melting point $\angle 2.60 \angle 147 – 150\degree$

**Purity**

(1) Clarity of solution—Place 0.5 g of Cholesterol in a glass-stoppered flask, dissolve in 50 mL of warm ethanol (95), and allow to stand at room temperature for 2 hours: no turbidity or deposit is produced.

(2) Acidity—Place 1.0 g of Cholesterol in a flask, dis-
solve in 10 mL of diethyl ether, add 10.0 mL of 0.1 mol/L sodium hydroxide VS, and shake for 1 minute. Expel the diethyl ether, and boil for 5 minutes. Cool, add 10 mL of water, and titrate with 0.05 mol/L sulfuric acid VS (indicator: 2 drops of phenolphthalein TS). Perform a blank determination.

The volume of 0.1 mol/L sodium hydroxide VS consumed is not more than 0.30 mL.

**Loss on drying** <2.4> Not more than 0.30% (1 g, in vacuum, 60°C, 4 hours).

**Residue on ignition** <2.4> Not more than 0.1% (1 g).

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

---

**Cibenzoline Succinate**

シベンゾリンコハク酸塩

![Cibenzoline Succinate](https://example.com/cibenzoline_succinatestructure.png)

\[ \text{C}_{18}\text{H}_{18}\text{N}_{2}\cdot\text{C}_{4}\text{H}_{6}\text{O}_{4} \cdot 380.44 \]

\[ 2\cdot[(1\text{RS})\cdot2\text{-Diphenylcyclopropan-1-yl}]\cdot4,5\text{-dihydro-1H-imidazole monosuccinate} \]

[100678-32-8]

Cibenzoline Succinate, when dried, contains not less than 98.5% and not more than 101.0% of \( \text{C}_{18}\text{H}_{18}\text{N}_{2}\cdot\text{C}_{4}\text{H}_{6}\text{O}_{4} \).

**Description** Cibenzoline Succinate occurs as a white crystalline powder.

It is freely soluble in methanol and in acetic acid (100), and sparingly soluble in water and in ethanol (99.5).

A solution of Cibenzoline Succinate in methanol (1 in 10) shows no optical rotation.

**Identification**

1. Determine the absorption spectrum of a solution of Cibenzoline Succinate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

2. Determine the infrared absorption spectrum of Cibenzoline Succinate as directed in the paste method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

3. Shake 0.4 g of Cibenzoline Succinate with 2.5 mL of sodium hydroxide TS and 5 mL of ethyl acetate, allow to stand, and to 1 mL of the water layer so obtained add 0.5 mL of 1 mol/L hydrochloric acid TS and 0.5 mL of iron (III) chloride TS: a blown precipitate is formed.

**Melting point** <2.60> 163 – 167°C

**pH** <2.54> Dissolve 0.2 g of Cibenzoline Succinate in 10 mL of water: the pH of this solution is between 4.0 and 6.0.

**Purity**

1. **Clarity and color of solution**—A solution obtained by dissolving 0.2 g of Cibenzoline Succinate in 10 mL of water is clear and colorless.

2. **Heavy metals** <1.07>—Proceed with 1.0 g of Cibenzoline Succinate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

3. **Arsenic** <1.17>—Prepare the test solution with 1.0 g of Cibenzoline Succinate according to Method 3, using a solution of magnesium nitrate hexahydrate in ethanol (95%) (1 in 25), and perform the test (not more than 2 ppm).

4. **Related substances**—Dissolve 0.10 g of Cibenzoline Succinate in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 5 mL and 2 mL of this solution, and add 0.5 mL of 0.1 mol/L perchloric acid VS to each. Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 10 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol, and ammonia solution (28:20:3:2) to a distance of about 10 cm, air-dry the plate, and dry more at 80°C for 30 minutes. After cooling, examine under ultraviolet light (main wavelength: 254 nm): the spot other than the principal spot obtained with the sample solution is not more intense than the spot with the standard solution (1). Allow the plate to stand for 30 minutes in iodine vapor: the spot other than the principal spot obtained with the sample solution is not more intense than the spot with the standard solution (1), and the spot, which is more intense than the spot with the standard solution (2), is not more than two.

**Loss on drying** <2.4> Not more than 0.3% (1 g, 105°C, 2 hours).

**Residue on ignition** <2.4> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Cibenzoline Succinate, previously dried, dissolved in 50 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS until the color of the solution changes from violet to blue-green through blue (indicator: 2 drops of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 38.04 mg of \( \text{C}_{18}\text{H}_{18}\text{N}_{2}\cdot\text{C}_{4}\text{H}_{6}\text{O}_{4} \).

**Containers and storage** Containers—Tight containers.

---

**Cibenzoline Succinate Tablets**

シベンゾリンコハク酸塩錠

Cibenzoline Succinate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of cibenzoline succinate (\( \text{C}_{18}\text{H}_{18}\text{N}_{2}\cdot\text{C}_{4}\text{H}_{6}\text{O}_{4} \cdot 380.44 \)).

**Method of preparation** Prepare as directed under Tablets, with Cibenzoline Succinate.

**Identification** To a quantity of powdered Cibenzoline Suc-
cinate Tablets, equivalent to 50 mg of Cibenzoline Succinate according to the labeled amount, add 100 mL of water, shake for 10 minutes, and centrifuge. To 2 mL of the supernatant liquid add water to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry. It exhibits a maximum between 221 nm and 225 nm.

**Uniformity of dosage units** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Cibenzoline Succinate Tablets add a suitable amount of water so that each mL contains about 10 mg of cibenzoline succinate (C₁₈H₁₈N₂.C₄H₆O₄), and allow standing for 10 minutes while occasional shaking. To this solution add methanol so that each mL contains about 2 mg of cibenzoline succinate (C₁₈H₁₈N₂.C₄H₆O₄), add exactly 1 mL of the internal standard solution per 10 mg of cibenzoline succinate (C₁₈H₁₂N₂.C₄H₆O₄), then add methanol so that each mL contains about 1 mg of cibenzoline succinate (C₁₈H₁₂N₂.C₄H₆O₄). Centrifuge the solution, and use the supernatant liquid as the sample solution. Then, proceed as directed in the Assay.

**Dissolution** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Cibenzoline Succinate Tablets is not less than 80%.

Start the test with 1 tablet of Cibenzoline Succinate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 11 μg of cibenzoline succinate (C₁₈H₁₂N₂.C₄H₆O₄) according to the labeled amount, and use this solution as the sample solution. Separate, weigh accurately about 28 mg of cibenzoline succinate for assay, previously dried at 105°C for 2 hours, and dissolve in water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Determine the absorbances, A₁ and A₅, of the peak area of cibenzoline to that of the internal standard. System repeatability: When the test is repeated 6 times under the above operating conditions, cibenzoline and the internal standard are eluted in this order with the resolution between these peaks being not less than 6. System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, cibenzoline and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 5 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (3 μm in particle diameter).
Mobile phase: 2.67 g of sodium di-2-ethylhexyl sulfosuccinate in 2000 mL of a mixture of water, acetonitrile and diluted phosphoric acid (1 in 10) (1000:1000:1).
Flow rate: Adjust the flow rate so that the retention time of cibenzoline is about 3 minutes.

**System suitability**—
System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, cibenzoline and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

**Containers and storage**—
Containers—Tight containers.

---

### Assay

Weigh accurately not less than 20 Cibenzoline Succinate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 0.1 g of cibenzoline succinate (C₁₈H₁₂N₂.C₄H₆O₄), add 10 mL of water, shake, and add 40 mL of methanol and exactly 10 mL of the internal standard solution. Shake for 20 minutes, add methanol to make 100 mL, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 0.1 g of cibenzoline succinate for assay, previously dried at 105°C for 2 hours, add 10 mL of water and 40 mL of methanol to dissolve, then add exactly 10 mL of the internal standard solution and methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography. Perform the test with 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography. The ratio of the peak area of cibenzoline succinate tablets is not less than 0.1 g of cibenzoline succinate tablets, equivalent to 50 mg of Cibenzoline Succinate Tablets, according to the labeled amount. The area of cibenzoline to that of the internal standard is not more than 1.0%.

**Internal standard solution**—Dissolve 0.1 g of 2-ethylhexyl parahydroxybenzoate in methanol to make 100 mL.

**Amount (mg) of cibenzoline succinate (C₁₈H₁₂N₂.C₄H₆O₄) in tablet**

\[
M = M_C \times \frac{Q_C}{Q_S} \times \frac{C}{100}
\]

**M**: Amount (mg) of cibenzoline succinate for assay

**C**: Labeled amount (mg) of cibenzoline succinate (C₁₈H₁₂N₂.C₄H₆O₄) in 1 tablet

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 5 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (3 μm in particle diameter).
Mobile phase: 2.67 g of sodium di-2-ethylhexyl sulfosuccinate in 2000 mL of a mixture of water, acetonitrile and diluted phosphoric acid (1 in 10) (1000:1000:1).
Flow rate: Adjust the flow rate so that the retention time of cibenzoline is about 3 minutes.

**System suitability**—
System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, cibenzoline and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

**Containers and storage**—
Containers—Tight containers.
Ciclacillin

Description
Ciclacillin occurs as white to light yellowish white crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, and practically insoluble in acetonitrile and in ethanol (95).

Identification
Determine the infrared absorption spectrum of Ciclacillin as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ciclacillin RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 0.771 g of ammonium acetate in about 900 mL of water, adjust the pH to 4.0 with acetic acid (100), and add water to make 1000 mL. To 850 mL of this solution add 150 mL of acetonitrile.
Flow rate: Adjust the flow rate so that the retention time of ciclacillin is about 4 minutes.
System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, ciclacillin and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak areas of ciclacillin to that of the internal standard is not more than 1.0%.

Containers and storage
Containers—Tight containers.

Ciclosporin

Ciclosporin A

Description
Ciclosporin occurs as a white powder.

It is very soluble in acetonitrile, in methanol and in ethanol (95), freely soluble in diethyl ether, and practically insoluble in water.

Identification
Determine the infrared absorption spectrum of Ciclosporin as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ciclosporin RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 0.771 g of ammonium acetate in about 900 mL of water, adjust the pH to 4.0 with acetic acid (100), and add water to make 1000 mL. To 850 mL of this solution add 150 mL of acetonitrile.
Flow rate: Adjust the flow rate so that the retention time of ciclacillin is about 4 minutes.
System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, ciclacillin and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak areas of ciclacillin to that of the internal standard is not more than 1.0%.

Containers and storage
Containers—Tight containers.

Ciclosporin

Ciclosporin A

C62H111N11O12: 1202.61
[39865-13-3]

Ciclosporin contains not less than 98.5% and not more than 101.5% of C62H111N11O12, calculated on the dried basis.

Description
Ciclosporin occurs as a white powder.

It is very soluble in acetonitrile, in methanol and in ethanol (95), freely soluble in diethyl ether, and practically insoluble in water.

Identification
Determine the infrared absorption spectrum of Ciclosporin as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ciclosporin RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 0.771 g of ammonium acetate in about 900 mL of water, adjust the pH to 4.0 with acetic acid (100), and add water to make 1000 mL. To 850 mL of this solution add 150 mL of acetonitrile.
Flow rate: Adjust the flow rate so that the retention time of ciclacillin is about 4 minutes.
System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, ciclacillin and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak areas of ciclacillin to that of the internal standard is not more than 1.0%.

Containers and storage
Containers—Tight containers.
method under Infrared Spectrophotometry <2,25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ciclosporin RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2,49> \([\alpha]_D^{25} = -185 \text{ to } -193^\circ\) (0.1 g calculated on the dried basis, methanol, 20 mL, 100 mm).

**Purity**

(1) Clarity and color of solution—Dissolve 1.0 g of Ciclosporin in 10 mL of ethanol (95); the solution is clear, and has no more color than the following control solutions (1), (2) or (3).

Control solution (1): To exactly 3.0 mL of Iron (III) Chloride CS and exactly 0.8 mL of Cobalt (II) Chloride CS add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

Control solution (2): To exactly 3.0 mL of Iron (III) Chloride CS, exactly 1.3 mL of Cobalt (II) Chloride CS and exactly 0.5 mL of Copper (II) Sulfate CS add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

Control solution (3): To exactly 0.5 mL of Iron (III) Chloride CS and exactly 1.0 mL of Cobalt (II) Chloride CS add diluted hydrochloric acid (1 in 40) to make exactly 100 mL.

(2) Heavy metals <1,07>—Proceed with 1.0 g of Ciclosporin according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Use the sample solution obtained in the Assay as the sample solution. Pipet 2 mL of the sample solution, add a mixture of water and acetonitrile (1:1) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2,01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of the peak of ciclosporin is not more than 1.5 times the peak area of ciclosporin obtained from 20 mL of the standard solution. The total area of all peaks other than the ciclosporin from the sample solution is not more than 7/10 times the peak area of ciclosporin from the standard solution, and the total area of all peaks other than the ciclosporin is not larger than 1.5 times the peak area of ciclosporin from the standard solution.

**Operating conditions**

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of ciclosporin beginning after the solvent peak.

**System suitability**

Test for required detection: To exactly 2 mL of the standard solution add a mixture of water and acetonitrile (1:1) to make exactly 20 mL. Confirm that the peak area of ciclosporin obtained from 20 \(\mu\)L of this solution is equivalent to 7 to 13% of that of ciclosporin obtained from 20 \(\mu\)L of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 20 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ciclosporin is not more than 3.0%.

**Loss on drying** <2,49> Not more than 2.0% (1 g, in vacuum at a pressure not exceeding 0.67 kPa, 60°C, 3 hours).

**Residue on ignition** <2,44> Not more than 0.1% (0.5 g).
Cilastatin Sodium

シラスタチナトリウム

\[
C_{16}H_{25}N_2NaO_5S: 380.43 \\
\]

Cilastatin Sodium contains not less than 98.0% and not more than 101.0% of \( C_{16}H_{25}N_2NaO_5S \), calculated on the anhydrous basis and corrected on the amount of the residual solvent.

**Description** Cilastatin Sodium occurs as a white to pale yellowish white powder.

It is very soluble in water, freely soluble in methanol, and slightly soluble in ethanol (99.5).

It is hygroscopic.

**Identification (1)** Determine the infrared absorption spectrum of Cilastatin Sodium as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\)\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) A solution of Cilastatin Sodium (1 in 10) responds to the Qualitative Tests \(<1.09\) for sodium salt.

**Optical rotation** \(<2.49\> \quad [\alpha]_D^{20} +41.5 - +44.5^\circ \quad (0.1 \text{ g}, \text{calculated on the anhydrous basis and corrected on the amount of the residual solvent}, \text{a solution of hydrochloric acid in methanol (9 in 1000), 10 mL, 100 mL}).

**pH** \(<2.54\> \quad \text{The pH of a solution prepared by dissolving 1.0 g of Cilastatin Sodium in 100 mL of water is between 6.5 and 7.5.}

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cilastatin Sodium in 100 mL of water: the solution is clear and the solution has no more color than the following control solution.

Control solution: To a mixture of 2.4 mL of Iron (III) Chloride CS and 0.6 mL of Cobalt (II) Chloride CS add water to make 10 mL, pipet 5 mL of this solution, and add water to make exactly 100 mL.

(2) Heavy metals \(<1.07\>—\text{Proceed with 1.0 g of Cilastatin Sodium according to Method 2, and perform the test. After carbonization, add 0.5 mL of sulfuric acid instead of nitric acid. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).}

(3) Arsenic \(<1.10\>—\text{To 2.0 g of Cilastatin Sodium add 5 mL of nitric acid and 1 mL of sulfuric acid, and heat carefully until white fumes are evolved. After cooling, heat with two 2-mL portions of nitric acid, then heat with several 2-mL portions of hydrogen peroxide (30) until a colorless or pale yellow solution is obtained. After cooling, add water to make 5 mL, and perform the test with this solution as the test solution: it shows no more color than the following color standard.}

Color standard: Prepare a solution according to the above procedure without using Cilastatin Sodium, add exactly 2 mL of Standard Arsenic Solution, and perform the test in the same manner as the test solution (not more than 1 ppm).

(4) Related substances—Dissolve about 40 mg of Cilastatin Sodium in 25 mL of water, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu \text{L} \) each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.07\) according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than cilastatin from the sample solution is not larger than 1/6 times the peak area of cilastatin from the standard solution, and the total area of the peaks other than the peak of cilastatin is not larger than the peak area of cilastatin from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4.5 mm in inner diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 \( \mu \text{m} \) in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase A: A mixture of diluted phosphoric acid (1 in 1000) and acetonitrile (7:3).

Mobile phase B: Diluted phosphoric acid (1 in 1000).

Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 – 30</td>
<td>15 → 100</td>
<td>85 → 0</td>
</tr>
<tr>
<td>30 – 40</td>
<td>100</td>
<td></td>
</tr>
</tbody>
</table>

Flow rate: 2.0 mL per minute.

Time span of measurement: 40 minutes.

**System suitability**—

Test for required detectability: Pipet 1 mL of the standard solution, and add water to make exactly 30 mL. Confirm that the peak area of cilastatin obtained with 20 \( \mu \text{L} \) of this solution is equivalent to 2.3 to 4.5% of that obtained with 20 \( \mu \text{L} \) of the standard solution.

System performance: When the procedure is run with 20 \( \mu \text{L} \) of the standard solution under the above operating conditions, the retention time of cilastatin is about 20 minutes, and the number of theoretical plates and the symmetry factor of the peak of cilastatin are not less than 10,000 and not more than 2.5, respectively.

System repeatability: When the test is repeated 3 times with 20 \( \mu \text{L} \) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cilastatin is not more than 2.0%.

(5) Residual solvents \(<2.46\>—\text{Weigh accurately about 0.2 g of Cilastatin Sodium, add exactly 2 mL of the internal fluid to a vessel, and stir to dissolve. Add water to make 50 mL, and analyze by liquid chromatography (2.46) under the following conditions:}

- Mobile phase A: A mixture of phosphoric acid (1 in 10) and acetonitrile (7:3).
- Mobile phase B: Phosphoric acid (1 in 1000).
- Column: A stainless steel column 4.5 mm in inner diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (3 \( \mu \text{m} \) in particle diameter).
- Flow rate: 2.0 mL per minute.
- Time span of measurement: 40 minutes.
- Time after injection of sample: 0 – 30 minutes.
- System suitability:
  - Test for required detectability: Pipet 1 mL of the standard solution, and add water to make exactly 30 mL. Confirm that the peak area of cilastatin obtained with 20 \( \mu \text{L} \) of this solution is equivalent to 2.3 to 4.5% of that obtained with 20 \( \mu \text{L} \) of the standard solution.
  - System performance: When the procedure is run with 20 \( \mu \text{L} \) of the standard solution under the above operating conditions, the retention time of cilastatin is about 20 minutes, and the number of theoretical plates and the symmetry factor of the peak of cilastatin are not less than 10,000 and not more than 2.5, respectively.
  - System repeatability: When the test is repeated 3 times with 20 \( \mu \text{L} \) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cilastatin is not more than 2.0%.
standard solution, dissolve in water to make 10 mL, and use this solution as the sample solution. Separately, measure exactly 2 mL of acetone, 0.5 mL of methanol and 0.5 mL of mesityl oxide, and add water to make exactly 1000 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution, add water to make 10 mL, and use this solution as the standard solution. Perform the test with 2 μL each of the sample solution and standard solution as directed under Gas Chromatography <2.02> according to the following conditions. Calculate the ratios of the peak areas of acetone, methanol and mesityl oxide and to the peak area of the internal standard are not more than 4.0 and not more than 0.4%, respectively. Not more than 50 ppm. Not more than 20 ppm.

Internal standard solution—To 0.5 mL of 1-propanol add water to make 1000 mL.

Operating conditions—
Detector: A hydrogen flame-ionization detector.
Column: A glass column 3.2 mm in inside diameter and 2.1 m in length, packed with teflon for gas chromatography (250 – 420 μm) coated with polyethylene glycol 20 M for gas chromatography at the ratio of 10%.
Column temperature: A constant temperature of about 70°C.
Carrier gas: Helium.
Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 5 minutes.
Time span of measurement: About 3 times as long as the retention time of the internal standard.

System suitability—
System performance: When the procedure is run with 2 μL of the standard solution under the above operating conditions, the relative standard deviations of the ratio of the peak area of acetone, methanol and mesityl oxide to that of the internal standard are not more than 4.0%, respectively.

Water <2.48> Not more than 2.0% (0.5 g, volumetric titration, direct titration).

Assay Weigh accurately about 0.3 g of Cilastatin Sodium, dissolve in 30 mL of methanol, add 5 mL of water, and adjust to pH 3.0 with 0.1 mol/L hydrochloric acid TS. Titrate <2.50> with 0.1 mol/L sodium hydroxide VS from the first equivalence point to the third equivalence point (potentiometric titration).

Cilazapril Hydrate
シラザプリル水和物

C₂₂H₃₁N₃O₅.H₂O: 435.51
(15,95)-(1S)-9-[(1S)-(1-Ethoxycarbonyl-3-phenylpropyl)amino]-10-o xoctahydro-6H-pyridazino[1,2-a][1,2]diazepine-1-carboxylic acid monohydrate [92077-78-6] Cilazapril Hydrate contains not less than 98.5% and not more than 101.0% of cilazapril (C₂₂H₃₁N₃O₅: 417.50), calculated on the anhydrous basis.

Description Cilazapril Hydrate occurs as white to yellowish white crystals or crystalline powder.
It is very soluble in methanol, freely soluble in ethanol (99.5) and in acetic acid (100), and slightly soluble in water. It gradually turns yellow on exposure to light. Melting point: about 101°C (with decomposition).

Identification (1) To 4 mL of a solution of Cilazapril Hydrate (1 in 1000) add 2 mL of Dragendorff’s TS: an orange precipitate is produced.
(2) Determine the infrared absorption spectrum of Cilazapril Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]₂₀°: −53 – −58° (0.2 g calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

Purity (1) Chloride <1.03>—Perform the test using 1.0 g of Cilazapril Hydrate. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.009%).
(2) Sulfate <1.14>—Dissolve 1.0 g of Cilazapril Hydrate in 40 mL of water and 1.5 mL of dilute hydrochloric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.019%).
(3) Heavy metals <1.07>—Proceed with 1.0 g of Cilazapril Hydrate according to Method 4, and perform the test. However, use 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 8). Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).
(4) Related substances—Dissolve 0.10 g of Cilazapril Hydrate in 20 mL of methanol, and use this solution as the
Cilazapril Tablets / Official Monographs

The Cilazapril Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of cilazapril (C\(_{22}\)H\(_{21}\)N\(_3\)O\(_5\)) (417.50).

**Method of preparation**
Prepare as directed under Tablets, with Cilazapril Hydrate.

**Identification**
To a quantity of powdered Cilazapril Tablets, equivalent to 2 mg of cilazapril (C\(_{22}\)H\(_{21}\)N\(_3\)O\(_5\)) according to the labeled amount, add 2 mL of a mixture of acetonitrile and ethyl acetate (3:1), shake, and centrifuge. Pipet 4 mL of the supernatant liquid, add exactly 1 mL of the internal standard solution, add the mixture of water and acetonitrile (7:3) to make 10 mL, and use this solution as the standard solution. Separately, weigh accurately about 26 mg of Cilazapril for assay (separately determine the water \(<\, 2.4\text{mg}\) in the same manner as Cilazapril Hydrate), and dissolve in the mixture of water and acetonitrile (7:3) to make 50 mL. Pipet 2 mL of this solution, add exactly 10 mL of the internal standard solution, add the mixture of water and acetonitrile (7:3) to make 50 mL, and use this solution as the standard solution. Perform the test with 100 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography (2.02). Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Cilazapril Tablets add 5 mL of a mixture of water and acetonitrile (7:3), shake well until disintegration, add the mixture of water and acetonitrile (7:3) to make exactly 10 mL, and shake for 2 hours, and immediately examine under ultraviolet light (main wavelength: 254 nm): the spots obtained from the sample and standard solutions are dark brown and they show the same \(R_f\) value.

**Uniformity of dosage units**
Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Internal standard solution—A solution of dimethyl phthalate in a mixture of water and acetonitrile (7:3) (1 in 12,500).

**Operating conditions**
Proceed as directed in the operating conditions in the Assay.

**System suitability**
System performance: When the procedure is run with 100 \(\mu\)L of the standard solution under the above conditions, cilazapril and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 100 \(\mu\)L of the standard solution under the above conditions, the relative standard deviation of the ratio of the peak area of cilazapril to that of the internal standard is not more than 2.0%.

**Dissolution**
When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Cilazapril Tablets is not less than 85%.

Start the test with 1 tablet of Cilazapril Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \(\mu\)m. Establish the first 10 mL of the filtrate, pipet \(V\, mL\) of the subsequent filtrate, and add water to make exactly \(V + 10\, mL\) so that each mL contains...
about 0.28 µg of cilazapril (C₂₂H₃₁N₃O₅) according to the labeled amount. Pipet 10 mL of the solution, add exactly 5 mL of acetonitrile, and use this solution as the sample solution. Separately, weigh accurately about 29 mg of cilazapril for assay (separately determine the water in the same manner as Cilazapril Hydrate), and dissolve in water to make exactly 100 mL. Pipet 5 mL of the solution, add water to make exactly 100 mL. Then, pipet 2 mL of this solution, add water to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 5 mL of acetonitrile, and use this solution as the standard solution. Perform the test with exactly 100 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of cilazapril to that of the internal standard.

$$M_5: \text{Amount (mg) of cilazapril for assay, calculated on the anhydrous basis}$$

C: Labeled amount (mg) of cilazapril (C₂₂H₃₁N₃O₅) in 1 tablet

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: To a solution consisting of 180 mL of tetrahydrofuran for liquid chromatography, 120 mL of acetonitrile for liquid chromatography and 3 mL of triethylamine add water to make 1000 mL, and adjust the pH to 2.5 with phosphoric acid.

Flow rate: Adjust the flow rate so that the retention time of cilazapril is about 10 minutes.

System suitability—

System performance: When the procedure is run with 50 µL of the standard solution under the above conditions, cilazapril and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 50 µL of the standard solution under the above conditions, the relative standard deviation of the ratio of the peak area of cilazapril to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Cilostazol

シロスタゾール

$$C_{20}H_{27}N_5O_2: 369.46$$

6-[4-{1-Cyclohexyl-1H-tetrazol-5-yl]butyloxy}-3,4-dihydroquinolin-2(1H)-one [73963-72-1]

Cilostazol, when dried, contains not less than 98.5% and not more than 101.5% of C₂₀H₂₇N₅O₂.

Description Cilostazol occurs as white to pale yellowish white, crystals or crystalline powder.
It is slightly soluble in methanol, in ethanol (99.5) and in acetonitrile, and practically insoluble in water.

**Identification (1)** Determine the absorption spectrum of a solution of Cilostazol in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry 224, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cilostazol RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cilostazol as directed in the potassium bromide disk method under Infrared Spectrophotometry 225, and compare the spectrum with the Reference Spectrum or the spectrum of Cilostazol RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** 260 - 162°C

**Purity (1)** Heavy metals 207—Proceed with 2.0 g of Cilostazol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 25 mg of Cilostazol in 25 mL of acetonitrile, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add acetonitrile to make exactly 100 mL. Pipet 10 mL of this solution, add acetonitrile to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 207 according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than cilostazol obtained with the sample solution is not larger than 7/10 times the peak area of cilostazol with the standard solution, and the total area of the peaks other than the peak of cilostazol is not larger than 1.2 times the peak area of cilostazol with the standard solution.

**Operating conditions—**
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol, ethyl acetate and methanol (10:7:3).

Flow rate: Adjust the flow rate so that the retention time of cilostazol is about 7 minutes.

Time span of measurement: About 3 times as long as the retention time of cilostazol beginning after the solvent peak.

**System suitability—**
Test for required detectability: Pipet 1 mL of the standard solution, and add acetonitrile to make exactly 10 mL. Confirm that the peak area of cilostazol obtained with 10 μL of this solution is equivalent to 7 to 13% of that with 10 μL of the standard solution.

System performance: Pipet 1 mL of the sample solution, add 1 mL of a solution prepared by dissolving 5 mg of 3,4-dihydro-6-hydroxy-2(1H)-quinolinone in 10 mL of acetonitrile and acetonitrile to make exactly 100 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, 3,4-dihydro-6-hydroxy-2(1H)-quinolinone and cilostazol are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cilostazol is not more than 2.0%.

**Loss on drying** 247—Not more than 0.1% (1 g, 105°C, 2 hours).

**Residue on ignition** 247—Not more than 0.1% (1 g).

**Assay** Weigh accurately about 50 mg each of Cilostazol and Cilostazol RS, previously dried, dissolve each in a suitable amount of methanol, add exactly 5 mL of the internal standard solution and methanol to make 50 mL. To 1 mL each of these solutions add methanol to make 10 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 207 according to the following conditions, and calculate the ratios, Qf and Qs, of the peak area of cilostazol to that of the internal standard.

Amount (mg) of C20H27N5O2 = M5 × Qf/Qs

M5: Amount (mg) of Cilostazol RS

**Internal standard solution**—A solution of benzophenone in methanol (1 in 250).

**Operating conditions—**
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water, acetonitrile and methanol (10:9:1).

Flow rate: Adjust the flow rate so that the retention time of cilostazol is about 9 minutes.

**System suitability—**
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, cilostazol and the internal standard are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 5 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cilostazol to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Well-closed containers.

### Cilostazol Tablets

シロスタゾール錠

Cilostazol Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of cilostazol (C20H27N5O2: 369.46).
**Method of preparation** Prepare as directed under Tablets, with Cilostazol.

**Identification** Mix well an amount of powdered Cilostazol Tablets, equivalent to 50 mg of Cilostazol according to the labeled amount, with 10 mL of acetone, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 25 mg of Cilostazol RS in 5 mL of acetone, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.03). Spot 6 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography, develop the plate with a mixture of ethyl acetate, acetonitrile, methanol and formic acid (75:25:5:1) to a distance of about 12 cm, and air-dry the plate. Spray evenly Dragendorff’s TS for spraying on the plate: the principal spot with the sample solution and the spot with the standard solution are orange in color and have the same Rf value.

**Uniformity of dosage units**<6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Cilostazol Tablets add 2 mL of water to disintegrate the tablet, add the internal standard solution exactly 5 mL for a 50-mg tablet and exactly 10 mL for a 100-mg tablet, and add methanol to make 50 mL. Shake for 10 minutes for the 50-mg tablet and for 20 minutes for the 100-mg tablet. To 1 mL of the solution add methanol to make 10 mL for the 50-mg tablet and 20 mL for the 100-mg tablet, filter through a membrane filter with a pore size not exceeding 0.5 μm, and use the filtrate as the sample solution. Proceed as directed in the Assay.

\[
\text{Amount (mg) of cilostazol (C}_{20}\text{H}_{27}\text{N}_{5}\text{O}_{2}) = M_s \times Q_t / Q_s \times C / 50
\]

\[M_s: \text{Amount (mg) of Cilostazol RS}
\]

\[C: \text{Labeled amount (mg) of cilostazol (C}_{20}\text{H}_{27}\text{N}_{5}\text{O}_{2}) \text{ in 1 tablet}
\]

**Internal standard solution**—A solution of benzophenone in methanol (1 in 250).

**Dissolution**<6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of a solution of sodium lauryl sulfate (3 in 1000) as the dissolution medium, the dissolution rates of a 50-mg tablet and a 100-mg tablet in 45 minutes and a 100-mg tablet in 60 minutes are not less than 75% and not less than 70%, respectively.

Start the test with 1 tablet of Cilostazol Tablets, withdraw not less than 20 mL of the medium at the specified time after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet the subsequent V mL, add the dissolution medium to make exactly V mL so that each mL contains about 5.6 μg of Cilostazol (C_{20}H_{27}N_{5}O_{2}) according to the labeled amount, and use this solution as the standard solution. Separately, weigh accurately about 28 mg of Cilostazol RS, previously dried at 105°C for 2 hours, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, add the dissolution medium to make exactly 200 mL, and use this solution as the standard solution. Determine the absorbances, A_s and A_c, of the sample solution and standard solution at 257 nm as directed under Ultraviolet-visible Spectrophotometry <2.20> using the dissolution medium as the control.

Dissolution rate (%) with respect to the labeled amount of cilostazol (C_{20}H_{27}N_{5}O_{2})

\[M_s = M_s \times A_s / A_c \times V / V \times 1 / C \times 18 \]

\[M_s: \text{Amount (mg) of Cilostazol RS}
\]

\[C: \text{Labeled amount (mg) of cilostazol (C}_{20}\text{H}_{27}\text{N}_{5}\text{O}_{2}) \text{ in 1 tablet}
\]

**Assay** Weigh accurately not less than 20 Cilostazol Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 50 mg of Cilostazol (C_{20}H_{27}N_{5}O_{2}), add exactly 5 mL of the internal standard solution and methanol to make 50 mL, and shake well for 10 minutes. To 1 mL of this solution add methanol to make 10 mL, filter through a membrane filter with a pore size not exceeding 0.5 μm, and use the filtrate as the sample solution. Separately, weigh accurately about 50 mg of Cilostazol RS, previously dried at 105°C for 2 hours, dissolve in a suitable amount of methanol, and add exactly 5 mL of the internal standard solution, and add methanol to make 50 mL. To 1 mL of this solution add methanol to make 10 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Q_t and Q_s, of the peak area of cilostazol to that of the internal standard.

\[\text{Amount (mg) of cilostazol (C}_{20}\text{H}_{27}\text{N}_{5}\text{O}_{2}) = M_s \times Q_t / Q_s \]

\[M_s: \text{Amount (mg) of Cilostazol RS}
\]

**Internal standard solution**—A solution of benzophenone in methanol (1 in 250).

**Operating conditions**—
Proceed as directed in the operating conditions in the Assay under Cilostazol.

**System suitability**—
System performance: Proceed as directed in the system suitability in the Assay under Cilostazol.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of cilostazol to that of the internal standard is not more than 1.5%.

**Containers and storage** Containers—Well-closed containers.

**Cimetidine**

シメチジン

\[\text{C}_{10}\text{H}_{16}\text{N}_{6}\text{S}: 252.34 \]

2-Cyano-1-methyl-3-[2-[(5-methyl-1H-imidazol-4-yl)methylsulfanyl]ethyl]guanidine [51481-61-9]

Cimetidine, when dried, contains not less than 99.0% of C_{10}H_{16}N_{6}S.

**Description** Cimetidine occurs as a white crystalline pow-
**Cinoxacin**

**Identification (1)** To 0.1 mL of a solution of Cimetidine in ethanol (95) (1 in 100) add 5 mL of citric acid-acetic anhydride TS, and heat in a water bath for 15 minutes: a red-purple color develops.

(2) Determine the infrared absorption spectrum of Cimetidine, previously dried, as directed in the potassium bromide disk method under the Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**pH** $<2.54>$ Dissolve 0.5 g of Cimetidine in 50 mL of freshly boiled and cooled water, shake for 5 minutes and filter: the pH of the filtrate is between 9.0 and 10.5.

**Melting point** $<2.60>$ 140 – 144°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Cimetidine in 10 mL of methanol: the solution is clear and colorless to pale yellow in color.

(2) Heavy metals $<1.07>$—Proceed with 2.0 g of Cimetidine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic $<1.11>$—Dissolve 1.0 g of Cimetidine in 5 mL of dilute hydrochloric acid, and perform the test with this solution (not more than 2 ppm).

(4) Related substances—Dissolve 0.5 g of Cimetidine in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $<2.03>$, spot 4 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, methanol and ammonia solution (28) (14:4:1) to a distance of about 15 cm, air-dry the plate, and then dry at 80°C for 30 minutes. Allow the plate to stand in iodine vapor for 45 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** $<2.41>$ Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** $<2.44>$ Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.24 g of Cimetidine, previously dried, dissolve in 75 mL of acetic acid (100), and titrate $<2.50>$ with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 25.23 mg of C$_{10}$H$_{10}$N$_{2}$S

**Containers and storage** Containers—Well-closed containers. Storage—Light-resistant.

---

**Cinoxacin**

シノキサシン

C$_{12}$H$_{10}$N$_{2}$O$_{5}$: 262.22

5-Ethyl-8-oxo-5,8-dihydro[1,3]dioxolo[4,5-g]cinnoline-7-carboxylic acid

Cinoxacin, when dried, contains not less than 98.0% and not more than 101.0% of C$_{12}$H$_{10}$N$_{2}$O$_{5}$.

**Description** Cinoxacin occurs as a white to pale yellow crystalline powder. It is odorless or has a slight, characteristic odor. It has a bitter taste.

It is slightly soluble in N,N-dimethylformamide and in acetone, very slightly soluble in ethanol (99.5), and practically insoluble in water.

It dissolves in sodium hydroxide TS.

**Purity (1)** Sulfate $<1.14>$—Dissolve 0.20 g of Cinoxacin in 10 mL of dilute sodium hydroxide TS, and add water to make 100 mL. To 1 mL of this solution add 0.1 mol/L hydrochloric acid TS to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry $<2.24>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave lengths.

(2) Determine the infrared absorption spectrum of Cinoxacin as directed in the potassium bromide disk method under Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Related substances**—Dissolve 10 mg of Cinoxacin in 10 mL of dilute sodium hydroxide TS, add 20 mL of 0.1 mol/L hydrochloric acid TS, shake, filter, and add water to the filtrate to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.20 mL of 0.005 mol/L sulfuric acid VS by adding 10 mL of dilute sodium hydroxide TS, 20 mL of 0.1 mol/L hydrochloric acid TS, and water to make 50 mL (not more than 0.048%).

(2) Heavy metals $<1.07>$—Proceed with 1.0 g of Cinoxacin according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 10 mg of Cinoxacin in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $<2.03>$. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of acetonitrile, water and ammonia solution (28) (14:4:1) to a distance of...
about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot obtained from the sample solution are not more intense than the spot from the standard solution.

(4) Residual solvent—Being specified separately.

**Loss on drying** 2.44
Not more than 0.5% (1 g, 105°C, 1 hour).

**Residue on ignition** 2.44
Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.4 g of Cinoxacin, previously dried, add 60 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and dissolve by warming. After cooling, titrate with 0.1 mol/L perchloric acid VS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry 2.24>, and determine the absorbances, \(A_T\) and \(A_S\), at 351 nm.

\[
\text{Amount (mg) of cinoxacin (C}_{12}\text{H}_{10}\text{N}_{2}\text{O}_{5}) = M_S \times A_T/A_S \times V/V_0
\]

\(M_S\): Amount (mg) of cinoxacin for assay
\(C\): Labeled amount (mg) of cinoxacin (C\(_{12}\)H\(_{10}\)N\(_2\)O\(_5\)) in 1 capsule

**Dissolution** 6.1D
When the test is performed at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of 2nd solution for dissolution test as the dissolution medium, the dissolution rate in 90 minutes of Cinoxacin Capsules is not less than 70%.

Start the test with 1 capsule of Cinoxacin Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet \(V\) mL of the subsequent filtrate, add the dissolution medium to make exactly \(V\) mL so that each mL contains about 11 μg of cinoxacin (C\(_{12}\)H\(_{10}\)N\(_2\)O\(_5\)) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 22 mg of cinoxacin for assay, previously dried at 105°C for 1 hour, and dissolve in the dissolution medium to make exactly 100 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry 2.24>, and determine the absorbances, \(A_T\) and \(A_S\), at 351 nm.

\[
\text{Dissolution rate (%)} = \frac{M_S \times A_T/A_S \times V/V_0}{C} 	imes 100
\]

\(M_S\): Amount (mg) of cinoxacin for assay
\(C\): Labeled amount (mg) of cinoxacin (C\(_{12}\)H\(_{10}\)N\(_2\)O\(_5\)) in 1 capsule

**Assay** Weigh accurately the mass of not less than 20 Cinoxacin Capsules, take out the contents, and powder. Wash the capsule shells with a small amount of diethyl ether, allow to stand at room temperature to vaporize the diethyl ether, weigh accurately the mass of the capsule shells, and calculate the mass of the contents. Weigh accurately a portion of the powder, equivalent to about 50 mg of cinoxacin (C\(_{12}\)H\(_{10}\)N\(_2\)O\(_5\)), add 10 mL of dilute sodium hydroxide TS, shake, add water to make exactly 100 mL, and filter. Discard the first 20 mL of the filtrate, pipet 1 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of cinoxacin for assay, previously dried at 105°C for 1 hour, dissolve in 10 mL of dilute sodium hydroxide TS, and add water to make exactly 100 mL. Pipet 1 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry 2.24>, and determine the absorbances, \(A_T\) and \(A_S\), at 351 nm.
Cisplatin

シスプラチン

\[ \text{C}_{2}\text{H}_{6}\text{N}_{2}\text{Pt}: 300.05 \]

\[(\text{SP}-4-2)-\text{Diamminedichloroplatinum} \]

[15663-27-1]

Cisplatin, when dried, contains not less than 98.0% and not more than 102.0% of C\textsubscript{2}H\textsubscript{6}N\textsubscript{2}Pt.

**Description**

Cisplatin occurs as a yellow crystalline powder.

It is sparingly soluble in \( N, N \)-dimethylformamide, slightly soluble in water, and practically insoluble in ethanol (99.5).

**Identification**

1. To 5 mL of a solution of Cisplatin (1 in 2000) add 2 to 3 drops of a solution of tin (II) chloride dihydrate (1 in 100); a brown precipitate is formed.

2. Determine the absorption spectrum of a solution of Cisplatin in a solution of sodium chloride in 0.01 mol/L hydromorphic acid TS (9 in 1000) (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cisplatin RS prepared in the same manner as the sample solution; both spectra exhibit similar intensities of absorption at the same wavelengths.

3. Determine the infrared absorption spectrum of Cisplatin as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Cisplatin RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

4. A solution of Cisplatin (1 in 2000) responds to the Qualitative Tests <1.09> (1) for chloride.

**Purity**

Ammonium amminetrichloroplatinate—Conduct this procedure using light-resistant vessels. Dissolve 50 mg of Cisplatin in a solution of sodium chloride (9 in 1000) to make exactly 100 mL, and use this solution as the sample solution. Separately, dissolve 10 mg of ammonium amminetrichloroplatinate for liquid chromatography, previously dried at 80°C for 3 hours, in the solution of sodium chloride (9 in 1000) to make exactly 200 mL. Pipet 2 mL of this solution, add the solution of sodium chloride (9 in 1000) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 40 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine the peak area of ammonium amminetrichloroplatinate and the peak area of Cisplatin by the automatic integration method: the peak area from the sample solution is not larger than that from the standard solution.

### Operating conditions—

**Detector**

An ultraviolet absorption photometer (wave-length: 209 nm).

**Column**

A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with silica gel for liquid chromatography having quaternary ammonium groups (10 \( \mu \)m in particle diameter).

**Column temperature**

A constant temperature of about 25°C.

**Mobile phase**

A solution of ammonium sulfate (1 in 1000).

**Flow rate**

Adjust the flow rate so that the retention time of ammonium amminetrichloroplatinate is about 8 minutes.

### System suitability—

**System performance**

When the procedure is run with 40 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ammonium amminetrichloroplatinate are not less than 1500 and not more than 2.0, respectively.

**System repeatability**

When the test is repeated 6 times with 40 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ammonium amminetrichloroplatinate is not more than 3.0%.

**Loss on drying**

Not more than 0.1% (1 g, 105°C, 4 hours).

**Assay**

Conduct this procedure using light-resistant vessels. Weigh accurately about 25 mg each of Cisplatin and Cisplatin RS, previously dried, dissolve in \( N, N \)-dimethylformamide to make exactly 25 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 40 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of cisplatin by the automatic integration method.

\[
M_S = \text{Amount (mg) of Cisplatin RS} \\
M_C = \text{Amount (mg) of Cisplatin} \\
M = M_S \times A_T/A_S
\]

**Operating conditions—**

**Detector**

An ultraviolet absorption photometer (wave-length: 310 nm).

**Column**

A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with aminopropylsilanized silica gel for liquid chromatography (5 \( \mu \)m in particle diameter).

**Column temperature**

A constant temperature of about 25°C.

**Mobile phase**

A mixture of ethyl acetate, methanol, water and \( N, N \)-dimethylformamide (25:16:5:5).

**Flow rate**

Adjust the flow rate so that the retention time of cisplatin is about 4 minutes.

**System suitability—**

**System performance**

When the procedure is run with 40 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of cisplatin are not less than 3000 and not more than 2.0, respectively.

**System repeatability**

When the test is repeated 6 times with 40 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of cisplatin is not more than 1.0%.
Containers and storage  Containers—Tight containers.

Anhydrous Citric Acid

無水クエン酸

C₆H₈O₇: 192.12
2-Hydroxypropane-1,2,3-tricarboxylic acid
[77-92-9]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbol (*) •).

Anhydrous Citric Acid contains not less than 99.5% and not more than 100.5% of C₆H₈O₇, calculated on the anhydrous basis.

*Description*  Anhydrous Citric Acid occurs as colorless crystals, white granules or crystalline powder.

It is very soluble in water, and freely soluble in ethanol (95%).

*Identification*  Determine the infrared absorption spectrum of Anhydrous Citric Acid, previously dried at 105°C for 2 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Purity  (1) Clarity and color of solution—Dissolve 2.0 g of Anhydrous Citric Acid in water to make 10 mL: the solution is clear and has no more color than the following control solutions (1), (2) or (3).

Control solution (1): To 1.5 mL of Cobalt (II) Chloride CS and 6.0 mL of Iron (III) Chloride CS add water to make 1000 mL.

Control solution (2): To 0.15 mL of Cobalt (II) Chloride CS, 7.2 mL of Iron (III) Chloride CS and 0.15 mL of Copper (II) Sulfate CS add water to make 1000 mL.

Control solution (3): To 2.5 mL of Cobalt (II) Chloride CS, 6.0 mL of Iron (III) Chloride CS and 1.0 mL of Copper (II) Sulfate CS add water to make 1000 mL.

(2) Sulfates—Dissolve 2.0 g of Anhydrous Citric Acid in water to make 30 mL, and use this solution as the sample solution. Separately, dissolve 0.181 g of potassium sulfate in 1000 mL. Pipet 5 mL of this solution, and add 5 mL of water to make exactly 100 mL. To 4.5 mL of this solution add 3 mL of a solution of potassium hexacyanoferrate (III) (1 in 20), mix, and add lead solution (not more than 10 ppm). •

(5) Readily carbonizable substances <1.15>—Perform the test with 0.5 g of Anhydrous Citric Acid, provided that the solution is heated at 90°C for 1 hour and then cool quickly: the solution has no more color than Matching Fluid K.

Water <2.48>  Not more than 1.0% (2 g, volumetric titration, direct titration).

Residue on ignition <2.48>  Not more than 0.1% (1 g).

Assay  Weigh accurately about 0.55 g of Anhydrous Citric Acid, dissolve in 50 mL of water, and titrate with 1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS).

Each mL of 1 mol/L sodium hydroxide VS = 64.04 mg of C₆H₈O₇.

*Containers and storage*  Containers—Tight containers.

C₆H₈O₇·H₂O: 210.14
2-Hydroxypropane-1,2,3-tricarboxylic acid monohydrate
[59469-29-7]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbol (•). Citric Acid Hydrate contains not less than 99.5% and not more than 100.5% of anhydrous citric acid (C₆H₈O₇: 192.12), calculated on the anhydrous basis.

*Description*  Citric Acid Hydrate occurs as colorless crystals, white granules or crystalline powder.

It is soluble in water, and freely soluble in ethanol (95).

It is efflorescent in dry air.

*Identification*  Determine the infrared absorption spectrum of Citric Acid Hydrate, previously dried at 105°C for 2 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit...
similar intensities of absorption at the same wave numbers.

**Purity** (1) Clarity and color of solution—Dissolve 2.0 g of Citric Acid Hydrate in water to make 10 mL; the solution is clear and has no more color than the following control solutions (1), (2) or (3).

Control solution (1): To 1.5 mL of Cobalt (II) Chloride CS and 6.0 mL of Iron (III) Chloride CS add water to make 1000 mL.

Control solution (2): To 0.15 mL of Cobalt (II) Chloride CS, 7.2 mL of Iron (III) Chloride CS and 0.15 mL of Copper (II) Sulfate CS add water to make 1000 mL.

Control solution (3): To 2.5 mL of Cobalt (II) Chloride CS, 6.0 mL of Iron (III) Chloride CS and 1.0 mL of Copper (II) Sulfate CS add water to make 1000 mL.

(2) Sulfates—Dissolve 2.0 g of Citric Acid Hydrate in water to make 30 mL, and use this solution as the sample solution. Separately, dissolve 0.181 g of potassium sulfate in diluted ethanol (3 in 10) to make exactly 500 mL. Pipet 5 mL of this solution, and add diluted ethanol (3 in 10) to make exactly 100 mL. To 4.5 mL of this solution add 3 mL of a solution of barium chloride dihydrate (1 in 4), shake, and allow to stand for 1 minute. To 2.5 mL of this solution add 15 mL of the sample solution and 0.5 mL of acetic acid (31), and allow to stand for 5 minutes: the solution has no more turbidity than the following control solution.

Control solution: Dissolve 0.181 g of potassium sulfate in water to make exactly 500 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and proceed in the same manner as above using this solution instead of the sample solution.

(3) Oxalic acid—Dissolve 0.80 g of Citric Acid Hydrate in 4 mL of water, add 3 mL of hydrochloric acid and 1 g of zinc, and boil for 1 minute. After allowing to stand for 2 minutes, take the supernatant liquid, add 0.25 mL of a solution of phenylhydrazinium hydrochloride (1 in 4), shake, and allow to stand for 1 minute. To 2.5 mL of this solution add 15 mL of the sample solution and 0.5 mL of acetic acid (31), and allow to stand for 5 minutes: the solution has no more turbidity than the following control solution prepared at the same time.

Control solution: To 4 mL of a solution of oxalic acid dihydrate (1 in 10,000) add 3 mL of hydrochloric acid and 1 g of zinc, and proceed in the same manner as the test solution.

(4) Heavy metals <1.07—Proceed with 2.0 g of Citric Acid Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Readily carbonizable substances <1.15—Perform the test with 0.5 g of Citric Acid Hydrate, provided that the solution is heated at 90°C for 1 hour and then cool quickly: the solution has no more color than Matching Fluid K.

**Water** <2.48 Not less than 7.5% and not more than 9.0% (0.5 g, volumetric titration, direct titration).

**Residue on ignition** <2.44 Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.55 g of Citric Acid Hydrate, dissolve in 50 mL of water, and titrate <2.50 with 1 mol/L sodium hydroxide VS (indicator: 2 drops of phenolphthalein TS).

Each mL of 1 mol/L sodium hydroxide VS = 64.04 mg of C6H8O7

*Containers and storage* Containers—Tight containers.

---

**Clarithromycin**

クラリスロマイシン

C38H69NO13: 747.95 (2R,3S,4S,5R,6R,8R,10R,11S,12S,13R)-5-(3,4,6-Trideoxy-3-dimethylamino-β-D-xylo-hexopyanosyl)-3-(2,6-dideoxy-3-C-methyl-3-O-methyl-α-L-ribo-hexopyranosyl)-11,12-dihydroxy-6-methoxy-2,4,6,8,10,12-hexamethyl-9-oxopentadecan-13-olide [81103-11-9]

Clarithromycin is a derivative of erythromycin. It contains not less than 950 μg (potency) and not more than 1050 μg (potency) per mg, calculated on the anhydrous basis. The potency of Clarithromycin is expressed as mass (potency) of clarithromycin (C38H69NO13).

**Description** Clarithromycin occurs as a white crystalline powder and has a bitter taste. It is soluble in acetone and in chloroform, slightly soluble in methanol and in ethanol (95), and practically insoluble in water.

**Identification** (1) To 5 mg of Clarithromycin add 2 mL of sulfuric acid, and shake gently: a red-brown color develops.

(2) Dissolve 3 mg of Clarithromycin in 2 mL of acetone, and add 2 mL of hydrochloric acid: an orange color develops and changes immediately to red to deep purple.

(3) Determine the infrared absorption spectra of Clarithromycin and Clarithromycin RS as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Dissolve 10 mg each of Clarithromycin and Clarithromycin RS in 4 mL of chloroform, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop with a mixture of chloroform, methanol and ammonia water (28) (100:5:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly sulfuric acid on the plate, and heat at 105°C for 10 minutes: the principal spot from the sample solution and the spot from the standard solution show a dark purple color and have the same Rf value.
Optical rotation $< 2.4^\circ$  $[\alpha]_D^{25} < -87^\circ$ to $-97^\circ$ (0.25 g calculated on the anhydrous basis, chloroform, 25 mL, 100 mm).

Melting point 2.60°C  220 - 227°C

Purity (1)  Heavy metals $< 1.07$—Proceed with 2.0 g of Clarithromycin according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2)  Arsenic—Prepare the test solution with 1.0 g of Clarithromycin according to Method 3, and perform the test (not more than 2 ppm).

(3)  Related substances—Weigh accurately about 0.1 g of Clarithromycin, dissolve in the mobile phase to make exactly 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Clarithromycin RS, dissolve in the mobile phase to make exactly 20 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography $< 2.01 >$ according to the following conditions, and determine the peak area by the automatic integration method: the amount of each related substance calculated on the anhydrous basis is not more than 2.0%, and the total of them is not more than 5.0%. Exclude any peak with an area of less than 0.05%.

Amount (%) of each related substance calculated on the anhydrous basis

\[ M_S / M_T \times A_T / A_S \times 100 \]

Total amount (%) of the related substances calculated on the anhydrous basis

\[ M_S / M_T \times \Sigma A_T / A_S \times 100 \]

$M_S$: Amount (mg) of Clarithromycin RS

$M_T$: Amount (mg) of the sample, calculated on the anhydrous basis

$A_T$: Peak area of clarithromycin obtained with the standard solution

$A_S$: Peak area of each related substance obtained with the sample solution

\[ \Sigma A_T \]: Total area of the peaks other than clarithromycin obtained with the sample solution

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 5 times as long as the retention time of the main peak after 2 minutes of sample injection.

System suitability—

Test for required detection: To exactly 2 mL of the standard solution add the mobile phase to make exactly 10 mL, and use this solution as the solution for system suitability test. Confirm that when the procedure is run with 10 µL of the solution for system suitability test, the peak area of clarithromycin is equivalent to 14 to 26% of that obtained with 10 µL of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 10 µL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of clarithromycin is not more than 3.0%.

Water $< 2.4^\circ$  Not more than 2.0% (0.5 g, volumetric titration, direct titration).

Residue on ignition $< 2.4^\circ$  Not more than 0.1% (2 g).

Assay  Weigh accurately a sufficient amount of Clarithromycin and Clarithromycin RS, equivalent to about 0.1 g (potency), and dissolve in the mobile phase to make exactly 20 mL. Pipet 2 mL each of these solutions, add exactly 2 mL of the internal standard solution, add the mobile phase to make 20 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography $< 2.01 >$ according to the following conditions, and calculate the ratios, $Q_T$ and $Q_S$, of the peak area of clarithromycin to that of the internal standard.

Amount [µg (potency)] of $C_{38}H_{60}NO_{13}$

\[ M_S = M_s \times Q_T / Q_S \times 1000 \]

$M_S$: Amount [mg (potency)] of Clarithromycin RS

Internal standard solution—A solution of butyl parahydroxybenzoate in the mobile phase (1 in 20,000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octadecylsilsilica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: A mixture of diluted 0.2 mol/L potassium dihydrogenphosphate TS (1 in 3) and acetonitrile (13:7).

Flow rate: Adjust the flow rate so that the retention time of clarithromycin is about 8 minutes.

System suitability—

System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, clarithromycin and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of clarithromycin to that of the internal standard is not more than 2.0%.

Containers and storage  Containers—Well-closed containers.

Clarithromycin Tablets

クラリスロマイシン錠

Clarithromycin Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of clarithromycin ($C_{38}H_{60}NO_{13}$: 747.95).

Method of preparation  Prepare as directed under Tablets, with Clarithromycin.

Identification  Shake a quantity of pulverized Clarithromycin Tablets, equivalent to 60 mg (potency) of Clarithromycin
according to the labeled amount, with 40 mL of acetone for 10 minutes, and centrifuge at 4000 rpm for 5 minutes. Evaporate 30 mL of the supernatant liquid, and determine the infrared absorption spectrum of the residue so obtained as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.25Y; it exhibits absorption at the wave numbers of about 2980 cm⁻¹, 2940 cm⁻¹, 1734 cm⁻¹, 1693 cm⁻¹, 1459 cm⁻¹, 1379 cm⁻¹ and 1171 cm⁻¹.

**Uniformity of dosage units** 6.02  Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Clarithromycin Tablets add exactly V/20 mL of the internal standard solution (1), then add the mobile phase so that each mL contains about 5 mg (potency) of clarithromycin (C₃₈H₆₉NO₁₃) to make V mL, and disperse to fine particles with the aid of ultrasonic waves for 20 minutes while occasional vigorous shaking. Centrifuge this solution at 4000 rpm for 15 minutes, and filter the supernatant liquid through a membrane filter with a pore size of not more than 0.45 μm. Then, proceed as directed in the Assay.

Amount [mg (potency)] of clarithromycin (C₃₈H₆₉NO₁₃) = Mₜ × Q₁/Qₕ × V/10

Mₜ: Amount [mg (potency)] of Clarithromycin RS

**Internal standard solution (1)—** A solution of butyl parahydroxybenzoate in the mobile phase (1 in 1000).

**Internal standard solution (2)—** To exactly 1 mL of the internal standard solution (1) add the mobile phase to make exactly 20 mL.

**Dissolution 6.10** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L disodium hydrogen phosphate-citric acid buffer solution, pH 6.0 as the dissolution medium, the dissolution rates in 30 minutes of a 50-mg tablet and a 200-mg tablet are not less than 80% and not less than 75%, respectively.

Start the test with 1 tablet of Clarithromycin Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the mobile phase to make exactly V mL so that each mL contains about 28 μg (potency) of Clarithromycin according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately an amount of Clarithromycin RS, equivalent to about 28 mg (potency), and disperse in acetonitrile for liquid chromatography to make exactly 100 mL. Pipet 5 mL of this solution, and add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 100 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and calculate the ratios, Q₁ and Qₕ, of the peak areas of clarithromycin to that of the internal standard.

Amount [mg (potency)] of clarithromycin (C₃₈H₆₉NO₁₃) = Mₜ × Q₁/Qₕ × V/10

Mₜ: Amount [mg (potency)] of Clarithromycin RS

**Operating conditions—**

Produce as directed in the operating conditions in the Assay.

**System suitability—**

**System performance:** When the procedure is run with 100 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clarithromycin are not less than 3000 and not more than 2.0, respectively.

**System repeatability:** When the test is repeated 6 times with 100 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clarithromycin is not more than 2.0%.

**Assay** To not less than 5 Clarithromycin Tablets add diluted 0.2 mol/L potassium dihydrogen phosphate TS (1 in 3) so that each mL contains about 8 mg (potency) of clarithromycin (C₃₈H₆₉NO₁₃), disperse to fine particles with the aid of ultrasonic waves, add exactly 1 mL of the internal standard solution (1) per 100 mg (potency) of clarithromycin according to the labeled amount, then add acetonitrile for liquid chromatography so that each mL contains about 5 mg (potency) of clarithromycin (C₃₈H₆₉NO₁₃), and disperse to fine particles with the aid of ultrasonic waves for 10 minutes while occasional vigorous shaking. Centrifuge of this solution at 4000 rpm for 15 minutes, and filter the supernatant liquid through a membrane filter with a pore size of not more than 0.45 μm. Discard the first 3 mL of the filtrate, to 2 mL of the subsequent filtrate add the mobile phase to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Clarithromycin RS, equivalent to about 50 mg (potency), and dissolve in the mobile phase to make exactly 10 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution (2) and the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and calculate the ratios, Q₁ and Qₕ, of the peak area of clarithromycin to that of the internal standard.

Amount [mg (potency)] of clarithromycin (C₃₈H₆₉NO₁₃) = Mₜ × Q₁/Qₕ × V/10

Mₜ: Amount [mg (potency)] of Clarithromycin RS

**Internal standard solution (1)—** A solution of butyl parahydroxybenzoate in the mobile phase (1 in 1000).

**Internal standard solution (2)—** To exactly 1 mL of the internal standard solution (1) add the mobile phase to make exactly 20 mL.

**Operating conditions—**

**Dissolution 6.10** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L disodium hydrogen phosphate-citric acid buffer solution, pH 6.0 as the dissolution medium, the dissolution rate in 30 minutes of a 50-mg tablet and a 200-mg tablet are not less than 80% and not less than 75%, respectively.

Start the test with 1 tablet of Clarithromycin Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the mobile phase to make exactly V mL so that each mL contains about 28 μg (potency) of Clarithromycin according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately an amount of Clarithromycin RS, equivalent to about 28 mg (potency), and disperse in acetonitrile for liquid chromatography to make exactly 100 mL. Pipet 5 mL of this solution, and add the mobile phase to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 100 μL each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and determine the peak areas, A₁ and Aₕ, of clarithromycin.

Dissolution rate (%) with respect to the labeled amount of clarithromycin (C₃₈H₆₉NO₁₃) = Mₜ × A₁/Aₕ × V/V × 1/C × 90

Mₜ: Amount [mg (potency)] of Clarithromycin RS

C: Labeled amount [mg (potency)] of clarithromycin (C₃₈H₆₉NO₁₃) in 1 tablet

**Operating conditions—**

Produce as directed in the operating conditions in the Assay.
Clebopride Malate

**Chemical Name:** 4-Amino-N-(1-benzylpiperidin-4-yl)-5-chloro-2-methoxybenzamido mono-(2RS)-malate

**CAS Number:** 57645-91-7

**Molar Mass:** 507.96

**Description:** Clebopride Malate occurs as a white crystalline powder. It is freely soluble in acetic acid (100), soluble in methanol, sparingly soluble in water, and slightly soluble in ethanol (99.5).

A solution of Clebopride Malate in methanol (1 in 25) shows no optical rotation.

**Identification (1):** Determine the absorption spectrum of a solution of Clebopride Malate in methanol (1 in 80000) as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Identification (2):** Determine the infrared absorption spectrum of Clebopride Malate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Assay:** Weigh accurately about 0.5 g of Clebopride Malate, previously dried, dissolve in 20 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS contains 50.80 mg of C_{20}H_{24}ClN_{3}O_{2}.C_{4}H_{6}O_{5}.

**Containers and Storage:** Containers—Well-closed containers.

**System Suitability:**

- **System performance:** When the procedure is run with 10 μL of the standard solution under the above operating conditions, clarithromycin and the internal standard are eluted in this order with the resolution between these peaks being not less than 3.
- **System repeatability:** When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of clarithromycin to that of the internal standard is not more than 2.0%.

**Loss on Drying (<2.4>)**

Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on Ignition (<2.4>)**

Not more than 0.1% (1 g).

**Heavy Metals (<1.07>)**

Proceed with 2.0 g of Clebopride Malate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Related Substances**

Dissolve 0.10 g of Clebopride Malate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 0.2 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of the peaks other than the peak of clebopride obtained from the sample solution is not larger than the peak area of clebopride from the standard solution.

**Operating Conditions:**

- **Detector:** An ultraviolet absorption photometer (wavelength: 240 nm).
- **Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecysilane silanized silica gel for liquid chromatography (7 μm in particle diameter).
- **Column temperature:** A constant temperature of about 25°C.
- **Mobile phase:** Dissolve 3.85 g of ammonium acetate in water to make 500 mL, and filter through a membrane filter with a pore size not exceeding 0.5 μm. To 400 mL of the filtrate add 600 mL of methanol.
- **Flow rate:** Adjust the flow rate so that the retention time of clebopride is about 15 minutes.
- **Time span of measurement:** About 2 times as long as the retention time of clebopride.

**System Suitability:**

Test for required detectability: Pipet 10 mL of the standard solution, and add water to make exactly 100 mL. Confirm that the peak area of clebopride obtained from 10 μL of this solution is equivalent to 7 to 13% of that of clebopride from 10 μL of the standard solution.

System performance: Dissolve 30 mg Clebopride Malate and 5 mg of propyl parahydroxybenzoate in the mobile phase to make 100 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, propyl parahydroxybenzoate and clebopride are eluted in this order with the resolution between these peaks being not less than 3.

System repeatability: The test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clebopride is not more than 2.5%.

**Residual Solvent**

- Being specified separately.
Clemastine Fumarate

克伦斯汀布马酸盐

C₂₁H₂₆ClNO.C₄H₄O₄: 459.96

(2R)-2-[2-[(1R)-1-(4-Chlorophenyl)-1-phenylethoxy]ethyl]-1-methylpyrrolidine monofumarate

[Clemastine Fumarate occurs as a white, crystalline powder. It is odorless. It is sparingly soluble in methanol and in acetic acid (100), slightly soluble in ethanol (95), very slightly soluble in diethyl ether, and practically insoluble in water.

**Identification**  (1) To 5 mg of Clemastine Fumarate add 5 mL of sulfuric acid, and shake to dissolve: a yellow color develops. Slowly drop this solution into 10 mL of water: the yellow color immediately disappears.

(2) To 0.01 g of Clemastine Fumarate add 1 mL of fuming nitric acid, and evaporate on a water bath to dryness. Then add 2 mL of diluted hydrochloric acid (1 in 2) and 0.2 g of zinc powder, heat for 10 minutes on a water bath, cool, and filter. Add 20 mL of water to the filtrate. The solution responds to the Qualitative Tests <1.00> for primary aromatic amines.

(3) To 5 mL of a solution of Clemastine Fumarate (1 in 50,000), add 5 mL of 4-dimethylaminobenzaldehyde TS, and warm for 10 minutes: a red-purple color develops.

(4) Perform the test with Clemastine Fumarate as directed under Flame Coloration Test <1.04> (2): a green color appears.

(5) Dissolve 0.04 g of Clemastine Fumarate and 0.01 g of fumaric acid for thin-layer chromatography in 2 mL each of a mixture of ethanol (95) and water (4:1) by gentle warming, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 µL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol to make exactly 250 mL, and use this solution as the standard solution (1). Pipet 5 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 µL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and ammonia solution (28) (90:10:1) to a distance of about 10 cm, and air-dry the plate. After spraying evenly Dragendorff’s TS on the plate, immediately spray evenly hydrogen peroxide TS: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (1), and not more than 2 spots from the sample solution are more intense than the spot from the standard solution (2).

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.4 g of Clemastine Fumarate, previously dried, dissolved in 50 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 46.00 mg of C₂₁H₂₆ClNO.C₄H₄O₄

**Containers and storage** Containers—Tight containers.

Clindamycin Hydrochloride

クリンダマイシン塩酸塩

C₁₈H₁₇ClN₅O₆S.HCl: 461.44

Methyl 7-chloro-6,7,8-trideoxy-6-[(2S,4R)-1-methyl-4-propylypyrrolidine-2-carboxamido]-1-thio-L-threo-α-D-galacto-octopyranoside monohydrochloride

[21662-39-5]

Clindamycin Hydrochloride is the hydrochloride of a derivative of lincomycin.
It contains not less than 838 μg (potency) and not more than 940 μg (potency) per mg, calculated on the anhydrous basis. The potency of Clindamycin Hydrochloride is expressed as mass (potency) of clindamycin (C18H33ClN2O5S: 424.98).

**Description** Clindamycin Hydrochloride occurs as white to grayish white, crystals or crystalline powder.

It is freely soluble in water and in methanol, and slightly soluble in ethanol (99.5).

**Identification** (1) Determine the infrared absorption spectrum of Clindamycin Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Clindamycin Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) A solution of Clindamycin Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> (2) for chloride.

**Optical rotation** <2.49> [α]D: 135° to 150° (0.5 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

**Purity** Heavy metals <1.07>—Proceed with 2.0 g of Clindamycin Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Water** <2.48> Not more than 6.0% (0.3 g, volumetric titration, direct titration).

**Assay** Weigh accurately an amount of Clindamycin Hydrochloride and an amount of Clindamycin Hydrochloride RS, equivalent to about 20 mg (potency), dissolve each in the mobile phase to make exactly 20 mL, and use these solutions as the sample solution and standard solution, respectively. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A1 and A5, of clindamycin in each solution.

\[ \text{Amount} [\mu g \text{ (potency)}] \text{ of clindamycin (} C_{18}H_{33}ClN_{2}O_{5}S) = M_s \times A_1/A_5 \times 1000 \]

\[ M_s: \text{Amount [mg (potency)] of Clindamycin Hydrochloride RS} \]

**Operating conditions**

- **Detector:** An ultraviolet absorption photometer (wavelength: 210 nm).
- **Column:** A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
- **Column temperature:** A constant temperature of about 25°C.
- **Mobile phase:** To 0.05 mol/L potassium dihydrogen phosphate TS add 8 mol/L potassium hydroxide TS to adjust the pH to 7.5. To 550 mL of this solution add 450 mL of acetonitrile for liquid chromatography.
- **Flow rate:** Adjust the flow rate so that the retention time of clindamycin is about 10 minutes.

**System suitability**—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clindamycin are not less than 6000 and not more than 1.5, respectively.

**System repeatability:** When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clindamycin is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

### Clindamycin Hydrochloride Capsules

Clindamycin Hydrochloride Capsules contain not less than 93.0% and not more than 107.0% of the labeled potency of clindamycin (C18H33ClN2O5S: 424.98).

**Method of preparation** Prepare as directed under Capsules, with Clindamycin Hydrochloride.

**Identification** To an amount of the contents of Clindamycin Hydrochloride Capsules, equivalent to 10 mg (potency) of Clindamycin Hydrochloride, add 2 mL of methanol, shake well, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 10 mg of Clindamycin Hydrochloride RS in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>.

Spot 10 μL of each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, toluene and ammonia solution (28) (140:60:3) to a distance of about 12 cm, and air-dry the plate. Spray evenly a mixture of 500 mL of a solution of L-tartaric acid (1 in 5) and 50 mL of bismuth subnitrate TS on the plate: the Rf values of the principal spot with the sample solution and the spot with the standard solution are not different each other.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 capsule of Clindamycin Hydrochloride Capsules add a suitable amount of the mobile phase, shake for 30 minutes, and add the mobile phase to make exactly V mL so that each mL contains 0.75 mg (potency) of Clindamycin Hydrochloride. Centrifuge this solution, and use the supernatant liquid as the sample solution. Then, proceed as directed in the Assay.

\[ \text{Amount [mg (potency)] of clindamycin (} C_{18}H_{33}ClN_{2}O_{5}S) = M_s \times A_1/A_5 \times V/100 \]

\[ M_s: \text{Amount [mg (potency)] of Clindamycin Hydrochloride RS} \]

**Dissolution** <6.1D> When the test is performed at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of water as the dissolution medium, the dissolution rate of a 75-mg capsule in 15 minutes and that of a 150-mg capsule in 30 minutes are not less than 80%.

Start the test with 1 capsule of Clindamycin Hydrochlo-
ride Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ so that each mL contains about 83 µg (potency) of Clindamycin Hydrochloride according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately an amount of Clindamycin Hydrochloride RS, equivalent to about 17 mg (potency), dissolve in water to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.0\% > \), and determine the peak areas, \( A_f \) and \( A_s \), of clindamycin.

Dissolution rate (%) with respect to the labeled amount of clindamycin hydrochloride

\[
M_s = M_f \times \frac{A_f}{A_s} \times \frac{V}{V'} \times \frac{C}{C'} \times 450
\]

\( M_f: \) Amount [mg (potency)] of Clindamycin Hydrochloride RS

\( C: \) Labeled amount [mg (potency)] of clindamycin \((C_{18}H_{33}ClN_2O_5S)\) in 1 tablet

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclysilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Adjust the pH of 0.05 mol/L potassium dihydrogen phosphate TS to 7.5 with 8 mol/L potassium hydroxide TS to adjust the pH to 7.5. To 550 mL of this solution add 450 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of clindamycin is about 7 minutes.

System suitability—

System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of clindamycin are not less than 3000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of clindamycin is not more than 1.0%.

Containers and storage Containers—Tight containers.

**Clindamycin Phosphate**

クリンダマイシンリン酸エステル

\( C_{18}H_{35}ClIN_2O_5SP: \) 504.96

Methyl 7-chloro-6,7,8-trideoxy-6-\( \{2S,4R\}\)-1-methyl-4-propylpyrrolidine-2-carboxamido-1-thio-L-threo-a-D-galacto-octopyranoside 2-dihydrogenphosphate [24729-96-2]

Clindamycin Phosphate is a derivative of clindamycin.

It contains not less than 800 µg (potency) and not more than 846 µg (potency) per mg, calculated on the anhydrous basis. The potency of Clindamycin Phosphate is expressed as mass (potency) of clindamycin \((C_{18}H_{35}ClIN_2O_5S): \) 424.98.

**Description** Clindamycin Phosphate occurs as a white to pale yellowish white crystalline powder.

It is freely soluble in water, sparingly soluble in methanol, and practically insoluble in ethanol (95).

**Identification** Determine the infrared absorption spectrum...
of Clindamycin Phosphate, previously dried at 100°C for 2 hours, as directed in the paste method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum or the spectrum of Clindamycin Phosphate RS previously dried at 100°C for 2 hours: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49> $\alpha_D^{25} + 115 - +130^\circ$ (0.25 g calculated on the anhydrous basis, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 0.1 g of Clindamycin Phosphate in 10 mL of water. The pH of the solution is between 3.5 and 4.5.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Clindamycin Phosphate in 10 mL of freshly boiled and cooled water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Prepare with 2.0 g of Clindamycin Phosphate according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 5 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Clindamycin Phosphate according to Method 4, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 0.1 g of Clindamycin Phosphate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography 2.01 according to the following conditions, and calculate the ratios, $Q_T$ and $Q_S$, of the peak area of clindamycin phosphate to that of the internal standard.

Amount [µg (potency)] of clindamycin (C$_{18}$H$_{33}$ClN$_2$O$_5$S) 

\[ M_S \times Q_T/Q_S \times 1000 \]

$M_S$: Amount [mg (potency)] of Clindamycin Phosphate RS

**Internal standard solution**—A solution of methyl parahydroxybenzoate in the mobile phase (3 in 50,000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 10.54 g of potassium dihydrogen phosphate in 775 mL of water, adjust the pH to 2.5 with phosphoric acid, and add 225 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of clindamycin phosphate is about 8 minutes.

**System suitability**—

System performance: When the procedure is run with 20 $\mu$L of the standard solution under the above operating conditions, clindamycin phosphate and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 6 times with 20 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of clindamycin phosphate to that of the internal standard is not more than 2.5%.

**Containers and storage** Containers—Tight containers.

### Clindamycin Phosphate Injection

クリンダマイシンリン酸エステル注射液

Clindamycin Phosphate Injection is an aqueous injection.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of clindamycin phosphate (C$_{18}$H$_{33}$ClN$_2$O$_5$S: 504.96).

**Method of preparation** Prepare as directed under Injections, with Clindamycin Phosphate.

**Description** Clindamycin Phosphate Injection is a clear, colorless or light yellow liquid.

**Identification** To a volume of Clindamycin Phosphate Injection, equivalent to 0.15 g (potency) of Clindamycin Phosphate according to the labeled amount, add 4 mL of water, 2 mL of 8 mol/L sodium hydroxide TS and 0.1 mL of sodium pentacyanonitrosylferrate (III) TS, mix, heat in a water bath for 10 minutes, and add 2 mL of hydrochloric acid: a blue-green color develops.

**Osmotic pressure ratio** Being specified separately.
Clinofibrate / Official Monographs

**pH** \(<2.5\rightarrow 6.0 \sim 7.0\)

**Bacterial endotoxins** \(<4.01\>\) Less than 0.1 EU/mg (potency).

**Extractable volume** \(<6.05\>\) It meets the requirement.

**Foreign insoluble matter** \(<6.06\>\) Perform the test according to Method 1; it meets the requirement.

**Insoluble particulate matter** \(<6.07\>\) It meets the requirement.

**Sterility** \(<4.06\>\) Perform the test according to the Membrane filtration method; it meets the requirement.

**Assay** Measure exactly a volume of Clindamycin Phosphate Injection, equivalent to about 0.3 g (potency) of Clindamycin Phosphate, and add the mobile phase to make exactly 100 mL. Pipet 7 mL of this solution, add exactly 25 mL of the internal standard solution and the mobile phase to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately an amount of Clindamycin Phosphate RS, equivalent to about 20 mg (potency), dissolve in exactly 25 mL of the internal standard solution, add the mobile phase to make 100 mL, and use this solution as the standard solution. Then, proceed as directed in the Assay under Clindamycin Phosphate.

\[
\text{Amount [mg (potency)] of clindamycin phosphate (C_{16}H_{39}CIN_{2}O_{5}PS)} = M_S \times \frac{Q_1}{Q_3} \times 100/7
\]

\[
M_S: \text{Amount [mg (potency)] of Clindamycin Phosphate RS}
\]

**Internal standard solution**—A solution of methyl parahydroxybenzoate in the mobile phase (3 in 50,000).

**Containers and storage** Containers—Hermetic containers.

---

**Clinofibrate**

**クリノフィブラート**

\[
\text{C}_{28}\text{H}_{35}\text{O}_{4}: 468.58
\]

2,2’-(4,4’-Cyclohexyldenediphenoxy)-2,2’-dimethyl dibutanoic acid

[30299-08-2]

Clinofibrate, when dried, contains not less than 98.5% of \(\text{C}_{28}\text{H}_{35}\text{O}_{4}\).

**Description** Clinofibrate occurs as a white to yellowish white powder.

It is odorless and has no taste.

It is freely soluble in methanol, in ethanol (99.5), in acetone and in diethyl ether, and practically insoluble in water.

A solution of Clinofibrate in methanol (1 in 20) shows no optical rotation.

Melting point: about 146°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Clinofibrate in ethanol (99.5) (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clinofibrate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity** (1) Heavy metals \(<1.07\>\)—Proceed with 1.0 g of Clinofibrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic \(<1.11\>\)—Prepare the test solution with 1.0 g of Clinofibrate according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.10 g of Clinofibrate in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add acetone to make exactly 50 mL. Pipet 5 mL of this solution, add acetone to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.03\>\). Spot 50 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, cyclohexane and acetic acid (100) (12:5:3) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \(<2.41\>\) Not more than 1.0% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** \(<2.44\>\) Not more than 0.2% (1 g).

**Isomer ratio** To 50 mg of Clinofibrate add 0.4 mL of thionyl chloride, stopper tightly, heat on a water bath of 60°C for 5 minutes with occasional shaking, and evaporate the excess thionyl chloride at a temperature not exceeding 60°C under reduced pressure. Dissolve the residue in 2 mL of toluene previously dried with synthetic zeolite for drying, add 2 mL of a solution of \(\text{d}-(+)-\alpha\)-methylbenzylamine in toluene previously dried with synthetic zeolite for drying (3 in 100), mix gently, allow to stand for 10 minutes, and evaporate the toluene at a temperature not exceeding 60°C under reduced pressure. Dissolve the residue in 5 mL of chloroform, and use this solution as the sample solution. Perform the test with 5 \(\mu\)L of the sample solution as directed under Liquid Chromatography \(<2.07\>\) according to the following conditions. Determine each peak area, \(A_a, A_b, A_c\) and \(A_d\), of three peaks appear in order near the retention time of 40 minutes: a value, \(A_d/(A_a + A_b + A_c) \times 100\), is between 40 and 70.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 30 cm in length, packed with silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).
Column temperature: A constant temperature of about 20°C.
Mobile phase: A mixture of hexane and 2-propanol (500:3).
Flow rate: Adjust the flow rate so that the retention time of the peak appearing first is about 35 minutes.
Selection of column: Proceed with 5 μL of the sample solution under the above operating conditions. Use a column giving a complete separation of the three peaks.

**Assay**
Weigh accurately about 0.45 g of Clobetasol Propionate RS, previously dried, dissolve in 40 mL of ethanol (99.5), add 30 mL of water, and titrate \( <2.3 Dream > \) with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 23.43 mg of C\(_25\)H\(_{32}\)ClFO\(_5\).

**Containers and storage**
Containers—Tight containers.

---

**Clobetasol Propionate**

\( \text{C}_{25}\text{H}_{32}\text{ClFO}_{5} \): 466.97
21-Chloro-9-fluoro-11β,17-dihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17-propanoate

[C2122-46-7]

Clobetasol Propionate, when dried, contains not less than 97.0\%\( \text{w} \)\( \text{w} \) and not more than 102.0\%\( \text{w} \)\( \text{w} \) of C\(_25\)H\(_{32}\)ClFO\(_5\).

**Description**
Clobetasol Propionate occurs as a white to pale yellowish white crystalline powder.
It is soluble in methanol and in ethanol (99.5), and practically insoluble in water.
It gradually turns yellow by light.
Melting point: about 196°C (with decomposition).

**Identification**
Determine the infrared absorption spectra of Clobetasol Propionate as directed in the paste method under Infrared Spectrophotometry \( <2.2 Dream > \), and compare the spectrum with the Reference Spectrum or the spectrum of Clobetasol Propionate RS: both spectra exhibit similar intensities of absorbance at the same wave numbers.

**Optical rotation** \( <2.4 Dream > \) \( [\alpha]_D^{10} +109 - +115^\circ \) (after drying, 0.1 g, methanol, 10 mL, 100 mm).

**Purity**

1. Heavy metals \( <1.07 \) — Proceed with 1.0 g of Clobetasol Propionate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).
2. Related substances — Dissolve 10 mg of Clobetasol Propionate in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 5 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.01 \) according to the following conditions, and determine each peak area of these solutions by the automatic integration method: the area of the peak other than clobetasol propionate obtained from the sample solution is not larger than 2/5 times the peak area of clobetasol propionate from the standard solution. Furthermore, the total area of the peaks other than clobetasol propionate is not larger than the peak area of clobetasol propionate from the standard solution.

**Operating conditions**
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.
Time span of measurement: About 2.5 times as long as the retention time of clobetasol propionate, beginning after the solvent peak.

**System suitability**
Test for required detectability: Pipet 2 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of clobetasol propionate obtained from 10 μL of this solution is equivalent to 2.8 to 5.2% of that from 10 μL of the standard solution.

**System performance**
Dissolve 20 mg of Clobetasol Propionate in 20 mL of methanol. To 5 mL of this solution add 10 mL of a solution of beclometasone dipropionate in methanol (1 in 1000), and then add the mobile phase to make 50 mL. When the procedure is run with 10 μL of this solution under the above conditions, clobetasol propionate and beclometasone dipropionate are eluted in this order with the resolution between these peaks being not less than 8.

**System repeatability**
When the test is repeated 6 times with 10 μL of the standard solution under the above conditions, the relative standard deviation of the peak area of clobetasol propionate is not more than 2.0%.

**Loss on drying** \( <2.4 Dream > \) Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** \( <2.4 Dream > \) Not more than 0.1% (1 g, platinum crucible).

**Assay**
Weigh accurately about 10 mg each of Clobetasol Propionate and Clobetasol Propionate RS, both previously dried, dissolve each in the mobile phase, add exactly 100 mL of the internal standard solution, add the mobile phase to make 250 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.01 \) according to the following conditions, and calculate the ratios, \( Q_S \) and \( Q_S \), of the peak area of clobetasol propionate to that of the internal standard.

\[
\text{Amount (mg) of C}_{25}\text{H}_{32}\text{ClFO}_{5} = M_S \times \frac{Q_S}{Q_S}
\]

**Internal standard solution**
A solution of beclometasone dipropionate in the mobile phase (1 in 5000).

**Operating conditions**
Detector: An ultraviolet absorption photometer (wavelength: 240 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 7.8 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust the pH to 2.5 with phosphoric acid, and then add water to make 1000 mL. To 425 mL of this solution add 475 mL of acetonitrile and 100 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of clobetasol propionate is about 10 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above conditions, clobetasol propionate and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above conditions, the relative standard deviation of the ratio of the peak area of clobetasol propionate to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Clocapramine Hydrochloride Hydrate

クロカプラミン塩酸塩水和物

C_{28}H_{37}ClN_{4}O.2HCl.H_{2}O: 572.01

1’-[3-(3-Chloro-10,11-dihydro-5H-dibenzo[b,f]azepin-5-yl)propyl]-1,4-bipiperidine-4’-carboxamide dihydrochloride monohydrate [60789-62-0]

Clocapramine Hydrochloride Hydrate, when dried, contains not less than 98.0% of clocapramine hydrochloride (C_{28}H_{37}ClN_{4}O.2HCl: 553.99).

Description Clocapramine Hydrochloride Hydrate occurs as white crystals or crystalline powder. It is odorless, and has a bitter taste.

It is freely soluble in acetic acid (100), sparingly soluble in water and in methanol, slightly soluble in ethanol (95), in chloroform and in isopropylamine, and practically insoluble in acetic anhydride and in diethyl ether.

It is gradually colored by light.

Melting point: about 260°C (with decomposition, after drying).

Identification (1) To 5 mL of a solution of Clocapramine Hydrochloride Hydrate (1 in 2500) add 1 mL of nitric acid: a blue color develops at first, and rapidly changes to deep blue, and then changes to green to yellow-green.

(2) Determine the absorption spectrum of a solution of Clocapramine Hydrochloride Hydrate in methanol (1 in 40,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Clocapramine Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Dissolve 0.1 g of Clocapramine Hydrochloride Hydrate in 10 mL of water by warming, and after cooling, add 2 mL of ammonia TS, and filter. Acidify the filtrate with dilute nitric acid: the solution responds to the Qualitative Tests <1.09> (2) for chloride.

Purity (1) Sulfate <1.14>—Dissolve 0.5 g of Clocapramine Hydrochloride Hydrate in 40 mL of water by warming, after cooling, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(2) Heavy metals <1.07>—Proceed with 2.0 g of Clocapramine Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.10 g of Clocapramine Hydrochloride Hydrate in 10 mL of a mixture of chloroform and isopropylamine (99:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and isopropylamine (99:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.05>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of diethyl ether, ethyl acetate, methanol and ammonia solution (28:100:70:40:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> 2.0–3.5% (0.5 g, in vacuum at a pressure not exceeding 0.67 kPa, phosphorus (V) oxide, 105°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Clocapramine Hydrochloride Hydrate, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100) (6:1), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.
Each mL of 0.1 mol/L perchloric acid VS = 27.70 mg of C_{17}H_{20}ClNO.HCl

Containers and storage Containers—Tight containers.
Storage—Light-resistant.

Clofedan Hydrochloride

クロフェダノール塩酸塩

C_{17}H_{20}ClNO.HCl: 326.26
(1R5)-1-(2-Chlorophenyl)-3-dimethylamino-1-phenylpropan-1-ol monohydrochloride
[511-13-7]

Clofedan Hydrochloride, when dried, contains not less than 98.5% of C_{17}H_{20}ClNO.HCl.

Description Clofedan Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in methanol, in ethanol (95) and in acetic acid (100), sparingly soluble in water, and practically insoluble in diethyl ether.

A solution of Clofedan Hydrochloride in methanol (1 in 20) does not show optical rotation.

Melting point: about 190°C (after drying, with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Clofedan Hydrochloride in 0.01 mol/L hydrochloric acid TS (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.2>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clofedan Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) A solution of Clofedan Hydrochloride (1 in 100) responds to the Qualitative Tests <1.09> for chloride.

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Clofedan Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 0.05 g of Clofedan Hydrochloride in 25 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 3 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of all peaks other than clofedanol from the sample solution is not larger than the peak area of clofedanol from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecyl-silanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 1.34 g of potassium methanesulfonate in diluted phosphoric acid (1 in 1000) to make 1000 mL, and to 650 mL of this solution add 350 mL of methanol.
Flow rate: Adjust the flow rate so that the retention time of clofedanol is about 9 minutes.

Selection of column: Dissolve 0.01 g each of Clofedan Hydrochloride and ethyl parahydroxybenzoate in methanol to make 100 mL. Proceed with 3 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of clofedanol and ethyl parahydroxybenzoate in this order with the resolution of these peaks being not less than 4.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of clofedanol obtained from 3 μL of the standard solution composes between 20% and 50% of the full scale.
Time span of measurement: About three times as long as the retention time of clofedanol beginning after the solvent peak.

Loss on drying <2.41> Not more than 2.0% (1 g, in vacuum, silica gel, 80°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Clofedan Hydrochloride, previously dried, dissolve in 15 mL of acetic acid (100), add 35 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 32.63 mg of C_{17}H_{20}ClNO.HCl

Containers and storage Containers—Tight containers.

Clofibrate

クロフィブラート

C_{12}H_{15}ClO_{3}: 242.70
Ethyl 2-(4-chlorophenoxy)-2-methylpropanoate
[637-07-0]

Clofibrate contains not less than 98.0% of C_{12}H_{15}ClO_{3}, calculated on the unhydrous basis.
Separately, determine the absorption spectrum of a solution similar to the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

Identification

(1) Determine the absorption spectrum of a solution of Clofibrate in ethanol (99.5) (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1 or the spectrum of a solution of Clofibrate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Clofibrate in ethanol (99.5) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 2 or the spectrum of a solution of Clofibrate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clofibrate as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Clofibrate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Refractive index <2.45> \( n^\prime \): 1.500 - 1.505

Specific gravity <2.50> \( d^\prime \): 1.137 - 1.144

Purity (1) Acidity—Dissolve 2.0 g of Clofibrate in 100 mL of neutralized ethanol, and add 1 drop of phenolphthalein TS and 0.20 mL of 0.1 mol/L sodium hydroxide VS: the solution is red in color.

(2) Heavy metals <1.07>—Proceed with 2.0 g of Clofibrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.13>—To 5.0 g of Clofibrate add 20 mL of nitric acid and 5 mL of sulfuric acid, and heat until white fumes are evolved. After cooling, if necessary, add further 5 mL of nitric acid, heat until white fumes are evolved, and repeat this procedure until the solution is colorless to light yellow. After cooling, add 15 mL of saturated ammonium oxalate solution, and heat again until white fumes are evolved. Cool, add water to make 25 mL, use 5 mL of this solution as the test solution, and perform the test.

Color standard: Prepare a solution according to the above procedure without using Clofibrate as the blank. Transfer 5 mL of the solution to a generator bottle, add 2.0 mL of Standard Arsenic Solution, and then proceed as directed in the test solution (not more than 20 ppm).

(4) p-Chlorophenol—To 1.0 g of Clofibrate add exactly 1 mL of the internal standard solution, then add the mobile phase to make 5 mL, and use this solution as the sample solution. Separately, dissolve 10 mg of 4-chlorophenol in a mixture of hexane and 2-propanol (9:1) to make exactly 100 mL. Pipet 10 mL of this solution, and add a mixture of hexane and 2-propanol (9:1) to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 4 mL of the internal standard solution, then add the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 20 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of 4-chlorophenol to that of the internal standard: \( Q_1 \) is not greater than \( Q_2 \).

Internal standard solution—A solution of 4-ethoxyphenol in the mobile phase (1 in 30,000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 275 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 30 cm in length, packed with cyanopropyl-silanized silica gel for liquid chromatography (5 to 10 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of hexane, 2-propanol and acetic acid (100) (1970:30:1).

Flow rate: Adjust the flow rate so that the retention time of clofibrate is about 2 minutes.

Selection of column: Dissolve 10.0 g of clofibrate, 6 mg of 4-chlorophenol and 6 mg of 4-ethoxyphenol in 1000 mL of hexane. Proceed with 20 \( \mu \)L of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of clofibrate, 4-chlorophenol and 4-ethoxyphenol in this order, with the resolution between the peaks of clofibrate and 4-chlorophenol is not less than 5, and with the resolution between the peaks of 4-chlorophenol and 4-ethoxyphenol is not less than 2.

Water <2.48> Not more than 0.2% (5 g, volumetric titration, direct titration).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Clofibrate, add exactly 50 mL of 0.1 mol/L potassium hydroxide-ethanol VS, and heat in a water bath under a reflux condenser with a carbon dioxide absorbing tube (soda-lime) for 2 hours with frequent shaking. Cool, and titrate <2.50> immediately the excess potassium hydroxide with 0.1 mol/L hydrochloric acid VS (indicator: 3 drops of phenolphthalein TS). Perform a blank determination.

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS = 24.27 mg of C\(_{12}\)H\(_{15}\)ClO\(_3\)

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Clofibrate Capsules

クロフィブラートカプセル

Clofibrate Capsules contain not less than 93.0% and not more than 107.0% of the labeled amount of clofibrate (C\(_{12}\)H\(_{15}\)ClO\(_3\)): 242.70.

Method of preparation Prepare as directed under Capsules, with Clofibrate.

Identification Cut and open Clofibrate Capsules, and use the contents as the sample. Determine the absorption spectrum of a solution of the sample in ethanol (99.5) (1 in 10,000) as directed under Ultraviolet-visible Spectropho-
JP XVI

Official Monographs / Clomifene Citrate 659

Clomifene Citrate

クロミフェンクエン酸塩

\[
\begin{align*}
C_{26}H_{28}ClNO.C_6H_8O_7: \text{Molecular weight} = 598.08
\end{align*}
\]

2-[4-(2-Chloro-1,2-diphenylvinlylphenoxy)-N,N-dieethylamino mononitrate

Clomifene Citrate, when dried, contains not less than 98.0% of \( C_{26}H_{28}ClNO.C_6H_8O_7 \).

Description

Clomifene Citrate occurs as a white to pale yellowish white powder. It is odorless.

It is freely soluble in methanol and in acetic acid (100), sparingly soluble in ethanol (95), and practically insoluble in diethyl ether.

It gradually changes in color by light.

Melting point: about 115°C

Identification

(1) To 2 mL of a solution of Clomifene Citrate in methanol (1 in 200) add 2 mL of Reinecke salt TS: a light red precipitate is produced.

(2) Determine the absorption spectrum of a solution of Clomifene Citrate in 0.1 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry \( <2.24> \), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Clomifene Citrate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) A solution of Clomifene Citrate in methanol (1 in 200) responds to the Qualitative Tests \( <1.09> \) (1) and (2) for citrate salt.

Purity

(1) Clarity and color of solution—A solution of 1.0 g of Clomifene Citrate in 30 mL of methanol is clear and colorless.

(2) Heavy metals \( <1.07> \)—Proceed with 2.0 g of Clomifene Citrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

Loss on drying \( <2.47> \) Not more than 1.0% (1 g, in vacuum, phosphorus (V) oxide, 3 hours).

Residue on ignition \( <2.47> \) Not more than 0.1% (1 g).

Isomer ratio

To 0.10 g of Clomifene Citrate add 10 mL of water and 1 mL of sodium hydroxide TS, and extract with three 15-mL portions of diethyl ether. Wash the combined diethyl ether extracts with 20 mL of water, add 10 g of anhydrous sodium sulfate to the combined diethyl ether extracts, shake for 1 minute, filter, and evaporate the diethyl ether of the filtrate. Dissolve the residue in 10 mL of chloroform, and use this solution as the sample solution. Perform the test with 2 \( \mu \)L of the sample solution as directed under Gas Chromatography \( <2.02> \) according to the following conditions. Determine the areas of two adjacent peaks, \( A_a \) and \( A_b \), hav-
ing retention times of about 20 minutes, where \( A_s \) is the peak area of shorter retention time and \( A_l \) is the peak area of longer retention time: \( A_l/(A_s + A_l) \) is between 0.3 and 0.5. 

Operating conditions—

Detector: A hydrogen flame-ionization detector.

Column: A column 3 mm in inside diameter and 1 m in length, having methylsilicone polymer coated at the ratio of 1% on siliceous earth for gas chromatography (125 to 150 \( \mu \)m in particle diameter).

Column temperature: A constant temperature of about 195°C.

Carrier gas: Nitrogen.

Flow rate: Adjust the flow rate so that the retention time of the first peak of clomifene citrate is about 20 minutes.

System suitability—

System performance: When the procedure is run with 2 \( \mu \)L of the sample solution under the above operating conditions, the resolution between the two peaks is not less than 1.3.

System repeatability: When the test is repeated 5 times with 2 \( \mu \)L of the sample solution under the above operating conditions, the relative standard deviation of \( A_l/(A_s + A_l) \) is not more than 5.0%.

Assay

Weigh accurately about 1 g of Clomifene Citrate, previously dried, dissolve in 50 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 59.81 mg of \( \text{C}_2\text{H}_2\text{ClNO.C}_6\text{H}_8\text{O}_7 \).

Containers and storage

Containers—Tight containers.

Storage—Light-resistant.

Clomifene Citrate Tablets

クロミフェンクエン酸塩錠

Clomifene Citrate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of clomifene citrate (\( \text{C}_{26}\text{H}_{28}\text{ClNO.C}_6\text{H}_8\text{O}_7 \): 598.08).

Method of preparation

Prepare as directed under Tablets, with Clomifene Citrate.

Identification (1)

Weigh a portion of powdered Clomifene Citrate Tablets, equivalent to 1 g of Clomifene Citrate according to the labeled amount, shake vigorously with 100 mL of chloroform, and filter. Concentrate the filtrate on a water bath, allow to stand at room temperature, collect the crystals formed by filtration, wash with a small quantity of chloroform. Proceed with the crystals as directed in the Identification (1) and (3) under Clomifene Citrate.

(2) Determine the absorption spectrum of a solution of the crystals obtained in (1) in 0.1 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry: it exhibits maxima between 233 nm and 237 nm, and between 290 nm and 294 nm.

Uniformity of dosage units

Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Clomifene Citrate Tablets add 10 mL of water, and shake until the tablets are disintegrated. To this solution add 50 mL of methanol, shake for 10 minutes, and add methanol to make exactly 100 mL. Centrifuge this solution, pipet 4 mL of the supernatant liquid, add methanol to make exactly \( V \) mL so that each mL contains about 20 \( \mu \)g of clomifene citrate (\( \text{C}_{26}\text{H}_2\text{ClNO.C}_6\text{H}_8\text{O}_7 \)), and use this solution as the sample solution. Proceed as directed in the Assay.

Amount (mg) of clomifene citrate (\( \text{C}_{26}\text{H}_2\text{ClNO.C}_6\text{H}_8\text{O}_7 \))

\[ M_5 = M_s \times A_l/\left(A_s + A_l\right) \times V/100 \]

\( M_5 \): Amount (mg) of Clomifene Citrate RS

Dissolution

When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of the 1st fluid for dissolution test as the dissolution medium, the dissolution rate in 30 minutes of Clomifene Citrate Tablets is not less than 80%.

Start the test with 1 tablet of Clomifene Citrate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \( \mu \)m. Discard the first 10 mL of the filtrate, pipet \( V \) mL of the subsequent filtrate, add the dissolution medium to make exactly \( V \) mL so that each mL contains about 28 \( \mu \)g of clomifene citrate (\( \text{C}_{26}\text{H}_2\text{ClNO.C}_6\text{H}_8\text{O}_7 \)) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of Clomifene Citrate RS, previously dried in vacuum using phosphorus (V) oxide as a desiccant for 3 hours, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \( A_T \) and \( A_S \), at 291 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry, using the dissolution medium as the blank.

Dissolution rate (%) with respect to the labeled amount of clomifene citrate (\( \text{C}_{26}\text{H}_2\text{ClNO.C}_6\text{H}_8\text{O}_7 \))

\[ M_5 = M_s \times A_T/\left(A_S + A_T\right) \times 100 \]

\( M_5 \): Amount (mg) of Clomifene Citrate RS

C: Labeled amount (mg) of clomifene citrate (\( \text{C}_{26}\text{H}_2\text{ClNO.C}_6\text{H}_8\text{O}_7 \)) in 1 tablet

Assay

Weigh accurately, and powder not less than 20 Clomifene Citrate Tablets. Weigh accurately a portion of the powder, equivalent to about 50 mg of clomifene citrate (\( \text{C}_{26}\text{H}_2\text{ClNO.C}_6\text{H}_8\text{O}_7 \)), add 50 mL of methanol, shake for 10 minutes, and add methanol to make exactly 100 mL. Centrifuge a portion of this solution, pipet 4 mL of the supernatant liquid, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Clomifene Citrate RS, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 3 hours, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, and dilute with methanol to make exactly 100 mL. Centrifuge this solution, and use this solution as the standard solution. Determine the absorbances, \( A_T \) and \( A_S \), of the sample solution and the standard solution, respectively, at 295 nm as directed under Ultraviolet-visible Spectrophotometry.

Amount (mg) of clomifene citrate (\( \text{C}_{26}\text{H}_2\text{ClNO.C}_6\text{H}_8\text{O}_7 \))

\[ M_5 = M_s \times A_T/\left(A_S + A_T\right) \]
Clomipramine Hydrochloride

Clomipramine Hydrochloride, when dried, contains not less than 98.5% of C_{19}H_{23}ClN_{2}HCl.

Description
Clomipramine Hydrochloride occurs as a white to pale yellow, crystalline powder. It is odorless.

It is very soluble in acetic acid (100), freely soluble in water, in methanol and in chloroform, soluble in ethanol (95), sparingly soluble in acetic anhydride, slightly soluble in acetone, and practically insoluble in ethyl acetate and in diethyl ether.

Identification
(1) Dissolve 3 mg of Clomipramine Hydrochloride in 1 mL of nitric acid: a deep blue color develops.

(2) Determine the absorption spectrum of a solution of Clomipramine Hydrochloride in 0.1 mol/L hydrochloric acid in 1 mL of nitric acid: a deep blue color develops.

Loss on drying
<2.4% Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition
<2.4% Not more than 0.1% (1 g).

Assay
Weigh accurately about 0.5 g of Clomipramine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 35.13 mg of C_{19}H_{23}ClN_{2}HCl.

Containers and storage
Containers—Well-closed containers.

Storage—Light-resistant.

Clonazepam

Clonazepam, when dried, contains not less than 99.0% of C_{15}H_{10}ClN_{3}O_{3}.

C_{15}H_{10}ClN_{3}O_{3}: 315.71

5-(2-Chlorophenyl)-7-nitro-1,3-dihydro-2H-1,4-benzodiazepin-2-one
[1622-61-3]
Clonidine Hydrochloride / Official Monographs

**Description**
Clonazepam occurs as white to light yellow, crystals or crystalline powder.

It is sparingly soluble in acetic anhydride and in acetone, slightly soluble in methanol and in ethanol (95), very slightly soluble in diethyl ether, and practically insoluble in water.

It is gradually colored by light.

Melting point: about 240°C (with decomposition).

**Identification (1)**
Determine the absorption spectrum of a solution of Clonazepam in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Clonazepam, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Perform the test with Clonazepam as directed under Flame Coloration Test \(<1.04>\) (2): a green color appears.

**Purity (1)**
Chloride \(<1.07>\)—To 1.0 g of Clonazepam add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. Discard the first 20 mL portion of the filtrate, and take the subsequent 20 mL portion of the filtrate, and add 6 mL of dilute nitric acid and water to make 50 mL. Use this solution as the test solution, and perform the test. Prepare the control solution as follows: to 0.25 mL of 0.01 mol/L hydrochloric acid VS add 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.022%).

(2) Heavy metals \(<1.07>\)—Proceed with 1.0 g of Clonazepam according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.25 g of Clonazepam in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 100 mL, then pipet 1 mL of this solution, add acetone to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.07>\). Spot 10 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of nitromethane and acetone (10:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \(<2.41>\) Not more than 0.30% (1 g, 105°C, 4 hours).

**Residue on ignition** \(<2.44>\) Not more than 0.1% (1 g).

**Assay**
Weigh accurately about 0.5 g of Clonazepam, previously dried, dissolve in 70 mL of acetic anhydride, and titrate \(<2.50>\) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 31.57 mg of C\(_{15}\)H\(_{10}\)ClN\(_3\)O\(_3\)

**Containers and storage**
Containers—Well-closed containers.

Storage—Light-resistant.

**Clonidine Hydrochloride**
クロニジン塩酸塩

\[
\text{C}_9\text{H}_9\text{Cl}_2\text{N}_3\cdot\text{HCl}: 266.55
\]

2-(2,6-Dichlorophenylimino)imidazolidine monohydrochloride

【4205-91-8】

Clonidine Hydrochloride, when dried, contains not less than 99.0% of C\(_9\)H\(_9\)Cl\(_2\)N\(_3\)H\(_2\)Cl.

**Description**
Clonidine Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in methanol, soluble in water and in ethanol (95), and practically insoluble in acetic anhydride and in diethyl ether.

**Identification (1)**
To 5 mL of a solution of Clonidine Hydrochloride (1 in 1000) add 6 drops of Dragendorff’s TS: an orange precipitate is formed.

(2) Determine the absorption spectrum of a solution of Clonidine Hydrochloride in 0.01 mol/L hydrochloric acid TS (3 in 10,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Clonidine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry \(<2.25>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Clonidine Hydrochloride (1 in 50) responds to the Qualitative Tests \(<1.09>\) for chloride.

**pH** \(<2.54>\) Dissolve 1.0 g of Clonidine Hydrochloride in 20 mL of water: the pH of this solution is between 4.0 and 5.5.

**Purity (1)**
Clarity and color of solution—Dissolve 1.0 g of Clonidine Hydrochloride in 20 mL of water: the solution is clear and colorless.

(2) Heavy metals \(<1.07>\)—Proceed with 2.0 g of Clonidine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic \(<1.17>\)—Prepare the test solution with 0.5 g of Clonidine Hydrochloride according to Method 3, and perform the test (not more than 4 ppm).

(4) Related substances—Dissolve 0.20 g of Clonidine Hydrochloride in 2 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 1 mL and 2 mL of this solution, to each add methanol to make exactly 20 mL, and use these solutions as the standard solution (1) and
the standard solution (2), respectively. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.05\). Spot 2 \(\mu\)L each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, 1,4-dioxane, ethanol (99.5) and ammonia solution (28) (10:8:2:1) to a distance of about 12 cm, air-dry the plate, and then dry at 100°C for 1 hour. Spray evenly sodium hypochlorite TS on the plate, air-dry the plate for 15 minutes, and then spray evenly potassium iodide starch TS on the plate: the spots other than the principal spot and the spot of the starting point from the sample solution are not more intense than the spot from the standard solution (2), and the numbers of spots other than the principal spot and the spot of the starting point, which are more intense than the spot from the standard solution (1), are not more than 3.

**Loss on drying** \(<2.4\>) Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** \(<2.44\>) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Clonidine Hydrochloride, previously dried, and dissolve in 30 mL of acetic acid (100) by warming. After cooling, add 70 mL of acetic chloride, previously dried, and dissolve in 30 mL of acetic acid. Weigh accurately about 0.3 g of Clonidine Hydrochloride (2) and dissolve in 25 mL of acetic acid (100). Pipet 2 mL of the solutions as directed under Thin-layer Chromatography (1 in 100) to a distance of about 12 cm, air-dry the plate, and then dry at 100°C for 1 hour. Spray evenly sodium hypochlorite TS on the plate, air-dry the plate for 15 minutes, and then spray evenly potassium iodide starch TS on the plate: the spots other than the principal spot and the spot of the starting point from the sample solution are not more intense than the spot from the standard solution (2), and the numbers of spots other than the principal spot and the spot of the starting point, which are more intense than the spot from the standard solution (1), are not more than 3.

**Containers and storage** Containers—Tight containers.

**Cloperastine Hydrochloride**

クロペラスチン塩酸塩

![](image)

C₂₀H₂₄ClNO.HCl: 366.32

1-[2-[(RS)-(4-Chlorophenyl) (phenyl)methoxy]ethyl]piperidine monohydrochloride

[14984-68-0]

Cloperastine Hydrochloride, when dried, contains not less than 98.5% of C₂₀H₂₃ClNO.HCl.

**Description** Cloperastine Hydrochloride occurs as white, crystals or crystalline powder.

It is very soluble in water, in methanol, in ethanol (95) and in acetic acid (100), and soluble in acetic anhydride.

A solution of Cloperastine Hydrochloride (1 in 10) shows no optical rotation.

**Identification (1)** Determine the absorption spectrum of a solution of Cloperastine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\), and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Cloperastine Hydrochloride in 0.1 mol/L hydrochloric acid TS (1 in 62,500) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\), and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cloperastine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry \(<2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Shake 10 mL of a solution of Cloperastine Hydrochloride (1 in 100) with 2 mL of ammonia TS and 20 mL of diethyl ether, separate the water layer, wash the water layer with 20 mL of diethyl ether, and filter. Acidify the filtrate with dilute nitric acid: the solution responds to the Qualitative Tests \(<1.09\) for chloride.

**Melting point** \(<2.60\> 148 – 152°C

**Purity (1)** Heavy metals \(<1.07≥—Proceed with 1.0 g of Cloperastine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 40 mg of Cloperastine Hydrochloride in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\) according to the following conditions, and determine each peak area of both solutions by the automatic integration method: The areas of two peaks corresponding to the relative retention times about 0.8 and about 3.0 with respect to cloperastine obtained from the sample solution are not larger than the peak area of cloperastine from the standard solution, respectively, and the area of the peak corresponding to the relative retention time about 2.0 is not larger than 5/3 times the peak area of cloperastine from the standard solution, and the areas of the peaks other than cloperastine and other than the peaks mentioned above are all not larger than 5/3 times the peak area of cloperastine from the standard solution. The total area of these peaks is not larger than 2 times the peak area of cloperastine from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 222 nm).

Column: A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of methanol, 0.1 mol/L mono-basic potassium phosphate TS and perchloric acid (500:30:1).

Flow rate: Adjust the flow rate so that the retention time of cloperastine is about 7 minutes.

Selection of column: Dissolve 0.03 g of Cloperastine Hydrochloride and 0.04 g of benzophenone in 100 mL of the
mobile phase. To 2.0 mL of this solution add the mobile phase to make 50 mL. Perform the test with 20 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of cloperastine and benzophenone in this order with the resolution between these peaks being not less than 6.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of cloperastine obtained from 20 μL of the standard solution is about 30% of the full scale.

Time span of measurement: About 4 times as long as the retention time of cloperastine, beginning after the solvent peak.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.5 g of Cloperastine Hydrochloride, previously dried, dissolve in 70 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate chloric acid VS add 20 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL. Perform the test with this solution as the test solution. Prepare the control solution as follows: To 0.40 mL of 0.01 mol/L perchloric acid VS add 20 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.014%).

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Clorazepate Dipotassium**

**モノ（塩化カリウム）**

![Chemical structure](image)

C$_{16}$H$_{10}$ClKN$_2$O$_3$.KOH: 408.92

Monopotassium 7-chloro-2-oxo-5-phenyl-2,3-dihydro-1H-1,4-benzodiazepine-3-carboxylate mono (potassium hydroxide)

[57109-90-7]

Clorazepate Dipotassium, when dried, contains not less than 98.5% and not more than 101.0% of C$_{16}$H$_{10}$ClKN$_2$O$_3$.KOH.

**Description** Clorazepate Dipotassium occurs as white to light yellow, crystals or crystalline powder.

It is freely soluble in water, and very slightly soluble in ethanol (99.5). It dissolves in acetic acid (100).

The pH of a solution obtained by dissolving 1 g of Clorazepate Dipotassium in 100 mL of water is between 11.5 and 12.5.

It gradually turns yellow on exposure to light.

**Identification** (1) Carefully and gradually ignite to redness 30 mg of Clorazepate Dipotassium with 50 mg of sodium. After cooling, add 3 drops of ethanol (99.5) and 5 mL of water, mix well, and filter: the filtrate responds to the Qualitative Tests <1.09> for chloride.

(2) Determine the absorption spectrum of a solution of Clorazepate Dipotassium (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Clorazepate Dipotassium as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Clorazepate Dipotassium responds to the Qualitative Tests <1.09> (1) for potassium salt.

**Purity** (1) Chloride <1.03>>—Dissolve 1.0 g of Clorazepate Dipotassium in 20 mL of water, add 20 mL of acetone, 6 mL of dilute nitric acid and water to make 50 mL. Perform the test with this sample as the test solution. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Clorazepate Dipotassium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 2 ppm).

(3) Arsenic <1.11>>—Prepare the test solution with 1.0 g of Clorazepate Dipotassium according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 15 mg of Clorazepate Dipotassium in 25 mL of a mixture of water, potassium carbonate solution (97 in 1000) and acetonitrile (3:1:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mixture of water, potassium carbonate solution (97 in 1000) and acetonitrile (3:1:1) to make exactly 200 mL, and use this solution as the standard solution. Prepare these solutions quickly and perform the test within 3 minutes. Perform the test with exactly 5 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine each peak area by the automatic integration method: the peak area of nordiazepam, having the relative retention time of about 3.0 with respect to clorazepic acid, obtained from the sample solution is not larger than the peak area of clorazepic acid from the standard solution, the area of the peak other than clorazepic acid and nordiazepam is not larger than 1/5 times the peak area of clorazepic acid from the standard solution, and the total area of the peaks other than clorazepic acid is not larger than 2 times the peak area of clorazepic acid from the standard solution. For this comparison, use the peak area of nordiazepam, having the relative retention time of about 3.0 with respect to clorazepic acid, after multiplying by the relative response factor, 0.64.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 232 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 13.8 g of sodium dihydrogen phos-
Perform a blank determination in the same manner, and until the color of solution changes from violet to blue—Dipotassium, previously dried, dissolve in 100 mL of acetic acid (100), and titrate.

Containers—Tight containers.

Loss on drying Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 60°C, 5 hours).

Assay Weigh accurately about 0.15 g of Clorazepate Dipotassium, previously dried, dissolve in 100 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS until the color of solution changes from violet to blue-green through blue (indicator: 3 drops of crystal violet TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

\[ = 13.63 \, \text{mg of C}_{16}\text{H}_{10}\text{ClKNO}_{3} \times \text{KO}_{2} \]

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Clorazepate Dipotassium Capsules

クロラゼプ酸ニカリウムカプセル

Clorazepate Dipotassium Capsules contain not less than 93.0% and not more than 107.0% of the labeled amount of clorazepate dipotassium (C_{16}H_{10}ClKNO_{3} \times \text{KO}_{2}; 408.92).

Method of preparation Prepare as directed under Capsules, with Clorazepate Dipotassium.

Identification To 10 mL of the sample solution obtained in the Assay add water to make 20 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24): it exhibits a maximum between 228 nm and 232 nm.

Purity Related substances—Take out the contents of Clorazepate Dipotassium Capsules, and powder. To a portion of the powder, equivalent to 15 mg of Clorazepate Dipotassium according to the labeled amount, add a mixture of water, potassium carbonate solution (97 in 1000) and acetonitrile (3:1:1) to make 25 mL, and mix for 10 minutes. Filter the solution through a membrane filter with a pore size not exceeding 0.45 μm, discard the first 5 mL of the filtrate, and use subsequent filtrate as the sample solution. Pipet 1 mL of the sample solution, add a mixture of water, potassium carbonate solution (97 in 1000) and acetonitrile (3:1:1) to make exactly 200 mL, and use this solution as the standard solution. Then, proceed as directed in the Purity (4) under Clorazepate Dipotassium: the peak area of nor Diazepam, having the relative retention time of about 3.0 with respect to clorazepic acid, obtained from the sample solution is not larger than 3 times the peak area of clorazepic acid from the standard solution, and the total area of the peaks other than clorazepic acid and nor Diazepam is not larger than the peak area of clorazepic acid from the standard solution. For this comparison, use the peak area of nor Diazepam after multiplying by the relative response factor, 0.64.

Uniformity of dosage units (6.02) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 capsule of Clorazepate Dipotassium Capsules add 70 mL of water, shake for 15 minutes, and add water to make exactly 100 mL. Centrifuge the solution, pipet V mL of the supernatant liquid, add water to make exactly V mL so that each mL contains about 12 μg of clorazepate dipotassium (C_{16}H_{10}ClKNO_{3} \times \text{KO}_{2}), and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of clorazepate dipotassium

\[ (\text{C}_{16}\text{H}_{10}\text{ClKNO}_{3} \times \text{KO}_{2}) = \frac{M_{s} \times A_{T} \times A_{S} \times V/V 	imes 2/25}{M_{A}} \]

M_{s}: Amount (mg) of clorazepate dipotassium for assay

Dissolution (6.10) When the test is performed at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Clorazepate Dipotassium Capsules is not less than 80%.

Start the test with 1 capsule of Clorazepate Dipotassium Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 8.3 μg of clorazepate dipotassium (C_{16}H_{10}ClKNO_{3} \times \text{KO}_{2}) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 21 mg of clorazepate dipotassium for assay, previously dried in vacuum over phosphorus (V) oxide at 60°C for 5 hours, and dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_{T} and A_{S}, at 252 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry (2.24).

Dissolution rate (% with respect to the labeled amount of clorazepate dipotassium (C_{16}H_{10}ClKNO_{3} \times \text{KO}_{2})

\[ = \frac{M_{s} \times A_{T}/A_{S} \times V/V \times 1/C \times 36}{M_{A}} \]

M_{s}: Amount (mg) of clorazepate dipotassium for assay

C: Labeled amount (mg) of clorazepate dipotassium (C_{16}H_{10}ClKNO_{3} \times \text{KO}_{2}) in 1 capsule
Assay Carefully take out the contents of not less than 20 Clorazepate Dipotassium Capsules, weigh accurately the mass of the contents, and powder. Weigh accurately a portion of the powder, equivalent to about 15 mg of clorazepate dipotassium (C₁₆H₁₀ClKN₂O₃.KOH), add 70 mL of water, shake for 15 minutes, and add water to make exactly 100 mL. Centrifuge the solution, pipet 4 mL of the supernatant liquid, add water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 15 mg of clorazepate dipotassium for assay, previously dried in vacuum over phosphorus (V) oxide at 60°C for 5 hours, and dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 50 mL, and use this solution as the sample solution. Make a blank determination in and make any necessary correction.

\[
M_S = M_T \times A_T / A_S
\]

where:
- \(M_S\) = Amount (mg) of clorazepate dipotassium for assay
- \(M_T\) = Amount (mg) of clorazepate dipotassium
- \(A_T\) = Absorbance of the sample solution
- \(A_S\) = Absorbance of the standard solution

Containers and storage Containers—Tight containers.

Clotiazepam

クロチアゼパム

\[
\text{Clotiazepam, when dried, contains not less than 98.5\% of } \text{C}_{16}\text{H}_{15}\text{ClN}_{2}\text{O}_{5}\text{.}
\]

Description Clotiazepam occurs as white to light yellowish white crystals or crystalline powder. It is odorless, and has a slightly bitter taste.

It is very soluble in chloroform, freely soluble in methanol, in ethanol (95), in acetone, in acetic acid (100) and in ethyl acetate, soluble in diethyl ether, and practically insoluble in water.

It is gradually colored by light.

Identification (1) Dissolve 0.01 g of Clotiazepam in 3 mL of sulfuric acid: the solution shows a light yellow fluorescence under ultraviolet light (main wavelength: 365 nm).

(2) Determine the absorption spectrum of a solution of Clotiazepam in 0.1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Prepare the test solution with 0.01 g of Clotiazepam as directed under Oxygen Flask Combustion Method <1.007>, using 10 mL of diluted hydrogen peroxide (30) (1 in 5) as the absorbing liquid. Apply a small amount of water to the upper part of the Apparatus A, pull out C carefully, wash C, B and the inner side of A with 15 mL of methanol, and use the obtained solution as the test solution. Add 0.5 mL of dilute nitric acid to 15 mL of the test solution: this solution responds to the Qualitative Tests <1.099> (2) for chloride. The remaining test solution responds to the Qualitative Tests <1.099> (1) for sulfate.

Melting point 20°C to 106°C to 109°C

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Clotiazepam in 10 mL of ethanol (95): the solution is clear and is not more colored than the following control solution.

Control solution: To 5 mL of Matching Fluid C add 0.01 mol/L hydrochloric acid TS to make 10 mL.

(2) Chloride <1.03>—To 1.0 g of Clotiazepam add 50 mL of water, shake for 30 minutes, and filter. To 30 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.015%).

(3) Heavy metals <1.07>—Proceed with 2.0 g of Clotiazepam according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Clotiazepam, according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.25 g of Clotiazepam in 10 mL of acetone, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add acetone to make exactly 20 mL, pipet 2 mL of this solution, add acetone to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and acetone (5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (1 g, 80°C, 3 hours).

Residue on ignition <2.44> not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Clotiazepam, previously dried, dissolve in 80 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid (potentiometric titration). Perform a blank determination in, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 31.88 mg of \(\text{C}_{16}\text{H}_{15}\text{ClN}_{2}\text{O}_{5}\)

Containers and storage Containers—Tight containers. Storage—Light-resistant.
Clotrimazole

クロトリマゾール

\[ \text{C}_{22}\text{H}_{17}\text{ClN}_{2} : 344.84 \]
1-[(2-Chlorophenyl)(diphenyl)methyl]-1H-imidazole

[23593-75-1]

Clotrimazole, when dried, contains not less than 98.0% of C\textsubscript{22}H\textsubscript{17}ClN\textsubscript{2}.

**Description** Clotrimazole occurs as a white, crystalline powder. It is odorless and tasteless.

It is freely soluble in dichloromethane and in acetic acid (100), soluble in N,N-dimethylformamide, in methanol and in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water.

**Identification** (1) To 0.1 g of Clotrimazole add 10 mL of 5 mol/L hydrochloric acid TS, dissolve by heating, and cool. To this solution add 3 drops of Reinecke salt TS: a light red precipitate is produced.

(2) Determine the absorption spectrum of a solution of Clotrimazole in methanol (1 in 5000) as directed under Ultra-violet-visible Spectrophotometry \(<2.25>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Clotrimazole, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Perform the test with Clotrimazole as directed under Flame Coloration Test (2) \(<1.42>\): a green color appears.

**Melting point** \(<2.60>\) 142 – 145°C

**Purity** (1) Clarity and color of solution—Dissolve 0.5 g of Clotrimazole in 10 mL of dichloromethane: the solution is clear and colorless.

(2) Chloride \(<1.03>\)—Dissolve 1.0 g of Clotrimazole in 40 mL of N,N-dimethylformamide, add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.60 mL of 0.01 mol/L hydrochloric acid VS, 40 mL of N,N-dimethylformamide, 6 mL of dilute nitric acid and water to make 50 mL (not more than 0.021%).

(3) Sulfate \(<1.14>\)—Dissolve 0.5 g of Clotrimazole in 10 mL of methanol, and add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.05 mL of 0.005 mol/L sulfuric acid VS, 10 mL of methanol, 1 mL of dilute hydrochloric acid and water to make 50 mL (not more than 0.048%).

(4) Heavy metals \(<1.07>\)—Proceed with 2.0 g of Clotrimazole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Arsenic \(<1.17>\)—Prepare the test solution with 1.0 g of Clotrimazole according to Method 3, and perform the test (not more than 2 ppm).

(6) Imidazole—Dissolve 0.10 g of Clotrimazole in exactly 10 mL of dichloromethane, and use this solution as the sample solution. Separately, dissolve 25 mg of imidazole for thin-layer chromatography in dichloromethane to make exactly 50 mL. Pipet 5 mL of this solution, add dichloromethane to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.03>\). Spot 10 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and chloroform (3:2) to a distance of about 10 cm, and air-dry the plate. Spray evenly sodium hydrochloride TS on the plate, and air-dry the plate for 15 minutes, then spray evenly potassium iodide-starch TS on the plate: the spot from the sample solution, corresponding to that from the standard solution, is not more intense than that from the standard solution.

(7) (2-Chlorophenyl)-diphenylmethanol—Dissolve 0.20 g of Clotrimazole in exactly 10 mL of dichloromethane, and use this solution as the sample solution. Separately, dissolve 0.010 g of (2-chlorophenyl)-diphenylmethanol for thin-layer chromatography in dichloromethane to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.03>\). Spot 10 \(\mu\)L each of the sample solution and standard solution on a plate of silica gel with fluororescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate and ammonia solution (28:50:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot from the sample solution, corresponding to that from the standard solution, is not more intense than that from the standard solution.

**Loss on drying** \(<2.47>\) Not more than 0.5% (1 g, 105°C, 2 hours).

**Residue on ignition** \(<2.44>\) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.35 g of Clotrimazole, previously dried, and dissolve in 80 mL of acetic acid (100), and titrate \(<2.50>\) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 34.48 mg of C\textsubscript{22}H\textsubscript{17}ClN\textsubscript{2}.

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.
Cloxacin Sodium Hydrate

クロキサシリンナトリウム水和物

C_{19}H_{17}ClN_3NaO_5S.H_2O: 475.88
Monosodium (2S,5R,6R)-6-[(3-(2-chlorophenyl)-5-methylisoxazole-4-carbonyl)amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrate [7081-44-9]

Cloxacillin Sodium Hydrate contains not less than 900 μg (potency) and not more than 960 μg (potency) per mg, calculated on the anhydrous basis. The potency of Cloxacillin Sodium Hydrate is expressed as mass (potency) of cloxacillin (C_{19}H_{18}ClN_3O_5S: 435.88).

Description Cloxacillin Sodium Hydrate occurs as white to light yellowish white, crystals or crystalline powder.

It is freely soluble in water, in N,N-dimethylformamide and in methanol, and sparingly soluble in ethanol (95%).

Identification (1) Determine the absorption spectrum of a solution of Cloxacillin Sodium Hydrate in methanol (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cloxacillin Sodium RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cloxacillin Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum or the spectrum of Cloxacillin Sodium RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Cloxacillin Sodium Hydrate responds to the Qualitative Tests <1.09> (1) for sodium salt.

Optical rotation <2.49> [α]_D^20^0: +163 - +171° (1 g calculated on the anhydrous basis, water, 100 mL, 100 mm).

pH <2.5> Dissolve 1.0 g of Cloxacillin Sodium Hydrate in 10 mL of water: the pH of the solution is between 5.0 and 7.5.

Purity (1) Clarity and color of solution—A solution obtained by dissolving 1.0 g of Cloxacillin Sodium Hydrate in 10 mL of water is clear and colorless to light yellow.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Cloxacillin Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.12>—Prepare the test solution with 1.0 g of Cloxacillin Sodium Hydrate according to Method 5, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 50 mg of Cloxacillin Sodium Hydrate in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than cloxacillin obtained from the sample solution is not larger than the peak area of cloxacillin from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 4.953 g of diammonium hydrogen phosphate in 700 mL of water, and add 250 mL of acetonitrile. Adjust the pH to 4.0 with phosphoric acid, and add water to make exactly 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of cloxacillin is about 24 minutes.

Time span of measurement: About 3 times as long as the retention time of cloxacillin.

System suitability—

Test for required detectability: Measure exactly 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cloxacillin obtained from 10 μL of this solution is equivalent to 7 to 13% of that from 10 μL of the standard solution.

System performance: Weigh accurately about 50 mg of Cloxacillin Sodium RS, dissolve in a suitable amount of the mobile phase, add 5 mL of a solution of guaifenesin in the mobile phase (1 in 200), then add the mobile phase to make exactly 50 mL, and use this solution as the solution for system suitability test. When the procedure is run with 10 μL of the solution for system suitability test under the above operating conditions, guaifenesin and cloxacillin are eluted in this order with the resolution between these peaks being not less than 25.

System repeatability: When the test is repeated 6 times with 10 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the ratios of the peak area of cloxacillin to that of guaifenesin is not more than 1.0%.

Water <2.48> 3.0 - 4.5% (0.2 g, volumetric titration, direct titration).

Assay Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—Bacillus subtilis ATCC 6633

(ii) Culture medium—Use the medium in 1) Medium for test organism [5] under (1) Agar media for seed and base layer.

(iii) Standard solutions—Weigh accurately an amount of Cloxacillin Sodium RS equivalent to about 20 mg (potency), and dissolve in 0.05 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL. Take exactly a suitable amount of this solution, add 0.05 mol/L phosphate buffer solution, pH 7.0 to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the
high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Cloxacillin Sodium Hydrate equivalent to about 20 mg (potency), and dissolve in 0.05 mol/L phosphate buffer solution, pH 7.0 to make exactly 100 mL. Take exactly a suitable amount of the solution, add 0.05 mol/L phosphate buffer solution, pH 7.0 to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage Containers—Tight containers.

Cloxazolam

クロキサゾラム

\[
\text{C}_{17}\text{H}_{14}\text{Cl}_{2}\text{N}_{2}\text{O}_{2} : 349.21
\]

\(11b\text{RS})\)-10-Chloro-11b-(2-chlorophenyl)-2,3,7,11b-tetrahydro[1,3]oxazolo[3,2-\(\text{d}\)][1,4]benzodiazepin-6(5\(\text{H}\))one \[24166-13-0\]

Cloxazolam, when dried, contains not less than 99.0% of \(\text{C}_{17}\text{H}_{14}\text{Cl}_{2}\text{N}_{2}\text{O}_{2}\).

Description Cloxazolam occurs as white crystals or crystalline powder.

It is odorless and tasteless.

It is freely soluble in acetic acid (100), sparingly soluble in dichloromethane, slightly soluble in ethanol (99.5) and in diethyl ether, very slightly soluble in ethanol (95), and practically insoluble in water.

It dissolves in dilute hydrochloric acid.

It is gradually colored by light.

Melting point: about 200°C (with decomposition).

Identification (1) Dissolve 0.01 g of Cloxazolam in 10 mL of ethanol (99.5) by heating, and add 1 drop of hydrochloric acid: the solution shows a light yellow color and a yellow-green fluorescence under ultraviolet light (main wavelength: 365 nm). Add 1 mL of sodium hydroxide TS to this solution: the color and fluorescence of this solution disappear immediately.

(2) Dissolve 0.01 g of Cloxazolam in 5 mL of dilute hydrochloric acid by heating in a water bath for 10 minutes. After cooling, 1 mL of this solution responds to the Qualitative Tests <1.09> for primary aromatic amines.

(3) Place 2 g of Cloxazolam in a 200-mL flask, add 50 mL of ethanol (95) and 25 mL of sodium hydroxide TS, and boil under a reflux condenser for 4 hours. After cooling, neutralize with dilute hydrochloric acid, and extract with 30 mL of dichloromethane. Dehydrate with 3 g of anhydrous sodium sulfate, filter, and evaporate the dichloromethane of the filtrate. Dissolve the residue in 5 mL of methanol by heating on a water bath, and cool immediately in an ice bath. Collect the crystals, and dry the crystals is vacuum at 60°C for 1 hour: it melts \(\approx 2.60\) between 87°C and 91°C.

(4) Determine the absorption spectrum of a solution of Cloxazolam in ethanol (99.5) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(5) Proceed with Cloxazolam as directed under Flame Coloration Test <1.04> (2), and perform the test: a green color appears.

Absorbance \(\leq 2.24\) \(E_{1\%}^{1\text{cm}}\) (244 nm): 390 – 410 (after drying, 1 mg, ethanol (99.5), 100 mL).

Purity (1) Chloride \(\leq 1.03\)—To 1.0 g of Cloxazolam add 50 mL of water, allow to stand for 1 hour with occasional shaking, and filter. To 25 mL of this filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.20 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.014%).

(2) Heavy metals \(\leq 1.07\)—Proceed with 1.0 g of Cloxazolam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic \(\leq 1.17\)—Place 1.0 g of Cloxazolam in a Kjeldahl flask, add 5 mL of sulfuric acid and 5 mL of nitric acid, and heat gently. Repeat the addition of 2 to 3 mL of nitric acid at times, and continue heating until a colorless to light yellow solution is obtained. After cooling, add 15 mL of saturated ammonium oxalate solution, and heat the solution until dense white fumes are evolved, and evaporate to a volume of 2 to 3 mL. After cooling, dilute with water to 10 mL, and perform the test with this solution as the test solution (not more than 2 ppm).

(4) Related substances—Dissolve 0.05 g of Cloxazolam in 10 mL of dichloromethane, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add dichloromethane to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Immediately after air-drying, develop the plate with a mixture of toluene and acetone (5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than that from the standard solution.

Loss on drying \(\leq 2.4\%\) Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition \(\leq 2.4\%\) Not more than 0.1% (1 g).

Assay Weigh accurately about 0.5 g of Cloxazolam, previously dried, and dissolve in 50 mL of acetic acid (100). Titrate \(\leq 2.50\) with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue to blue-green (indicator: 2 drops of crystal violet TS). Perform a blank determination.

Each mL of 0.1 mol/L perchloric acid VS = 34.92 mg of \(\text{C}_{17}\text{H}_{14}\text{Cl}_{2}\text{N}_{2}\text{O}_{2}\).
Containers and storage  Containers—Tight containers.  Storage—Light-resistant.

Cocaine Hydrochloride

コカイン塩酸塩

\[
\begin{align*}
\text{C}_{17}\text{H}_{21}\text{NO}_4\cdot\text{HCl} &: 339.81 \\
(1R,2R,3S,5S)-2-\text{Methoxycarbonyl}-8-\text{methyl}-8-\text{azabicyclo}[3.2.1]\text{oct}-3-\text{yl} \text{ benzoate monohydrochloride} \[53-21-4]\n\end{align*}
\]

Cocaine Hydrochloride, when dried, contains not less than 98.0% of \(\text{C}_{17}\text{H}_{21}\text{NO}_4\cdot\text{HCl}\).

Description  Cocaine Hydrochloride occurs as colorless crystals or a white crystalline powder.

It is very soluble in water, freely soluble in ethanol (95%) and in acetic acid (100), slightly soluble in acetic anhydride, and practically insoluble in diethyl ether.

Identification  (1) Determine the absorption spectrum of a solution of Cocaine Hydrochloride in 0.01 mol/L hydrochloric acid TS (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 1: both spectra exhibit similar intensities of absorption at the same wavelengths. Separately, determine the absorption spectrum of a solution of Cocaine Hydrochloride in 0.01 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum 2: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cocaine Hydrochloride, previously dried, as directed in the potassium bromide disk method under the Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Cocaine Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> (2) for chloride.

Optical rotation  <2.49> \([\alpha]_D^0\) = \(-70 \text{ to } -73^\circ\) (after drying, 0.5 g, water, 20 mL, 100 mm).

Purity  (1) Acidity—Dissolve 0.5 g of Cocaine Hydrochloride in 10 mL of water, add 1 drop of methyl red TS, and neutralize with 0.01 mol/L sodium hydroxide VS: the consumed volume is not more than 1.0 mL.

(2) Cinnamyl cocaine—Dissolve 0.10 g of Cocaine Hydrochloride in 5 mL of water, and add 0.3 mL of diluted sulfuric acid (1 in 20) and 0.10 mL of 0.02 mol/L potassium permanganate VS: the red color does not disappear within 30 minutes.

(3) Isoatropyl cocaine—Dissolve 0.10 g of Cocaine Hydrochloride in 30 mL of water in a beaker. Transfer 5 mL of this solution to a test tube, add 1 drop of ammonia TS, and mix. After the precipitate is coagulated, add 10 mL of water, and transfer the mixture to the former beaker, to which 30 mL of water has been added previously. Wash the test tube with 10 mL of water, combine the washings with the mixture in the beaker, add 3 drops of ammonia TS to the combined mixture, and mix gently: a crystalline precipitate is produced. Allow to stand for 1 hour: the supernatant liquid is clear.

Loss on drying  <2.47> Not more than 1.0% (1 g, 105°C, 4 hours).

Residue on ignition  <2.44> Not more than 0.1% (0.5 g).

Assay  Weigh accurately about 0.5 g of Cocaine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 33.98 mg of \(\text{C}_{17}\text{H}_{21}\text{NO}_4\cdot\text{HCl}\).

Containers and storage  Containers—Tight containers. Storage—Light-resistant.

Coconut Oil

Oleum Cocos

ヤシ油

Coconut oil is the fixed oil obtained from the seeds of \(\text{Cocos nucifera}\) Linné (\text{Palmae}).

Description  Coconut Oil is a white to light yellow mass or a colorless or light yellow, clear oil. It has a slight, characteristic odor and a mild taste. It is freely soluble in diethyl ether and in petroleum ether. It is practically insoluble in water. At a temperature below 15°C, it congeals to a hard and brittle solid.

Melting point: 20 – 28°C

Acid value  <1.13> Not more than 0.2.

Saponification value  <1.13> 246 – 264

Unsaponifiable matter  <1.13> Not more than 1.0%.

Iodine value  <1.13> 7 – 11

Containers and storage  Containers—Tight containers.
Codeine Phosphate Hydrate

Codeine Phosphate Hydrate occurs as white to yellowish white crystals or crystalline powder. It is freely soluble in water and in acetic acid (100), slightly soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether. The pH of a solution of Codeine Phosphate Hydrate (1 in 10) is between 3.0 and 5.0. It is affected by light.

Identification (1) Determine the absorption spectrum of a solution of Codeine Phosphate Hydrate (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Codeine Phosphate Hydrate, previously dried at 105°C same wavelengths. Both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Codeine Phosphate Hydrate (1 in 20) responds to the Qualitative Tests <2.09> (1) for phosphate. Optical rotation <2.49> [α]D20 = −98 to −102° (0.4 g calculated on the anhydrous basis, water, 20 mL, 100 mm).

Purity (1) Chloride <1.03>—Perform the test with 0.5 g of Codeine Phosphate Hydrate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(2) Sulfate <1.14>—Perform the test with 0.20 g of Codeine Phosphate Hydrate. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.240%).

(3) Related substances—Dissolve 0.20 g of Codeine Phosphate Hydrate in 10 mL of a mixture of 0.01 mol/L hydrochloric acid TS and ethanol (99.5) (4:1). Use this solution as the standard solution. Prepare the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethanol (99.5), toluene, acetone and ammonia solution (28) (14:14:7:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Water <2.48> 1.5–3.0% (0.5 g, volumetric titration, direct titration).

Assay Dissolve about 0.5 g of Codeine Phosphate Hydrate, accurately weighed, in 70 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue to greenish blue (indicator: 3 drops of crystal violet TS). Perform a blank determination, and make any necessary correction. Each mL of 0.1 mol/L perchloric acid VS = 39.74 mg of C18H21NO3.H3PO4.

Containers and storage Containers—Tight containers. Storage—Light-resistant.

1% Codeine Phosphate Powder

10% Codeine Phosphate Powder contains not less than 10.0% and not more than 11.0% of codeine phosphate hydrate C18H21NO3.H3PO4·1/2H2O: 406.37.

Method of preparation

<table>

To make 1000 g Prepare as directed under Granules or Powders, with the above ingredients.

Identification Determine the absorption spectrum of a solution of 1% Codeine Phosphate Powder (1 in 100) as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 283 nm and 287 nm.

Assay Weigh accurately about 5 g of 1% Codeine Phosphate Powder, dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of codeine phosphate for assay (previously determine the water <2.48> in the same manner as Codeine Phosphate Hydrate), dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Qf and Qs, of the peak area of codeine to that of the internal standard.
Weigh accurately about 2.5 g of 10% Assay exhibits a maximum between 283 nm and 287 nm.

Separately, weigh accurately about 50 mg of codeine phosphate for assay (previous-solution as the sample solution). Separately, weigh accurately about 50 mg of codeine phosphate powder, dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution and water to make 20 mL, and use this solution as the sample solution.

Internal standard solution—A solution of etilefrine hydrochloride (3 in 10,000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran, and mix.
Flow rate: Adjust the flow rate so that the retention time of codeine is about 10 minutes.
System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, codeine and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.
System repeatability: When the test is repeated 5 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of codeine to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Tight containers.

10% Codeine Phosphate Powder

コデインリン酸塩散 10%

10% Codeine Phosphate Powder contains not less than 9.3% and not more than 10.7% of codeine phosphate hydrate (C18H21NO3.H3PO4.1/2H2O: 406.37).

Containers and storage—Containers—Tight containers.

Codeine Phosphate Tablets

コデインリン酸塩錠

Codeine Phosphate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of codeine phosphate hydrate (C18H21NO3.H3PO4.1/2H2O: 406.37).

Method of preparation—Prepare as directed under Tablets, with Codeine Phosphate Hydrate.

Identification—To a quantity of powdered Codeine Phosphate Tablets, equivalent to 0.1 g of Codeine Phosphate Hydrate according to the labeled amount, add 20 mL of water, shake, and filter. To 2 mL of the filtrate add water to make 100 mL, and determine the absorption spectrum as directed
under Ultraviolet-visible Spectrophotometry ($\leq 2.40$): it exhibits a maximum between 283 nm and 287 nm.

**Uniformity of dosage units** ($\leq 6.02$) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Codeine Phosphate Tablets add 3 V/25 mL of water to disintegrate, add 2 V/25 mL of diluted dilute sulfuric acid (1 in 20), and treat with ultrasonic waves for 10 minutes. To this solution add exactly 2 V/25 mL of the internal standard solution, add water to make $V$ mL so that each mL contains about 0.2 mg of codeine phosphate hydrate ($C_{18}H_{21}NO_3.H_3PO_4.1/2H_2O$), filter, and use the filtrate as the sample solution. Separately, weigh accurately about 50 mg of codeine phosphate for assay (separately, determine the water $<2.4\sigma$ in the same manner as Codeine Phosphate Hydrate), and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 2 mL of the internal standard solution, add water to make exactly 25 mL, and use this solution as the standard solution. Proceed as directed in the Assay.

**Operating conditions**
- Proceed as directed in the operating conditions in the Assay.

**System suitability**

- System performance: When the procedure is run with 100 $\mu$L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of codeine are not less than 5000 and not more than 1.5, respectively.
- System repeatability: When the test is repeated 6 times with 100 $\mu$L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of codeine is not more than 2.0%.

**Assay** Weigh accurately and powder not less than 20 Codeine Phosphate Tablets. Weigh accurately a portion of the powder, equivalent to about 0.1 g of codeine phosphate hydrate ($C_{18}H_{21}NO_3.H_3PO_4.1/2H_2O$), add 30 mL of water, shake, add 20 mL of diluted dilute sulfuric acid (1 in 20), treat the mixture with ultrasonic waves for 10 minutes, and add water to make exactly 100 mL. Filter the solution, then pipet 5 mL of the filtrate, add exactly 10 mL of the internal standard solution and water to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of codeine phosphate for assay (previously determine the water $<2.4\sigma$ in the same manner as Codeine Phosphate Hydrate), dissolve in water to make exactly 100 mL, then pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 20 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography ($\leq 2.0\sigma$) according to the following conditions, and calculate the ratios, $Q_1$ and $Q_2$, of the peak area of codeine to that of the internal standard.

\[
\text{Amount (mg) of codeine phosphate hydrate} = M_5 \times \frac{Q_1}{Q_2} \times \frac{V}{250} \times 1.023
\]

\[
M_5: \text{Amount (mg) of codeine phosphate for assay, calculated on the anhydrous basis}
\]

**Internal standard solution**—A solution of ethylefurin hydrochloride (3 in 2000).

**Dissolution** ($\leq 6.10$) When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Codeine Phosphate Tablets is not less than 80%.

Start the test with 1 tablet of Codeine Phosphate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 $\mu$m. Discard the first 10 mL of the filtrate, pipet $V$ mL of the subsequent filtrate, add water to make exactly $V$ mL so that each mL contains about 5.6 $\mu$g of codeine phosphate hydrate ($C_{18}H_{21}NO_3.H_3PO_4.1/2H_2O$) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of codeine phosphate for assay (separately, determine the water $\leq 2.4\sigma$ in the same manner as Codeine Phosphate Hydrate), dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 100 $\mu$L each of the sample solution and standard solution as directed under Liquid Chromatography ($\leq 2.0\sigma$) according to the following conditions, and calculate the ratios, $Q_1$ and $Q_2$, of the peak area of codeine to that of the internal standard.

\[
\text{Amount (mg) of codeine phosphate hydrate} = M_5 \times \frac{Q_1}{Q_2} \times 2 \times 1.023
\]

\[
M_5: \text{Amount (mg) of codeine phosphate for assay, calculated on the anhydrous basis}
\]

**Internal standard solution**—A solution of etilefrine hydrochloride (3 in 10,000).

**Operating conditions**
- Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
- Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 $\mu$m in particle diameter).
- Column temperature: A constant temperature of about 40°C.
- Mobile phase: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of distilled phosphoric acid (1 in 1000), and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran, and mix.
- Flow rate: Adjust the flow rate so that the retention time of codeine is about 10 minutes.

**System suitability**

- System performance: When the procedure is run with 20 $\mu$L of the standard solution under the above operating conditions, codeine and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.
- System repeatability: When the test is repeated 5 times...
with 20 \mu L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of codeine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

### Cod Liver Oil

肝油

Cod Liver Oil is the fatty oils obtained from fresh livers and pyloric appendages of *Gadus macrocephalus* Tilesius or *Theragra chalcogramma* Pallas (Gadidae).

Cod Liver Oil contains not less than 2000 Vitamin A Units and not more than 5000 Vitamin A Units per g.

**Description** Cod Liver Oil is a yellow to orange oily liquid. It has a characteristic, slightly fishy odor and a mild taste. It is miscible with chloroform. It is slightly soluble in ethanol (95), and practically insoluble in water.

It is decomposed by air or by light.

**Identification** Dissolve 0.1 g of Cod Liver Oil in 10 mL of chloroform, and to 1 mL of this solution add 3 mL of antimony (III) chloride TS: a blue color develops immediately, but the color fades rapidly.

**Specific gravity** \(<1.13>\ d^2_2: 0.918 – 0.928\)

**Acid value** \(<1.13>\ Not more than 1.7.\)

**Saponification value** \(<1.13>\ 180 – 192\)

**Unsaponifiable matter** \(<1.13>\ Not more than 3.0%.\)

**Iodine value** \(<1.13>\ 130 – 170\)

**Purity** Rancidity—No unpleasant odor of rancid oil is perceptible on warming Cod Liver Oil.

**Assay** Proceed with about 0.5 g of Cod Liver Oil, accurately weighed, as directed in Method 2 under the Vitamin A Assay. Proceed with about 0.5 g of Cod Liver Oil, accurately weighed, as directed in Method 2 under the Vitamin A Assay, and perform the test.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and almost well-filled, or under nitrogen atmosphere.

---

### Colchicine

コルヒチン

![Colchicine structure](image)

C_{22}H_{25}NO_6: 399.44

\[\text{N-[}(7S)-(1,2,3,10-Tetramethoxy-9-oxo-5,6,7,9-tetrahydrobenzo[a]heptalen-7-yl)]acetamide [64-86-8]\]

Colchicine contains not less than 97.0% and not more than 102.0% of C_{22}H_{26}NO_6, calculated on the anhydrous basis and corrected by the amount of ethyl acetate.

**Description** Colchicine occurs as a yellowish white powder. It is very soluble in methanol, freely soluble in \(N,N\)-dimethylformamide, in ethanol (95) and in acetic anhydride, and sparingly soluble in water.

It is colored by light.

**Identification (1)** Determine the absorption spectrum of a solution of Colchicine in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry \(2.24\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) To 1 g of potassium bromide for infrared absorption spectrum add 0.5 mL of a solution of Colchicine in methanol (1 in 50), grind thoroughly, and dry in vacuum at 80°C for 1 hour. Determine the infrared absorption spectrum of this powder as directed in the potassium bromide disk method under Infrared Spectrophotometry \(2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** \(2.49\) \([\alpha]_D^2\): \(-235\) to \(250^\circ\) (0.1 g calculated on the anhydrous basis and corrected by the amount of ethyl acetate, ethanol (95), 10 mL, 100 mm).

**Purity (1)** Colchicine—Dissolve 0.10 g of Colchicine in 10 mL of water, and to 5 mL of this solution add 2 drops of iron (III) chloride TS: no definite green color develops.

(2) Chloroform and ethyl acetate—Weigh accurately about 0.6 g of Colchicine, dissolve in exactly 2 mL of the internal standard solution, add \(N,N\)-dimethylformamide to make 10 mL, and use this solution as the sample solution. Separately, weigh 0.30 g of chloroform using a 100-mL volumetric flask containing about 20 mL of \(N,N\)-dimethylformamide, and add \(N,N\)-dimethylformamide to make exactly 100 mL. Pipet 2 mL of this solution, add \(N,N\)-dimethylformamide to make exactly 200 mL, and use this solution as the standard solution (1). Separately, weigh accurately about 1.8 g of ethyl acetate using a 100-mL volumetric flask containing about 20 mL of \(N,N\)-dimethylformamide, and add \(N,N\)-dimethylformamide to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 2 mL of the internal standard solution and \(N,N\)-dimethylformamide to make 10 mL,
and use this solution as the standard solution (2). Perform the test with exactly 2 μL each of the sample solution and standard solutions (1) and (2) as directed under Gas Chromatography <2.02> according to the following conditions: the peak area of chloroform from sample solution is not larger than that from the standard solution (1). Calculate the ratios of the peak area of ethyl acetate to that of the internal standard, $Q_{1}$ and $Q_{2}$, of the sample solution and standard solution (2), and calculate the amount of ethyl acetate by the following formula: the amount of ethyl acetate is not more than 6.0%.

\[
\text{Amount (g) of ethyl acetate (C}_4\text{H}_8\text{O}_2) = \frac{M_5}{M_1 \times Q_1/2} \\
\text{M}_5: \text{Amount (g) of ethyl acetate} \\
\text{M}_1: \text{Amount (g) of the sample}
\]

**Internal standard solution**—A solution of 1-propanol in N,N-dimethylformamide (3 in 200).

**Operating conditions**
- Detector: A hydrogen flame-ionization detector.
- Column: A fused silica column 0.53 mm in inside diameter and 30 m in length, coated inside surface with polyethylene glycol 20 M for gas chromatography 1.0 μm in thickness.
- Column temperature: 60°C for 7 minutes, then up to 100°C at a rate of 40°C per minute if necessary, and hold at 100°C for 10 minutes.
- Injection port temperature: A constant temperature of about 130°C.
- Detector temperature: A constant temperature of about 200°C.
- Carrier gas: Helium.
- Flow rate: Adjust the flow rate so that the retention time of ethyl acetate is about 3 minutes.

**System suitability**—
Test for required detectability: Pipet 2 mL of the standard solution (2), and add N,N-dimethylformamide to make exactly 25 mL. Pipet 1 mL of this solution, and add N,N-dimethylformamide to make exactly 50 mL. Confirm that the peak area of ethyl acetate obtained from 2 μL of this solution is equivalent to 0.11 to 0.21% of that from 2 μL of the standard solution (2).

System performance: To 1 mL of chloroform add N,N-dimethylformamide to make 10 mL. To 1 mL of this solution add 2 mL of ethyl acetate and N,N-dimethylformamide to make 50 mL. Confirm that the peak area of ethyl acetate obtained from 2 μL of this solution is equivalent to 0.11 to 0.21% of that from 2 μL of the standard solution (2).

System performance: To 1 mL of chloroform add N,N-dimethylformamide to make 10 mL. To 1 mL of this solution add 2 mL of ethyl acetate and N,N-dimethylformamide to make 50 mL. When the procedure is run with 2 μL of this solution under the above operating conditions, the relative standard deviation of the peak area of ethyl acetate is not more than 1.5.

System repeatability: When the test is repeated 6 times with 20 μL of the sample solution under the above operating conditions, the relative standard deviation of the peak area of chloroform is not more than 2.0%.

**Water**<2.48> Not more than 2.0% (0.5 g, volumetric titration, back titration).

**Assay**
Weigh accurately about 0.4 g of Colchicine, dissolve in 25 mL of acetic anhydride, and titrate <2.50> with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

\[
\text{Each mL of 0.05 mol/L perchloric acid VS} = 19.97 \text{ mg of C}_2\text{H}_2\text{NO}_6
\]

**Containers and storage**
Containers—Tight containers.
Storage—Light-resistant.
Colistin Sodium Methanesulfonate
コリスチンメタンスルホン酸ナトリウム

Colistin Sodium Methanesulfonate is the sodium salt of colistin derivatives, and is a mixture of colistin A sodium methanesulfonate and colistin B sodium methanesulfonate. It, when dried, contains not less than 11,500 Units per mg. The unit of Colistin Sodium Methanesulfonate is expressed as mass of colistin A (R = 6-methyloctanic acid, R' = H; C_{53}H_{100}N_{16}O_{13}: 1169.46).

**Description**
Colistin Sodium Methanesulfonate occurs as a white to light yellowish white powder.

It is freely soluble in water, and practically insoluble in ethanol (95).

**Identification (1)**
Dissolve 20 mg of Colistin Sodium Methanesulfonate in 2 mL of water, add 0.5 mL of sodium hydroxide TS, and add 5 drops of copper (II) sulfate TS while shaking: a blue-purple color develops.

(2) Dissolve 40 mg of Colistin Sodium Methanesulfonate in 1 mL of 1 mol/L hydrochloric acid TS, and add 0.5 mL of dilute iodine TS: the color of iodine disappears.

(3) Determine the infrared absorption spectrum of Colistin Sodium Methanesulfonate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Colistin Sodium Methanesulfonate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) Colistin Sodium Methanesulfonate responds to the Qualitative Tests <1.09> (1) for sodium salt.

**pH**
Dissolve 0.1 g of Colistin Sodium Methanesulfonate in 10 mL of water, and allow to stand for 30 minutes: the pH of the solution is between 6.5 and 8.5.

**Purity**
Clarity and color of solution—Dissolve 0.16 g of Colistin Sodium Methanesulfonate in 10 mL of water: the solution is clear and colorless.

Heavy metals <1.07>—Proceed with 1.0 g of Colistin Sodium Methanesulfonate according to Method 4, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

Arsenic <1.11>—Prepare the test solution with 1.0 g of Colistin Sodium Methanesulfonate according to Method 4, and perform the test (not more than 2 ppm).

Free colistin—Dissolve 80 mg of Colistin Sodium Methanesulfonate in 3 mL of water, add 0.05 mL of a solu-
tion of silicotungstic acid 26-water (1 in 10), and immediately compare the solution with the reference suspension described under Test Methods for Plastic Containers <7.02>: the turbidity is not greater than that of the reference suspension (not more than 0.25%).

**Loss on drying**
Not more than 3.0% (0.1 g, reduced pressure, 60°C, 3 hours).

**Assay**
Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—Escherichia coli NIHJ

(ii) Culture medium—To 10.0 g of peptone, 30.0 g of sodium chloride, 3.0 g of meat extract and 20.0 g of agar add 1000 mL of water, then add a suitable amount of sodium hydroxide TS so that the pH of the medium is being 6.5 to 6.6 after sterilization, sterile, and use this as the seeded agar medium and the agar medium for base layer.

(iii) Standard solutions—Weigh accurately an amount of Colistin Sodium Methanesulfonate RS, previously dried, dissolve in phosphate buffer solution, pH 6.0 to make a solution containing 100,000 Units per mL, and use this solution as the standard stock solution. Keep the standard stock solution at 10°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, and add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10,000 Units and 2500 Units, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Colistin Sodium Methanesulfonate, previously dried, dissolve in phosphate buffer solution, pH 6.0 to make a solution containing about 100,000 Units per mL, and use this solution as the sample stock solution. Take exactly a suitable amount of the sample stock solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10,000 Units and 2500 Units, and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage**
Containers—Tight containers.
Colistin Sulfate

コリスチン硫酸塩

Colistin Sulfate is the sulfate of a mixture of peptide substances having antibacterial activity produced by the growth of Bacillus polymyxa var. colistinus.

It, when dried, contains not less than 16,000 units per mg. The potency of Colistin Sulfate is expressed as unit calculated from the amount of colistin A (C₅₃H₁₀₀N₁₆O₁₃·2H₂SO₄: 1169.46). One unit of Colistin Sulfate is equivalent to 0.04 µg of colistin A (C₅₃H₁₀₀N₁₆O₁₃).

**Description** Colistin Sulfate occurs as a white to light yellowish white powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5).

It is hygroscopic.

**Identification** (1) Dissolve 20 mg of Colistin Sulfate in 2 mL of water, add 0.5 mL of sodium hydroxide, then add 5 drops of copper (II) sulfate. A purple color develops.

(2) Dissolve 50 mg of Colistin Sulfate in 10 mL of diluted hydrochloric acid (1 in 2). Transfer 1 mL of this solution in a tube for hydrolysis, seal, and heat at 135°C for 5 hours. After cooling, open the tube, and evaporate the content to dryness until the odor of hydrochloric acid is no more perceptible. Dissolve the residue in 0.5 mL of water, and use this solution as the sample solution. Separately, dissolve 20 mg each of L-leucine, L-threonine, phenylalanine and L-serine in 10 mL of water, and use these solutions as the standard solutions.

**Purity** (1) Sulfuric acid—Weigh accurately about 0.25 g of previously dried Colistin Sulfate, dissolve in a suitable amount of water, adjust the pH to 11 with ammonia solution (28), and add water to make 100 mL. To this solution add exactly 10 mL of 0.1 mol/L barium chloride VS and 50 mL of ethanol (99.5), and titrate with 2.50 M 0.1 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the blue-purple color of the solution disappears (indicator: 0.5 mg of phthalein purple): the amount of sulfuric acid (SO₄) is 16.0 to 18.0%.

Each mL of 0.1 mol/L barium chloride VS = 9.606 mg of SO₄

(2) Related substances—Dissolve 50 mg of Colistin Sulfate in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 1 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of pyridine, 1-butanol, water, 25 mL, 100 mm).

**Residue on drying** <2.41> Not more than 6.0% (1 g, in vacuum, 60°C, 3 hours).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics <4.02> according to the following conditions.

(i) Test organism—Escherichia coli NIHJ

(ii) Culture medium—Dissolve 10.0 g of peptone, 30.0 g of sodium chloride, 3.0 g of meat extract and 15.0 g of agar in 1000 mL of water, adjust the pH with sodium hydroxide TS so that the solution will be 6.5 to 6.6 after sterilization, and use as the agar media for seed layer and for base layer.

(iii) Standard solutions—Weigh accurately an amount of Colistin Sulfate RS, previously dried, equivalent to about 1,000,000 units, dissolve in phosphate buffer solution, pH 6.0 to make exactly 10 mL, and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 10°C, and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10,000 units and 2500 units, and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Colistin Sulfate, previously dried, equivalent to about 1,000,000 units, and dissolve in phosphate buffer solution, pH 6.0 to make exactly 10 mL. Take exactly a suitable
amount of this solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10,000 units and 2500 units, and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage** Containers—Tight containers.

**Corn Oil**

*Oleum Maydis*

トウモロコシ油

Corn Oil is the fixed oil obtained from the embryo of *Zea mays* Linné (*Gramineae*).

**Description** Corn Oil is a clear, light yellow oil. It is odorless or has a slight odor, and a mild taste.

It is miscible with diethyl ether and with petroleum ether. It is slightly soluble in ethanol (95), and practically insoluble in water.

At –7°C, it congeals to an unguentary mass.

**Specific gravity** $d_{25}^2$: 0.915 – 0.921

**Acid value** <1.13 Not more than 0.2.

**Saponification value** <1.13 187 – 195

**Unsaponifiable matter** <1.13 Not more than 1.5%.

**Iodine value** <1.13 103 – 130

**Containers and storage** Containers—Tight containers.

**Corn Starch**

*Amylum Maydis*

トウモロコシデンプン

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopoeia. The parts of the text that are not harmonized are marked with symbols (*,* *).

Corn Starch consists of starch granules derived from the ripe seeds of *Zea mays* Linné (*Gramineae*).

**Description** Corn Starch occurs as white to pale yellowish white masses or powder.

It is practically insoluble in water and in ethanol (99.5). •

**Identification** (1) Under a microscope <5.0D, using mixture of water and glycerin (1:1), Corn Starch appears as either angular polyhedral granules of irregular sizes with diameters ranging from about 2 μm to about 23 μm or as rounded or spheroidal granules of irregular sizes with diameters ranging from about 25 μm to about 35 μm. The central hilum consists of a distinct cavity or two- to five-rayed cleft, and there are no concentric striations. Between orthogonally oriented polarizing plates or prisms, the starch granules show a distinct black cross intersecting at the hilum.

(2) To 1 g of Corn Starch add 50 mL of water, boil for 1 minute, and allow to cool: a subtle white-turbid, pasty liquid is formed.

(3) To 1 mL of the pasty liquid obtained in (2) add 0.05 mL of diluted iodine TS (1 in 10): an orange-red to deep blue color is formed and the color disappears by heating.

**pH** <2.54 Put 5.0 g of Corn Starch in a non-metal vessel, add 25.0 mL of freshly boiled and cooled water, mix gently for 1 minute, and allow to stand for 15 minutes: the pH of the solution is between 4.0 and 7.0.

**Purity** (1) Iron—To 1.5 g of Corn Starch add 15 mL of 2 mol/L hydrochloric acid TS, mix, filter, and use the filtrate as the test solution. To 2.0 mL of Standard Iron Solution add water to make 20 mL, and use as the control solution. Put 10 mL each of the test solution and the control solution in test tubes, add 2 mL of a solution of citric acid (1 in 5) and 0.1 mL of mercapo acetic acid, and mix. Alkalize with ammonia solution (28) to litmus paper, add water to make 20 mL, and mix. Transfer 10 mL each of these solutions into test tubes, allow to stand for 5 minutes, and compare the color of these solutions against a white background: the color of the test solution is not more intense than that of the control solution (not more than 10 ppm).

(2) Oxidizing substances—To 4.0 g of Corn Starch add 50.0 mL of water, shake for 5 minutes, and centrifuge. To 30.0 mL of the supernatant liquid add 1 mL of acetic acid (100) and 0.5 to 1.0 g of potassium iodide, shake, and allow to stand for 25 to 30 minutes at a dark place. Add 1 mL of starch TS, and titrate <2.50 with 0.002 mol/L sodium thiosulfate VS until the color of the solution disappears. Perform a blank determination and make any necessary correction: the volume of 0.002 mol/L sodium thiosulfate VS consumed is not more than 1.4 mL (not more than 20 ppm, calculated as hydrogen peroxide).

(3) Sulfur dioxide—

(i) Apparatus Use as shown in the following figure.

(ii) Procedure Introduce 150 mL of water into the boiling flask, close the tap of the funnel, and pass carbon dioxide through the whole system at a rate of 100 ± 5 mL per minute. Pass cooling water through the condenser, and place 10 mL of hydrogen peroxide-sodium hydroxide TS in the test-tube. After 15 minutes, remove the funnel without interrupting the stream of carbon dioxide, and introduce through

---

The figures are in mm.
Reisdue on ignition 90 minutes.

Place the flask in a water bath, and heat the mixture for 1 hour. Transfer the contents of the test-tube with the aid of a little water to a wide-necked conical flask. Heat in a water bath for 15 minutes, and cool. Add 0.1 mL of bromphenol blue TS, and titrate with 0.1 mol/L sodium hydroxide VS until the color changes from yellow to violet-blue lasting for at least 20 seconds. Perform a blank determination and make any necessary correction. Calculate the amount of sulfur dioxide by applying the following formula: it is not more than 50 ppm.

\[ \text{Amount (ppm) of sulfur dioxide} = \frac{V \times M}{1000 \times 3.203} \]

\[ M: \text{Amount (g) of the sample} \]

\[ V: \text{Amount (mL) of 0.1 mol/L sodium hydroxide VS consumed} \]

* Foreign matter—Under a microscope <5.0>, Corn Starch does not contain starch granules of any other origin. It may contain a minute quantity, if any, of fragments of the tissue of the original plant.

**Loss on drying** <2.4> Not more than 15.0% (1 g, 130°C, 90 minutes).

**Residue on ignition** <2.4> Not more than 0.6% (1 g).

**Containers and storage** Containers—Well-closed containers.

Cortisone Acetate

コルチゾン酢酸エステル

\[
\text{C}_{23}\text{H}_{30}\text{O}_6: 402.48
\]

17,21-Dihydroxypregn-4-ene-3,11,20-trione 21-acetate [50-04-4]

Cortisone Acetate, when dried, contains not less than 97.0% and not more than 102.0% of C_{23}H_{30}O_{6}.

**Description** Cortisone Acetate occurs as white crystals or crystalline powder.

It is sparingly soluble in methanol, slightly soluble in ethanol (99.5), and practically insoluble in water.

Melting point: about 240°C (with decomposition).

**Identification** (1) To 2 mg of Cortisone Acetate add 2 mL of sulfuric acid, and allow to stand for a while: a yellowish green color is produced, and it gradually changes to yellow-orange. Examine the solution under ultraviolet light: the solution shows a light green fluorescence. Add carefully 10 mL of water to this solution: the color of the solution is discharged, and the solution remains clear.

(2) Determine the absorption spectrum of a solution of Cortisone Acetate in methanol (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cortisone Acetate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Cortisone Acetate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Cortisone Acetate RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Cortisone Acetate and Cortisone Acetate RS in acetonitrile, respectively, then evaporate the acetonitrile to dryness, and repeat the test on the residues.

**Optical rotation** <2.4> [α]_{D}^{20}: +207 – +216° (after drying, 0.1 g, methanol, 10 mL, 100 mm).

**Purity** Related substances—Dissolve 25 mg of Cortisone Acetate in 10 mL of a mixture of acetonitrile, water and acetic acid (100) (70:30:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution and add the mixture of acetonitrile, water and acetic acid (100) (70:30:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 15 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than cortisone acetate obtained with the sample solution is not larger than 1/2 times the peak area of cortisone acetate with the standard solution, and the total area of the peaks other than cortisone acetate is not larger than 1.5 times the peak area of cortisone acetate with the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase A: A mixture of water and acetonitrile (7:3). Mobile phase B: A mixture of acetonitrile and water (7:3). Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>

Flow rate: About 1 mL per minute.

Time span of measurement: About 3 times as long as the retention time of cortisone acetate beginning after the sol-
Cresol

クレゾール

C₆H₅O: 108.14

Cresol is a mixture of isomeric cresols.

Description Cresol is a clear, colorless or yellow to yellow-brown liquid. It has a phenol-like odor. It is miscible with ethanol (95) and with diethyl ether. It is sparingly soluble in water. It dissolves in sodium hydroxide TS. A saturated solution of Cresol is neutral to bromocresol purple TS. It is a highly refractive liquid. It becomes dark brown by light or on aging.

Identification To 5 mL of a saturated solution of Cresol add 1 to 2 drops of dilute iron (III) chloride TS: a blue-purple color develops.

Specific gravity <2.56> dₑ°: 1.032 – 1.041

Purity (1) Hydrocarbons—Dissolve 1.0 mL of Cresol in 60 mL of water: the solution shows no more turbidity than that produced in the following control solution.

Control solution: To 54 mL of water add 6.0 mL of 0.005 mol/L sulfuric acid and 1.0 mL of barium chloride TS, and after thorough shaking, allow to stand for 5 minutes.

(2) Sulfur compounds—Transfer 20 mL of Cresol in a 100-mL conical flask, place a piece of moistened lead (II) acetate paper on the mouth of the flask, and warm for 5 minutes on a water bath: the lead (II) acetate paper may develop a yellow color, but neither a brown nor a dark tint.

Distilling range <2.57> 196 – 206°C, not less than 90 vol%.

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Cresol Solution

クレゾール水

Cresol Solution contains not less than 1.25 vol% and not more than 1.60 vol% of cresol.

Method of preparation

| Saponated Cresol Solution | 30 mL |
| Water, Purified Water or Purified Water in Containers | a sufficient quantity |

To make 1000 mL

Prepare by mixing the above ingredients.

Description Cresol Solution is a clear or slightly turbid, yellow solution. It has the odor of cresol.

Identification Shake 0.5 mL of the oily layer obtained in the Assay with 30 mL of water, filter, and perform the following tests using this filtrate as the sample solution:

(1) To 5 mL of the sample solution add 1 to 2 drops of iron (III) chloride TS: a blue-purple color develops.
Containers and storage
Containers—Tight containers.

Saponated Cresol Solution

クロゾール石ケン液

Saponated Cresol Solution contains not less than 42 vol% and not more than 52 vol% of cresol.

| Potassium Hydroxide| a suitable quantity | Added to
| Water, Purified Water or Purified Water in Containers | a sufficient quantity |

To make 1000 mL

Dissolve Potassium Hydroxide, in required quantity for saponification, in a sufficient quantity of Water, Purified Water or Purified Water in Containers. Add this solution to fixed oil, previously warmed, add a sufficient quantity of Ethanol, if necessary, heat in a water bath by thorough stirring, and continue the saponification. After complete saponification, add Cresol, stir thoroughly until the mixture becomes clear, and add sufficient Water, Purified Water or Purified Water in Containers to make 1000 mL. A corresponding amount of Sodium Hydroxide may be used in place of Potassium Hydroxide.

Description
Saponated Cresol Solution is a yellow-brown to red-brown, viscous liquid. It has the odor of cresol.

It is miscible with water, with ethanol (95) and with glycerin.

It is alkaline.

Identification
Proceed as directed in the Identification under Cresol, using the distillate in the Purity (3).

Purity
(1) Alkalinity—Mix well 0.50 mL of Saponated Cresol Solution with 10 mL of neutralized ethanol, add 2 to 3 drops of phenolphthalein TS and 0.10 mL of 1 mol/L hydrochloric acid VS: no red color develops.

(2) Unsaponified matter—To 1.0 mL of Saponated Cresol Solution add 5 mL of water, and shake: the solution is clear.

(3) Cresol fraction—Transfer 180 mL of Saponated Cresol Solution to a 2000-mL distilling flask, add 300 mL of water and 100 mL of dilute sulfuric acid, and distil with steam until the distillate becomes clear. Draw off the water from the condenser, and continue the distillation until water vapor begins to come out of the tip of the condenser. Cool the condenser again, and continue distillation for 5 minutes. Dissolve 20 g of sodium chloride per 100 mL of the distillate, allow to stand, and collect the separated clear oil layer. After adding about 15 g of powdered calcium chloride for drying in small portions with frequent shaking, allow to stand for 4 hours. Filter, and distil exactly 50 mL of the filtrate: the distillate is not less than 43 mL between 196°C and 206°C.

Assay
Transfer 5 mL of Saponated Cresol Solution, exactly measured, to a 500-mL distilling flask, holding the pipet vertically for 15 minutes to draw off the solution into the flask. Add 200 mL of water, 40 g of sodium chloride and 3 mL of dilute sulfuric acid, connect the distilling apparatus with the distilling flask, and distil into a cassia flask which contains 30 g of powdered sodium chloride and exactly 3 mL of kerosene, until the distillate reaches 90 mL. Draw off the water from the condenser, and continue the distillation until water vapor begins to come out of the tip of the condenser. Allow the cassia flask to stand in warm water for 15 minutes to dissolve the sodium chloride, and allow to stand for 4 hours. Filter, and distil exactly 50 mL of the filtrate: the distillate is not less than 43 mL between 196°C and 206°C.

Storage—Light-resistant.

Croconazole Hydrochloride

クロコナゾール塩酸塩

Croconazole Hydrochloride, when dried, contains not less than 98.5% of C_{16}H_{15}ClN_{2}O.HCl.

Description
Croconazole Hydrochloride occurs as white to pale yellowish white crystals or crystalline powder.

It is very soluble in water, freely soluble in methanol, in ethanol (95) and in acetic acid (100), and practically insolu-
ble in diethyl ether.

**Identification** (1) Determine the absorption spectrum of a solution of Croconazole Hydrochloride in methanol (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.2d>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Croconazole Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.2s>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dissolve 0.05 g of Croconazole Hydrochloride in 10 mL of water, add 2 mL of sodium hydroxide TS and 20 mL of diethyl ether, and shake. Wash the separated aqueous layer with two 10-mL portions of diethyl ether, and acidify the solution with 2 mL of dilute nitric acid: the solution responds to the Qualitative Tests <1.09> for chloride.

**Melting point** <2.6d> 148 ~ 153°C

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Croconazole Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 50 mg of Croconazole Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, hexane, methanol and ammonia solution (28) (30:15:5:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot and other than the spot of the starting point from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.5% (1 g, 60°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Croconazole Hydrochloride, previously dried, dissolve in 10 mL of acetic acid (100), add 40 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS [indicator: 1 to 2 drops of a solution of malachite green oxalate in acetic acid (100) (1 in 100)] until the color of the solution changes from blue-green through green to yellow-green. Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 34.72 mg of C₁₈H₁₅ClN₂O.HCl

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

---

**Croscarmellose Sodium**

クロスカルメロースナトリウム

[74811-65-7]

This monograph is harmonized with the European Pharmacopoeia and the U.S. Pharmacopeia. The parts of the test that are not harmonized are marked with symbol (••).

**Croscarmellose Sodium** is the sodium salt of a cross-linked poly carboxymethylcellulose.

**Description** Croscarmellose Sodium occurs as a white to yellowish white powder.

It is practically insoluble in ethanol (99.5) and in diethyl ether.

It swells with water and becomes a suspension.

It is hygroscopic. •

**Identification** (1) To 1 g of Croscarmellose Sodium add 100 mL of a solution of methylene blue (1 in 250,000), stir well, and allow to stand: blue cotton-like precipitates appear.

(2) To 1 g of Croscarmellose Sodium add 50 mL of water, and stir well to make a suspension. To 1 mL of this suspension add 1 mL of water and 5 drops of freshly prepared solution of 1-naphthol in methanol (1 in 25), and gently add 2 mL of sulfuric acid along a wall of the vessel: a red-purple color appears at the zone of contact.

(3) The suspension obtained in (2) responds to the Qualitative Tests <1.09> (1) for sodium salt.

**pH** <2.54> To 1.0 g of Croscarmellose Sodium add 100 mL of water, and stir for 5 minutes: the pH of the supernatant liquid is between 5.0 and 7.0.

**Purity** •(1) Heavy metals <1.07>—Proceed with 2.0 g of Croscarmellose Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm). •

•(2) Sodium chloride and sodium glycolate—The total amount of sodium chloride and sodium glycolate is not more than 0.5%, calculated on the dried basis.

(i) Sodium chloride: Weigh accurately about 5 g of Croscarmellose Sodium, add 50 mL of water and 5 mL of hydrogen peroxide (30), and heat on a water bath for 20 minutes with occasional stirring. After cooling, add 100 mL of water and 10 mL of nitric acid, and titrate <2.50> with 0.1 mol/L silver nitrate VS (potentiometric titration). Perform a blank determination in the same manner and make any necessary correction.

Each mL of 0.1 mol/L silver nitrate VS = 5.844 mg of NaCl

(ii) Sodium glycolate: Weigh accurately about 0.5 g of Croscarmellose Sodium, add 2 mL of acetic acid (100) and 5 mL of water, and stir for 15 minutes. Add gradually 50 mL of acetone with stirring, then add 1 g of sodium chloride, stir for 3 minutes, and filter through a filter paper moistened with acetone. Wash the residue thoroughly with 30 mL of acetone, combine the filtrate and washings, add acetone to make exactly 100 mL, and use this solution as the sample stock solution. Separately, dissolve 0.100 g of glycolic acid
in water to make 200 mL. Pipet 0.5 mL, 1 mL, 2 mL, 3 mL, and 4 mL of this solution, add water to make them exactly 5 mL, then add 5 mL of acetic acid (100) and acetone to make exactly 100 mL, and designate them standard stock solution (1), standard stock solution (2), standard stock solution (3), standard stock solution (4) and standard stock solution (5), respectively. Pipet 2 mL each of the sample stock solution and the standard stock solutions (1), (2), (3), (4) and (5), and heat them in a water bath for 20 minutes to evaporate acetone. After cooling, add exactly 5 mL of 2,7-dihydroxy- naphthalene TS, mix, then add 15 mL of 2,7-dihydroxy- naphthalene TS, mix, cover the mouth of the vessels with aluminum foil, and heat in a water bath for 20 minutes. After cooling, add sulfuric acid to make exactly 25 mL, mix, and designate them sample solution, standard solution (1), standard solution (2), standard solution (3), standard solution (4) and standard solution (5), respectively. Separately, to 10 mL of a mixture of water and acetic acid (100) (1:1) add acetone to make exactly 100 mL, and proceed with exactly 2 mL of this solution in the same manner for preparation of the sample solution, and use the solution so obtained as the blank solution. Determine the absorbances, A1, A21, A32, A43, A54 and A55, of the sample solution and the standard solutions (1), (2), (3), (4) and (5), respectively, at 540 nm as directed under Ultraviolet-visible Spectrophotometry 2.2.4, using the blank solution as the control. Determine the amount (g) of glycolic acid, X, in 100 mL of the sample solution from the calibration curve obtained with the standard solutions, and calculate the amount of sodium glycolate by the following formula.

\[
A = \frac{1150M/(7102 - 412M - 80C)}{(162 + 584C)/(7102 - 80C)}
\]

\[
S = \frac{A}{(162 + 584C)/(7102 - 80C)}
\]

M: Amount (mmol) of sodium hydroxide needed to neutralize 1 g of sample, calculated on the dried basis

C: The value (%) obtained in Residue on ignition

Loss on drying <2.41 Not more than 10.0% (1 g, 105°C, 6 hours).

Residue on ignition <2.45 14.0 - 28.0% (after drying, 1 g).

Containers and storage Containers—Tight containers.

Cyanamide

シアナミド

\[\text{H}_2\text{N—CN}\]

CH₃N₂: 42.04
Aminonitrile [420-04-2]

Cyanamide contains not less than 97.0% and not more than 101.0% of CH₃N₂, calculated on the anhydrous basis.

Description Cyanamide occurs as white crystals or crystalline powder.

It is very soluble in water, in methanol, in ethanol (99.5) and in acetone.

The pH of a solution of Cyanamide (1 in 100) is between 5.0 and 6.5.

It is hygroscopic.

Melting point: about 46°C

Identification (1) To 1 mL of a solution of Cyanamide (1 in 100) add 1 mL of potassium 1,2-naphthoquinone-4-sulfonate TS and 0.2 mL of sodium hydroxide TS: a deep red color develops.

(2) Drop one or two drops of a solution of Cyanamide in acetone (1 in 100) onto a potassium bromide disk prepared as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.2.5, and air-dry the disk. Determine the infrared absorption spectrum of the disk as directed in the film method under Infrared Spectrophotometry 2.2.5, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.
Cyanocobalamin

Vitamin B12

Cyanocobalamin contains not less than 96.0% and not more than 102.0% of C₆₃H₈₈CoN₁₄O₁₄P, calculated on the dried basis.

Description
Cyanocobalamin occurs as dark red crystals or powder.

It is sparingly soluble in water, and slightly soluble in ethanol (99.5).

It is hygroscopic.

Identification
(1) Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry ≤2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Cyanocobalamin RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Mix 1 mg of Cyanocobalamin with 50 mg of potassium hydrogen sulfate, and fuse by igniting. Cool, break up the mass with a glass rod, add 3 mL of water, and dissolve by boiling. Add 1 drop of phenolphthalein TS, then add dropwise sodium hydroxide TS until a light red color just develops. Add 0.5 g of sodium acetate trihydrate, 0.5 mL of dilute acetic acid and 0.5 mL of a solution of disodium 1-nitroso-2-naphthol-3,6-disulfonate (1 in 500): a red to orange-red color is immediately produced. Then add 0.5 mL of hydrochloric acid, and boil for 1 minute: the red color does not disappear.

(3) Transfer 5 mg of Cyanocobalamin to a 50-mL distilling flask, dissolve in 5 mL of water, and add 2.5 mL of hypophosphorous acid. Connect the flask with a short condenser, and dips its tip into a test tube containing 1 mL of a solution of sodium hydroxide (1 in 50). Heat gently for 10 minutes, then distil 1 mL into a test tube. To the test tube add 4 drops of a saturated solution of ammonium iron (II) sulfate hexahydrate, shake gently, then add about 30 mg of sodium fluoride, and heat the contents to boil. Immediately add dropwise diluted sulfuric acid (1 in 7) until a clear solution results, then add 3 to 5 drops more of diluted sulfuric acid (1 in 7): a blue to blue-green color develops.

pH ≤2.54> Dissolve 0.10 g of Cyanocobalamin in 20 mL of water: the pH of this solution is between 4.2 and 7.0.

Purity
(1) Clarity and color of solution—Dissolve 20 mg of Cyanocobalamin in 10 mL of water: the solution is clear and red in color.

(2) Related substances—Conduct this procedure using light-resistant vessels. Dissolve 10 mg of Cyanocobalamin in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography ≤2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peak other than cyanocobalamin obtained from the sample solution is not larger than the peak area of cyanocobalamin from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 361 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 30°C.
Mobile phase: Dissolve 10 g of anhydrous disodium hydrogen phosphate in 1000 mL of water, and adjust to pH 3.5 with phosphoric acid. To 147 mL of this solution add 53 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of cyanocobalamin is about 7 minutes.

Time span of measurement: About 4 times as long as the retention time of cyanocobalamin, beginning after the solvent peak.

**System suitability—**

Test for required detectability: Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of cyanocobalamin obtained with 20 μL of this solution is equivalent to 7 to 13% of that with 20 μL of the solution for system suitability test.

System performance: Perform this procedure quickly after the solution is prepared. To 25 μg of cyanocobalamin add 10 mL of water, and warm, if necessary, to dissolve. After cooling, add 0.5 mL of sodium toluenesulfonchloramide TS, 0.5 mL of 0.05 mol/L hydrochloric acid TS and water to make 25 mL, mix, and allow the solution to stand for 5 minutes. To 1 mL of the solution add the mobile phase to make 10 mL. When the procedure is run with 20 μL of the solution under the above operating conditions, two principal peaks appear with the resolution between these peaks being not less than 2.5.

System repeatability: When the test is repeated 6 times with 20 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of cyanocobalamin is not more than 3.0%.

**Loss on drying** <2.41> Not more than 12% (50 mg, in vacuum at a pressure not exceeding 0.67 kPa, phosphorus (V) oxide, 100°C, 4 hours).

**Assay** Weigh accurately about 20 mg each of Cyanocobalamin and Cyanocobalamin RS (previously determine the loss on drying <2.41> in the same conditions as Cyanocobalamin), dissolve in water to make exactly 1000 mL, respectively, and use these solutions as the sample solution and the standard solution. Determine the absorbances, $A_1$ and $A_2$, of the sample solution and the standard solution, respectively, at 361 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
\text{Amount (mg) of } C_{63}H_{88}CoN_{14}O_{14}P = M_5 \times \frac{A_1}{A_2}
\]

$M_5$: Amount (mg) of Cyanocobalamin RS, calculated on the dried basis

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

---

**Cyanocobalamin Injection**

**Vitamin B₁₂ Injection**

シアノコバラミン注射液

Cyanocobalamin Injection is an aqueous solution for injection.

It contains not less than 95.0% and not more than 115.0% of the labeled amount of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$: 1355.37)

**Method of preparation** Prepare as directed under Injections, with Cyanocobalamin.

**Description** Cyanocobalamin Injection is a clear, light red to red liquid.

**Identification** Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 277 nm and 279 nm, between 360 nm, and 362 nm and between 548 nm and 552 nm. Determine the absorbances, $A_1$ and $A_2$, of this solution at the wavelengths of maximum absorption between 360 nm and 362 nm, and between 548 nm and 552 nm, respectively: the ratio $A_2 / A_1$ is not less than 0.29 and not more than 0.32.

**Bacterial endotoxins** <4.01> Less than 0.30 EU/μg.

**Extractable volume** <6.05> It meets the requirement.

**Foreign insoluble matter** <6.06> Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> It meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Measure exactly a volume of Cyanocobalamin Injection, equivalent to about 2 mg of cyanocobalamin ($C_{63}H_{88}CoN_{14}O_{14}P$), add water to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of Cyanocobalamin RS (previously determine the loss on drying <2.41> in the same conditions as Cyanocobalamin), add water to make exactly 1000 mL, and use this solution as the standard solution. With these solutions, proceed as directed in the Assay under Cyanocobalamin.

\[
\text{Amount (mg) of cyanocobalamin } C_{63}H_{88}CoN_{14}O_{14}P = M_5 \times \frac{A_1}{A_2} \times \frac{1}{10}
\]

$M_5$: Amount (mg) of Cyanocobalamin RS, calculated on the dried basis

**Containers and storage** Containers—Hermetic containers, and colored containers may be used. Storage—Light-resistant.
Cyclopentolate Hydrochloride

シクロペントラート塩酸塩

\[ \text{C}_{17}\text{H}_{25}\text{NO}_{3}\cdot\text{HCl} : 327.85 \]

2-(Dimethylamino)ethyl (2-hydroxycyclopentyl)phenylacetate monohydrochloride [5370-29-1]

Cyclopentolate Hydrochloride, when dried, contains not less than 98.5% of \( \text{C}_{17}\text{H}_{25}\text{NO}_{3}\cdot\text{HCl} \).

**Description**
Cyclopentolate Hydrochloride occurs as a white, crystalline powder. It is odorless, or has a characteristic odor.

It is very soluble in water, freely soluble in ethanol (95), in acetic acid (100) and in chloroform, sparingly soluble in acetic anhydride, and practically insoluble in diethyl ether.

**Identification (1)**
To 1 mL of a solution of Cyclopentolate Hydrochloride (1 in 100) add 1 mL of Reinecke salt TS: a light red precipitate is formed.

(2) Dissolve 0.2 g of Cyclopentolate Hydrochloride in 2 mL of water, add 2 mL of sodium hydroxide TS, and boil for 1 minute. After cooling, add 2 drops of nitric acid: a phenylacetic acid-like odor is perceptible.

(3) Determine the infrared absorption spectrum of Cyclopentolate Hydrochloride, previously dried, as directed in Method 1, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Cyclopentolate Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**pH** &lt;2.54\&gt; Dissolve 0.20 g of Cyclopentolate Hydrochloride in 20 mL of water: the pH of this solution is between 4.5 and 5.5.

**Melting point** &lt;2.60\&gt; 135 – 138°C

**Purity (1)**
Clarity and color of solution—Dissolve 1.0 g of Cyclopentolate Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals &lt;1.07\&gt;—Proceed with 1.0 g of Cyclopentolate Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.20 g of Cyclopentolate Hydrochloride in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add chloroform to make exactly 20 mL. Pipet 1 mL of this solution, add chloroform to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography &lt;2.03\&gt;. Spot 10 \( \mu \text{L} \) each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 2-propanol, \( n \)-butyl acetate, water and ammonia solution (28:100:60:23:17) to a distance of about 10 cm, and air-dry the plate. Spray evenly a solution of sulfuric acid in ethanol (99.5) (1 in 10) on the plate, and heat at 120°C for 30 minutes. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** &lt;2.44\&gt; Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** &lt;2.44\&gt; Not more than 0.05% (1 g).

**Assay**
Weigh accurately about 0.5 g of Cyclopentolate Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (4:1), and titrate &lt;2.50\&gt; with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue-green to yellow-green (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 32.79 mg of \( \text{C}_{17}\text{H}_{25}\text{NO}_{3}\cdot\text{HCl} \).

**Containers and storage**
Containers—Tight containers.

Cyclophosphamide Hydrate

シクロホスファミド水和物

\[ \text{C}_{17}\text{H}_{32}\text{Cl}_2\text{N}_2\text{O}_2\text{P} \cdot \text{H}_2\text{O} : 279.10 \]

\( \text{N},\text{N-Bis}(2\text{-chloroethyl})-3,4,5,6\text{-tetrahydro-2H-1,3,2-} \]

oxazaphosphorin-2-amine 2-oxide monohydrate [6055-19-2]

Cyclophosphamide Hydrate contains not less than 97.0% of \( \text{C}_{17}\text{H}_{32}\text{Cl}_2\text{N}_2\text{O}_2\text{P} \cdot \text{H}_2\text{O} \).

**Description**
Cyclophosphamide Hydrate occurs as white crystals or crystalline powder. It is odorless.

It is very soluble in acetic acid (100), freely soluble in ethanol (95), in acetic anhydride and in chloroform, and soluble in water and in diethyl ether.

Melting point: 45 – 53°C

**Identification (1)**
Dissolve 0.1 g of Cyclophosphamide Hydrate in 10 mL of water, and add 5 mL of silver nitrate TS: no precipitate is produced. Then boil this solution: a white precipitate is produced. Collect the precipitate, and wash with 0.1 mol/L perchloric acid VS until the color of the precipitate changes from violet through blue-green to yellow-green (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 32.79 mg of \( \text{C}_{17}\text{H}_{32}\text{Cl}_2\text{N}_2\text{O}_2\text{P} \cdot \text{H}_2\text{O} \).

**Residue on ignition** &lt;2.44\&gt; Not more than 0.05% (1 g).

**Assay**
Weigh accurately about 0.5 g of Cyclophosphamide Hydrate, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (4:1), and titrate &lt;2.50\&gt; with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue-green to yellow-green (indicator: 2 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 32.79 mg of \( \text{C}_{17}\text{H}_{32}\text{Cl}_2\text{N}_2\text{O}_2\text{P} \cdot \text{H}_2\text{O} \).

**Containers and storage**
Containers—Tight containers.
Cycloserine

Cycloserine contains not less than 950 \( \mu g \) (potency) and not more than 1020 \( \mu g \) (potency) per mg, calculated on the dried basis. The potency of Cycloserine is expressed as mass (potency) of cycloserine \( \text{C}_3\text{H}_6\text{N}_2\text{O}_2 \).

**Description** Cycloserine occurs as white to light yellowish white, crystals or crystalline powder.

It is soluble in water, and sparingly soluble in ethanol (95).

**Identification** Determine the infrared absorption spectrum of Cycloserine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \( \langle 2.25 \rangle \), and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Cycloserine RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** \( \langle 2.49 \rangle \) \([\alpha]_D^2 = +108\) – +114° (2.5 g calculated on the dried basis, 2 mol/L sodium hydroxide TS, 50 mL, 100 mm).

**pH** \( \langle 2.54 \rangle \) Dissolve 1.0 g of Cycloserine in 20 mL of water: the pH of the solution is between 5.0 and 7.4.

**Purity** (1) Heavy metals \( \langle 1.07 \rangle \) — Proceed with 1.0 g of Cycloserine according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Condensation products—Dissolve 20 mg of Cycloserine in sodium hydroxide TS to make exactly 50 mL, and determine the absorbance of this solution at 285 nm as directed under Ultraviolet-visible Spectrophotometry \( \langle 2.24 \rangle \): not more than 0.8.

**Loss on drying** \( \langle 2.41 \rangle \) Not more than 1.5% (0.5 g, reduced pressure, 60°C, 3 hours).

**Residue on ignition** \( \langle 2.44 \rangle \) Not more than 0.5% (1 g).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics \( \langle 4.02 \rangle \) according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium i in 1) Medium

(iii) Standard solutions—Weigh accurately an amount of Cycloserine RS, previously dried at 60°C for 3 hours under reduced pressure of not exceeding 0.67 kPa, equivalent to about 40 mg (potency), dissolve in water to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 24 hours. Take exactly a suitable amount of the standard stock solution before use, and add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 100 \( \mu g \) (potency) and 50 \( \mu g \) (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(4) Sample solutions—Weigh accurately an amount of Cycloserine equivalent to about 40 mg (potency), dissolve in water to make exactly 100 mL. Take exactly a suitable amount of this solution, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 100 \( \mu g \) (potency) and 50 \( \mu g \) (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and storage** Containers—Well-closed containers.

**Storage**—Not exceeding 30°C.

---

Cycloserine

C\(_3\)H\(_6\)N\(_2\)O\(_2\): 102.09

(4R)-4-Aminoisoxazolidin-3-one

[68-41-7]

Cycloserine occurs as white to light yellowish white, crystals or crystalline powder.

It is soluble in water, and sparingly soluble in ethanol (95).
Cyproheptadine Hydrochloride Hydrate

シプロヘプタジン塩酸塩水和物

Cyproheptadine Hydrochloride Hydrate, when dried, contains not less than 98.5% of cyproheptadine hydrochloride (C₂₁H₂₁N.HCl: 323.86).

Description Cyproheptadine Hydrochloride Hydrate occurs as a white to pale yellow, crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in methanol and in acetic acid (100), soluble in chloroform, sparingly soluble in ethanol (95), slightly soluble in water, and practically insoluble in diethyl ether.

Identification (1) Dissolve 0.1 g of Cyproheptadine Hydrochloride Hydrate in 10 mL of methanol, apply 1 drop of this solution on filter paper, air-dry, and examine under ultraviolet light (main wavelength: 254 nm): the solution shows a pale blue fluorescence.

(2) Weigh 0.1 g of Cyproheptadine Hydrochloride Hydrate, transfer to a separator, dissolve in 5 mL of chloroform, add 4 mL of water and 1 mL of sodium carbonate TS, and shake. Transfer the chloroform layer to another separator, and wash with 4 mL of water by shaking well. It dissolves in 1 mol/L hydrochloric acid TS.

(3) Determine the absorption spectrum of a solution of Cyproheptadine Hydrochloride Hydrate in ethanol (95) (1 in 100,000) as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) A saturated solution of Cyproheptadine Hydrochloride Hydrate responds to the Qualitative Tests (1.09) (2) for chloridate.
solution with 0.35 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.041%).

(3) Sulfate $<1.14>$—Dissolve 0.6 g of L-Cysteine in 30 mL of water and 3 mL of dilute hydrochloric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: To 0.35 mL of 0.005 mol/L sulfuric acid VS add 3 mL of dilute hydrochloric acid and water to make 50 mL. Prepare the test solution and the control solution with 4 mL of barium chloride TS, respectively (not more than 0.028%).

(4) Ammonium $<1.02>$—Prepare the test with 0.25 g of L-Cysteine, using the distillation under reduced pressure. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(5) Heavy metals $<1.07>$—Proceed with 1.0 g of L-Cysteine according to Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(6) Iron $<1.10>$—Prepare the test solution with 1.0 g of L-Cysteine according to Method 1, and perform the test using Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(7) Related substances—Dissolve 0.10 g of L-Cysteine in N-ethylmaleimide solution (1 in 50) to make exactly 10 mL, leave for 30 minutes, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 10 mL, pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution (1). Separately, dissolve 0.10 g of L-cysteine in 0.5 mol/L hydrochloric acid TS to make exactly 20 mL. Pipet 1 mL of this solution, add water to make 100 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography $<2.03>$. Spot 10 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water, and acetic acid (100) (3:1:1) to a distance of about 10 cm, and dry the plate for 30 minutes at 80°C. Spray the plate evenly with a solution of ninhydrin in a mixture of methanol and acetic acid (100) (97:3) (1 in 100), and then heat at 80°C for 10 minutes: the spot obtained from the sample solution corresponding to the spot obtained from the standard solution (2) is not more intense than the spot from the standard solution (2). Also, the spots other than the principal spot and the spots mentioned above from the sample solution are not more intense than the spot from the standard solution (1).

Loss on drying $<2.41>$ Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 3 hours).

Residue on ignition $<2.44>$ Not more than 0.1% (1 g).

Assay Weigh accurately about 0.2 g of L-Cysteine, place it in a stoppered flask, and dissolve in 20 mL of water. Dissolve 4 g of potassium iodide in this solution, immediately place in ice cold water, add 5 mL of dilute hydrochloric acid and exactly 25 mL of 0.05 mol/L iodine VS, leave in a dark place for 20 minutes, and then titrate $<2.50>$ an excess amount of iodine with 0.1 mol/L sodium thiosulfate VS (indicator: starch TS). Perform a blank determination using the same method.

Each mL of 0.05 mol/L iodine VS = 12.12 mg of C₅H₇NO₃S

Containers and storage Containers—Tight containers.

### L-Cysteine Hydrochloride Hydrate

L-システイン塩酸塩水和物

C₅H₇NO₃S.HCl·H₂O: 175.63
(2R)-2-Amino-3-sulfanylpropanoic acid monohydrochloride monohydrate

$[7048-04-6]$

L-Cysteine Hydrochloride Hydrate contains not less than 98.5% and not more than 101.0% of L-cysteine hydrochloride (C₅H₇NO₃S.HCl: 157.62), calculated on the dried basis.

**Description** L-Cysteine Hydrochloride Hydrate occurs as white crystals or crystalline powder. It has a characteristic odor and a strong acid taste.

It is very soluble in water, and soluble in ethanol (99.5). It dissolves in 6 mol/L hydrochloric acid TS.

**Identification** (1) Determine the infrared absorption spectrum of L-Cysteine Hydrochloride Hydrate as directed in the potassium chloride disk method under Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) To 10 mL of a solution of L-Cysteine Hydrochloride Hydrate (1 in 50) add 1 mL of hydrogen peroxide (30), heat on a water bath for 20 minutes, and cool: the solution responds to the Qualitative Tests $<1.09>$ (2) for chloride.

**Optical rotation** $<2.49>$ $\alpha_1^D$ +6.0° to +7.5° (2 g, calculated on the dried basis, 6 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**pH** $<2.54>$ The pH of a solution prepared by dissolving 1.0 g of L-Cysteine Hydrochloride Hydrate in 100 mL of water is between 1.3 and 2.3.

**Purity** (1) Clarity and color of solution—A solution obtained by dissolving 1.0 g of L-Cysteine Hydrochloride Hydrate in 10 mL of water is clear and colorless.

(2) Sulfate $<1.14>$—Dissolve 0.8 g of L-Cysteine Hydrochloride Hydrate in 30 mL of water and 3 mL of dilute hydrochloric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: To 0.35 mL of 0.005 mol/L sulfuric acid VS add 3 mL of dilute hydrochloric acid and water to make 50 mL. To both of the test solution and the control solution add 4 mL of barium chloride TS (not more than 0.021%).

(3) Ammonium $<1.02>$—Prepare the test with 0.25 g of L-Cysteine Hydrochloride Hydrate using the distillation under reduced pressure. Prepare the control solution with 5.0 mL of Standard Ammonium Solution (not more than 0.02%).

(4) Heavy metals $<1.07>$—Proceed with 1.0 g of L-Cysteine Hydrochloride Hydrate according to Method 4, and perform the test. Prepare the control solution with 1.0
mL of Standard Lead Solution (not more than 10 ppm).

(5) Iron <1.10>—Prepare the test solution with 1.0 g of L-Cysteine Hydrochloride Hydrate according to Method 1, and perform the test according to Method A. Prepare the control solution with 1.0 mL of Standard Iron Solution (not more than 10 ppm).

(6) Related substances—Dissolve 0.10 g of L-Cysteine Hydrochloride Hydrate in N-ethylmaleimide solution (1 in 50) to make 10 mL, allow to stand for 30 minutes, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 10 mL. Pipet 1 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-Layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Then develop with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and dry the plate at 80°C for 30 minutes. Spray evenly a solution of ninhydrin in a mixture of methanol and acetic acid (100) (97:3) (1 in 100) on the plate, and then heat at 80°C for 10 minutes: the spots other than the principal spot obtained with the sample solution is not more intense than the spot obtained with the standard solution.

Loss on drying <2.41> 8.5 – 12.0% (1 g, in vacuum, phosphorus (V) oxide, 20 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.25 g of L-Cysteine Hydrochloride Hydrate, place in a glass-stoppered flask, and dissolve in 20 mL of water. Dissolve 4 g of potassium iodide in this solution, soak immediately in ice cold water, add 5 mL of dilute hydrochloric acid and exactly 25 mL of 0.05 mol/L iodine VS, allow to stand for 20 minutes in a dark place, titrate <2.50> the excess of iodine with 0.1 mol/L sodium thiosulfate VS (indicator: starch TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.05 mol/L iodine VS = 15.76 mg of C₆H₇NO₃S.HCl

Containers and storage Containers—Tight containers.

Cytarabine

シタラビン

C₉H₁₅N₃O₅: 243.22
1-β-D-Arabinofuranosylcytosine
[147-94-4]

Cytarabine, when dried, contains not less than 98.5% and not more than 101.0% of C₉H₁₅N₃O₅.

Description Cytarabine occurs as white crystals or crystalline powder.

It is freely soluble in water, soluble in acetic acid (100), and very slightly soluble in ethanol (99.5). It dissolves in 0.1 mol/L hydrochloric acid TS.

Melting point: about 214°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Cytarabine in 0.1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Cytarabine as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D: +154 – +160° (after drying, 0.1 g, water, 10 mL, 100 mm).

pH <2.54> Dissolve 0.20 g of Cytarabine in 20 mL of water: the pH of this solution is between 6.5 and 8.0.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Cytarabine in 10 mL of water: the solution is clear and colorless.

(2) Chloride <1.07>—Perform the test with 1.0 g of Cytarabine. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.009%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Cytarabine according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 0.10 g of Cytarabine in 10 mL of water, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add water to make exactly 200 mL, and use this solution as the standard solution (1). Pipet 10 mL of the standard solution (1), add water to make exactly 25 mL and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with 1-butanol saturated with water to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (1), and the number of them which are more intense than the spot from the standard solution (2) is not more than two. Spray evenly acidic potassium permanganate TS on the plate: any spot other than the principal spot does not appear.

Loss on drying <2.41> Not more than 1.0% (1 g, in vacuum, silica gel, 4 hours).

Residue on ignition <2.44> Not more than 0.5% (1 g).

Assay Weigh accurately about 0.2 g of Cytarabine, previously dried, dissolve in 50 mL of acetic acid (100), and titrate <2.50> with 0.05 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any
necessary correction.
Each mL of 0.05 mol/L perchloric acid VS = 12.16 mg of C₈H₁₇N₃O₅

Containers and storage  Containers—Tight containers.

Danazol

Danazol, when dried, contains not less than 98.5% and not more than 101.0% of C₂₂H₂₇NO₂.

Description  Danazol occurs as a white to pale yellow crystalline powder.
It is soluble in acetone, sparingly soluble in ethanol (99.5), and practically insoluble in water.
Melting point: about 225°C (with decomposition).

Identification (1)  Determine the absorption spectrum of a solution of Danazol in ethanol (95%) (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Danazol RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2)  Determine the infrared absorption spectrum of Danazol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Danazol RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49>  [α]D: +8° to +11° (after drying, 0.25 g, ethanol (99.5), 50 mL, 100 mm).

Purity (1)  Chloride <1.07>—To 2.0 g of Danazol add 80 mL of water, shake well, and boil for 5 minutes. After cooling, add water to make 100 mL, and filter through a glass filter (G4). Discard the first 30 mL of the filtrate, take 40 mL of the subsequent filtrate, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.011%).

(2)  Heavy metals <1.07>—Proceed with 2.0 g of Danazol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3)  Related substances—Dissolve 0.20 g of Danazol in 4 mL of acetonitrile, and use this solution as the standard solution. Pipet 2 mL of the sample solution, add acetone to make exactly 200 mL. Pipet 4 mL of this solution, add acetone to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of cyclohexane and ethyl acetate (3:2) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot and the spot of the starting point obtained from the sample solution are not more intense than the spot from the standard solution.

(4)  Residual solvent—Being specified separately.

Loss on drying <2.41>  Not more than 0.2% (1 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

Residue on ignition <2.44>  Not more than 0.1% (1 g).

Assay  Weigh accurately about 25 mg each of Danazol and Danazol RS, previously dried, dissolve separately in ethanol (95) to make exactly 50 mL. Pipet 2 mL each of these solutions, add ethanol (95) to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A_S and A_T, at 285 nm.

Amount (mg) of danazol (C₂₂H₂₇NO₂) = M_S × A_T/A_S

M_S: Amount (mg) of Danazol RS

Containers and storage  Containers—Well-closed containers.

Storage—Light-resistant.

Dantrolene Sodium Hydrate

Dantrolene Sodium Hydrate contains not less than 98.0% of dantrolene sodium (C₁₄H₉N₄NaO₅: 336.23), calculated on the anhydrous basis.

Description  Dantrolene Sodium Hydrate occurs as a yellowish orange to deep orange, crystalline powder.
It is soluble in propylene glycol, sparingly soluble in methanol, slightly soluble in ethanol (95), very slightly soluble in water and in acetic acid (100), and practically insoluble in acetone, in tetrahydrofuran and in diethyl ether.

Identification (1)  Determine the absorption spectrum of a solution of Dantrolene Sodium Hydrate in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Refer-
ence Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dantrolene Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 0.1 g of Dantrolene Sodium Hydrate add 20 mL of water and 2 drops of acetic acid (100), shake well, and filter: the filtrate responds to the Qualitative Tests <1.09> (1) for sodium salt.

Purity (1) Alkalinity—To 0.7 g of Dantrolene Sodium Hydrate add 10 mL of water, shake well, and centrifuge or filter through a membrane filter. To 5 mL of the supernatant liquid or the filtrate add 45 mL of water, 3 drops of phenolphthalein TS and 0.10 mL of 0.1 mol/L hydrochloric acid liquid or the filtrate add 45 mL of water, 3 drops of phenolphthalein TS and 0.10 mL of 0.1 mol/L hydrochloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 33.62 mg of C_{14}H_{9}N_{3}NaO_{7}

Containers and storage Containers—Tight containers.

Daunorubicin Hydrochloride

ダウノルビシン塩酸塩

\[
\text{C}_{27}\text{H}_{29}\text{NO}_{10}\cdot\text{HCl} : 563.98
\]

(25.45)-2-Acetyl-4-(3-amino-2,3,6-trideoxy-a-L-lyxo-hexopyranosyloxy)-2,5,12-trihydroxy-7-methoxy-1,2,3,4-tetrahydrotetracene-6,11-dione monohydrochloride [23541-50-6]

Daunorubicin Hydrochloride is the hydrochloride of an anthracycline substance having antitumor activity produced by the growth of Streptomyces peucetius.

It contains not less than 940 μg (potency) and not more than 1050 μg (potency) per mg, calculated on the dried basis. The potency of Daunorubicin Hydrochloride is expressed as mass (potency) of daunorubicin hydrochloride (C_{27}H_{25}NO_{10}·HCl).

Description Daunorubicin Hydrochloride occurs as a red powder.

It is soluble in water and in methanol, and slightly soluble in ethanol (99.5).

Identification (1) Determine the absorption spectrum of a solution of Daunorubicin Hydrochloride in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Daunorubicin Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) A solution of Daunorubicin Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> (2) for chloride.

Optical rotation <2.49> \[ [\alpha]_{D}^{27} : +250 - +275 \] (15 mg calculated on the dried basis, methanol, 10 mL, 100 mm).

pH <2.54> Dissolve 0.15 g of Daunorubicin Hydrochloride in 30 mL of water: the pH of the solution is between 4.5 and 6.0.
Purity (1) Clarity and color of solution—Dissolve 20 mg of Daunorubicin Hydrochloride in 10 mL of water: the solution is clear and red.

(2) Heavy metals $<1.07$—Proceed with 1.0 g of Daunorubicin Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 10 mg of Daunorubicin Hydrochloride in 5 mL of methanol, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography $<2.07>$. Spot 10 μL of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, water and acetic acid (100:15:5:1:1) to a distance of about 10 cm, and air-dry the plate. Examine the spots with the naked eye: the spot other than the principal spot obtained from the sample solution is not more intense than the spot from the standard solution.

Loss on drying $<2.41>$ Not more than 7.5% (0.1 g, reduced pressure not exceeding 0.67 kPa, 60°C, 3 hours).

Assay Weigh accurately an amount of Daunorubicin Hydrochloride and Daunorubicin Hydrochloride RS, equivalent to about 20 mg (potency), dissolve each in a suitable amount of the mobile phase, add exactly 4 mL of the internal standard solution and the mobile phase to make 20 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 5 μL of each of the sample solution and standard solution as directed under Thin-layer Chromatography $<2.07>$. Spot 2.0 μL of the sample solution and standard solution on a plate of silica gel for liquid chromatography (10 mm, 3 hours). Perform the test with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of daunorubicin to that of the internal standard is not more than 2.0%.

Containers and storage Containers—Tight containers.

Deferoxamine Mesilate デフェロキサミンメシル酸塩

C$_{22}$H$_{32}$N$_{6}$O$_{9}$·CH$_{4}$O$_{3}$S: 656.79
N-$\{5$-(Acetylhydroxyamino)pentyl]-N’-$\{5$-[3-[5-aminopentyl]hydroxycarbamoyl]propanoylamino]pentyl]-N’$-$hydroxyxysuccinamide monomethanesulfonate [138-14-7]

Deferoxamine Mesilate contains not less than 98.0% and not more than 102.0% of C$_{22}$H$_{32}$N$_{6}$O$_{9}$·CH$_{4}$O$_{3}$S, calculated on the anhydrous basis.

Description Deferoxamine Mesilate occurs as a white to pale yellowish white, crystalline powder.

It is freely soluble in water, and practically insoluble in ethanol (99.5), in 2-propanol and in diethyl ether.

Melting point: about 147°C (with decomposition).

Identification (1) To 5 mL of a solution of Deferoxamine Mesilate (1 in 500) add 1 drop of iron (III) chloride TS: a deep red color develops.

(2) A 50 mg portion of Deferoxamine Mesilate responds to the Qualitative Tests $<1.092$ for mesilate.

(3) Determine the infrared absorption spectrum of Deferoxamine Mesilate as directed in the potassium bromide disk method under Infrared Spectrophotometry $<2.25>$, and compare the spectrum with the Reference Spectrum or the Spectrum of Deferoxamine Mesilate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

pH $<2.54>$ Dissolve 1.0 g of Deferoxamine Mesilate in 10 mL of water: the pH of this solution is between 3.5 and 5.5.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Deferoxamine Mesilate in 10 mL of water: the solution is clear and colorless to pale yellow.

(2) Chloride $<1.03>$—Perform the test with 1.0 g of Deferoxamine Mesilate. Prepare the control solution with 0.90 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.032%).

(3) Sulfate $<1.14>$—Perform the test with 0.6 g of Deferoxamine Mesilate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.040%).

(4) Heavy metals $<1.07>$—Proceed with 2.0 g of Deferoxamine Mesilate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).
(5) Arsenic <1,11>—Prepare the test solution with 1.0 g of Deferoxamine Mesilate according to Method 3, and perform the test. Use a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) (not more than 2 ppm).

(6) Related substances—Dissolve 50 mg of Deferoxamine Mesilate in 50 mL of the mobile phase, and use this solution as the standard solution. Perform the test with exactly 20 mL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of peaks other than deferoxamine obtained from the sample solution is not larger than the peak area of deferoxamine from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 230 nm).
Column: A stainless steel column 4 mm in inside diameter and 20 cm in length, packed with octadecysilanol silica gel for liquid chromatography (10 µm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 1.52 g of diammonium hydrogen phosphate, 0.37 g of disodium dihydrogen ethylenediamine tetraacetate dihydrate and 1.08 g of sodium 1-heptanesulfonate in 950 mL of water, and adjust the pH of this solution to 2.8 with phosphoric acid. To 800 mL of this solution add 100 mL of 2-propanol.
Flow rate: Adjust the flow rate so that the retention time of deferoxamine is about 15 minutes.
Time span of measurement: About two times as long as the retention time of deferoxamine, beginning after the solvent peak.
System suitability—
Test for required detection: To exactly 2 mL of the standard solution add the mobile phase to make exactly 100 mL. Confirm that the peak area of deferoxamine obtained from 20 µL of this solution is equivalent to 1.5 to 2.5% of that of deferoxamine obtained from 20 µL of the standard solution.

System performance: Dissolve 16 mg of Deferoxamine Mesilate and 4 mg of methyl parahydroxybenzoate in 50 mL of the mobile phase. When the procedure is run with 20 µL of this solution under the above operating conditions, deferoxamine and methyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 4.
System repeatability: When the test is repeated 6 times with 20 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of deferoxamine is not more than 3.0%.

Water <2.48>—Not more than 2.0% (0.2 g, volumetric titration, direct titration).
Residue on ignition <2.44>—Not more than 0.1% (1 g).

Assay Weigh accurately about 60 mg of Deferoxamine Mesilate and Deferoxamine Mesilate RS (previously determine the water <2.48>) in the same manner as Deferoxamine Mesilate), dissolve each in 20 mL of water, add exactly 10 mL of 0.05 mol/L sulfuric acid TS, and add water to make exactly 50 mL. Pipet 5 mL of each of these solutions, add exactly 5 mL of 0.05 mol/L ferric chloride TS and exactly 0.2 mL of iron (III) chloride TS, then add water to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with these solutions as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution prepared by adding 0.05 mol/L sulfuric acid TS to 0.2 mL of iron (III) chloride TS to make exactly 50 mL as the blank, and determine the absorbances, $A_T$ and $A_s$, of each solution from the sample solution and the standard solution at 340 nm.

Amount (mg) of C$_2_{11}$H$_{28}$N$_6$O$_8$.CH$_4$O$_3$S

$$M_s = M_s \times A_T/A_s$$

$M_s$: Amount (mg) of Deferoxamine Mesilate RS, calculated on the anhydrous basis
Containers and storage Containers—Tight containers.

**Dehydrocholic Acid**

デヒドロコール酸

C$_{24}$H$_{32}$O$_2$: 402.52
3,7,12-Trioxo-5β-cholan-24-oic acid [81-23-2]

Dehydrocholic Acid, when dried, contains not less than 98.5% of C$_{24}$H$_{32}$O$_5$.

Description Dehydrocholic Acid occurs as a white, crystalline powder. It is odorless, and has a bitter taste.
It is sparingly soluble in 1,4-dioxane, slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.
It dissolves in sodium hydroxide TS.

Identification (1) Dissolve 5 mg of Dehydrocholic Acid in 1 mL of sulfuric acid and 1 drop of formaldehyde solution, and allow to stand for 5 minutes. Add 5 mL of water to the solution: the solution shows a yellow color and a blue-green fluorescence.
(2) To 0.02 g of Dehydrocholic Acid add 1 mL of ethanol (95), shake, add 5 drops of 1,3-dinitrobenzene TS and 0.5 mL of a solution of sodium hydroxide (1 in 8), and allow to stand: a purple to red-purple color develops, and gradually changes to brown.

Optical rotation <2.49> [α]$D$: +29$^\circ$ to +32$^\circ$ (after drying, 0.2 g, 1,4-dioxane, 10 mL, 100 mm).

Melting point <2.60> 233 – 242°C
Purity (1) Odor—To 2.0 g of Dehydrocholic Acid add 100 mL of water, and boil for 2 minutes: the solution is odorless.
(2) Clarity and color of solution—To 0.10 g of Dehydrocholic Acid, previously powdered in a mortar, add 30 mL of
ethanol (95), and dissolve by shaking for 10 minutes: the solution is clear and colorless.

(3) Chloride <1.03>—To 2.0 g of Dehydrocholic Acid add 100 mL of water, shake for 5 minutes and filter, and use this filtrate as the sample solution. To 25 mL of the sample solution add 6 mL of dilute nitric acid, heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(4) Sulfate <1.14>—Add 1 mL of dilute hydrochloric acid to 25 mL of the sample solution obtained in (3), heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(5) Heavy metals <1.07>—Proceed with 1.0 g of Dehydrocholic Acid according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(6) Barium—To the solution obtained in (1) add 2 mL of hydrochloric acid, and boil for 2 minutes. Cool, filter, and wash with water until 100 mL of the filtrate is obtained. To 10 mL of the filtrate add 1 mL of dilute sulfuric acid: no turbidity is produced.

Loss on drying <2.41> Not more than 1.0% (1 g, 105°C, 2 hours).

Residue on ignition <2.44> Not more than 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Dehydrocholic Acid, previously dried, add 40 mL of neutralized ethanol and 20 mL of water, and dissolve by warming. Add 2 drops of phenolphthalein TS, titrate <2.5D> with 0.1 mol/L sodium hydroxide VS, adding 100 mL of freshly boiled and cooled water as the end point is approached, and continue the titration.

Each mL of 0.1 mol/L sodium hydroxide VS = 40.25 mg of C₂₄H₃₄O₅.

Containers and storage Containers—Well-closed containers.

Purified Dehydrocholic Acid

精製デヒドロコール酸

C₂₄H₃₄O₅: 402.52
3,7,12-Trioxo-5β-cholan-24-oic acid
[81-23-2]

Purified Dehydrocholic Acid, when dried, contains not less than 99.0% of C₂₄H₃₄O₅.

Description Purified Dehydrocholic Acid occurs as a white, crystalline powder. It is odorless, and has a bitter taste.

It is sparingly soluble in 1,4-dioxane, slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.

It dissolves in sodium hydroxide TS.

Identification (1) Dissolve 5 mg of Purified Dehydrocholic Acid in 1 mL of sulfuric acid and 1 drop of formaldehyde solution, and allow to stand for 5 minutes. Add 5 mL of water to the solution: the solution shows a yellow color and blue-green fluorescence.

(2) To 0.02 g of Purified Dehydrocholic Acid add 1 mL of ethanol (95), shake, add 5 drops of 1,3-dinitrobenzene TS and 0.5 mL of a solution of sodium hydroxide (1 in 8), and allow to stand: a purple to red-purple color develops, and gradually changes to brown.

Optical rotation <2.49> [α]₀^2θ: +29° to +32° (after drying, 0.2 g, 1,4-dioxane, 10 mL, 100 mm).

Melting point <2.60> 237 – 242°C

Purity (1) Odor—To 2.0 g of Purified Dehydrocholic Acid add 100 mL of water, and boil for 2 minutes: the solution is odorless.

(2) Clarity and color of solution—Dissolve 0.10 g of Purified Dehydrocholic Acid, previously powdered in a mortar, in 30 mL of ethanol (95) by shaking for 10 minutes: the solution is clear and colorless.

(3) Chloride <1.03>—To 2.0 g of Purified Dehydrocholic Acid add 100 mL of water, shake for 5 minutes and filter, and use this filtrate as the sample solution. To 25 mL of the sample solution add 6 mL of dilute nitric acid, heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(4) Sulfate <1.14>—Add 1 mL of dilute hydrochloric acid to 25 mL of the sample solution obtained in (3), heat in a water bath for 6 minutes, filter after cooling, and collect the clear filtrate. Wash the residue with 10 mL of water, combine the washings and the filtrate, dilute with water to 50 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).
mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(5) Heavy metals \(<1.07\)—Proceed with 1.0 g of Purified Dehydrocholic Acid according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(6) Barium—To the solution obtained in (1) add 2 mL of hydrochloric acid, and boil for 2 minutes, cool, filter, and wash the filter with water until 100 mL of the filtrate is obtained. To 10 mL of the filtrate add 1 mL of dilute sulfuric acid: no turbidity is produced.

Loss on drying \(<2.4\) Not more than 1.0% (1 g, 105°C, 2 hours).

Residue on ignition \(<2.44\) Not more than 0.2% (1 g).

Assay Weigh accurately about 0.5 g of Purified Dehydrocholic Acid, previously dried, add 40 mL of neutralized ethanol and 20 mL of water, and dissolve by warming. Add 2 drops of phenolphthalein TS, then titrate with 2.0 mL of Standard Lead Solution (not more than 20 ppm), adding 100 mL of freshly boiled and cooled water as the end point is approached, and continue the titration.

Each mL of 0.1 mol/L sodium hydroxide VS = 40.25 mg of C₂₄H₃₄O₅.

Containers and storage Containers—Well-closed containers.

Dehydrocholic Acid Injection

Dehydrocholate Sodium Injection

デヒドロコール酸注射液

Dehydrocholic Acid Injection is an aqueous solution for injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of dehydrocholic acid (C₂₄H₃₄O₅: 402.52).

Method of preparation Dissolve Purified Dehydrocholic Acid in a solution of Sodium Hydroxide, and prepare as directed under Injections.

Description Dehydrocholic Acid Injection is a clear, colorless to light yellow liquid, and has a bitter taste. pH: 9 - 11

Identification Transfer a volume of Dehydrocholic Acid Injection, equivalent to 0.1 g of Purified Dehydrocholic Acid according to the labeled amount, to a separator, and add 10 mL of water and 1 mL of dilute hydrochloric acid: a white precipitate is produced. Extract the mixture with three 15-mL portions of chloroform, combine all the chloroform extracts, evaporate the chloroform on a water bath, and dry the residue at 105°C for 1 hour: the residue so obtained melts \(>2.50\)° between 235°C and 242°C.

Purity Heavy metals \(<1.07\)—Evaporate a volume of Dehydrocholic Acid Injection, equivalent to 1.0 g of Purified Dehydrocholic Acid according to the labeled amount, on a water bath to dryness. Proceed with the residue according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

Bacterial endotoxins \(<0.07\) Less than 0.30 EU/mg.

Extractable volume \(<6.05\) It meets the requirement.

Foreign insoluble matter \(<6.06\) Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter \(<6.07\) It meets the requirement.

Sterility \(<4.06\) Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Transfer an exactly measured volume of Dehydrocholic Acid Injection, equivalent to about 0.5 g of dehydrocholic acid (C₂₄H₃₄O₅), to a 100-mL separator, and add, if necessary, water to make 25 mL. Add 2 mL of hydrochloric acid, and extract with 25-mL, 20-mL and 15-mL portions of chloroform successively. Combine the chloroform extracts, wash with cold water until the washings become negative to acid, and evaporate the chloroform on a water bath. Dissolve the residue in 40 mL of neutralized ethanol and 20 mL of water by warming. Add 2 drops of phenolphthalein TS to this solution, titrate \(>2.50\)° with 0.1 mol/L sodium hydroxide VS, adding 100 mL of freshly boiled and cooled water as the end point is approached, and continue the titration.

Each mL of 0.1 mol/L sodium hydroxide VS = 40.25 mg of C₂₄H₃₄O₅.

Containers and storage Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant.

Demethylchlortetracycline Hydrochloride

デメチルクロルテトラサイクリン塩酸塩

Demethylchlortetracycline Hydrochloride is the hydrochloride of a tetracycline substance having antibacterial activity produced by the growth of the mutant of Streptomyces aureofaciens.

It contains not less than 900 μg (potency) and not more than 1010 μg (potency) per mg, calculated on the dried basis. The potency of Demethylchlortetracycline Hydrochloride is expressed as mass
(potency) of demethylchlortetracycline hydrochloride (C_{21}H_{27}ClN_{5}O_{8}HCl).

**Description** Demethylchlortetracycline Hydrochloride occurs as a yellow crystalline powder.

It is soluble in water, and slightly soluble in ethanol (99.5).

**Identification** (1) Dissolve 40 mg of Demethylchlortetra
cycline Hydrochloride in 250 mL of water. To 10 mL of this solution add 85 mL of water and 5 mL of a solution of sodium hydroxide (1 in 5). Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectro-
photometry <2.25>, and compare the absorbance with the Refer-
ence Spectrum or the spectrum of a solution of Demethyl-
chlortetracycline Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Demethylchlortetracycline Hydrochloride as directed in the potassium chloride disk method under Infrared Spectro-
photometry <2.25>, and compare the spectrum with the Refer-
ence Spectrum or the spectrum of Demethylchlortetracycline Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Demethylchlortetracycline Hydrochloride (1 in 100) responds to the Qualitative Tests <1.07> (2) for chloride.

**Optical rotation** <2.44> \([\alpha]_D^{20} = -248 - 263^\circ\) (0.25 g calculated on the dried basis, 0.1 mol/L hydrochloric acid TS, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Demethylchlortetracycline Hydrochloride in 100 mL of water: the pH of the solution is between 2.0 and 3.0.

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Demethylchlortetracycline Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Demethylchlortetracycline Hydrochloride according to Method 4, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 25 mg of Demethylchlortetracycline Hydrochloride in 50 mL of 0.01 mol/L hydrochloric acid TS, and use this solution as the sample solution. Pipet 5 mL of the sample solution, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area obtained from the chromatograms of these solutions by the automatic integration method: each peak area other than demethylchlortetracycline obtained from the sample solution is not larger than 1.2 times that of demethylchlortetracycline from the standard solution, and the sum of the areas of the peaks other than demethylchlortetracycline is not larger than 2 times the peak area of demethylchlortetracycline from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

**Time span of measurement:** About 2 times as long as the retention time of demethylchlortetracycline beginning after the solvent peak.

**System suitability**—

Test for required detectability: Measure exactly 10 mL of the standard solution, add 0.01 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the solution for system suitability test. Pipet 5 mL of the solution for system suitability test, and add 0.01 mol/L hydrochloric acid TS to make exactly 50 mL. Confirm that the peak area of demethylchlortetracycline obtained from 20 μL of this solution is equivalent to 7 to 13% of that from 20 μL of the solution for system suitability test.

System performance: Proceed as directed in the system suitability in the Assay.

**System repeatability:** When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of demethylchlortetracycline is not more than 1.0%.

**Loss on drying** <2.41> Not more than 2.0% (1 g, in vacuum, 60°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.2% (1 g).

**Assay** Weigh accurately an amount of Demethylchlortetra
cycline Hydrochloride and Demethylchlortetracycline Hydro-
chloride RS, equivalent to about 25 mg (potency), dis-
solve each in 0.01 mol/L hydrochloric acid TS to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A_T and A_S, of demethylchlortetracycline.

Amount [μg (potency)] of C_{21}H_{27}ClN_{5}O_{8}HCl = M_S × A_T/A_S × 1000

M_S: Amount [mg (potency)] of Demethylchlortetracycline Hydrochloride RS

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wave-
length: 254 nm).

Column: A stainless steel column 4.1 mm in inside diam-
eter and 25 cm in length, packed with styrene-divinylbenzene copolymer for liquid chromatography (10 μm in particle di-
meter).

Column temperature: A constant temperature of about 60°C.

Mobile phase: Dissolve 3.5 g of dipotassium hydrogen phosphate, 1.5 g of tetrabutylammonium hydrogensulfate and 0.4 g of disodium dihydrogen ethylenediamine tetaa-
cetate dihydrate in 300 mL of water, and adjust the pH to 8.5 with sodium hydroxide TS. To this solution add 75.0 g of i-
butanol and water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of demethylchlortetracycline is about 8 minutes.

**System suitability**—

System performance: Heat 10 mL of the standard solution on a water bath for 60 minutes. When the procedure is run with 20 μL of this solution so obtained under the above operating conditions, 4-epidemethylchlortetracycline and demethylchlortetracycline are eluted in this order with the resolution between these peaks being not less than 3. The
relative retention time of 4-epidemethylchlortetracycline with respect to demethylchlortetracycline is about 0.7.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of demethylchlortetracycline is not more than 1.0%.

Containers and storage Containers—Tight containers. Storage—Light-resistant.

Deslanoside
デスラノシド

Deslanoside, when dried, contains not less than 90.0% and not more than 102.0% of C_{47}H_{74}O_{19}.

Description Deslanoside occurs as colorless or white crystals or a white, crystalline powder. It is odorless.

It is freely soluble in anhydrous pyridine, sparingly soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.

It is hygroscopic.

Identification Transfer 1 mg of Deslanoside to a small test tube about 10 mm in inside diameter, dissolve in 1 mL of a solution of iron (III) chloride hexahydrate in acetic acid (100) (1 in 1000), and underlay gently with 1 mL of sulfuric acid: at the zone of contact of two liquids a brown ring is produced, and the color of the upper layer near to the contact zone changes gradually to blue through purple, and the entire acetic acid layer shows a blue-green color through a deep blue color.

Purity (1) Clarity and color of solution—Dissolve 20 mg of Deslanoside in 10 mL of ethanol (95) and 3 mL of water by warming, cool, and dilute to 100 mL with water: the solution is clear and colorless.

Related substances—Dissolve 10 mg of Deslanoside in exactly 5 mL of methanol, and use this solution as the sample solution. Dissolve 1.0 mg of Deslanoside RS in exactly 5 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.93). Spot 20 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, methanol and water (84:15:1) to a distance of about 13 cm, and air-dry the plate. Spray evenly dilute sulfuric acid on the plate, and heat the plate at 110°C for 10 minutes: the spots other than the principal spot obtained from the sample solution are not larger and not more intense than the spot from the standard solution.

Optical rotation (2.49) [α]_D^20: +6.5 to +8.5° (after drying, 0.5 g, anhydrous pyridine, 25 mL, 100 mm).

Loss on drying (2.41) Not more than 8.0% (0.5 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

Residue on ignition (2.44) Not more than 0.5% (0.1 g).

Assay Dissolve about 12 mg each of Deslanoside and Deslanoside RS, previously dried and accurately weighed, in 20 mL each of methanol, add water to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Pipet 5 mL each of these solutions, transfer to light-resistant, 25-mL volumetric flasks, shake well with 5 mL each of 2,4,6-trinitrophenol TS and 0.5 mL each of a solution of sodium hydroxide (1 in 10), add dilute methanol (1 in 4) to make 25 mL, and allow to stand at a temperature between 18°C and 22°C for 25 minutes. Determine the absorbances, A_1 and A_2, of the subsequent solutions of the sample solution and the standard solution, respectively, at 485 nm as directed under Ultraviolet-visible Spectrophotometry (2.22), using a solution prepared with 5 mL of dilute methanol (1 in 5) in the same manner as the blank.

Amount (mg) of C_{47}H_{74}O_{19} = M_s × A_1/A_2

M_s: Amount (mg) of Deslanoside RS

Containers and storage Containers—Tight containers.

Deslanoside Injection
デスラノシド注射液

Deslanoside Injection is an aqueous solution for injection.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of deslanoside (C_{47}H_{74}O_{19}: 943.08).

Method of preparation Dissolve Deslanoside in 10 vol% ethanol and prepare as directed under Injections. It may contain Glycerin. It may be prepared with a suitable amount of Ethanol and Water for Injection or Sterile Water for Injection in Containers.

Description Deslanoside Injection is a clear and colorless liquid.

pH: 5.0 – 7.0
Identification (1) Place a volume of Deslanoside Injection, equivalent to 2 mg of Deslanoside according to the labeled amount, in a separator, add sodium chloride in the ratio of 0.2 g to each mL of this solution, and extract with three 10-mL portions of chloroform. Combine the chloroform extracts, mix uniformly, pipet 15 mL of this solution, and evaporate the chloroform under reduced pressure. Proceed with the residue as directed in the Identification under Deslanoside.

(2) Evaporate the remaining chloroform extract obtained in (1) under reduced pressure, dissolve the residue in 5 mL of methanol, and use this solution as the sample solution. Separately, dissolve 1 mg of Deslanoside RS in 5 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \( \text{(2.03)} \). Spot 20 \( \mu \)L each of these solutions on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, methanol and water (84:15:1) to a distance of about 13 cm, and air-dry the plate. Spray evenly dilute sulfuric acid upon the plate, and heat the plate at 110 °C for 10 minutes: the spots from the sample solution and standard solution show a black color and have the same \( R_f \) value.

Bacterial endotoxins \(< 4.0 \) It meets the requirement.

Extractable volume \(< 6.0 \) It meets the requirement.

Foreign insoluble matter \(< 6.06 \) Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter \(< 6.07 \) It meets the requirement.

Sterility \(< 4.06 \) Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Measure exactly a volume of Deslanoside Injection, equivalent to about 3 mg of deslanoside (C47H74O19). Add 5 mL of methanol and water to make 25 mL. Use this solution as the sample solution, and proceed as directed in the Assay under Deslanoside.

\[
\text{Amount (mg) of deslanoside (C}_{47}\text{H}_{74}\text{O}_{19}) = M_s \times A_1/A_2 \times 1/4
\]

\( M_s \): Amount (mg) of Deslanoside RS

Containers and storage Containers—Hermetic containers. Storage—Light-resistant.

### Dexamethasone

#### デキサメタゾン

**C_{22}H_{29}FO_5**: 392.46
9-Fluoro-11β,17β,21-trihydroxy-16α-methylpregna-1,4-diene-3,20-dione [50-02-2]

Dexamethasone, when dried, contains not less than 97.0% and not more than 102.0% of C_{22}H_{29}FO_5.

**Description** Dexamethasone occurs as white to pale yellow crystals or crystalline powder. It is sparingly soluble in methanol, in ethanol (95) and in acetone, slightly soluble in acetonitrile, and practically insoluble in water.

Melting point: about 245°C (with decomposition).

**Identification (1)** Proceed with 10 mg of Dexamethasone as directed under Oxygen Flask Combustion Method \( \text{(1.09)} \), using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid: the solution obtained responds to the Qualitative Tests \( \text{(1.09)} \) for fluoride.

(2) Dissolve 1 mg of Dexamethasone in 10 mL of ethanol (95). Mix 2 mL of the solution with 10 mL of phenylhydrazine hydrochloride TS, heat in a water bath at 60°C for 20 minutes, and cool the solution. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry \( \text{(2.24)} \), using as the blank the solution prepared with 2 mL of ethanol (95) in the same manner as the former solution, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Dexamethasone RS prepared in the same manner as the former solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Dexamethasone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry \( \text{(2.25)} \), and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Dexamethasone RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Dexamethasone and Dexamethasone RS in acetone, respectively, then evaporate the acetone to dryness, and repeat the test on the residues.

**Optical rotation** \( \text{<2.49\text{°}} \) \([\alpha]_D^2\text{°} + 86 - +94°\) (after drying, 0.1 g, methanol, 10 mL, 100 mm).

**Purity (1)** Heavy metals \(< 1.07\)—Proceed with 1.0 g of Dexamethasone according to Method 2, and perform the test. Prepare the control solution with 3.0 mL of Standard Lead Solution (not more than 30 ppm).

(2) Related substances—Dissolve 0.18 g of Dexamethasone in 100 mL of acetonitrile. To 33 mL of this solution add a solution, prepared by dissolving 1.32 g of ammonium for-
Dextran 40

Dextran 40 is a product obtained by partial decomposition of polysaccharide, which is produced by fermentation of sucrose with *Leuconostoc mesenteroides* van Tieghem (*Lactobacillaceae*), and the average molecular mass is about 40,000.

When dried, it contains not less than 98.0% and not more than 102.0% of dextran 40.

**Description**

Dextran 40 occurs as a white, amorphous powder. It is odorless and tasteless. It is practically insoluble in ethanol (95%) and in diethyl ether. It dissolves gradually in water. It is hygroscopic.

**Identification**

To 1 mL of a solution of Dextran 40 (1 in 3000) add 2 mL of anthrone TS: a blue-green color develops and turns gradually dark blue-green. Then to this solution add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100): the solution does not change in color.

**pH**

Dissolve 1.0 g of Dextran 40 in 10 mL of water: the pH of this solution is between 5.0 and 7.0.

**Purity**

1. Clarity and color of solution—Dissolve 1.0 g of Dextran 40 in 10 mL of water by warming: the solution is clear and colorless.

2. Chloride

**Operating conditions**

Detector: An ultraviolet absorption photometer (wave-length: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and acetonitrile (2:1).

Flow rate: Adjust the flow rate so that the retention time of dexamethasone is about 6 minutes.

**System suitability**

System performance—When the procedure is run with 10 μL of the standard solution under the above operating conditions, dexamethasone and the internal standard are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of dexamethasone to that of the internal standard is not more than 1.0%.

**Containers and storage**

Containers—Tight containers.

Storage—Light-resistant.

---

**System suitability**

Test for required detectability: To exactly 1 mL of the standard solution add the mobile phase to make exactly 10 mL. Confirm that the peak area of dexamethasone obtained with 10 μL of this solution is equivalent to 8 to 12% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of dexamethasone are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of dexamethasone is not more than 1.0%.

**Loss on drying**

Not more than 0.5% (0.2 g, 105°C, 3 hours).

**Residue on ignition**

Not more than 0.1% (0.2 g, platinum crucible).

**Assay**

Dissolve about 10 mg each of Dexamethasone and Dexamethasone RS, previously dried and accurately weighed, in 70 mL each of diluted methanol (1 in 2), add exactly 5 mL each of the internal standard solution, then add diluted methanol (1 in 2) to make 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with 10 μL of each of these solutions as directed under Liquid Chromatography according to the following conditions, and calculate the ratios, Qt and Qs, of the peak area of dexamethasone to that of the internal standard, respectively.

Amount (mg) of C22H29FO5 = M5 × Qt/Qs

**Internal standard solution**—A solution of propyl parahydroxybenzoate in diluted methanol (1 in 2) (1 in 1000).

**Operating conditions**

Detector: An ultraviolet absorption photometer (wave-length: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and acetonitrile (2:1).

Flow rate: Adjust the flow rate so that the retention time of dexamethasone is about 6 minutes.

**Containers and storage**

Containers—Tight containers.

Storage—Light-resistant.

2. Chloride
Bacterial endotoxins

Dissolve 10.0 g of Dextran 40 in isotonic sodium chloride solution to make 100 mL, sterilize, and use this solution as the sample solution. Inject 1.0 mL of the sample solution on 3 occasions at intervals of 2 days into the peritoneal cavity of each of 4 well-nourished, healthy guinea pigs weighing 250 to 300 g. Inject 0.10 mL of horse serum into the peritoneal cavity of each of 4 guinea pigs of another group as a control. Inject 0.20 mL of the sample solution intravenously to each of 2 guinea pigs of the first group 14 days after the first intraperitoneal injection and into each of the remaining 2 guinea pigs 21 days after the injection, and inject 0.20 mL of horse serum intravenously in the same manner into each guinea pig of the second group. Observe the signs of respiratory distress, collapse or death of the animals for 30 minutes after each intravenous injection and 24 hours later: the animals of the first group exhibit no signs mentioned above.

All the animals of the second group exhibit symptoms of respiratory distress or collapse and not less than 3 animals are killed.

Assay Weigh accurately about 3 g of Dextran 40, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh exactly 0.450 g of glucose, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the control solution. Pipet 5 mL each of the sample solution and the control solution, and add water to make exactly 50 mL, respectively. Pipet 5 mL each of these solutions, add 5 mL of alkaline copper TS, exactly measured, and heat for 15 minutes in a water bath. After cooling, add 1 mL of a solution of potassium iodine (1 in 40) and 1.5 mL of dilute sulfuric acid, and titrate with 0.005 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS).

The tinctur consumed for the sample solution is not less than that for the control solution.

**Loss on drying** Less than 5.0% (1 g, 105°C, 6 hours).

**Residue on ignition** Less than 0.1% (1 g).

**Bacterial endotoxins** Less than 2.5 EU/g.

**Viscosity** (1) Dextran 40—Weigh accurately 0.2 to 0.5 g of Dextran 40, previously dried, dissolve in water to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and with water as directed in Method 1 at 25°C: the intrinsic viscosity is between 0.16 and 0.19.

(2) High-molecular fraction—Weigh accurately about 6 g of Dextran 40, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 7% to 10% of the precipitate (usually 80 to 90 mL) at 25 ± 1°C with stirring. Dissolve the precipitate at 35°C in a water bath with occasional shaking, and allow to stand for more than 15 hours at 25 ± 1°C. Remove the supernatant liquid by decantation, and heat the precipitate of the lower layer to dryness on a water bath. Dry the residue, and determine the intrinsic viscosity of the dried substance as directed in (1): the value is not more than 0.27.

(3) Low-molecular fraction—Weigh accurately about 6 g of Dextran 40, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 90% to 93% of the precipitate (usually 115 to 135 mL) at 25 ± 1°C with stirring, centrifuge at 25°C, and evaporate the supernatant liquid to dryness on a water bath. Dry the residue, and determine the intrinsic viscosity of the dried substance as directed in (1): the value is not less than 0.09.

**Antigenicity** Dissolve 10.0 g of Dextran 40 in isotonic sodium chloride solution to make 100 mL, sterilize, and use this solution as the sample solution. Invert 1.0 mL of the sample solution on 3 occasions at intervals of 2 days into the peritoneal cavity of each of 4 well-nourished, healthy guinea pigs weighing 250 to 300 g. Inject 0.10 mL of horse serum into the peritoneal cavity of each of 4 guinea pigs of another group as a control. Inject 0.20 mL of the sample solution intravenously to each of 2 guinea pigs of the first group 14 days after the first intraperitoneal injection and into each of the remaining 2 guinea pigs 21 days after the injection, and inject 0.20 mL of horse serum intravenously in the same manner into each guinea pig of the second group. Observe the signs of respiratory distress, collapse or death of the animals for 30 minutes after each intravenous injection and 24 hours later: the animals of the first group exhibit no signs mentioned above.

All the animals of the second group exhibit symptoms of respiratory distress or collapse and not less than 3 animals are killed.

**Dextran 40 Injection**

**Dextran 40 注射液**

Dextran 40 Injection is an aqueous solution for injection.

It contains not less than 9.5 w/v% and not more than 10.5 w/v% of dextran 40.

To make 100 mL

Prepare as directed under Injections, with the above ingredients.

No preservative is added.

**Description** Dextran 40 Injection is a clear and colorless liquid. It is slightly viscous.

**Identification** (1) Dilute 1 mL of Dextran 40 Injection with water to 200 mL, and to 1 mL of the diluted solution add 2 mL of anthrone TS: a blue-green color develops and turns gradually dark blue-green. Add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100) to this solution: the solution does not change in color.

(2) Dextran 40 Injection responds to the Qualitative Tests <1.06> for sodium salt and for chloride.

**pH** 4.5 – 7.0

**Bacterial endotoxins** Less than 0.50 EU/mL.
Extractable volume <6.05> It meets the requirement.

Viscosity <2.53> Measure exactly 2 to 5 mL of Dextran 40 Injection, add isotonic sodium chloride solution to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and with isotonic sodium chloride solution as directed in Method 1 at 25°C: the intrinsic viscosity is between 0.16 and 0.19. Calculate the concentration of the sample solution (g/100 mL) as directed in the Assay.

Assay To exactly 30 mL of Dextran 40 Injection add water to make exactly 50 mL, and use this solution as the sample solution. Determine the optical rotation \( \alpha_o \) with the sample solution as directed under Optical Rotation Determination <2.49> in a 100-mL cell at 20 ± 1°C.

Amount (mg) of dextran 40 in 100 mL of Dextran 40 Injection

\[ \alpha_o \times 846.0 \]

Containers and storage Containers—Hermetic containers. Plastic containers for aqueous injections may be used.

Storage—Avoid exposure to undue fluctuations in temperature.

Dextran 70 デキストラン 70

Dextran 70 is a product obtained by partial decomposition of polysaccharide, which is produced by fermentation of sucrose with *Leuconostoc mesenteroides* van Tieghem (*Lactobacillaceae*), and the average molecular mass is about 70,000.

When dried, it contains not less than 98.0% and not more than 102.0% of dextran 70.

Description Dextran 70 occurs as a white, amorphous powder. It is odorless and tasteless.

It is practically insoluble in ethanol (95) and in diethyl ether.

It dissolves gradually in water.

It is hygroscopic.

Identification To 1 mL of a solution of Dextran 70 (1 in 3000) add 2 mL of anthrone TS: a blue-green color develops and turns gradually dark blue-green. Then to this solution add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100): the solution does not change in color.

pH <2.54> Dissolve 3.0 g of Dextran 70 in 50 mL of water: the pH of this solution is between 5.0 and 7.0.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Dextran 70 in 10 mL of water with warming: the solution is clear and colorless.

(2) Chloride <1.07>—With 2.0 g of Dextran 70, perform the test. Prepare the control solution with 1.0 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.018%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Dextran 70 according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.5 g of Dextran 70 according to Method 1, and perform the test (not more than 1.3 ppm).

(5) Nitrogen—Weigh accurately about 2 g of Dextran 70, previously dried, perform the test as directed under Nitrogen Determination <1.007>, where 10 mL of sulfuric acid is used for decomposition, and 45 mL of a solution of sodium hydroxide (2 in 5) is added: the amount of nitrogen (N: 14.007) is not more than 0.101%.

(6) Reducing substances—Weigh exactly 3.00 g of Dextran 70, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh exactly 0.300 g of glucose, previously dried, dissolve in water to make exactly 500 mL, and use this solution as the control solution. Pipet 5 mL each of the sample solution and the control solution, and add water to make exactly 50 mL, respectively. Pipet 5 mL of these diluted solutions, add exactly 5 mL of alkaline copper TS, and heat for 15 minutes in a water bath. After cooling, add 1 mL of a solution of potassium iodide (1 in 40) and 1.5 mL of dilute sulfuric acid, and titrate <2.50> with 0.005 mol/L sodium thiosulfate VS (indicator: 2 mL of starch TS).

The titrant consumed for the sample solution is not less than that for the control solution.

Loss on drying <2.41> Not more than 5.0% (1 g, 105°C, 6 hours).

Residue on ignition <2.44> Not more than 0.10% (1 g).

Viscosity <2.53> (1) Dextran 70—Weigh accurately 0.2 to 0.5 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and with water as directed in Method 1 at 25°C: the intrinsic viscosity is between 0.21 and 0.26.

(2) High-molecular fraction—Weigh accurately about 6 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 7% to 10% of the precipitate (usually, 75 to 85 mL) at 25 ± 1°C with stirring. Dissolve the precipitate in a water bath at 35°C with occasional shaking, and allow to stand for more than 15 hours at 25 ± 1°C. Remove the supernatant liquid by decantation, and heat the precipitate of the lower layer on a water bath to dryness. Dry the residue, and determine the intrinsic viscosity of the dried residue as directed in (1): the value is not more than 0.35.

(3) Low-molecular fraction—Weigh accurately about 6 g of Dextran 70, previously dried, dissolve in water to make exactly 100 mL, and transfer to a flask. Add slowly enough methanol to get 90% to 93% of the precipitate (usually 110 to 130 mL) at 25 ± 1°C with stirring, centrifuge at 25°C, and evaporate the supernatant liquid to dryness on a water bath. Dry the residue, and determine the intrinsic viscosity of the dried residue as directed in (1): the value is not less than 0.10.

Antigenicity Dissolve 6.0 g of Dextran 70 in isotonic sodium chloride solution to make 100 mL, sterilize, and use this solution as the sample solution. Inject 1.0 mL of the sample solution on 3 occasions at intervals of 2 days into the peritoneal cavity of each of 4 well-nourished, healthy guinea pigs weighing 250 to 300 g. Separately, inject 0.10 mL of horse serum into the peritoneal cavity of each of 4 guinea pigs of another group as a control. Inject 0.20 mL of the sample solution intravenously to each of 2 guinea pigs of the
first group 14 days after the first intraperitoneal injection and into each of the remaining 2 guinea pigs 21 days after the injection, and inject 0.20 mL of horse serum intravenously in the same manner into each guinea pig of the second group. Observe the signs of respiratory distress, collapse or death of the animals for 30 minutes after each intravenous injection and 24 hours later: the animals of the first group exhibit not signs.

All the animals of the second group exhibit symptoms of respiratory distress or collapse and not less than 3 animals are killed.

**Pyrogen**

Dissolve 6.0 g of Dextran 70 in isotonic sodium chloride solution to make 100 mL, and perform the test: this solution meets the requirement.

**Assay**

Weigh accurately about 3 g of Dextran 70, previously dried, dissolve in water to make exactly 50 mL, and use this solution as the sample solution. Determine the optical rotation $\alpha_20$ as directed under Optical Rotation Determination $<2.49>$ in a 100–mL cell at 20 $\pm$ 1°C.

Amount (mg) of dextran $70 \times \alpha_20 = 253.8$

**Containers and storage**

Containers—Tight containers.

**Dextran Sulfate Sodium Sulfur 5**

デキストラン硫酸エステルナトリウム イオウ5

Dextran Sulfate Sodium Sulfur 5 is a sodium salt of sulfate ester obtained by sulfation of partial decomposition products of dextran, which is produced by fermentation of sucrose with Lactobacillaceae Van Tieghem (Leuconostoc mesenteroides).

**Description**

Dextran Sulfate Sodium Sulfur 5 occurs as a white to light yellowish white powder. It is odorless, and has a saline taste.

It is freely soluble in water and practically insoluble in ethanol (95) and in diethyl ether.

It is hygroscopic.

**Identification**

1. To 10 mL of a solution of toluidine blue (1 in 100,000) add 0.05 mL of a solution of Dextran Sulfate Sodium Sulfur 5 (3 in 50) dropwise: a color of the solution changes from blue to red-purple.

2. To 1 mL of a solution of Dextran Sulfate Sodium Sulfur 5 (1 in 1500) add 2 mL of anthrone TS: a blue-green color develops, which turns dark blue-green gradually. Then, add 1 mL of dilute sulfuric acid (1 in 2) or 1 mL of acetic acid (100) to this solution: the solution remains dark blue-green.

3. A solution of Dextran Sulfate Sodium Sulfur 5 (1 in 100) responds to the Qualitative Tests $<1.09>$ (1) for sodium salt.

**Optical rotation**

$<2.49>$ $[\alpha]_20^D = [135.0 + 155.0]$° (calculated on the dried basis, 1.5 g, water, 25 mL, 100 mm).

**pH**

$<2.54>$ Dissolve 1.0 g of Dextran Sulfate Sodium Sulfur 5 in 20 mL of water: the pH of this solution is between 5.5 and 7.5.

**Purity**

Clarity of solution—Dissolve 2.5 g of Dextran Sulfate Sodium Sulfur 5 in 50 mL of water: the solution is clear. And, determine the absorbance of the solution at 420 nm as directed under Ultraviolet-visible Spectrophotometry $<2.2>C$: not more than 0.090.

2. Chloride $<1.03>$—Perform the test with 0.10 g of Dextran Sulfate Sodium Sulfur 5. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.106%).

3. Sulfate $<1.14>$—Dissolve 0.10 g of Dextran Sulfate Sodium Sulfur 5 in 6 mL of water, add 0.6 mL of barium chloride TS, and heat in a water bath for 4 minutes. After cooling, add 1 mL of dilute hydrochloric acid and water to make 50 mL, allow to stand for 10 minutes, and observe: the turbidity of the solution is not more intense than that of the control solution. Prepare the control solution as follows: to 0.50 mL of 0.005 mol/L sulfuric acid VS add 6 mL of water, and proceed in the same manner (not more than 0.240%).

4. Heavy metals $<1.07>$—Proceed with 1.0 g of Dextran Sulfate Sodium Sulfur 5 according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

5. Arsenic $<1.11>$—Prepare the test solution with 1.0 g of Dextran Sulfate Sodium Sulfur 5 according to Method 3, and perform the test (not more than 2 ppm).

**Sulfur content**

Weigh accurately about 1.0 g of Dextran Sulfate Sodium Sulfur 5, dissolve in 5 mL of water, add 1.5 mL of hydrochloric acid, and heat in a water bath for 1 hour. After cooling, add water to make exactly 100 mL, and use this solution as the sample solution. To exactly 10 mL of the sample solution add exactly 20 mL of 0.02 mol/L barium chloride VS, add 5 mL of methanol, and heat in a water bath for 30 minutes. After cooling, neutralize with sodium hydroxide TS, and add 70 mL of water, 10 mL of a solution of zinc disodium ethylenediamine tetraacetate tetrahydrate (1 in 20), 3 mL of ammonium chloride TS and 7 mL of strong ammonium water, and titrate $<2.50>$ with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red to light blue (indicator: 5 drops of eriochrome black T TS). Perform a blank determination. Amount of sulfur (S: 32.07), calculated on the dried basis, is between 3.0 and 6.0%.

Each mL of 0.02 mol/L barium chloride VS $= 0.6414$ mg of S

**Loss on drying**

$<2.41>$ Not more than 10.0% (0.5 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

**Viscosity**

Weigh accurately about 1.5 g of Dextran Sulfate Sodium Sulfur 5, calculated on the dried basis, dissolve in a solution of sodium chloride (29 in 500) to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and a solution of sodium chloride (29 in 500) at 25 $\pm$ 0.02°C as directed: the intrinsic viscosity is between 0.030 and 0.040.

**Containers and storage**

Containers—Tight containers.
Dextran Sulfate Sodium Sulfur 18
デキストラン硫酸エステルナトリウム イオウ 18

Dextran Sulfate Sodium Sulfur 18 is a sodium salt of sulfate ester obtained by sulfation of partial decomposition products of dextran, which is produced by fermentation of sucrose with *Leuconostoc mesenteroides* Van Tieghem (Lactobacillaceae).

**Description** Dextran Sulfate Sodium Sulfur 18 occurs as a white to yellowish white powder. It is odorless, and has a saline taste.

It is freely soluble in water and practically insoluble in ethanol (95) and in diethyl ether.

It is hygroscopic.

**Identification** (1) To 10 mL of a solution of toluidine blue (1 in 100,000) add 0.05 mL of a solution of Dextran Sulfate Sodium Sulfur 18 (3 in 50) dropwise: a color of the solution changes from blue to red-purple.

(2) To 1 mL of a solution of Dextran Sulfate Sodium Sulfur 18 (1 in 1500) add 2 mL of anthrone TS: a blue-green color develops, which turns dark blue-green gradually. Then, add 1 mL of diluted sulfuric acid (1 in 2) or 1 mL of acetic acid (100) to this solution: the solution remains dark blue-green.

(3) A solution of Dextran Sulfate Sodium Sulfur 18 (1 in 100) responds to the Qualitative Tests <1.09> (1) for sodium salt.

**Optical rotation** <2.49> [α]D

Optical rotation <2.49> [α]D: + 90.0 – + 110.0° (calculated on the dried basis, 1.5 g, water, 25 mL, 100 mm).

**pH** <2.54> Dissolve 1.0 g of Dextran Sulfate Sodium Sulfur 18 in 20 mL of water: the pH of this solution is between 5.5 and 7.5.

**Purity** (1) Chloride <1.03>—Perform the test with 0.10 g of Dextran Sulfate Sodium Sulfur 18. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.106%).

(2) Sulfate <1.14>—Dissolve 0.10 g of Dextran Sulfate Sodium Sulfur 18 in 6 mL of water, add 0.6 mL of barium chloride TS, and heat in a water bath for 4 minutes. After cooling, add 1 mL of dilute hydrochloric acid and water to make 50 mL, allow to stand for 10 minutes, and observe: the turbidity of the solution is not more intense than that of the control solution. Prepare the control solution as follows: to 1.0 mL of 0.005 mol/L sulfuric acid VS add 6 mL of water, and proceed in the same manner (not more than 0.480%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Dextran Sulfate Sodium Sulfur 18 according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Dextran Sulfate Sodium Sulfur 18 according to Method 3, and perform the test (not more than 2 ppm).

**Sulfur content** Weigh accurately about 0.5 g of Dextran Sulfate Sodium Sulfur 18, dissolve in 5 mL of water, add 1.5 mL of hydrochloric acid, and heat in a water bath for 1 hour. After cooling, add water to make exactly 100 mL, and use this solution as the sample solution. To exactly 10 mL of the sample solution add exactly 20 mL of 0.02 mol/L barium chloride VS, add 5 mL of methanol, and heat in a water bath for 30 minutes. After cooling, neutralize with sodium hydroxide TS, and add 70 mL of water, 10 mL of a solution of zinc disodium ethylenediamine tetraacetate tetrahydrate (1 in 20), 3 mL of ammonium chloride TS and 7 mL of strong ammonium water, and titrate <2.56> with 0.02 mol/L disodium dihydrogen ethylenediamine tetraacetate VS until the color of the solution changes from red to light blue (indicator: 5 drops of eriochrome black T TS). Perform a blank determination. Amount of sulfur (S: 32.07), calculated on the dried basis, is between 15.0 and 20.0%.

Each mL of 0.02 mol/L barium chloride VS

\[
= 0.6414 \text{ mg of S}
\]

**Loss on drying** <2.41> Not more than 10.0% (0.5 g, in vacuum, phosphorus (V) oxide, 60°C, 4 hours).

**Viscosity** <2.55> Weigh accurately about 1.5 g of Dextran Sulfate Sodium Sulfur 18, calculated on the dried basis, dissolve in a solution of sodium chloride (29 in 500) to make exactly 100 mL, and use this solution as the sample solution. Perform the test with the sample solution and a solution of sodium chloride (29 in 500) at 25 ± 0.02°C as directed: the intrinsic viscosity is between 0.020 and 0.032.

**Containers and storage** Containers—Tight containers.

Dextrin
デキストリン

**Description** Dextrin occurs as a white or light yellow, amorphous powder or granules. It has a slight, characteristic odor and a sweet taste. It does not irritate the tongue. Dextrin is freely soluble in boiling water, soluble in water, and practically insoluble in ethanol (95) and in diethyl ether.

**Identification** To 0.1 g of Dextrin add 100 mL of water, shake, and filter if necessary. To 5 mL of the filtrate add 1 drop of iodine TS: a light red-brown or light red-purple color develops.

**Purity** (1) Clarity and color of solution—Take 2.0 g of Dextrin in a Nessler tube, add 40 mL of water, dissolve by heating, cool, and add water to make 50 mL: the solution is colorless or light yellow. It is clear, and even if turbid, the turbidity is not more than that of the following control solution.

Control solution: To 1.0 mL of 0.005 mol/L sulfuric acid VS add 1 mL of dilute hydrochloric acid, 46 mL of water and 2 mL of barium chloride TS, allow to stand for 10 minutes, and shake before use.

(2) Acidity—To 1.0 g of Dextrin add 5 mL of water, dissolve by heating, cool, and add 1 drop of phenolphthalein TS and 0.50 mL of 0.1 mol/L sodium hydroxide VS: a red color develops.

(3) Chloride <1.03>—To 2.0 g of Dextrin add 80 mL of water, dissolve by heating, cool, add water to make 100 mL, and filter. Take 40 mL of the filtrate, and add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more
than 0.013%)

4. Sulfate: To 45 mL of the filtrate obtained in (3) add 1 mL of dilute hydrochloric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.019%).

5. Oxalate: To 1.0 g of Dextrin add 20 mL of water, dissolve by heating, cool, add 1 mL of acetic acid (31), and filter. To 5 mL of the filtrate add 5 drops of calcium chloride TS: no turbidity is produced immediately.

6. Calcium: To a 5-mL portion of the filtrate obtained in (5) add 5 drops of ammonium oxalate TS: no turbidity is produced immediately.

7. Heavy metals: Proceed with 0.5 g of Dextrin according to Method 2, and perform the test. Prepare the control solution with 2.5 mL of Standard Lead Solution (not more than 50 ppm).

Loss on drying: Not more than 10% (0.5 g, 105°C, 4 hours).

Residue on ignition: Not more than 0.5% (0.5 g).

Containers and storage: Containers—Well-closed containers.

Dextromethorphan Hydrobromide Hydrate

Dextromethorphan Hydrobromide Hydrate contains not less than 98.0% of dextromethorphan hydrobromide \(C_{18}H_{25}NO.HBr.H_2O\): 370.32, calculated on the anhydrous basis.

Description: Dextromethorphan Hydrobromide Hydrate occurs as white crystals or crystalline powder.

It is very soluble in methanol, freely soluble in ethanol (95) and in acetic acid (100), and sparingly soluble in water.

Melting point: about 126°C (Insert the capillary tube into the bath preheated to 116°C, and continue the heating so that the temperature rises at a rate of about 3°C per minute.)

Identification (1) Determine the absorption spectrum of a solution of Dextromethorphan Hydrobromide Hydrate (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry \(2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dext-romethorphan Hydrobromide Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 50 mL of a solution of Dextromethorphan Hydrobromide Hydrate (1 in 100) add 2 drops of phenolphalein TS and sodium hydroxide TS until a red color develops. Add 50 mL of chloroform, shake, and add 5 mL of dilute nitric acid to 40 mL of the water layer. This solution responds to the Qualitative Tests \(1.09\) for bromide.

Optical rotation: \(2.49\) [α]D: +26 – +30° (0.34 g, calculated on the anhydrous basis, water, 20 mL, 100 mm).

pH: Dissolve 1.0 g of Dextromethorphan Hydrobromide Hydrate in 100 mL of water: the pH of this solution is between 5.2 and 6.5.

Purity: Clarity and color of solution: Dissolve 0.20 g of Dextromethorphan Hydrobromide Hydrate in 20 mL of water: the solution is clear and colorless.

(2) N,N-dimethylaniline: To 0.50 g of Dextromethorphan Hydrobromide Hydrate add 20 mL of water, and dissolve by heating on a water bath. After cooling, add 2 mL of dilute acetic acid, 1 mL of sodium nitrite TS and water to make 25 mL: the solution has no more color than the following control solution.

Control solution: Dissolve 0.10 g of N,N-dimethylaniline in 400 mL of water by warming on a water bath, cool, and add water to make 500 mL. Pipet 5 mL of this solution, and add water to make 200 mL. To 1.0 mL of this solution add 2 mL of dilute acetic acid, 1 mL of sodium nitrite TS and water to make 25 mL.

(3) Heavy metals: Proceed with 1.0 g of Dextromethorphan Hydrobromide Hydrate according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Phenolic compounds: Dissolve 5 mg of Dextromethorphan Hydrobromide Hydrate in 1 drop of dilute hydrochloric acid and 1 mL of water, add 2 drops of iron (III) chloride TS and 2 drops of potassium hexacyanoferrate (III) TS, shake, and allow to stand for 15 minutes: no blue-green color develops.

(5) Related substances: Dissolve 0.25 g of Dextromethorphan Hydrobromide Hydrate in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(2.03\). Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of toluene, ethyl acetate, methanol, dichloromethane and 13.5 mol/L ammonia TS (55:20:13:10:2) to a distance of about 15 cm, and air-dry the plate. Spray evenly bismuth potassium iodide TS on the plate, and then spray evenly hydrogen peroxide TS on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Water: \(2.48\) 4.0 – 5.5% (0.2 g, volumetric titration, back titration).
Residue on ignition  
Not more than 0.1% (1 g).

Assay  
Weigh accurately about 0.5 g of Dextromethorphan Hydrobromide Hydrate, dissolve in 10 mL of acetic acid (100) and add 40 mL of acetic anhydride. Titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS
= 35.23 mg of C_{18}H_{25}NO.HBr

Containers and storage  Containers—Well-closed containers.

Diastase  
ジアスターゼ

Diastase is an enzyme drug mainly prepared from malt.

It has amylolytic activity.

It contains not less than 440 starch saccharifying activity units per g.

It is usually diluted with suitable diluents.

Description  Diastase occurs as a light yellow to light brown powder.

It is hygroscopic.

Purity  Rancidity—Diastase has no unpleasant or rancid odor, and has no unpleasant or rancid taste.

Loss on drying  Not more than 4.0% (1 g, 105°C, 5 hours).

Assay  
(i) Substrate solution—Use potato starch TS for amylolytic activity test.

(ii) Sample solution—Weigh accurately about 0.1 g of Diastase, and dissolve in water to make exactly 100 mL.

Containers and storage  Containers—Well-closed containers.

Diastase and Sodium Bicarbonate Powder  
ジアスターゼ・重曹散

Prepare before use as directed under Powders, with the above ingredients.

Description  Diastase and Sodium Bicarbonate Powder occurs as a slightly brownish, light yellow powder. It has a characteristic odor and a bitter taste.

Containers and storage  Containers—Well-closed containers.

Diazepam  
ジアゼパム

![Diazepam structure](image)

C_{16}H_{13}ClN_{2}O: 284.74
7-Chloro-1-methyl-5-phenyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one
[439-14-5]

Diazepam, when dried, contains not less than 98.0% of C_{16}H_{13}ClN_{2}O.

Description  Diazepam occurs as a white to light yellow, crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in acetone, soluble in acetic anhydride and in ethanol (95), sparingly soluble in diethyl ether, slightly soluble in ethanol (99.5), and practically insoluble in water.

Identification  
(1) Dissolve 10 mg of Diazepam in 3 mL of sulfuric acid, and observe under ultraviolet light (main wavelength: 365 nm): the solution shows a yellow-green fluorescence.

(2) Dissolve 2 mg of Diazepam in 200 mL of a solution of sulfuric acid in ethanol (99.5) (3 in 1000). Determine the absorption spectrum of the solution as directed under Ultra-
Diazepam Tablets

Diazepam Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of diazepam (C16H13ClN2O: 284.74).

Method of preparation—Prepare as directed under Tablets, with Diazepam.

Identification—To a portion of the powdered Diazepam Tablets, equivalent to 50 mg of Diazepam according to the labeled amount, add 50 mL of acetone, shake, and filter. Evaporate 1 mL of the filtrate on a water bath to dryness, and dissolve the residue with 100 mL of a solution of sulfuric acid in ethanol (99.5) (3 in 1000). Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24): it exhibits maxima between 240 nm and 244 nm, between 283 nm and 287 nm, and between 360 nm and 370 nm.

Uniformity of dosage units—Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Diazepam Tablets add 5 mL of water, and disintegrate the tablet by shaking. Then add 30 mL of methanol, shake for 10 minutes, add methanol to make exactly 50 mL, and centrifuge. Pipet 0.5 mL of the supernatant liquid, equivalent to 0.4 mg of diazepam (C16H13ClN2O), add exactly 5 mL of the internal standard solution, then add methanol to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of diazepam for assay, previously dried at 105°C for 2 hours, and disolve in methanol to make exactly 100 mL. Pipet 2 mL of this solution, add exactly 5 mL of the internal standard solution and add methanol to make 20 mL, and use this solution as the standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography (2.07) under the following conditions, and calculate the ratios, Qs and Qo, of the peak area of diazepam to that of the internal standard.

Amount (mg) of diazepam (C16H13ClN2O) = M3 × Qo/Qs × 1/V

M3: Amount (mg) of diazepam for assay

Internal standard solution—A solution of ethyl parahydroxybenzoate in methanol (1 in 25,000).

Operating conditions—

Proceed as directed in the operating conditions in the Assay.

System suitability—

System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, the internal standard and diazepam are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of diazepam to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Tight containers. Storage—Light-resistant.

System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, the internal standard and diazepam are eluted in this order with the resolution between these peaks being not less than 6.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of diazepam to that of the internal standard is not more than 1.0%.
Dissolution  Being specified separately.

Assay  Weigh accurately the mass of not less than 20 Diazepam Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 50 mg of diazepam (C₁₅H₁₃ClN₂O₂), add 10 mL of water, shake, then add 60 mL of methanol, shake for 10 minutes, add methanol to make exactly 100 mL, and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, then add methanol to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of diazepam for assay, previously dried at 105°C for 2 hours, and dissolve in 10 mL of water and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution and add methanol to make 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.03> according to the following conditions, and calculate the ratios, QT and QS, of the peak area of diazepam to that of the internal standard.

\[
M_0: \text{Amount (mg) of diazepam for assay} \quad M_S: \text{Amount (mg) of diazepam for assay} \\

\]

Dibekacin Sulfate  ジベカシン硫酸塩

C₁₅H₁₃N₂O₆·xH₂SO₄
3-Amino-3-deoxy-α-D-glucopyranosyl-(1→6)-[2,6-diamino-2,3,4,6-tetrahydroxy-α-D-erythro-hexopyranosyl-(1→4)]-2-deoxy-D-streptamine sulfate [58580-55-5]

Dibekacin Sulfate is the sulfate of a derivative of bekamycin.

It contains not less than 640 μg (potency) and not more than 740 μg (potency) per mg, calculated on the dried basis. The potency of Dibekacin Sulfate is expressed as mass (potency) of dibekacin (C₁₅H₁₃N₂O₄: 451.52).

Description  Dibekacin Sulfate occurs as a white to yellowish white powder.

It is very soluble in water, and practically insoluble in ethanol (99.5).

Identification (1)  Dissolve 20 mg each of Dibekacin Sulfate and Dibekacin Sulfate RS in 1 mL of water, and use these solutions as the sample solution and the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ammonia solution (28) and methanol (1:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 0.2% ninhydrin-water saturated 1-butanol TS, and heat at 100°C for 10 minutes: the principal spots obtained from the sample solution and standard solution show a purple-brown color and the same Rf value.

(2)  To 5 mL of a solution of Dibekacin Sulfate (1 in 50) add 1 drop of barium chloride TS: a white precipitate is produced.

Optical rotation <2.49>  [α]D²⁰: +96° to +106° (0.25 g calculated on the dried basis, water, 25 mL, 100 mm).

pH <2.54>  The pH of a solution obtained by dissolving 1.0 g of Dibekacin Sulfate in 20 mL of water is between 6.0 and 8.0.

Purity (1)  Clarity and color of solution—Dissolve 1.0 g of Dibekacin Sulfate in 10 mL of water: the solution is clear and colorless to pale yellow.

(2)  Heavy metals <1.07>—Proceed with 1.0 g of Dibekacin Sulfate in 10 mL of water: the results obtained are not more than 6.0 mg per g.
Dibekacin Sulfate Ophthalmic Solution

ジベカシン硫酸塩点眼液

Dibekacin Sulfate Ophthalmic Solution is an aqueous ophthalmic preparations.

It contains not less than 90.0% and not more than 110.0% of the labeled potency of dibekacin (C18H37N5O8: 451.52).

Method of preparation Prepare as directed under Ophthalmic Preparations, with Dibekacin Sulfate.

Description Dibekacin Sulfate Ophthalmic Solution is a clear, colorless liquid.

Identification To a volume of Dibekacin Sulfate Ophthalmic Solution add water so that each mL contains about 2.5 mg (potency) of Dibekacin Sulfate according to the labeled amount, and use this solution as the sample solution. Separately, dissolve an amount of Dibekacin Sulfate RS, equivalent to 5 mg (potency), in 2 mL of water, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.02. Spot 10 μL of each solution and standard solution on a plate of silica gel for thin-layer chromatography. Proceed as directed in the Identification (1) under Dibekacin Sulfate.

Method of preparation

Prepare the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics 4.02 according to the following conditions.

(i) Test organism—Bacillus subtilis ATCC 6633
(ii) Culture medium—Use the medium i in 1) Medium for test organism [5] under (1) Agar media for seed and base layer having pH 6.5 to 6.6 after sterilization.
(iii) Standard solutions—Weigh accurately an amount of Dibekacin Sulfate RS, previously dried, equivalent to about 20 mg (potency), dissolve in diluted phosphate buffer solution, pH 6.0 (1 in 2) to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5 to 15°C and use within 30 days. Take exactly a suitable amount of this standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0, to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.
(iv) Sample solutions—Weigh accurately an amount of Dibekacin Sulfate, equivalent to about 20 mg (potency), and dissolve in water to make exactly 50 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0, to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage Containers—Tight containers.

Dibucaine Hydrochloride

ジブカイン塩酸塩

C20H29N3O2·HCl: 379.92
2-Butyloxy-N-(2-diethylaminoethyl)-4-quinolinecarboxamide monohydrochloride [61-12-1]

Dibucaine Hydrochloride, when dried, contains not less than 98.0% of C20H29N3O2·HCl.

Description Dibucaine Hydrochloride occurs as white crystals or crystalline powder.

It is very soluble in water, in ethanol (95) and in acetic acid (100), freely soluble in acetic anhydride, and practically insoluble in diethyl ether.

It is hygroscopic.

Identification (1) Determine the absorption spectrum of a solution of Dibucaine Hydrochloride in 1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dibucaine Hydrochloride, previously dried, as directed in
Diclofenac Sodium

**Chloride**, previously dried, dissolve in 50 mL of water: the pH of this solution is between 5.0 and 6.0.

**Melting point** 2.60 95 – 100°C. Charge Dibucaine Hydrochloride into a capillary tube for melting point determination, and dry in vacuum over phosphorus (V) oxide at 80°C for 5 hours. Seal immediately the open end of the tube, and determine the melting point.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Dibucaine Hydrochloride in 20 mL of water: the solution is clear and colorless. Determine the absorbance of this solution at 430 nm as directed under Ultraviolet-visible Spectrophotometry <2.25>, using water as the blank: it is not more than 0.056%.

(2) Sulfate <1.14>—Perform the test with 0.3 g of Dibucaine Hydrochloride. Prepare the control solution with 0.35 mL of 0.005 mol/L sulfuric acid VS (not more than 0.056%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Dibucaine Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 0.20 g of Dibucaine Hydrochloride in 5 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 20 mL, then pipet 2 mL of this solution, add ethanol (95) to make exactly 20 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.67>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, phosphorus (V) oxide, 80°C (7:3), and air-dry the plate. Examine under ultraviolet light: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 2.0% (1 g, in vacuum, phosphorus (V) oxide, 80°C, 5 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Dibucaine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 19.00 mg of C₁₄H₁₀Cl₂NNaO₂.HCl

**Containers and storage** Containers—Tight containers.

Diclofenac Sodium

ジクロフェナクナトリウム

C₁₄H₁₀Cl₂NNaO₂: 318.13

Monosodium 2-(2,6-dichlorophenylamino)phenylacetate [15307-79-6]

Diclofenac Sodium, when dried, contains not less than 98.5% of C₁₄H₁₀Cl₂NNaO₂.

**Description** Diclofenac Sodium occurs as white to pale yellowish white crystals or crystalline powder.

It is freely soluble in water and in acetic acid (100), and practically insoluble in diethyl ether.

It is hygroscopic.

**Identification** (1) To 1 mL of a solution of Diclofenac Sodium in methanol (1 in 250) add 1 mL of nitric acid: a dark red color develops.

(2) Perform the test with 5 mg of Diclofenac Sodium as directed under Flame Coloration Test <1.04> (2): a light green color appears.

(3) Determine the infrared absorption spectrum of Diclofenac Sodium, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(4) A solution of Diclofenac Sodium (1 in 100) responds to the Qualitative Tests <1.09> for sodium salt.

**Purity** (1) Heavy metals <1.07>—Proceed with 2.0 g of Diclofenac Sodium according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Diclofenac Sodium according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.05 g of Diclofenac Sodium in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of these solutions as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the area of each peak other than the peak of diclofenac obtained from the sample solution is not larger than the peak area of the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diame-
and the absorbent cotton with 15 mL of chloroform, com-
moistened with chloroform. Wash the tip of the separator
with two 20-mL portions of chloroform, and filter the ex-
precipitate formed with 50 mL of chloroform. Extract again
for 3 hours. Add 2 mL of dilute hydrochloric acid, and extract the
previously dried, dissolve with 40 mL of water in a separa-

3 hours).

Loss on drying Not more than 0.5% (1 g, 105°C, 3 hours).

Assay Weigh accurately about 0.5 g of Diclofenac Sodium,
previously dried, dissolve with 40 mL of water in a separa-
tor, add 2 mL of dilute hydrochloric acid, and extract the precipitate formed with 50 mL of chloroform. Extract again
with two 20-mL portions of chloroform, and filter the ex-
tract each time through a pledget of absorbent cotton mois-
tened with chloroform. Wash the tip of the separator and the absorbent cotton with 15 mL of chloroform, com-
bine the washing with the extracts, add 10 mL of a solution of
1 mol/L hydrochloric acid TS in ethanol (99.5) (1 in 100),
and titrate with 0.1 mol/L potassium hydroxide-ethanol
VS from the first equivalent point to the second equivalent point (potentiometric titration).

Each mL of 0.1 mol/L potassium hydroxide-ethanol VS
= 31.81 mg of C5H6Cl2N2O4S2.

Containers and storage Containers—Tight containers.

Diclofenamide

Dichlorphenamide

ジクロフェナミド

C6H6Cl2N2O4S2: 305.16
4,5-Dichlorobenzene-1,3-disulfonamide
[120-97-8]

Diclofenamide, when dried, contains not less than
98.0% of C6H6Cl2N2O4S2.

Description Diclofenamide occurs as a white, crystalline
powder. It is very soluble in N,N-dimethylformamide, soluble in
water (95), and very slightly soluble in ethanol.

Diclofenamide dissolves in sodium hydroxide TS.

Identification (1) Dissolve 0.01 g of Diclofenamide in 100
mL of 0.01 mol/L sodium hydroxide TS. To 10 mL of the
solution add 0.1 mL of hydrochloric acid. Determine the
absorption spectrum of the solution as directed under Ultra-
violet-visible Spectrophotometry <2.24>, and compare the
spectrum with the Reference Spectrum or the spectrum of a
solution of Diclofenamide RS prepared in the same manner
as the sample solution: both spectra exhibit similar intensi-
ties of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dico-
fenamide, as directed in the potassium bromide disk method
under Infrared Spectrophotometry <2.25>, and compare the
spectrum with the Reference Spectrum or the spectrum of Diclofenamide RS: both spectra exhibit similar intensities of
absorption at the same wave numbers.

Melting point 229–237°C

Purity (1) Chloride 1.07—Dissolve 0.10 g of Diclofen-
amide in 10 mL of N,N-dimethylformamide, and add 6 mL
of dilute nitric acid and water to make 50 mL. Perform the
test using this solution as the test solution. Prepare the con-

mL of 0.01 mol/L hydro-
chloric acid VS add 10 mL of N,N-dimethylformamide,
6 mL of dilute nitric acid and water to make 50 mL (not more than 0.160%).

(2) Selenium—To 0.10 g of Diclofenamide add 0.5 mL
of a mixture of perchloric acid and sulfuric acid (1:1) and 2
mL of nitric acid, and heat on a water bath until no more
brown gas evolves and the solution becomes to be a light yel-
low clear solution. After cooling, add 4 mL of nitric acid to
this solution, then add water to make exactly 50 mL, and use
this solution as the sample solution. Separately, pipet 3 mL
of Standard Selenium Solution, add 0.5 mL of a mixture of
perchloric acid and sulfuric acid (1:1) and 6 mL of nitric
acid, then add water to make exactly 50 mL, and use this
solution as the standard solution. Perform the test with the
sample solution and standard solution as directed under Atomic Absorption Spectrophotometry <2.23> according to
the following conditions, and determine constant absor-
bances, A7 and A5, obtained on a recorder after rapid in-
creasing of the absorption: A7 is smaller than A5 (not more
than 30 ppm).

Perform the test by using a hydride generating system and
a thermal absorption cell. Lamp: A selenium hollow cathode lamp.
Wavelength: 196.0 nm.
Temperature of sample atomizer: When an electric fur-
nace is used, about 1000°C.
Carrier gas: Nitrogen or Argon.

(3) Heavy metals 1.07—Procede with 2.0 g of Diclo-
fenamide according to Method 2, and perform the test. Pre-
pare the control solution with 2.0 mL of Standard Lead Sol-
lution (not more than 10 ppm).

(4) Related substances—Dissolve 0.10 g of Diclofen-
amide in 50 mL of the mobile phase, and use this solution as
the sample solution. Pipet 2 mL of the sample solution, add
the mobile phase to make exactly 100 mL, and use this solu-

tion as the standard solution. Perform the test with exactly 10 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01>\) according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than the peak of diclofenamide obtained from the sample solution is not larger than the peak area of diclofenamide from the standard solution.

**Operating conditions**—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 5 times as long as the retention time of diclofenamide.

**System suitability**—

Test for required detection: To exactly 5 mL of the standard solution add the mobile phase to make exactly 100 mL. Confirm that the peak area of diclofenamide obtained from 10 \( \mu L \) of this solution is equivalent to 3.5 to 6.5% of that from 10 \( \mu L \) of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 10 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of diclofenamide is not more than 1.0%.

**Loss on drying** \(<2.41>\) Not more than 1.0% (1 g, in vacuum at a pressure not exceeding 0.67 kPa, 100°C, 5 hours).

**Residue on ignition** \(<2.44>\) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 50 mg each of Diclofenamide and Diclofenamide RS, previously dried, and dissolve each in 30 mL of the mobile phase. To each add exactly 10 mL of the internal standard solution and the mobile phase to make 50 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 10 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01>\) according to the following conditions, and calculate the ratios, \( Q_T \) and \( Q_S \), of the peak area of diclofenamide to that of the internal standard, respectively.

\[
\text{Amount (mg) of } C_6H_6Cl_2N_2O_4S_2 = M_S \times \frac{Q_T}{Q_S}
\]

\( M_S \): Amount (mg) of Diclofenamide RS

**Internal standard solution**—A solution of butyl parahydroxy benzoate in the mobile phase (3 in 5000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4 mm in inside diameter and 30 cm in length, packed with octadeccylsilanized silica gel for liquid chromatography (10 \( \mu m \) in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of sodium phosphate TS and acetonitrile (1:1).

Flow rate: Adjust the flow rate so that the retention time of diclofenamide is about 7 minutes.

**System suitability**—

System performance: When the procedure is run with 10 \( \mu L \) of the standard solution under the above operating conditions, diclofenamide and the internal standard are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 6 times with 10 \( \mu L \) of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of diclofenamide to that of the internal standard is not more than 1.0%.

**Diclofenamide Tablets**

**Dichlorphenamide Tablets**

**ジクロフェナミド錠**

Diclofenamide Tablets contain not less than 92.0% and not more than 108.0% of the labeled amount of diclofenamide (\( C_6H_6Cl_2N_2O_4S_2 \): 305.16).

**Method of preparation** Prepare as directed under Tablets, with Diclofenamide.

**Identification** To a quantity of powdered Diclofenamide Tablets, equivalent to 0.2 g of Diclofenamide according to the labeled amount, add 20 mL of methanol, shake, and filter. Evaporate the filtrate on a water bath to dryness, and dissolve 0.01 g of the residue in 100 mL of 0.01 mol/L sodium hydroxide TS. To 10 mL of this solution add 0.1 mL of hydrochloric acid TS, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\): it exhibits maxima between 284 nm and 288 nm, and between 293 nm and 297 nm.

**Dissolution** \(<6.10D>\) When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 60 minutes of Diclofenamide Tablets is not less than 70%.

Start the test with 1 tablet of Diclofenamide Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 \( \mu m \). Discard the first 10 mL of the filtrate, pipet \( V \) mL of the subsequent filtrate, add water to make exactly \( V \) mL so that each mL contains about 56 \( \mu g \) of diclofenamide (\( C_6H_6Cl_2N_2O_4S_2 \)) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 55 mg of Diclofenamide RS, previously dried under reduced pressure not exceeding 0.67 kPa at 100°C for 5 hours, dissolve in 10 mL of ethanol (95), and add water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \( A_T \) and \( A_S \), of the sample solution and standard solution at 285 nm as directed under Ultraviolet-visible Spectrophotometry \(<2.24>\), using water as the blank.

Dissolution rate (% with respect to the labeled amount of diclofenamide (\( C_6H_6Cl_2N_2O_4S_2 \))

\[
M_S = \frac{M_S}{A_T} = \frac{M_S}{A_S} \times \frac{1}{C} \times 90
\]

\( M_S \): Amount (mg) of Diclofenamide RS

\( C \): Labeled amount (mg) of diclofenamide (\( C_6H_6Cl_2N_2O_4S_2 \)) in 1 tablet.
**Dicloxacillin Sodium Hydrate**

**Description**

Dicloxacillin Sodium Hydrate occurs as a white to light yellowish white crystalline powder. It is odorless, and has an acid and bitter taste.

**Identification**

(1) Determine the absorption spectrum of a solution of Dicloxacillin Sodium Hydrate (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry \(\text{C22H25Cl2N3O3S.H2O}\), and compare the spectrum with the Reference Spectrum or the spectrum of Dicloxacillin Sodium RS: both spectra exhibit similar intensities of absorption at the same wave lengths.

(2) Determine the infrared absorption spectrum of Dicloxacillin Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(\text{C22H25Cl2N3O3S.H2O}\), and compare the spectrum with the Reference Spectrum or the spectrum of Dicloxacillin Sodium RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Dicloxacillin Sodium Hydrate responds to the Quantitative Tests \(\text{C22H25Cl2N3O3S.H2O}\) for sodium salt.

**Water**

Not less than 3.0% and not more than 4.5% (0.1 g, volumetric titration, direct titration).

**Assay**

Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics \(\text{C22H25Cl2N3O3S.H2O}\) according to the following conditions.

(i) Test organism—*Bacillus subtilis* ATCC 6633

(ii) Culture medium—Use the medium in (i) Medium for test organism [5] under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 6.5 to 6.6 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Dicloxacillin Sodium RS equivalent to about 50 mg (potency), dissolve in phosphate buffer solution, pH 6.0 to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C in a refrigerator, and use within 24 hours. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10 \(\mu\)g (potency) and 2.5 \(\mu\)g (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Dicloxacillin Sodium Hydrate equivalent to about 50 mg (potency), dissolve in phosphate buffer solution, pH 6.0 to make exactly 50 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 24 hours. Take exactly a suitable amount of the standard stock solution before use, add phosphate buffer solution, pH 6.0 to make solutions so that each mL contains 10 \(\mu\)g (potency) and 2.5 \(\mu\)g (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

**Containers and storage**

Containers—Well-closed containers.

---

**Diethylcarbamazine Citrate**

**Description**

Diethylcarbamazine Citrate occurs as a white, crystalline powder. It is odorless, and has an acid and bitter taste.

**Identification**

1. **Determination of Mass**
   - Weigh accurately an amount of Diethylcarbamazine Citrate, when dried, and use the amounts so that each mL contains 10 \(\mu\)g (potency) and 2.5 \(\mu\)g (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

2. **Determination of Potency**
   - Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics (0.1 g, volumetric titration, direct titration).

**Water**

Not less than 3.0% and not more than 4.5% (0.1 g, volumetric titration, direct titration).

**Assay**

Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics (0.1 g, volumetric titration, direct titration).

**Containers and storage**

Containers—Tight containers.
practically insoluble in acetone, in chloroform and in diethyl ether.

A solution of Diethylcarbamazine Citrate (1 in 20) is acid. It is hygroscopic.

**Identification** (1) Dissolve 0.5 g of Diethylcarbamazine Citrate in 2 mL of water, add 10 mL of sodium hydroxide TS, and extract with four 5-mL portions of chloroform. Wash the combined chloroform extracts with 10 mL of water, and evaporate the chloroform on a water bath. Add 1 mL of iodoethane to the residue, and boil gently under a reflux condenser for 5 minutes. Evaporate the excess iodoethane with the aid of a current of air, and dissolve the residue in 4 mL of ethanol (95). Cool the ethanol solution in an ice bath, with continuous stirring, add diethyl ether until precipitates are formed, and stir until crystallization is evident. Allow to stand in the ice bath for 30 minutes, and collect the precipitate. Dissolve the precipitate in 4 mL of ethanol (95), repeat the recrystallization in the same manner, then dry at 105°C for 4 hours: the crystals so obtained melt <2.60°C between 151°C and 155°C.

(2) Neutralize the remaining aqueous layer obtained in (1) with dilute sulfuric acid: the solution responds to the Qualitative Tests <1.00> (2) and (3) for citrate.

**Melting point** <2.60> 135.5 – 138.5°C

**Purity** Heavy metals <1.07>—Proceed with 2.0 g of Diethylcarbamazine Citrate according to Method 4, and perform the test. Prepare the control solution with 4.0 mL of Standard Lead Solution (not more than 20 ppm).

**Loss on drying** <2.41> Not more than 1.0% (2 g, 105°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.75 g of Diethylcarbamazine Citrate, previously dried, dissolve in 50 mL of acetic acid (100) by warming, cool, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 39.14 mg of C_{10}H_{21}N_{3}O.C_{6}H_{8}O_{7}

**Containers and storage** Containers—Tight containers.

**Diethylcarbamazine Citrate Tablets**

ジエチルカルバマジンクエン酸塩錠

Diethylcarbamazine Citrate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of diethylcarbamazine citrate (C\textsubscript{10}H\textsubscript{21}N\textsubscript{3}O.C\textsubscript{6}H\textsubscript{8}O\textsubscript{7}: 391.42).

**Method of preparation** Prepare as directed under Tablets, with Diethylcarbamazine Citrate.

**Identification** To a quantity of the powdered Diethylcarbamazine Citrate Tablets, equivalent to 0.1 g of Diethylcarbamazine Citrate according to the labeled amount, add 10 mL of water, shake well, and filter. To the filtrate add 1 mL of Reinecke salt TS: a light red precipitate is formed.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Diethylcarbamazine Citrate Tablets add 70 mL of the mobile phase, shake vigorously for 10 minutes, add the mobile phase to make exactly 100 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 3 mL of the filtrate, pipet 5 mL of the subsequent filtrate, equivalent to about 2.5 mg of diethylcarbamazine citrate (C\textsubscript{10}H\textsubscript{21}N\textsubscript{3}O.C\textsubscript{6}H\textsubscript{8}O\textsubscript{7}), exactly 5 mL of the internal standard solution, and add this solution to make 50 mL, and use this solution as the sample solution. Proceed as directed in the Assay.

Amount (mg) of diethylcarbamazine citrate (C\textsubscript{10}H\textsubscript{21}N\textsubscript{3}O.C\textsubscript{6}H\textsubscript{8}O\textsubscript{7})

\[ M_S = \frac{M_i \times Q_i}{Q_b} \times \frac{V_i}{V} \]

\[ M_S = \text{Amount (mg) of Diethylcarbamazine Citrate RS} \]

**Internal standard solution**—A solution of 2-aminobenzimidazole in the mobile phase (1 in 12,500).

**Assay** Weigh accurately about 25 mg of Diethylcarbamazine Citrate RS, previously dried at 105°C for 4 hours, dissolve in the mobile phase to make exactly 100 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 3 mL of the filtrate, pipet 5 mL of the subsequent filtrate, and add exactly 5 mL of the internal standard solution, and add the mobile phase to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Diethylcarbamazine Citrate RS, previously dried at 105°C for 4 hours, dissolve in the mobile phase to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q\textsubscript{i} and Q\textsubscript{b}, of the peak area of diethylcarbamazine to that of the internal standard.

Amount (mg) of diethylcarbamazine citrate (C\textsubscript{10}H\textsubscript{21}N\textsubscript{3}O.C\textsubscript{6}H\textsubscript{8}O\textsubscript{7})

\[ M_S = \frac{M_i \times Q_i}{Q_b} \times 2 \]

\[ M_S = \text{Amount (mg) of Diethylcarbamazine Citrate RS} \]

**Internal standard solution**—A solution of 2-aminobenzimidazole in the mobile phase (1 in 12,500).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: To 0.05 mol/L potassium dihydrogen phosphate TS add phosphoric acid to adjust the pH to 2.5. To 950 mL of this solution add 50 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of diethylcarbamazine is about 14 minutes.
JP XVI
Official Monographs / Diflucortolone Valerate  715

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, diethylcarbamazine and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.5.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of diethylcarbamazine to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Well-closed containers.

Difenidol Hydrochloride
ジフェニドール塩酸塩

\[
\text{C}_{21}\text{H}_{27}\text{NO}.\text{HCl}: 345.91
\]
1,1-Diphenyl-4-piperidino-1-butene hydrochloride [3254-89-5]

Difenidol Hydrochloride, when dried, contains not less than 98.5% of \( \text{C}_{21}\text{H}_{27}\text{NO}.\text{HCl} \).

Description Difenidol Hydrochloride occurs as white crystals or crystalline powder. It is odorless.

It is freely soluble in methanol, soluble in ethanol (95), sparingly soluble in water and in acetic acid (100), and practically insoluble in diethyl ether.

Melting point: about 217°C (with decomposition).

Identification (1) Dissolve 0.01 g of Difenidol Hydrochloride in 1 mL of sulfuric acid: an orange-red color develops. To this solution add carefully 3 drops of water: the solution becomes yellowish brown, and colorless on the addition of 10 mL of water.

(2) To 5 mL of a solution of Difenidol Hydrochloride (1 in 100) add 2 mL of Reinecke salt TS: a light red precipitate forms.

(3) To 10 mL of a solution of Difenidol Hydrochloride (1 in 100) add 2 mL of sodium hydroxide TS, and extract with two 15-mL portions of chloroform. Combine the extracts, wash with three 10-mL portions of water, evaporate with two 15-mL portions of chloroform. Combine the extracts, wash with three 10-mL portions of water, evaporate the chloroform on a water bath, and dry the residue in a desiccator (in vacuum, silica gel, 55°C) for 5 hours: the residue melts \( \approx 260°C \) between 103°C and 106°C.

(4) A solution of Difenidol Hydrochloride (1 in 100) responds to the Qualitative Tests \( <1.09 \) for chloride.

pH \( <2.44 \) Dissolve 1.0 g of Difenidol Hydrochloride in 100 mL of freshly boiled and cooled water: the pH of this solution is between 4.7 and 6.5.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Difenidol Hydrochloride in 10 mL of methanol: the solution is clear and colorless.

Diflucortolone Valerate
ジフルコルトロン吉草酸エステル

\[
\text{C}_{27}\text{H}_{36}\text{F}_{2}\text{O}_{5}: 478.57
\]
6α,9-Difluoro-11β,21-dihydroxy-16α-methylpregna-1,4-diene-3,20-dione 21-pentanate [59198-70-8]

Diflucortolone Valerate contains not less than 98.0% and not more than 102.0% of \( \text{C}_{27}\text{H}_{36}\text{F}_{2}\text{O}_{5} \), calculated on the dried basis.

Description Diflucortolone Valerate occurs as white crys-
tals or crystalline powder.

It is sparingly soluble in methanol and in ethanol (99.5), and practically insoluble in water.

**Identification (1)** Prepare the test solution by proceeding with 10 mg of Diflucortolone Valerate according to the Oxygen Flask Combustion Method \(<1.00\), using a mixture of 0.5 mL of 0.01 mol/L sodium hydroxide TS and 20 mL of water as the absorbing liquid; the test solution responds to the Qualitative Tests \(<1.00\) for fluoride.

(2) Determine the absorption spectrum of a solution of Diflucortolone Valerate in methanol (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Diflucortolone Valerate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Diflucortolone Valerate as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\), and compare the spectrum with the Reference Spectrum or the spectrum of Diflucortolone Valerate RS: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Optical rotation \(<2.49\) \([\alpha]_D^{20} + 110 – +115^\circ\) (0.1 g calculated on the dried basis, ethanol (99.5), 10 mL, 100 mm).

**Melting point \(<2.60\) 200 – 204°C**

**Purity (1)** Heavy metals \(<1.07\)—Proceed with 2.0 g of Diflucortolone Valerate in a platinum crucible according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm). Carbonize and incinerate as directed under Residue on Ignition \(<2.44\).

(2) Related substances—Use the sample solution obtained in the Assay as the sample solution. Perform the test with 10 \(\mu\)L of the sample solution as directed under Liquid Chromatography \(<2.01\) according to the following conditions. Determine each peak area of sample solution by the automatic integration method, and calculate the amounts of these peaks by the area percentage method: the amount of each peak of flucortolone valerate, 12α diflucortolone valerate and 14 diflucortolone valerate, having the relative retention times of about 0.97, 1.03 and 1.05 with respect to diflucortolone valerate, respectively, is not more than 0.6%, respectively; the amount of the peak of clocortolone valerate, having the relative retention time of about 1.09, is not more than 0.3%; and the amount of each peak other than those mentioned above is not more than 0.1%. Furthermore, the total amount of the peaks other than the peak of diflucortolone valerate is not more than 2.0%.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 238 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with sulfonamide group bound to hexadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase A: A mixture of 0.02 mol/L potassium dihydrogen phosphate TS, adjusted to pH 3.0 with phosphoric acid, and acetonitrile for liquid chromatography (11:9).
Mobile phase B: Acetonitrile for liquid chromatography.
Flowing of the mobile phase: Control the gradient by mixing the mobile phases A and B as directed in the following table.

<table>
<thead>
<tr>
<th>Time after injection of sample (min)</th>
<th>Mobile phase A (vol%)</th>
<th>Mobile phase B (vol%)</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

Flow rate: 1.0 mL per minute.

**System suitability—**

System performance: When the procedure is run with 10 \(\mu\)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of diflucortolone valerate are not less than
Digitoxin

Digitoxin, when dried, contains not less than 90.0% of C_{41}H_{64}O_{13}.

Description  Digitoxin occurs as a white to light yellowish white, crystalline powder. It is odorless.

It is soluble in chloroform, sparingly soluble in methanol and in ethanol (95), and practically insoluble in water and in diethyl ether.

Identification  (1) Transfer 1 mg of Digitoxin to a small test tube about 10 mm in inside diameter, dissolve in 1 mL of a solution of iron (III) chloride hexahydrate in acetic acid (100) (1 in 10,000), and underlay gently with 1 mL of sulfuric acid: at the zone of contact of the two liquids a brown ring develops slowly, and then fades.

(2) To 2 mg of Digitoxin add 25 mL of a freshly prepared solution of 1,3-dinitrobenzene in ethanol (95) (1 in 100), and dissolve by shaking. Take 2 mL of this solution, add 2 mL of a solution of tetramethylammonium hydroxide (100) (1 in 10,000), and dissolve by shaking. Take 2 mL of this solution, add 2 mL of a solution of cholesterol in ethanol (95) in a test tube, having the inner walls which are free from scratches, add 2 mL of a solution of cholesterol in ethanol (95) (1 in 200), mix gently, and allow to stand for 10 minutes: no turbidity is produced.

Optical rotation  <2.49> [α]_{D}^{19}: +16° - +18° (after drying, 0.5 g, chloroform, 20 mL, 200 mm).

Purity  Digitoxin—Dissolve 10 mg of Digitoxin in 2 mL of ethanol (95) in a test tube, having the inner walls which are free from scratches, add 2 mL of a solution of cholesterol in ethanol (95) (1 in 200), mix gently, and allow to stand for 10 minutes: no turbidity is produced.

Loss on drying  <2.41> Not more than 1.5% (0.5 g, in vacuum, 100°C, 2 hours).

Residue on ignition  <2.44> Not more than 0.5% (0.1 g).

Assay  Dissolve about 20 mg each of Digitoxin and Digitoxin RS, previously dried and accurately weighed, in methanol to make exactly 200 mL. Pipet 5 mL each of these solutions, add exactly 10 mL of the internal standard solution to each solution, add 12.5 mL of water, then add methanol to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Q_{T} and Q_{S}, of the peak area of digitoxin to that of the internal standard, respectively.

\[ M_{5} = \frac{Q_{T} / Q_{S}}{M_{5}} \]

M_{5}: Amount (mg) of C_{41}H_{64}O_{13} = M_{5} \times Q_{T} / Q_{S}

Internal standard solution—A solution of acenaphthene in methanol (3 in 1,000,000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column about 4 mm in inside diameter and 15 to 20 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: Room temperature.

Mobile phase: A mixture of methanol and water (3:1). Flow rate: Adjust the flow rate so that the retention time of digitoxin is about 5 minutes.

Selection of column: Proceed with 50 μL of the standard solution under the above operating conditions, and calculate the resolution. Use a column giving elution of digitoxin and the internal standard in this order with the resolution between these peaks being not less than 6.

Containers and storage  Containers—Light-resistant.

Storage—Light-resistant.
Digitoxin Tablets

Digitoxin Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of digitoxin (C41H64O13; 764.94).

Method of preparation Prepare as directed under Tablets, with Digitoxin.

Identification (1) Place a portion of powdered Digitoxin Tablets, equivalent to 2 mg of digitoxin (C41H64O13) according to the labeled amount, in a separator, shake with 30 mL of water, and shake vigorously with 30 mL of chloroform. Filter the chloroform extract with a funnel on which a small ing to the residue, and dissolve by shaking. Proceed with 2 mL of the solution as directed in the Identification (1) under Digitoxin.

(2) Evaporate 4 mL of the chloroform solution obtained in (1) to dryness, by warming under reduced pressure, add a freshly prepared solution of 1,3-dinitrobenzene in ethanol (95) (1 in 100) to the residue, and dissolve in 10 mL of chloroform. Transfer 5 mL of this solution to a small test tube about 10 mm in inside diameter, and evaporate to dryness on a water bath with the aid of a current of air. Proceed with the residue as directed in the Identification (1) under Digitoxin.

Uniformity of dosage units 6.02 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Transfer 1 tablet of Digitoxin Tablets to a 50-mL beaker, add 0.5 mL of water to disintegrate the tablet, add 5 mL of acetonitrile, and warm on a water bath for 5 minutes, covering the beaker with a watch glass. After cooling, transfer the solution to separator A, rinse the beaker with 30 mL of chloroform and then with 20 mL of water, transfer the rinsings to separator A, and extract by vigorous shaking. Transfer the chloroform extract to separator B containing 5 mL of a solution of sodium hydrogen carbonate (1 in 100), and shake to wash. Filter the chloroform layer through a pledget of absorbent cotton, previously moistened with chloroform. Extract the water layer in separator A with two 30-mL portions of chloroform, wash the chloroform extract with a solution of sodium hydrogen carbonate (1 in 100) in separator B, filter in the same manner, and combine the filtrate with the first one. Evaporate this filtrate to dryness under reduced pressure by warming, add diluted ethanol (95) (4 in 5) to make exactly V mL of a solution containing 5 µg of digitoxin (C41H64O13) per mL. Shake vigorously for 20 minutes to dissolve, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Digitoxin RS, previously dried under reduced pressure at 100°C for 2 hours, and dissolve in ethanol (95) to make exactly 100 mL. Measure exactly 1 mL of this solution, add the dissolution medium to make exactly 500 mL, warm at 37 ± 0.5°C for 60 minutes, and filter through a membrane filter (less than 0.8 µm in pore size). Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution.

Amount (mg) of digitoxin (C41H64O13)
\[ M_a \times \left( \frac{F_t - F_0}{F_0 - F_b} \right) \times \frac{V}{1000} \]
\[ M_a: \text{Amount (mg) of Digitoxin RS} \]

Dissolution 6.10D When the test is performed at 100 revolutions per minute according to the Basket method, using 500 mL of diluted hydrochloric acid (3 in 500) as the dissolution medium, the dissolution rates in 30 minutes and in 60 minutes of Digitoxin Tablets are not less than 60% and 85%, respectively. No retest requirement is applied to Digitoxin Tablets.

Start the test with 1 tablet of Digitoxin Tablets, withdraw α + 15 mL of the medium at the specified minute after starting the test, immediately add the same volume of fresh dissolution medium, previously warmed at 37 ± 0.5°C, to the vessel, and filter withdrawing medium through a membrane filter with a pore size not exceeding 0.8 µm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Measure exactly a mL of the sample solution, equivalent to about 2 µg of digitoxin (C41H64O13) according to the labeled amount, transfer to a glass-stoppered centrifuge tube Tα, and warm at 37 ± 0.5°C for 30 minutes. Further, at 60 minutes after starting the test, take α + 15 mL of the dissolved solution, proceed in the same manner as above, measure exactly a mL of the sample solution so obtained, and transfer to a glass-stoppered centrifuge tube Tα+15. Separately, weigh accurately 100 times the labeled amount of Digitoxin RS, previously dried under reduced pressure at 100°C for 2 hours, and dissolve in ethanol (95) to make exactly 100 mL. Measure exactly 1 mL of this solution, add the dissolution medium to make exactly 500 mL, warm at 37 ± 0.5°C for 60 minutes, and filter through a membrane filter (less than 0.8 µm in pore size). Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the standard solution. Measure exactly a mL each of the standard solution and the dissolution medium, transfer to glass-stoppered centrifuge tubes Tα and Tα+15, respectively. Add exactly 7 mL of chloroform to each of the glass-stoppered centrifuge tubes Tα, Tα+15, Tα+30, Tα+60, Tα+90, and Tα+150, shake vigorously for 10 minutes and centrifuge. Discard the aqueous layer, measure exactly 5 mL of the chloroform layer, transfer to brown test tubes Tα, Tα+15, Tα+30, Tα+60, Tα+90, and Tα+150, evaporate the chloroform, add exactly 4 mL each of 0.05 g/dL L-ascorbic acid-hydrochloric acid solution, shake well, and allow to stand at a constant temperature between 25°C and 30°C for 45 minutes. Determine the fluorescence intensities, \( F_{α} \), \( F_{α+15} \), \( F_{α+30} \), \( F_{α+60} \), and \( F_{α+90} \) of these solutions at about 395 nm of the excitation wavelength and at about 560 nm of the fluorescence wavelength as directed under Fluorometry <2.22>.

Dissolution rate (%) with respect to the labeled amount of digitoxin (C41H64O13) for 30 minutes
\[ M_b \times \left( \frac{F_0 - F_b}{F_0 - F_t} \right) \times \frac{V}{150} \]
\[ M_b: \text{Amount (mg) of Digitoxin RS} \]
Dissolution rate (%) with respect to the labeled amount of digitoxin (C_{41}H_{64}O_{13}) for 60 minutes

\[ = MS \times \left( \frac{F_{60} - F_{0}}{F_{S} - F_{0}} + \frac{F_{30} - F_{0}}{F_{S} - F_{0}} \times a + 15 \right) \times 1/C \]

\( MS \): Amount (mg) of Digitoxin RS

\( C \): The labeled amount (mg) of digitoxin (C_{41}H_{64}O_{13}) in 1 tablet

\( a + 15 \): Measured volume (mL) of dissolved solution at the specified minute

**Assay**  
Weigh accurately and powder not less than 20 Digitoxin Tablets. Weigh accurately a portion of the powder, equivalent to about 0.5 mg of digitoxin (C_{41}H_{64}O_{13}), and shake with 12.5 mL of water for 10 minutes. Add exactly 10 mL of the internal standard solution, shake for 20 minutes, and add methanol to make 50 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 20 mg of Digitoxin RS, previously dried in vacuum at 100°C for 2 hours, dissolve in methanol to make exactly 200 mL. Pipet 5 mL of the solution, add exactly 10 mL of the internal standard solution, add 12.5 mL of water, then methanol to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Digoxin.

\[ \text{Amount (mg) of digitoxin (C}_{41}\text{H}_{64}\text{O}_{13}) = MS \times Q_{T} / Q_{S} \times 1/40 \]

\( MS \): Amount (mg) of Digitoxin RS

**Internal standard solution**—A solution of acenaphthene in methanol (3 in 1,000,000).

**Containers and storage**  
Containers—Tight containers.  
Storage—Light-resistant.

---

**Digoxin**

ジゴキシン

C_{41}H_{64}O_{14}: 780.94

3\(\beta\)-[2,6-Dideoxy-\(\beta\)-d-ribo-hexopyranosyl-(1\(\rightarrow\)4)-2,6-dideoxy-\(\beta\)-d-ribo-hexopyranosyl-(1\(\rightarrow\)4)-2,6-dideoxy-\(\beta\)-d-ribo-hexopyranosyl]-12\(\beta\),14-dihydroxy-5\(\beta\),14\(\beta\)-card-20(22)-enolide

[20830-75-5]

Digoxin, when dried, contains not less than 96.0% and not more than 106.0% of C_{41}H_{64}O_{14}.

**Description**  
Digoxin occurs as colorless or white crystals or a white crystalline powder.

It is freely soluble in pyridine, slightly soluble in ethanol (95), very slightly soluble in acetic acid (100), and practically insoluble in water.

**Identification**  
(1) Transfer 1 mg of Digoxin to a small test tube about 10 mm in inside diameter, dissolve in 1 mL of a solution of iron (III) chloride hexahydrate in acetic acid (100) (1 in 10,000), and underlay gently with 1 mL of sulfuric acid: at the zone of contact of the two liquids a brown ring free from a reddish color is produced, and the color of the upper layer near the contact zone changes to green through purple. Finally the entire acetic acid layer shows a green color through a deep blue color.

(2) Determine the infrared absorption spectrum of Digoxin, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.49>  
\[ \left[ \alpha \right]_{D}^{20} \approx +10.0 - +13.0^\circ \] (after drying, 0.20 g, dehydrated pyridine, 10 mL, 100 mm).

**Purity**  
(1) Clarity and color of solution—Dissolve 0.10 g of Digoxin in 15 mL of diluted ethanol (95) (4 in 5) by warming: the solution is clear and colorless.

(2) Related substances—Dissolve 25.0 mg of Digitoxin in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet 10 mL of this solution, add 10 mL of water and dilute ethanol to make exactly 50 mL, and use this solution as the sample solution. Separately, dissolve exactly 5.0 mg of Gitoxin RS, previously dried under
Digoxin Injection / Official Monographs

Digoxin Injection is an aqueous solution for injection.

It contains not less than 90.0% and not more than 105.0% of the labeled amount of digoxin (C_{41}H_{64}O_{14}: 780.94).

Method of preparation Prepare as directed under Injections, with a solution of Digoxin in 10 to 50 vol% ethanol.

Description Digoxin Injection is a clear, colorless liquid.

Identification Dilute Digoxin Injection, if necessary, with methanol so that each mL contains about 0.25 mg of digoxin according to the labeled amount, and use this solution as the sample solution. In case where ingredients are suspected to affect the test, remove them by means of a solid-phase extraction. Separately, dissolve 0.5 mg of Digoxin RS in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.02. Spot 10 mL of each of the sample solution and standard solution on a plate of octadecylsilanized silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and water (7:3) to a distance of about 10 cm, and air-dry the plate. Spray evenly a mixture of a solution of trichloroacetic acid in ethanol (99.5) (1 in 4) and a freshly prepared solution of sodium toluenesulfonchloramide trihydrate (3 in 100) (4:1) on the plate, heat at 110°C for 10 minutes, and examine under ultraviolet light (main wavelength: 366 nm): the RF values of the principal spots with the sample solution and the standard solution are not different each other.

Alcohol number <1.01> 0.8 - 1.2 (Method 1).
Purity  Related substances—To a volume of Digoxin Injection, equivalent to about 2.5 mg of Digoxin according to the labeled amount, add dilute ethanol to make 50 mL, and use this solution as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area of the sample solution by the automatic integration method and calculate the amounts of these peaks by the area percentage method: the total amount of the peaks other than digoxin is not more than 5%.

Operating conditions—
Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 4 times as long as the retention time of digoxin, beginning after the solvent peak.

System suitability—
Test for required detectability: Dissolve 25 mg of digoxin in 50 mL of warm ethanol (95), cool, add ethanol (95) to make 100 mL. To 10 mL of this solution add 10 mL of water and dilute ethanol to make 50 mL, and use this solution as the solution for system suitability test. Pipet 2 mL of the solution for system suitability test, and add dilute ethanol to make exactly 100 mL. Pipet 5 mL of this solution, and add dilute ethanol to make exactly 100 mL. Confirm that the peak area of digoxin obtained from 10 μL of the solution for system suitability test

System performance: Dissolve 25 mg of digoxin in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make 100 mL. To 10 mL of this solution add 5 mL of a solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000), 10 mL of water and dilute ethanol to make 50 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, digoxin and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of digoxin to that of the internal standard is not more than 1.0%.

Containers and storage  Containers—Hermetic containers, and colored containers may be used.
Storage—Light-resistant.

Digoxin Tablets  ジゴキシン錠

Digoxin Tablets contain not less than 90.0% and not more than 105.0% of the labeled amount of digoxin (C41H64O14: 780.94).

Method of preparation  Prepare as directed under Tablets, with Digoxin.

Identification  To an amount of pulverized Digoxin Tablets, equivalent to 0.5 mg of Digoxin according to the labeled amount, add 2 mL of methanol, shake for 10 minutes, filter, and use the filtrate as the sample solution. Separately, dissolve 0.5 mg of Digoxin RS in 2 mL of methanol, and use this as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of octadecylsilanized silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and water (7:3) to a distance of about 10 cm, and air-dry the plate. Spray evenly a mixture of a solution of trichloroacetic acid in ethanol (99.5) (1 in 4) and a freshly prepared solution of sodium tol-

Each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Q1 and Q5, of the peak area of digoxin to that of the internal standard.

\[
M_S = \frac{M_S \times Q_1}{Q_5 \times 1/10}
\]

\[
Q_1 < 2.01
\]

\[
Q_5 < 6.05
\]

\[
Q_1 > 6.07
\]

\[
Q_5 > 2.03
\]

Storage—Light-resistant.
enesulfonchloramide trihydrate (3 in 100) (4:1) on the plate, heat at 110°C for 10 minutes, and examine under ultraviolet light (main wavelength: 366 nm): the Rf values of the principal spots with the sample solution and the standard solution are not different each other.

**Purity** Related substances—Powder not less than 20 Digoxin Tablets. Weigh a portion of the powder equivalent to 2.5 mg of Digoxin according to the labeled amount, add 30 mL of dilute ethanol, treat with ultrasonic waves for 20 minutes, and shake for 5 minutes. After cooling, add dilute ethanol to make 50 mL, filter, and use the filtrate as the sample solution. Perform the test with 10 μL of the sample solution as directed under Liquid Chromatography <2.07> according to the following conditions. Determine each peak area of the sample solution by the automatic integration method and calculate the amount of these peaks by the area percentage method: the total amount of the peaks other than digoxin is not more than 5%.

**Operating conditions**
- Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Assay.
- Time span of measurement: About 4 times as long as the retention time of digoxin, beginning after the solvent peak.

**System suitability**—
- Test for required detectability: Dissolve 25 mg of digoxin in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make 100 mL. To 10 mL of this solution add 10 mL of water and dilute ethanol to make 50 mL, and use this solution as the solution for system suitability test. Pipet 2 mL of the solution for system suitability test, and add dilute ethanol to make exactly 100 mL. Pipet 5 mL of this solution, and add dilute ethanol to make exactly 100 mL. Confirm that the peak area of digoxin obtained from 10 μL of this solution is equivalent to 0.07 to 0.13% of that of digoxin from 10 μL of the solution for system suitability test.
- System performance: Dissolve 25 mg of digoxin in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make 100 mL. To 10 mL of this solution add 5 mL of a solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000), 10 mL of water and dilute ethanol to make 50 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, digoxin and propyl parahydroxybenzoate are eluted in this order with the resolution between these peaks being not less than 5.
- System repeatability: When the test is repeated 6 times with 10 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of digoxin is not more than 2.5%.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Digoxin Tablets add 0.5 mL of water to disintegrate, then add exactly 0.5 mL of the internal standard solution, and add V mL of dilute ethanol so that each mL contains about 21 μg of digoxin (C41H64O14). Express this solution to ultrasonic waves for 20 minutes, shake for 5 minutes, filter, and use the filtrate as the sample solution. Separately, weigh accurately about 25 mg of Digoxin RS, previously dried under reduced pressure at 105°C for 1 hour, dissolve in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet 10 mL of this solution, and add ethanol (95) to make exactly 20 mL. Pipet 1 mL of this solution, add exactly 0.5 mL of the internal standard solution, then add 1.5 mL of water and (V − 2) mL of dilute ethanol, and use this as the standard solution. Proceed with the sample solution and standard solution as directed in the Assay.

**Amount (mg) of digoxin (C41H64O14)**

\[
M_S = \frac{M_F}{Q_F} \times 0.125
\]

**Mₙ:** Amount (mg) of Digoxin RS

**Internal standard solution**—A solution of propyl parahydroxybenzoate in ethanol (95) (1 in 40,000/V).

**Dissolution** <6.10>

When the test is performed at 100 revolutions per minute according to the Basket method, using 500 mL of diluted hydrochloric acid (3 in 500) as the dissolution medium, the dissolution rate in 60 minutes of Digoxin Tablets is not less than 65%. No retest requirement is applied to Digoxin Tablets.

Start the test with 1 tablet of Digoxin Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 25 mg of Digoxin RS, previously dried in vacuum at 105°C for 1 hour, dissolve in a small portion of ethanol (95), and add a mixture of ethanol (95) and water (4:1) to make exactly 500 mL. Pipet 5 mL of this solution, add the dissolution medium to make exactly 500 mL, and use this solution as the standard solution. Pipet 2 mL each of the sample solution, the standard solution and the dissolution medium, and transfer to brown glass-stoppered test tubes. Add exactly 10 mL of 0.012 g/dL L-ascorbic acid-hydrochloric acid TS to these tubes, and shake. Immediately add exactly 1 mL of dilute hydrogen peroxide TS, shake well, and allow to stand at a constant temperature between 25°C and 30°C for 45 minutes. Determine the fluorescence intensities, F₁, F₂, and F₃, of these solutions at 360 nm of the excitation wavelength and at 485 nm of the fluorescence wavelength as directed under Fluorometry <2.22>, respectively.

**Dissolution rate (%) with respect to the labeled amount of digoxin (C₄₁H₆₄O₁₄)**

\[
M_S = \frac{M_F}{Q_F} \times (F_F - F_B)/(F_S - F_B) \times 1/C
\]

**Mₙ:** Amount (mg) of Digoxin RS

**C:** The labeled amount (mg) of digoxin (C₄₁H₆₄O₁₄) in 1 tablet

**Assay** Weigh accurately the mass of not less than 20 Digoxin Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 2.5 mg of digoxin (C₄₁H₆₄O₁₄), add 30 mL of dilute ethanol, exposure to ultrasonic waves for 20 minutes, and shake for 5 minutes. Add exactly 5 mL of the internal standard solution and dilute ethanol to make 50 mL, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 25 mg of Digoxin RS, previously dried under reduced pressure at 105°C for 1 hour, dissolve in 50 mL of warm ethanol (95), cool, and add ethanol (95) to make exactly 100 mL. Pipet 10 mL of this solution, add exactly 5 mL of the internal standard solution, 10 mL of water and dilute ethanol to make 50 mL, and use this solution as the standard solution. Perform
the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Q1 and Q2, of the peak area of digoxin to that of the internal standard.

\[
\text{Amount (mg) of digoxin (C}_{41}\text{H}_{64}\text{O}_{14}) = M_S \times Q_2 / Q_1 \times 1/10
\]

M_S: Amount (mg) of Digoxin RS

**Internal standard solution**—A solution of propyl parahydroxybenzoate in ethanol (95) (1 in 4000).

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: A mixture of water and acetonitrile (7:3).

Flow rate: Adjust the flow rate so that the retention time of digoxin is about 10 minutes.

**System suitability**—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, digoxin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of digoxin to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.
Storage—Light-resistant.

**Dihydrocodeine Phosphate**

ジヒドロコデインリン酸塩

C_{18}N_{23}O_{32}·H_3PO_4·3·9·9·38·8·9·38 (5R,6S)-4,5-Epoxy-3-methoxy-17-methylmorphinan-6-ol monophosphate [24204-13-5]

Dihydrocodeine Phosphate contains not less than 98.0% of C_{18}H_{32}NO_3·H_3PO_4, calculated on the dried basis.

**Description** Dihydrocodeine Phosphate occurs as a white to yellowish white, crystalline powder.

It is freely soluble in water and in acetic acid (100), slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

The pH of a solution of Dihydrocodeine Phosphate (1 in 10) is between 3.0 and 5.0.
It is affected by light.

**Identification** (1) Determine the absorption spectrum of a solution of Dihydrocodeine Phosphate (1 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared spectrum of Dihydrocodeine Phosphate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Dihydrocodeine Phosphate (1 in 20) responds to the Qualitative Tests <1.99> (1) for phosphate.

**Purity** (1) Chloride <1.07>—Perform the test with 0.5 g of Dihydrocodeine Phosphate. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.021%).

(2) Sulfate <1.14>—Perform the test with 0.20 g of Dihydrocodeine Phosphate. Prepare the control solution with 1.0 mL of 0.005 mol/L sulfuric acid VS (not more than 0.240%).

(2) Related substances—Dissolve 0.20 g of Dihydrocodeine Phosphate in 10 mL of diluted ethanol (1 in 2), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add diluted ethanol (1 in 2) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.62>. The plate with a mixture of ethanol (99.5), toluene, acetone and ammonia solution (28) (14:14:7:1) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spots from the standard solution.

**Loss on drying <2.41>** Not more than 1.0% (0.5 g, 105°C, 4 hours).

**Assay** Weigh accurately about 0.5 g of Dihydrocodeine Phosphate, dissolve in 70 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS until the color of the solution changes from purple through blue to greenish blue (indicator: 3 drops of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS

= 39.94 mg of C_{18}H_{32}NO_3·H_3PO_4

**Containers and storage** Containers—Tight containers.
Storage—Light-resistant.
1% Dihydrocodeine Phosphate Powder

1% Dihydrocodeine Phosphate Powder contains not less than 0.90% and not more than 1.10% of dihydrocodeine phosphate \((C_{18}H_{23}NO_3.H_3PO_4: 399.38)\).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 1.0 g of sodium lauryl sulfate in 500 mL of diluted phosphoric acid (1 in 1000), and adjust the pH to 3.0 with sodium hydroxide TS. To 240 mL of this solution add 70 mL of tetrahydrofuran.

Flow rate: Adjust the flow rate so that the retention time of dihydrocodeine is about 9 minutes.

System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, dihydrocodeine and the internal standard are eluted in this order with the resolution between these peaks being not less than 4.

System repeatability: When the test is repeated 5 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of dihydrocodeine to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Tight containers.

Dihydroergotamine Mesilate
ジヒドロエルゴタミンメシル酸塩

C₃₃H₃₇N₅O₅.CH₄O₃S: 679.78
(5'S,10R)-5'-Benzy1-12'-hydroxy-2'-methyl-9,10-dihydroergotaman-3',6',18-trione monomethanesulfonate [6190-39-2]

Dihydroergotamine Mesilate contains not less than 97.0% of C₃₃H₃₇N₅O₅.CH₄O₃S, calculated on the dried basis.

Description—Dihydroergotamine Mesilate occurs as a white to yellowish white or grayish white to reddish white powder.

It is freely soluble in acetic acid (100), sparingly soluble in methanol and in chloroform, slightly soluble in water and in ethanol (95), and practically insoluble in acetic anhydride and in diethyl ether.

It is gradually colored by light.

Melting point: about 214°C (with decomposition).

Identification (1) Dissolve 1 mg of Dihydroergotamine Mesilate in 5 mL of a solution of L-tartaric acid (1 in 100). To 1 mL of this solution add 2 mL of 4-dimethylaminobenzaldehyde-ferric chloride TS, and shake: a blue color develops.

(2) To 0.1 g of Dihydroergotamine Mesilate add 0.4 g of sodium hydroxide, stir well, and incinerate by gradual ignition. After cooling, add 10 mL of water to the residue, heat to boiling, cool, and filter. To the filtrate add 0.5 mL of hydrochloric acid: the solution responds to the Qualitative Tests <1.09> for sulfate. Separately, to 0.1 g of Dihydroergotamine Mesilate add 5 mL of dilute hydrochloric acid, shake for 5 minutes, filter, and to the filtrate add 1 mL of barium chloride TS: the solution is clear.

(3) Determine the absorption spectrum of a solution of Dihydroergotamine Mesilate in methanol (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Dihydroergotamine Mesilate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D = -16.7° ± 22.7° [0.5 g, calculated on the dried basis, a mixture of ethanol (99.5), chloroform and ammonia solution (28) (10:10:1), 20 mL, 100 mm].

pH <2.54> Dissolve 0.05 g of Dihydroergotamine Mesilate in 50 mL of water: the pH of this solution is between 4.4 and 5.4.

Purity (1) Clarity and color of solution—Dissolve 0.10 g of Dihydroergotamine Mesilate in 0.1 mL of a solution of methanesulfonic acid (7 in 100) and 50 mL of water: the solution is clear, and has no more color than the following control solutions [1] or [2].

Control solution [1]: Pipet 0.6 mL of Iron (III) Chloride CS and 0.15 mL of Cobalt (II) Chloride CS, mix, and add dilute hydrochloric acid (1 in 40) to make exactly 100 mL.

Control solution [2]: Pipet 0.6 mL of Iron (III) Chloride CS, 0.25 mL of Cobalt (II) Chloride CS and 0.1 mL of Copper (II) Sulfate CS, mix, and add dilute hydrochloric acid (1 in 40) to make exactly 100 mL.

(2) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 0.10 g of Dihydroergotamine Mesilate in 5 mL of a mixture of chloroform and methanol (9:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (9:1) to make exactly 200 mL, and use this solution as the standard solution (1). Pipet 10 mL of the standard solution (1), add a mixture of chloroform and methanol (9:1) to make exactly 25 mL, and use this solution as the standard solution (2). Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solutions (1) and (2) on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:6:1) to a distance of about 15 cm, and dry the plate with cold wind within 1 minute. Develop the plate again immediately with a freshly prepared mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:6:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS for spraying on the plate, and dry the plate with warm wind: the spots other than the principal spot from the sample solution are not more intense than the spot from the stand-
ard solution (1), and the spots, which are more intense than the spot from the standard solution (2), are not more than two.

**Loss on drying** Not more than 4.0% (0.5 g, in vacuum at a pressure not exceeding 0.67 kPa, 100°C, 6 hours).

**Assay** Weigh accurately about 0.2 g of Dihydroergotamine Mesilate, dissolve in 170 mL of a mixture of acetic anhydride and acetic acid (100) (10:1), and titrate with 0.02 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.02 mol/L perchloric acid VS = 13.60 mg of \( C_{13}H_{17}N_2O_5 \cdot CH_4O_3S \)

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

---

**Dihydroergotoxine Mesilate**

ジヒドロエルゴトキシンメシル酸塩

Dihydroergocornine Mesilate

\( C_{13}H_{17}N_2O_5 \cdot CH_4O_3S: \) 659.79

\((5'S,10R)-12'-Hydroxy-2',5'-bis(1-methylethyl)-9,10-dihydroergotaman-3',6',18-trione monomethanesulfonate\)

Dihydro-\( \alpha \)-ergocryptine Mesilate

\( C_{13}H_{17}N_2O_5 \cdot CH_4O_3S: \) 673.82

Dihydro-\( \beta \)-ergocryptine Mesilate

\( C_{13}H_{17}N_2O_5 \cdot CH_4O_3S: \) 707.84

\((5'S,10R)-5'-Benzyl-12'-hydroxy-2'-((1-methylethyl)-9,10-dihydroergotaman-3',6',18-trione monomethanesulfonate\)

Dihydroergocristine Mesilate

\( C_{13}H_{17}N_2O_5 \cdot CH_4O_3S: \) 8067-24-1, Dihydroergotoxine Mesilate

Dihydroergotoxine Mesilate contains not less than 97.0% and not more than 103.0% of dihydroergotoxine mesilate [as a mixture of dihydroergocornine mesilate \( (C_{13}H_{17}N_2O_5 \cdot CH_4O_3S) \), dihydro-\( \alpha \)-ergocryptine mesilate \( (C_{13}H_{17}N_2O_5 \cdot CH_4O_3S) \), dihydro-\( \beta \)-ergocryptine mesilate \( (C_{13}H_{17}N_2O_5 \cdot CH_4O_3S) \) and dihydroergocristine mesilate \( (C_{13}H_{17}N_2O_5 \cdot CH_4O_3S) \)], calculated on the anhydrous basis. The relative contents of dihydroergocornine mesilate \( (C_{13}H_{17}N_2O_5 \cdot CH_4O_3S) \), dihydroeryderocryptine mesilate \( (C_{13}H_{17}N_2O_5 \cdot CH_4O_3S) \) and dihydroergocristine mesilate \( (C_{13}H_{17}N_2O_5 \cdot CH_4O_3S) \) are 30.3–36.3% each, and the content ratio of dihydro-\( \alpha \)-ergocryptine mesilate and dihydro-\( \beta \)-ergocryptine mesilate is 1.5–2.5:1.

**Description** Dihydroergotoxine Mesilate occurs as a white
to pale yellow powder.

It is soluble in methanol, sparingly soluble in ethanol (95), slightly soluble in water, in acetonitrile and in chloroform, and practically insoluble in diethyl ether.

**Identification** Determine the infrared absorption spectrum of Dihydroergotoxine Mesilate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2,25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2,49> $[\alpha]_{D}^{20} + 11.0 - + 15.0^\circ$ (0.2 g, calculated on the anhydrous basis, dilute ethanol, 20 mL, 100 mm).

**Purity (1)** Clarity and color of solution—Dissolve 0.10 g of Dihydroergotoxine Mesilate in 20 mL of water: the solution is clear and the color of the solution is not more intense than that of the following control solution.

Control solution: To a mixture of 1.0 mL of Cobalt (II) Chloride CS, 0.4 mL of Copper (II) Sulfate CS and 2.4 mL of Iron (III) Chloride CS add diluted hydrochloric acid (1 in 40) to make exactly 200 mL.

(2) Heavy metals <1,07>—Proceed with 1.0 g of Dihydroergotoxine Mesilate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Weigh accurately 0.100 g of Dihydroergotoxine Mesilate, dissolve it in a mixture of chloroform and methanol (9:1) to make exactly 5 mL, and use this solution as the sample solution. Separately, weigh accurately 10 mg of dihydroergocristine mesilate for thin-layer chromatography, and dissolve in a mixture of chloroform and methanol (9:1) to make exactly 100 mL. Pipet 6 mL, 4 mL and 2 mL of this solution, add a mixture of chloroform and methanol (9:1) to make exactly 10 mL, respectively, and use these solutions as the standard solutions (1), (2) and (3), respectively. Perform the test with these solutions as directed under Thin-layer Chromatography <2,01> without putting the filter paper in the developing vessel. Spot 5 µL each of the sample solution and the standard solutions (1), (2) and (3) on a plate of silica gel for thin-layer chromatography.

Develop the plate with a mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:3:1) to a distance of about 15 cm, and dry the plate with the aid of a cool air stream. Immediately after that, develop the plate again with a newly prepared mixture of dichloromethane, ethyl acetate, methanol and ammonia solution (28) (50:50:3:1) to a distance of about 15 cm, and dry the plate within 1 minute with the aid of a cool air stream. Spray evenly $p$-dimethylaminobenzaldehyde-hydrochloric acid TS on the plate, dry the plate within 2 minutes with the aid of a cool air stream, and heat it at 40°C for 15 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution (1), not more than 2 spots are more intense than that from the standard solution (2), and not more than 4 spots are more intense than that from the standard solution (3).

**Water** <2,48> Not more than 5.0% (0.2 g, volumetric titration, direct titration).

**Residue on ignition** <2,44> Not more than 0.1% (1 g).

**Assay (1)** Dihydroergotoxine mesilate—Weigh accurately about 30 mg each of Dihydroergotoxine Mesilate and Dihydroergotoxine Mesilate RS, and dissolve them separately in a suitable amount of a mixture of water and acetonitrile (3:1). To these solutions add exactly 10 mL of the internal standard solution and an amount of a mixture of water and acetonitrile (3:1) to make 50 mL, and use these solutions as the sample solution and the standard solution. Perform the test with 20 µL of the sample solution and standard solution as directed under Liquid Chromatography <2,01> according to the following conditions, and calculate the ratios of the peak areas of dihydroergocornine, dihydro-α-ergocryptine, dihydroergocristine and dihydro-β-ergocryptine to the peak area of the internal standard of these solutions.

**Amount (mg) of dihydroergotoxine mesilate**

$$\text{Amount} = M_S \times \left( \frac{Q_{TA} + Q_{TB} + Q_{TC} + Q_{TD}}{Q_{SA} + Q_{SB} + Q_{SC} + Q_{SD}} \right)$$

$M_S$: Amount (mg) of Dihydroergotoxine Mesilate RS, calculated on the anhydrous basis

$Q_{TA}$: Ratio of the peak area of dihydroergocornine to that of the internal standard of the sample solution $\times$ 659.80

$Q_{TB}$: Ratio of the peak area of dihydro-α-ergocryptine to that of the internal standard of the sample solution $\times$ 673.83

$Q_{TC}$: Ratio of the peak area of dihydroergocristine to that of the internal standard of the sample solution $\times$ 707.85

$Q_{TD}$: Ratio of the peak area of dihydro-β-ergocryptine to that of the internal standard of the sample solution $\times$ 727

$Q_{SA}$: Ratio of the peak area of dihydroergocornine to that of the internal standard of the standard solution $\times$ 659.80

$Q_{SB}$: Ratio of the peak area of dihydro-α-ergocryptine to that of the internal standard of the standard solution $\times$ 673.83

$Q_{SC}$: Ratio of the peak area of dihydroergocristine to that of the internal standard of the standard solution $\times$ 707.85

$Q_{SD}$: Ratio of the peak area of dihydro-β-ergocryptine to that of the internal standard of the standard solution $\times$ 727

**Internal standard solution**—Dissolve 0.04 g of chloramphenicol in a mixture of water and acetonitrile (3:1) to make 250 mL.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water, acetonitrile and triethylamine (30:10:1).

Flow rate: Adjust the flow rate so that the retention time of chloramphenicol is about 5 minutes.

**System suitability**—

System performance: When the procedure is run with 20 µL of the standard solution under the above operating conditions, the internal standard, dihydroergocornine, dihydro-α-ergocryptine, dihydroergocristine and dihydro-β-ergocrypt-
tine are eluted in this order with the resolution between the peaks of dihydro-α-ergocryptine and dihydroergocristine being not less than 1.5.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of dihydroergocornine, dihydro-α-ergocryptine, dihydroergocristine and dihydro-β-ergocryptine to that of the internal standard is not more than 0.5%.

(2) Relative contents of dihydroergocornine mesilate, dihydroergocornine mesilate and dihydroergocristine mesilate—Calculate the relative amounts of dihydroergocornine mesilate, dihydroergocryptine mesilate (dihydro-α-ergocryptine mesilate and dihydro-β-ergocryptine mesilate) and dihydroergocristine mesilate from the chromatogram obtained in Assay (1) for the sample solution using the following equations:

\[
\text{Relative amount (\%) of dihydroergocornine mesilate} = \frac{Q_{TA}}{Q_{TA} + Q_{TB} + Q_{TC} + Q_{TD}} \times 100
\]

\[
\text{Relative amount (\%) of dihydroergocryptine mesilate} = \frac{Q_{TB} + Q_{TD}}{Q_{TA} + Q_{TB} + Q_{TC} + Q_{TD}} \times 100
\]

\[
\text{Relative amount (\%) of dihydroergocristine mesilate} = \frac{Q_{TC}}{Q_{TA} + Q_{TB} + Q_{TC} + Q_{TD}} \times 100
\]

(3) Ratio of the content of dihydro-α-ergocryptine mesilate to dihydro-β-ergocryptine mesilate—Calculate the ratio of the amount of dihydro-α-ergocryptine mesilate to dihydro-β-ergocryptine mesilate from the chromatogram obtained in the Assay (1) for the sample solution using the following equations:

\[
\text{Ratio of the content of dihydro-α-ergocryptine mesilate to dihydro-β-ergocryptine mesilate} = \frac{Q_{TB}}{Q_{TD}}
\]

Containers and storage Containers—Well-closed containers.

Storage—Light-resistant.

Dilazep Hydrochloride Hydrate

Dilazep Hydrochloride Hydrate,

\[
\text{C}_{33}\text{H}_{44}\text{N}_{2}\text{O}_{10} \cdot \text{2HCl} \cdot \text{H}_{2}\text{O}: 695.63
\]

3,3’-(1,4-Diazepane-1,4-diyl)dipropyl bis(3,4,5-trimethoxybenzoate) dihydrochloride monohydrate

\[20153-98-4, \text{anhydride}\]

Dilazep Hydrochloride Hydrate contains not less than 98.0% of dilazep hydrochloride (\(\text{C}_{33}\text{H}_{44}\text{N}_{2}\text{O}_{10} \cdot \text{2HCl}: 677.62\)), calculated on the dried basis.

Description Dilazep Hydrochloride Hydrate occurs as a white, crystalline powder. It is odorless.

It is freely soluble in acetic acid (100) and in chloroform, soluble in water, slightly soluble in ethanol (95) and in acetic anhydride, and practically insoluble in diethyl ether.

Melting point: 200 – 204°C Immense the sample in a bath of 110°C, and raise the temperature at the rate of about 3°C per minute from 140°C to 150°C, about 10°C per minute from 160°C to 195°C and about 1°C per minute from 195°C.

Identification (1) To 1 mL of a solution of Dilazep Hydrochloride Hydrate (1 in 100) add 0.1 mL of a solution of hydroxylammonium chloride (1 in 10) and 0.1 mL of 8 mol/L potassium hydroxide TS, and warm in a water bath of 70°C for 10 minutes. After cooling, add 0.5 mL of dilute hydrochloric acid and 0.1 mL of iron (III) chloride TS: a purple color develops.

(2) To 5 mL of a solution of Dilazep Hydrochloride Hydrate (3 in 500) add 0.3 mL of Reinecke salt TS: a light red precipitate is formed.

(3) Determine the absorption spectrum of a solution of Dilazep Hydrochloride Hydrate (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Dilazep Hydrochloride Hydrate as directed in the potassium chloride disk method under Infrared Spectrophotometry 2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

pH 2.54 – 3.4 – Dissolve 1.0 g of Dilazep Hydrochloride Hydrate in 100 mL of water: the pH of this solution is between 3.0 and 4.0.

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Dilazep Hydrochloride Hydrate in 20 mL of water: the solution is clear and colorless.

(2) Sulfate 1.14 – Perform the test with 0.5 g of Dilazep Hydrochloride Hydrate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(3) Heavy metals 1.07 – Proceed with 2.0 g of Dilazep Hydrochloride Hydrate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic 1.11 – Prepare the test solution with 1.0 g of Dilazep Hydrochloride Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.40 g of Dilazep Hydrochloride Hydrate in 10 mL of chloroform, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add chloroform to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography 2.03. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol, ethyl acetate, dichloromethane and hydrochloric acid (500:200:100:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragenoff’s TS for spraying on the plate: the spots other than the principal spot from the sample
solution are not more intense than the spot from the standard solution.

Loss on drying $<2.4\%$ 2.0–3.0% (1 g, 105°C, 3 hours).

Residue on ignition $<2.4\%$ Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.3 g of Dilazep Hydrochloride Hydrate, dissolve in 40 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 33.88 mg of C$_2$H$_{12}$N$_2$O$_8$.2HCl

**Containers and storage** Containers—Tight containers.

## Diltiazem Hydrochloride

ジルチアゼム塩酸塩

C$_{22}$H$_{26}$N$_2$O$_4$S.HCl: 450.98

(25,35)-5-[2-(Dimethylamino)ethyl]-2-(4-methoxyphenyl)-4-oxo-2,3,4,5-tetrahydro-1,5-benzothiazepin-3-yl acetate monohydrochloride [33286-22-5]

Diltiazem Hydrochloride, when dried, contains not less than 98.5% of C$_{22}$H$_{26}$N$_2$O$_4$.2HCl.

**Description** Diltiazem Hydrochloride occurs as white crystals or crystalline powder. It is odorless.

It is very soluble in formic acid, freely soluble in water, in methanol and in chloroform, sparingly soluble in acetonitrile, slightly soluble in acetic anhydride and in ethanol (99.5), and practically insoluble in diethyl ether.

**Identification** (1) Dissolve 0.05 g of Diltiazem Hydrochloride in 1 mL of 1 mol/L hydrochloric acid TS, add 2 mL of ammonium thiocyanate-cobalt (II) nitrate TS and 5 mL of chloroform, shake well, and allow to stand: a blue color develops in the chloroform layer.

(2) Proceed as directed under Oxygen Flask Combustion Method $<1.06>$ with 0.03 g of Diltiazem Hydrochloride, using 20 mL of water as the absorbing liquid, and prepare the test solution: the test solution responds to the Qualitative Tests $<1.09>$ (1) for sulfate.

(3) Dissolve 0.01 g of Diltiazem Hydrochloride in 0.01 mol/L hydrochloric acid TS to make 100 mL. To 2 mL of the solution add 0.01 mol/L hydrochloric acid TS to make 20 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry $<2.24>$, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Determine the infrared absorption spectrum of Diltiazem Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry $<2.25>$: it exhibits absorption at the wave numbers of about 1741 cm$^{-1}$, 1678 cm$^{-1}$, 1252 cm$^{-1}$ and 1025 cm$^{-1}$.

(5) A solution of Diltiazem Hydrochloride (1 in 50) responds to the Qualitative Tests $<1.09>$ (2) for chloride.

**Optical rotation** $<2.49>$ $[\alpha]_D^15:+115-+120$° (after drying, 0.20 g, water, 20 mL, 100 mm).

**Melting point** $<2.60>$ 210–215°C (with decomposition).

**pH** $<2.54>$ Dissolve 1.0 g of Diltiazem Hydrochloride in 100 mL of water: the pH of this solution is between 4.3 and 5.3.

**Purity** (1) Clarity and color of solution—Dissolve 1.0 g of Diltiazem Hydrochloride in 20 mL of water: the solution is clear and colorless.

(2) Sulfate $<1.14>$—Perform the test with 1.0 g of Diltiazem Hydrochloride. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(3) Heavy metals $<1.07>$—Proceed with 2.0 g of Diltiazem Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic $<1.11>$—Place 1.0 g of Diltiazem Hydrochloride in a decomposition flask, add 5 mL of nitric acid and 2 mL of sulfuric acid, put a small funnel on the neck of the flask, and heat cautiously until white fumes are evolved. After cooling, add 2 mL of nitric acid, heat, and repeat this procedure twice, add several 2-mL portions of hydrogen peroxide (30), and heat until the solution becomes colorless to pale yellow. After cooling, add 2 mL of saturated solution of ammonium oxalate monohydrate, and heat again until white fumes are evolved. After cooling, add water to make 5 mL, use this solution as the test solution, and perform the test: the test solution has no more color than the following control solution (not more than 2 ppm).

Control solution: Proceed in the same manner as the test solution without Diltiazem Hydrochloride, add 2.0 mL of Standard Arsenic Solution and water to make 5 mL, and proceed in the same manner as the test solution.

(5) Related substances—Dissolve 50 mg of Diltiazem Hydrochloride in 50 mL of diluted ethanol (4 in 5), and use this solution as the sample solution. Measure exactly 1 mL of the sample solution, add diluted ethanol (4 in 5) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 20 mL each of the sample solution and standard solution as directed under Liquid Chromatography $<2.07>$ according to the following conditions. Determine each peak area of both solutions by automatic integration method: the total peak area of peaks other than the peak of diltiazem obtained from the sample solution is not larger than 3/5 times the peak area of diltiazem obtained from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 240 nm).

Column: A stainless steel column 4.6 mm in inside diame-
ter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 50°C.

Mobile phase: Dissolve 8 g of sodium acetate trihydrate and 1.5 g of d-camphorsulfonic acid in 500 mL of water, and filter using a membrane filter (0.4 μm in pore size). Add 250 mL each of acetonitrile and methanol to the filtrate, and adjust the solution to a pH of 6.6 by adding sodium acetate trihydrate.

Flow rate: Adjust the flow rate so that the retention time of diltiazem is about 9 minutes.

Time span of measurement: About twice as long as the retention time of diltiazem beginning after the solvent peak.

System suitability—

Test for required detection: To exactly 2 mL of the standard solution add diluted ethanol (4 in 5) to make exactly 10 mL. Confirm that the peak area of diltiazem obtained from this solution is equivalent to 15 to 25% of that from 20 μL of the standard solution.

System performance: Dissolve 0.03 g of Diltiazem Hydrochloride, 0.02 g of d-3-hydroxy-cis-2,3-dihydro-5-[2-(dimethylamino)ethyl]-2-(4-methoxyphenyl)-1,5-benzothiazepin-4-(5H)-one hydrochloride and 0.02 g of phenylbenzoate in 160 mL of ethanol (99.5), and add water to make 200 mL. When this solution is run with 20 μL of this solution under the above operating conditions, 3,5-dihydroxy-cis-2,3-dihydro-5-[2-(dimethylamino)ethyl]-2-(4-methoxyphenyl)-1,5-benzothiazepin-4-(5H)-one, diltiazem and phenyl benzoate are eluted in this order with the resolutions between the peaks of each and diltiazem and between the peaks of diltiazem and vare between 2.50 and 2.49, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of diltiazem is not more than 2.0%.

Loss on drying <2.40> Not more than 0.5% (1 g, 105°C, 2 hours).

Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.7 g of Diltiazem Hydrochloride, previously dried, dissolve in 2.0 mL of formic acid, add 60 mL of acetic anhydride, and titrate <2.56> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 45.10 mg of C22H26N2O4S.HCl

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Dimemorfan Phosphate

ジメモルファンリン酸塩

C18H22N.H3PO4: 353.39
(95,135,145)-3,17-Dimethylmorphinan monophosphate [36304-84-4]

Dimemorfan Phosphate, when dried, contains not less than 98.5% of C18H22N.H3PO4.

Description Dimemorfan Phosphate occurs as white to pale yellowish white crystals or crystalline powder.

It is freely soluble in acetic acid (100), sparingly soluble in water and in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

Melting point: about 265°C (with decomposition).

Identification (1) Determine the absorption spectrum of a solution of Dimemorfan Phosphate (1 in 5000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dimemorfan Phosphate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 2 mL of a solution of Dimemorfan Phosphate (1 in 100) add 2 to 3 drops of silver nitrate TS: a yellow precipitate is formed, and it dissolves on the addition of dilute nitric acid.

Optical rotation <2.49> [α]D²⁰: +25 to +27° (after drying, 1 g, methanol, 100 mL, 100 mm).

pH <2.54> Dissolve 1.0 g of Dimemorfan Phosphate in 100 mL of water: the pH of this solution is between 4.0 and 5.0.

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Dimemorfan Phosphate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic <1.17>—Prepare the test solution with 1.0 g of Dimemorfan Phosphate according to Method 3, and perform the test. Use 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 10) (not more than 2 ppm).
Dimenhydrinate

Dimenhydrinate, when dried, contains not less than 53.0% and not more than 55.5% of diphenhydramine (C₁₇H₂₁NO): 255.36, and not less than 44.0% and not more than 47.0% of 8-chlorotheophylline (C₁₇H₂₁NO·C₇H₇ClN₄O₂: 214.61).

Description

Dimenhydrinate occurs as a white, crystalline powder. It is odorless, and has a bitter taste. It is very soluble in chloroform, freely soluble in ethanol (95), and slightly soluble in water and in diethyl ether.

Identification (1)

Dissolve 0.5 g of Dimenhydrinate in 30 mL of dilute ethanol, add 30 mL of water, and use this solution as the sample solution. Transfer 30 mL of the sample solution to a separator, and add 2 mL of ammonia solution (28). Extract with two 10-mL portions of diethyl ether, combine the diethyl ether extracts, and wash the combined diethyl ether extracts with 5 mL of water, and then extract the combined extracts with 15 mL of dilute hydrochloric acid (1 in 100). With this acid extract perform the following tests.

(i) To 5 mL of this acid extract add 5 drops of Reinecke salt TS: a light red precipitate is produced.

(ii) To 10 mL of this acid extract add 10 mL of 2,4,6-trinitrophenol TS dropwise, and allow to stand for 30 minutes. Collect the precipitate by filtering, recrystallize from dilute ethanol, and dry at 105°C for 30 minutes: the crystals melt <2.60°C between 128°C and 133°C.

(2) To 30 mL of the sample solution obtained in the Identification (1) add 2 mL of dilute sulfuric acid, and cool for 30 minutes. Scratch the inside wall of the container frequently to facilitate crystallization. Filter, and wash the white crystals with a small amount of ice-cooled water. Dry the crystals for 1 hour at 105°C: the crystals melt <2.60°C between 300°C and 305°C with decomposition.

(3) To 0.01 g of the crystals obtained in the Identification (2) add 10 drops of hydrogen peroxide TS and 1 drop of hydrochloric acid, and evaporate on a water bath to dryness: the residue shows a yellow-red color. When the dish containing the residue is held over a vessel containing 2 to 3 drops of ammonia TS, the color changes to red-purple, which is discharged on the addition of 2 to 3 drops of sodium hydroxide TS.

(4) Mix well 0.05 g of the crystals obtained in the Identification (2) with 0.5 g of sodium peroxide in a nickel crucible, and heat until the mass melts. Cool, dissolve the melted mass in 20 mL of water, and acidify with dilute nitric acid: the solution responds to the Qualitative Tests <1.09r for chloride.

Melting point 102 – 107°C

Purity (1) Chloride <1.03—Transfer 50 mL of the filtrate obtained in the Assay (2) to a Nessler tube, add 1 mL of nitric acid, and allow to stand for 5 minutes: the turbidity of the solution is not greater than that of the following control solution.

Control solution: Dilute 0.25 mL of 0.01 mol/L hydrochloric acid VS with 6 mL of dilute nitric acid and with water to make 50 mL, add 1 mL of silver nitrate TS, and allow to stand for 5 minutes (not more than 0.044%).

(2) Bromide and iodide—Place 0.10 g of Dimenhydrinate in a glass-stoppered test tube, and add 0.05 g of sodium nitrite, 10 mL of chloroform and 10 mL of dilute hydrochloric acid. Stopper, shake well, and allow to stand: the chlorofom layer remains colorless.

Loss on drying <2.4r—Not more than 0.5% (3 g, in vacuum, phosphorus (V) oxide, 24 hours).

Residue on ignition <2.4r—Not more than 0.3% (1 g).

Assay (1) Diphenhydramine—Weigh accurately about 0.5 g of Dimenhydrinate, previously dried, transfer to a 250-mL separator, and add 50 mL of water, 3 mL of ammonia TS and 10 g of sodium chloride. Extract with six 15-mL portions of diethyl ether with shaking, combine the diethyl ether extracts, and wash the combined diethyl ether extracts with three 50-mL portions of water. To the diethyl ether extracts add exactly 25 mL of 0.05 mol/L sulfuric acid VS, and add 25 mL of water. Shake thoroughly, and evaporate the diethyl ether gently. Cool, and titrate the excess sulfuric acid with 0.1 mol/L sodium hydroxide VS (indicator: 3 drops of methyl red TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L sulfuric acid VS = 25.54 mg C₁₇H₂₁NO

(2) 8-Chlorotheophylline—Weigh accurately about 0.8 g of Dimenhydrinate, previously dried, transfer to a 200-mL volumetric flask, add 50 mL of water, 3 mL of ammonia TS and 6 mL of a solution of ammonium nitrate (1 in 10), and heat on a water bath for 5 minutes. Add exactly 25 mL of 0.1 mol/L silver nitrate VS, heat on a water bath for 15 minutes with occasional shaking, cool, and add water to make exactly 200 mL. Allow to stand overnight to settle the

JP XVI

Official Monographs / Dimenhydrinate 731
precipitate, and filter through a dry filter paper, discarding the first 20 mL of the filtrate. Measure exactly 100 mL of the subsequent filtrate, acidify with nitric acid, add 3 mL of nitric acid, and titrate the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L silver nitrate VS
\[= 21.46 \text{ mg of C}_7\text{H}_7\text{ClN}_4\text{O}_2\]

**Containers and storage** Containers—Well-closed containers.

## Dimenhydrinate Tablets

Dimenhydrinate Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of dimenhydrinate \((\text{C}_{17}\text{H}_{21}\text{NO} \cdot \text{C}_7\text{H}_7\text{ClN}_4\text{O}_2)\) according to the labeled amount, with 25 mL of warm ethanol (95), and filter. Dilute the filtrate with 40 mL of water, and filter again. Use the filtrate as the sample solution. Transfer 30 mL of the sample solution to a separator, and proceed as directed in the Identification (1) under Dimenhydrinate.

(2) With 30 mL of the sample solution obtained in (1), proceed as directed in the Identification (2), (3) and (4) under Dimenhydrinate.

### Method of Preparation

Prepare as directed under Tablets, with Dimenhydrinate.

### Dissolution [6.10]

When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 15 minutes of Dimenhydrinate Tablets is not less than 85%.

Start the test with 1 tablet of Dimenhydrinate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet \(V\) mL of the subsequent filtrate, add water to make exactly \(V\) mL so that each mL contains about 28 μg of dimenhydrinate \((\text{C}_{17}\text{H}_2\text{NO} \cdot \text{C}_7\text{H}_7\text{ClN}_4\text{O}_2)\) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of dimenhydrinate for assay, previously dried in vacuum over phosphorus (V) oxide for 24 hours, and dissolve in water to make exactly 50 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \(A_1\) and \(A_3\), of the sample solution and standard solution at 276 nm as directed under Ultraviolet-visible Spectrophotometry [2.24]

Dissolution rate (% with respect to the labeled amount of dimenhydrinate \((\text{C}_{17}\text{H}_2\text{NO} \cdot \text{C}_7\text{H}_7\text{ClN}_4\text{O}_2)\)
\[= M_S \times \frac{A_1}{A_S} \times \frac{V}{V'} \times \frac{1}{C} \times 90\]

\(M_S\): Amount (mg) of dimenhydrinate for assay
\(C\): Labeled amount (mg) of dimenhydrinate \((\text{C}_{17}\text{H}_2\text{NO} \cdot \text{C}_7\text{H}_7\text{ClN}_4\text{O}_2)\) in 1 tablet

### Assay

Weigh accurately, and powder not less than 20 Dimenhydrinate Tablets. Weigh accurately a portion of the powder, equivalent to about 0.5 g of dimenhydrinate \((\text{C}_{17}\text{H}_2\text{NO} \cdot \text{C}_7\text{H}_7\text{ClN}_4\text{O}_2)\), transfer to a flask, add 40 mL of ethanol (95), and heat with swirling on a water bath until the solution just boils. Continue to heat for 30 seconds, and filter through a glass filter (G4). Wash the filter with warm ethanol (95), transfer the filtrate and washings to a flask, and evaporate the ethanol on a water bath to make 5 mL. Add 50 mL of water, 3 mL of ammonia TS and 6 mL of a solution of ammonium nitrate (1 in 10), heat the mixture on a water bath for 5 minutes, add exactly 25 mL of 0.1 mol/L silver nitrate VS, and heat on a water bath for 15 minutes with occasional shaking. Transfer the mixture to a 200-mL volumetric flask, using water to rinse the flask, cool, add water to make exactly 200 mL, and proceed as directed in the Assay (2) under Dimenhydrinate.

Each mL of 0.1 mol/L silver nitrate VS
\[= 47.00 \text{ mg of C}_7\text{H}_7\text{ClN}_4\text{O}_2\]

### Dimercaprol

Dimercaprol is a colorless or pale yellow liquid. It has a mercaptan-like, disagreeable odor. It is miscible with methanol and with ethanol (99.5) It is soluble in peanut oil, and sparingly soluble in water. It shows no optical rotation.

**Identification (1)** Add 1 drop of Dimercaprol to a mixture of 1 drop of a solution of cobalt (II) chloride hexahydrate (1 in 200) and 5 mL of water: a yellow-brown color develops.

(2) Determine the infrared absorption spectrum of Dimercaprol as directed in the liquid film method under Infrared Spectrophotometry [2.25], and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Refractive index** [2.45]

\(\eta_{D}^{20} : 1.570 - 1.575\)

**Specific gravity** [2.56]

\(d_{20}^{20} : 1.238 - 1.248\)

### Purity (1)

Clarity and color of solution—Dissolve 1.0 mL of Dimercaprol in 20 mL of peanut oil: the solution is clear and colorless to pale yellow.

(2) Bromide—To 2.0 g of Dimercaprol add 25 mL of
dilute potassium hydroxide-ethanol TS, and heat in a water bath under a reflux condenser for 2 hours. Evaporate the ethanol in a current of warm air, add 20 mL of water, and cool. Add a mixture of 10 mL of strong hydrogen peroxide and 40 mL of water, boil gently under a reflux condenser for 10 minutes, and filter rapidly after cooling. Wash the residue with two 10-mL portions of water, combine the washings with the filtrate, add 10 mL of dilute nitric acid and exactly 5 mL of 0.1 mol/L silver nitrate VS, and titrate ≤2.50 with the excess silver nitrate with 0.1 mol/L ammonium thiocyanate VS (indicator: 2 mL of ammonium iron (III) sulfate TS). Perform a blank determination: not more than 1.0 mL of 0.1 mol/L silver nitrate VS is consumed.

Perform the test immediately with 0.05 mol/L iodine VS until a pale yellow color is produced. Perform a blank determination: not more than 1.0 mL of 0.1 mol/L silver nitrate VS is consumed.

(3) Heavy metals

Proceed with 1.0 g of Dimercaprol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Assay**

Weigh accurately about 0.15 g of Dimercaprol into a glass-stoppered flask, dissolve in 10 mL of methanol, and titrate ≤2.50 immediately with 0.05 mol/L iodine VS until a pale yellow color is produced. Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L iodine VS = 6.212 mg of C$_2$H$_3$O$_2$S

**Containers and storage**

Containers—Tight containers.

Storage—Not exceeding 5°C.

---

**Dimercaprol Injection**

ジメルカプロール注射液

Dimercaprol Injection is an oily solution for injection. It contains not less than 95.0% and not more than 105.0% of the labeled amount of dimercaprol (C$_2$H$_3$O$_2$S: 124.23).

**Method of preparation**

Prepare as directed under Injections, with Dimercaprol. Benzyl Benzoate or Benzyl Alcohol may be added to increase the solubility.

**Description**

Dimercaprol Injection is a clear, colorless or light yellow liquid. It has an unpleasant odor.

**Identification**

Measure a volume of Dimercaprol Injection, equivalent to 30 mg of Dimercaprol according to the labeled amount, and proceed as directed in the Identification (1) under Dimercaprol.

**Extractable volume**

≤6.0% It meets the requirement.

**Foreign insoluble matter**

≤6.0% Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter**

≤6.0% Perform the test according to Method 2: it meets the requirement.

**Sterility**

≤4.0% Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay**

Pipet a volume of Dimercaprol Injection, equivalent to about 0.1 g of dimercaprol (C$_2$H$_3$O$_2$S), into a flask, and rinse the pipet several times with a mixture of methanol and diethyl ether (3:1), adding the rinsings to the flask. Add the mixture of methanol and diethyl ether (3:1) to make 50 mL, and titrate ≤2.50 with 0.05 mol/L iodine VS until a yellow color persists. Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L iodine VS = 6.212 mg of C$_2$H$_3$O$_2$S

**Dimorpholamine**

ジモルホラミン

C$_{20}$H$_{38}$N$_4$O$_4$: 398.54
N,N’-Ethylenebis(N-butylmorpholine-4-carboxamide) [119-48-2]

Dimorpholamine, when dried, contains not less than 98.0% and not more than 101.0% of C$_{20}$H$_{38}$N$_4$O$_4$.

**Description**

Dimorpholamine is a white to light yellow, crystalline powder, masses or syrupy liquid. It is very soluble in ethanol (99.5) and in acetic anhydride, and soluble in water. The pH of a solution prepared by dissolving 1.0 g of Dimorpholamine in 10 mL of water is between 6.0 and 7.0. It is hygroscopic.

**Identification**

(1) Determine the absorption spectrum of a solution of Dimorpholamine (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry ≤2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Dimorpholamine, previously dried, as directed in the potassium bromide disk method under the Infrared Spectrophotometry ≤2.25, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Purity**

(1) Clarity and color of solution—Dissolve 1.0 g of Dimorpholamine in 50 mL of water: the solution is clear and colorless to pale yellow.

(2) Chloride ≤1.0%—To 20 mL of the solution obtained in (1) add 6 mL of dilute nitric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(3) Sulfate ≤1.4%—To 10 mL of the solution obtained in (1) add 1 mL of dilute hydrochloric acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.096%).

(4) Heavy metals ≤1.0%—Proceed with 2.0 g of Dimorpholamine according to Method 2, and perform the test.
Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(5) Related substances—Dissolve 0.20 g of Dimorpholamine in 10 mL of ethanol (99.5), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (99.5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.01>.

Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethanol (99.5) and water (4:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 10 minutes: the spot other than the principal spot from the sample solution is not more intense than the spot from the standard solution.

**Loss on drying <2.41>** Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 8 hours).

**Residue on ignition <2.44>** Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.6 g of Dimorpholamine, previously dried, dissolve in 50 mL of acetic anhydride, and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform the test with these solutions as directed under Thin-layer Chromatography <2.01>.

Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethanol (99.5) and water (4:1) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor for 10 minutes: the spot other than the principal spot from the sample solution is not more intense than the spot from the standard solution.

**Containers and storage** Containers—Hermetic containers.

**Storage**—Light-resistant.

---

### Dimorpholamine Injection

ジモルホラミン注射液

Dimorpholamine Injection is a clear, colorless liquid.

- **pH:** 3.0 – 5.5

**Identification**

1. **(1)** To a volume of Dimorpholamine Injection, equivalent to 0.1 g of Dimorpholamine according to the labeled amount, add 3 drops of Dragendorff’s TS: an orange color develops.

2. **(2)** To a volume of Dimorpholamine Injection, equivalent to 50 mg of Dimorpholamine according to the labeled amount, add 1 mL of dilute hydrochloric acid, and evaporate on a water bath to dryness. Dissolve the residue in 2 mL of hydrochloric acid, boil for 10 minutes under a reflux condenser, and evaporate to dryness on a water bath. Dissolve the residue with 1 mL of water, neutralize with sodium hydroxide TS, and add 0.2 mL of a solution of acetaldehyde (1 in 20), 0.1 mL of sodium pentacyanonitrosyl ferrate (III) TS and 0.5 mL of sodium carbonate TS: a blue color develops.

**Bacterial endotoxins <4.01>** Less than 5.0 EU/mg. Perform the test with the sample diluted to 0.15 w/v% with water for bacterial endotoxins test.

**Extractable volume <6.05>** It meets the requirement.

**Foreign insoluble matter <6.06>** Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter <6.07>** Perform the test according to Method 1: it meets the requirement.

**Sterility <4.06>** Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Measure exactly a volume of Dimorpholamine Injection, equivalent to about 30 mg of dimorpholamine \( \text{C}_{20}\text{H}_{38}\text{N}_{4}\text{O}_4 \), and add water to make exactly 200 mL. Pipet 1 mL of this solution, shake with exactly 4 mL of the internal standard solution for 5 minutes, and use this solution as the standard solution. Separately, weigh accurately about 0.15 g of dimorpholamine for assay, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 8 hours, and dissolve in water to make exactly 1000 mL. Pipet 1 mL of this solution, shake with exactly 4 mL of the internal standard solution for 5 minutes, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, \( Q_t \) and \( Q_s \), of the peak area of dimorpholamine to that of the internal standard.

\[
\text{Amount (mg) of dimorpholamine (C}_{20}\text{H}_{38}\text{N}_{4}\text{O}_4) = M_S \times \frac{Q_t}{Q_s} \times \frac{1}{5}
\]

- **Amount:** (mg) of dimorpholamine for assay

**Internal standard solution**—A solution of butyl parahydroxybenzoate in acetonitrile (1 in 25,000).

**Operating conditions**—

- **Detector:** An ultraviolet absorption photometer (wavelength: 216 nm).
- **Column:** A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
- **Column temperature:** A constant temperature of about 40°C.
- **Mobile phase:** A mixture of water and acetonitrile (1:1).
- **Flow rate:** Adjust the flow rate so that the retention time of dimorpholamine is about 4 minutes.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, dimorpholamine and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of dimorpholamine to that of the internal standard is not more than 1.0%

**Containers and storage** Containers—Hermetic containers.
Dinoprost

Prostaglandin F2α

ジノプロスト

C_{20}H_{34}O_5: 354.48

Dinoprost contains not less than 98.5% of C_{20}H_{34}O_5, calculated on the anhydrous basis.

Description

Dinoprost occurs as white, waxy masses or powder, or a clear, colorless to light yellow and viscous liquid. It is odorless.

It is very soluble in N,N-dimethylformamide, freely soluble in methanol, in ethanol (99.5) and in diethyl ether, and very slightly soluble in water.

Identification

(1) To 5 mg of Dinoprost add 2 mL of sulfuric acid, and dissolve by shaking for 5 minutes: a dark red color develops. To this solution add 30 mL of sulfuric acid: an orange color develops with a green fluorescence.

(2) Dissolve 1 mg of Dinoprost in 50 mL of diluted sulfuric acid (7 in 10), and warm in a water bath heated at 50°C for 40 minutes. After cooling, determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Warm Dinoprost at 40°C to effect a liquid, and determine the infrared absorption spectrum of the liquid as directed in the liquid film method under Infrared Spectroscopy <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation

<2.49> [α]_D^20: +24° to +31° (0.2 g, ethanol (99.5), 10 mL, 100 mm).

Purity

(1) Clarity and color of solution—Dissolve 0.20 g of Dinoprost in 5 mL of ethanol (99.5): the solution is clear and colorless to pale yellow.

(2) Related substances—Dissolve 10 mg of Dinoprost in 2 mL of methanol, add water to make 10 mL, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add diluted methanol (1 in 5) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the total area of the peaks other than the peak of dinoprost from the sample solution is not larger than the peak area of dinoprost from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 205 nm).

Column: A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.02 mol/L potassium dihydrogenphosphate TS and acetonitrile (5:2).

Flow rate: Adjust the flow rate so that the retention time of dinoprost is about 20 minutes.

Selection of column: Dissolve 0.01 g each of isopropyl parahydroxybenzoate and propyl parahydroxybenzoate in 2 mL of methanol, and add water to make 10 mL. To 1 mL of this solution add diluted methanol (1 in 5) to make 30 mL, proceed with 10 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of isopropyl parahydroxybenzoate and propyl parahydroxybenzoate in this order with the resolution between these peaks being not less than 2.5.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of dinoprost from the standard solution composes 5% to 15% of the full scale.

Time span of measurement: About 1.5 times as long as the retention time of dinoprost beginning after the solvent peak.

Water<2.48> Not more than 0.5% (0.3 g, volumetric titration, direct titration).

Assay

Weigh accurately about 50 mg of Dinoprost, dissolve in 30 mL of N,N-dimethylformamide, and titrate<2.50> with 0.02 mol/L tetramethylammonium hydroxide VS under a stream of nitrogen (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.02 mol/L tetramethylammonium hydroxide VS = 7.090 mg of C_{20}H_{34}O_5

Containers and storage

Containers—Tight containers.

Storage—Light-resistant, and in a place not exceeding 5°C.

Diphenhydramine

ジフェンヒドラミン

C_{17}H_{21}NO: 255.35

2-(Diphenylmethoxy)-N,N-dimethylethylamine [58-73-1]

Diphenhydramine contains not less than 96.0% of C_{17}H_{21}NO.

Description

Diphenhydramine is a clear, light yellow to
yellow liquid. It has a characteristic odor, and has a burning taste at first, followed by a slight sensation of numbness on the tongue.

It is miscible with acetic anhydride, with acetic acid (100), with ethanol (95) and with diethyl ether.

It is very slightly soluble in water.

Boiling point: about 162°C (in vacuum, 0.67 kPa).

Refractive index \( n_\text{D}^\text{20} \approx 1.55 \)

It is gradually affected by light.

**Identification (1)**

To 0.05 g of Diphenhydramine add 2 mL of sulfuric acid: an orange-red precipitate is produced immediately, and its color changes to red-brown on standing. Add carefully 2 mL of water to this solution: the intensity of the color changes, but the color tone does not change.

(2) Dissolve 0.1 g of Diphenhydramine in 10 mL of dilute ethanol, add an excess of a saturated solution of 2,4,6-trinitrophenol in dilute ethanol with stirring, and cool in ice. Collect the produced crystals, recrystallize from dilute ethanol, and dry at 105°C for 30 minutes: the crystals melt \(<2.60^\circ\text{C}\) between 128°C and 135°C.

**Specific gravity** \( <2.50 \quad d_\text{20}^\approx 1.013 – 1.020 \)

**Purity (1)**

- \( \beta \)-Dimethylaminoethanol—Dissolve 1.0 g of Diphenhydramine in 20 mL of diethyl ether, and extract with two 10-mL portions of water with thorough shaking. Combine the water extracts, and add 2 drops of phenolphthalein TS and 1.0 mL of 0.05 mol/L sulfuric acid VS: no red color develops.

- Benzohydrol—Transfer 1.0 g of Diphenhydramine to a separator, dissolve in 20 mL of diethyl ether, and extract with two 25-mL portions of diluted hydrochloric acid (1 in 15) with thorough shaking. Separate the diethyl ether layer, evaporate slowly on a water bath, and dry in a desiccator (in vacuum, silica gel) for 2 hours: the mass of the residue is not more than 20 mg.

- Heavy metals \(<1.07^\circ\text{C}\)—Proceed with 1.0 g of Diphenhydramine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

**Residue on ignition** \( <2.44 \quad \text{Not more than 0.1%} \ (1 \text{g}) \)

**Assay**

Weigh accurately about 0.5 g of Diphenhydramine, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate \( <2.50 \) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 25.54 mg of C₁₇H₂₁NO

**Containers and storage**

Containers—Tight containers.

Storage—Light-resistant, and almost well-filled.

---

**Diphenhydramine and Bromovalerylurea Powder**

**Method of preparation**

| Diphenhydramine Tannate | 90 g |
| Bromovalerylurea | 500 g |
| Starch, Lactose Hydrate, or their mixture | a sufficient quantity |

To make 100 g

Prepare as directed under Powders, with the above ingredients.

**Description**

Diphenhydramine and Bromovalerylurea Powder occurs as a slightly grayish white powder.

**Identification (1)**

To 0.1 g of Diphenhydramine and Bromovalerylurea Powder add 5 mL of dilute hydrochloric acid, 1 mL of ethanol (95) and 10 mL of water, shake, and filter. To the filtrate add 10 mL of sodium hydroxide TS, and extract with 10 mL of chloroform. Separate the chloroform layer, add 1 mL of bromphenol blue TS, and shake: a yellow color develops in the chloroform layer (diphenhydramine tannate).

(2) Shake 0.02 g of Diphenhydramine and Bromovalerylurea Powder with 10 mL of diethyl ether, filter, and evaporate the filtrate on a water bath. Dissolve the residue in 2 mL of sodium hydroxide TS, and add 5 mL of dimethylglyoxime-thiosemicarbazide TS, and heat on a water bath for 30 minutes: a red color develops (bromovalerylurea).

(3) Shake 0.3 g of Diphenhydramine and Bromovalerylurea Powder with 5 mL of methanol, filter, and use the filtrate as the sample solution. Dissolve 0.15 of bromovalerylurea and 0.03 g of diphenhydramine tannate in 5 mL each of methanol, and use the solutions as standard solution (1) and standard solution (2). Perform the test as directed under Thin-layer Chromatography \(<2.03\) with these solutions. Spot 5 \( \mu \text{L} \) each of the sample solution and standard solutions (1) and (2) on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate in a mixture of ethyl acetate, ethanol (99.5) and ammonia solution (28) (50:5:1) to a distance of about 10 cm. Air-dry the plate, and examine under ultraviolet light (main wavelength: 254 nm): 3 spots from the sample solution and the corresponding spot from standard solutions (1) and (2) show the same \( R_f \) value. Spray Dragendorff’s TS for spraying evenly on the plate: the spot from the standard solution (2) and the corresponding spot from the sample solution reveal an orange color.

**Containers and storage**

Containers—Well-closed containers.
Diphenhydramine Hydrochloride

ジフェンヒドラミン塩酸塩

C₁₇H₂₁NO.HCl: 291.82
2-(Diphenylmethoxy)-N,N-dimethylethylamine monohydrochloride

Diphenhydramine Hydrochloride, when dried, contains not less than 98.0% of C₁₇H₂₁NO.HCl.

**Description** Diphenhydramine Hydrochloride occurs as white crystals or crystalline powder. It is odorless, and has a bitter taste, followed by a sensation of numbness on the tongue.

It is very soluble in methanol and in acetic acid (100), freely soluble in water and in ethanol (95), sparingly soluble in acetic anhydride, and practically insoluble in diethyl ether.

It is gradually affected by light.

**Identification (1)** Determine the absorption spectrum of a solution of Diphenhydramine Hydrochloride in methanol (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Diphenhydramine Hydrochloride as directed in the potassium chloride disk method under Infrared Spectrophotometry (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Diphenhydramine Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> for chloride.

**pH** <2.40> Dissolve 1.0 g of Diphenhydramine Hydrochloride in 10 mL of water: the pH of this solution is between 4.0 and 5.0.

**Melting point** <2.60> 166–170°C

**Purity (1)** Clarity and color of solution—Dissolve 1.0 g of Diphenhydramine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 1.0 g of Diphenhydramine Hydrochloride according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Related substances—Dissolve 0.20 g of Diphenhydramine Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of hexane, ethyl acetate, methanol and ammonia solution (28) (10:4:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly iodine TS on the plate: the spots other than the principal spot and the spot on the original point from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.47> Not more than 0.5% (2 g, 105°C, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Diphenhydramine Hydrochloride, previously dried, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3). Titrate <2.30> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 29.18 mg of C₁₇H₂₁NO.HCl

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

Diphenhydramine, Phenol and Zinc Oxide Liniment

ジフェンヒドラミン・フェノール・亜鉛華リニメント

**Method of preparation**

| Diphenhydramine | 20 g |
| Phenol and Zinc Oxide Liniment | 980 g |

To make 1000 g

Dissolve and mix the above ingredients.

**Description** Diphenhydramine, Phenol and Zinc Oxide Liniment is a white to whitish, pasty mass. It has a slight odor of phenol.

**Identification (1)** To 3 g of Diphenhydramine, Phenol and Zinc Oxide Liniment add 20 mL of hexane, shake well, and separate the hexane layer. Shake thoroughly the hexane solution with 10 mL of 0.2 mol/L hydrochloric acid. Separate the aqueous layer, and adjust with sodium hydroxide TS to a pH of 4.6. Add 1 mL of bromphenol blue-potassium biphthalate TS and 10 mL of chloroform, and shake: a yellow color develops in the chloroform layer (diphenhydramine).

(2) Place 1 g of Diphenhydramine, Phenol and Zinc Oxide Liniment in a porcelain crucible, gradually raise the temperature by heating until the mass is charred, and ignite strongly: a yellow color is produced, and disappears on cooling. To the residue add 10 mL of water and 5 mL of dilute hydrochloric acid, shake well, and filter. Add 2 to 3 drops of potassium hexacyanoferrate (II) TS to the filtrate: a white precipitate is produced (zinc oxide).

(3) Shake 0.5 g of Diphenhydramine, Phenol and Zinc Oxide Liniment with 1 mL of water and 5 mL of chloroform, filter, and use the filtrate as the sample solution. Dissolve 0.01 g each of diphenhydramine and phenol in 5 mL each of chloroform, and use these solutions as standard solution (1) and standard solution (2). Perform the test as di-
Diphenhydramine Tannate

Diphenhydramine Tannate is a compound of diphenhydramine and tannic acid, and contains not less than 25.0% and not more than 35.0% of diphenhydramine (C_{17}H_{21}NO: 255.35).

**Description** Diphenhydramine Tannate occurs as a grayish white to light brown powder. It is odorless or has a slight, characteristic odor. It is tasteless. It is slightly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.

**Identification (1)** To 1 g of Diphenhydramine Tannate add 15 mL of water and 0.3 mL of dilute hydrochloric acid, shake thoroughly for 1 minute, filter, and use this filtrate as the sample solution. Transfer 10 mL of the sample solution to a separator, extract with two 20-mL portions of chloroform, combine the chloroform extracts, and evaporate on a water bath to dryness. To 5 mL of a solution of the residue (1 in 100) add 5 drops of Reinecke salt TS: a light red precipitate is produced.

**Heavy metals** Not more than 7.0 mg/kg.

**Assay** Transfer about 1.7 g of Diphenhydramine Tannate, accurately weighed, to a separator, dissolve in 20 mL of water and 3.0 mL of dilute hydrochloric acid with thorough shaking, add 20 mL of a solution of sodium hydroxide (1 in 10) and exactly 25 mL of isooctane, shake vigorously for 5 minutes, dissolve 2 g of sodium chloride with shaking, and allow to stand. To 20 mL of the isooctane layer add exactly 80 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 25.54 mg of C_{17}H_{21}NO

**Containers and storage** Containers—Tight containers.

**Description** Freeze-dried Diphtheria Antitoxin, Equine, is a preparation for injection which is dissolved before use. It contains diphtheria antitoxin in immunoglobulin of horse origin.

**Freeze-dried Diphtheria Antitoxin, Equine**

Freeze-dried Diphtheria Antitoxin, Equine, is a preparation for injection which is dissolved before use. It contains diphtheria antitoxin in immunoglobulin of horse origin.

**Description** Freeze-dried Diphtheria Antitoxin, Equine, becomes a colorless or light yellow-brown, clear liquid or a slightly whitish turbid liquid on addition of solvent.

Diphtheria Toxoid

Diphtheria Toxoid is a liquid for injection containing diphtheria toxoid prepared by treating diphtheria toxin with formaldehyde by a method involving no appreciable loss of the immunogenicity.

**Description** Diphtheria Toxoid is a clear, colorless to light yellow-brown liquid.

**Adsorbed Diphtheria Toxoid for Adult Use**

Adsorbed Diphtheria Toxoid for Adult Use is a liquid for injection containing diphtheria toxoid prepared by treating diphtheria toxin with formaldehyde by a method involving no appreciable loss of the immunogenicity and very few antigenic substances other than toxoid, and rendered insoluble with aluminum salt.

**Description** Adsorbed Diphtheria Toxoid for Adult Use in the Minimum Requirements for Biological Products.
Requirements of Biological Products.

**Description** Adsorbed Diphtheria Toxoid for Adult Use becomes a homogeneous, whitish turbid liquid on shaking.

### Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine

Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine is a liquid for injection consisting of a liquid containing the protective antigen of *Bordetella pertussis*, Diphtheria Toxoid and a liquid containing tetanus toxoid obtained by detoxifying the tetanus toxin with formaldehyde solution without impairing its immunogenicity, to which aluminum is added to make the antigen and the toxoids insoluble.

It conforms to the requirements of Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine in the Minimum Requirements for Biological Products.

**Description** Adsorbed Diphtheria-Purified Pertussis-Tetanus Combined Vaccine becomes a homogeneous, white turbid liquid on shaking.

### Diphtheria-Tetanus Combined Toxoid

Diphtheria-Tetanus Combined Toxoid is a liquid for injection containing diphtheria toxoid and tetanus toxoid which are prepared by treating diphtheria toxin and tetanus toxin, respectively, with formaldehyde by a method involving no appreciable loss of the immunogenicity.

It conforms to the requirements of Diphtheria-Tetanus Combined Toxoid in the Minimum Requirements for Biological Products.

**Description** Diphtheria-Tetanus Combined Toxoid is a colorless or light yellow-brown, clear liquid.

### Adsorbed Diphtheria-Tetanus Combined Toxoid

Adsorbed Diphtheria-Tetanus Combined Toxoid is a liquid for injection containing diphtheria toxoid and tetanus toxoid which are prepared by treating diphtheria toxin and tetanus toxin, respectively, with formaldehyde by a method involving no appreciable loss of the immunogenicity and rendered insoluble by adding aluminum salt.

It conforms to the requirements of Adsorbed Diphtheria-Tetanus Combined Toxoid in the Minimum Requirements for Biological Products.

**Description** Adsorbed Diphtheria-Tetanus Combined Toxoid becomes a homogeneous, whitish turbid liquid on shaking.

### Dipyridamole

Dipyridamole, when dried, contains not less than 98.5% of C_{24}H_{36}N_{8}O_{4}.

**Description** Dipyridamole occurs as yellow crystals or crystalline powder. It is odorless, and has a slightly bitter taste.

It is freely soluble in chloroform, sparingly soluble in methanol and in ethanol (99.5), and practically insoluble in water and in diethyl ether.

**Identification**

1. Dissolve 5 mg of Dipyridamole in 2 mL of sulfuric acid, add 2 drops of nitric acid, and shake: a deep purple color develops.

2. Determine the absorption spectrum of a solution of Dipyridamole in a mixture of methanol and hydrochloric acid (99:1) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

3. Determine the infrared absorption spectrum of Dipyridamole, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.0D> 165 – 169°C

**Purity**

1. Clarity and color of solution—Dissolve 0.5 g of Dipyridamole in 10 mL of chloroform: the solution is clear, and shows a yellow color.

2. Heavy metals <1.07>—Proceed with 2.0 g of Dipyridamole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

3. Arsenic <1.11>—Prepare the test solution with 1.0 g of Dipyridamole according to Method 3, and perform the
test (not more than 2 ppm).

(4) Related substances—Dissolve 50 mg of Diprydamole in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 0.5 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than the peak of diprydamole from the sample solution is not larger than the peak area of diprydamole from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
Column: A stainless steel column 4 mm in inside diameter and 15 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 0.2 g of potassium dihydrogen phosphate in 200 mL of water, and add 800 mL of methanol.
Flow rate: Adjust the flow rate so that the retention time of diprydamole is about 4 minutes.
Time span of measurement: About 5 times as long as the retention time of diprydamole.

System suitability—
Test for required detection: To exactly 5 mL of the standard solution add the mobile phase to make exactly 25 mL. Confirm that the peak area of diprydamole obtained from 20 μL of this solution is equivalent to 15 to 25% of that of diprydamole obtained from 20 μL of the standard solution.
System performance: Dissolve 7 mg of Diprydamole and 3 mg of terphenyl in 50 mL of methanol. When the procedure is run with 20 μL of this solution under the above operating conditions, diprydamole and terphenyl are eluted in this order with the resolution between these peaks being not less than 5.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of diprydamole is not more than 1.0%.

Loss on drying <2.41> Not more than 0.2% (1 g, 105°C, 3 hours).
Residue on ignition <2.44> Not more than 0.1% (1 g).

Assay Weigh accurately about 0.6 g of Diprydamole, previously dried, dissolve in 70 mL of methanol, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.
Each mL of 0.1 mol/L perchloric acid VS = 50.46 mg of C₂₁H₂₉N₃O.

Containers and storage Containers—Well-closed containers.
Storage—Light-resistant.

Disopyramide
ジソピラミド

C₂₁H₂₉N₃O: 339.47
(2RS)-4-Bis(1-methylethyl)amino-2-phenyl-2-(pyridin-2-yl)butanamide

[3737-09-5]

Disopyramide contains not less than 98.5% of C₂₁H₂₉N₃O, calculated on the dried basis.

Description Disopyramide occurs as white crystals or crystalline powder.
It is very soluble in methanol and in ethanol (95), freely soluble in acetic anhydride, in acetic acid (100) and in diethyl ether, and slightly soluble in water.

Identification (1) To 1 mL of a solution of Disopyramide in ethanol (95) (1 in 20) add 10 mL of 2,4,6-trinitrophenol TS, and warm: a yellow precipitate is formed. Filter this precipitate, wash with water, and dry at 105°C for 1 hour: the residue melts <2.60> between 172°C and 176°C.

(2) Determine the absorption spectrum of a solution of Disopyramide in 0.05 mol/L sulfuric acid-methanol TS (1 in 25,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Disopyramide, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

Absorbance <2.24> E₁% (cm) (269 nm): 194 – 205 (10 mg, 0.05 mol/L sulfuric acid-methanol TS, 500 mL).

Purity (1) Heavy metals <1.07>—Dissolve 1.0 g of Disopyramide in 10 mL of ethanol (95), and add 2 mL of dilute acetic acid (31) and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add 10 mL of ethanol (95), 2 mL of dilute acetic acid and water to make 50 mL (not more than 20 ppm).

(2) Arsenic <1.11>—Prepare the test solution with 1.0 g of Disopyramide according to Method 3, and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 0.40 g of Disopyramide in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 400 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>, Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water
and ammonia solution (28) (45:4:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \(<2.4\) Not more than 0.5% (0.5 g, in vacuum, 80°C, 2 hours).

**Residue on ignition** \(<2.4\) Not more than 0.20% (1 g).

**Assay** Weigh accurately about 0.25 g of Disopyramide, dissolve in 30 mL of acetic acid (100), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 16.97 mg of C₂₁H₂₉N₃O

**Containers and storage** Containers—Tight containers.

### Distigmine Bromide

ジスチグミン臭化物

![Distigmine Bromide](image)

C₂₂H₃₂Br₂N₄O₄: 576.32
3,3'-[Hexamethylenebis(methyliminocarbonyloxy)]bis(1-methylpyridinium) dibromide [15876-67-2]

Distigmine Bromide contains not less than 98.5% of C₂₂H₃₂Br₂N₄O₄, calculated on the anhydrous basis.

**Description** Distigmine Bromide occurs as a white, crystalline powder.

It is very soluble in water, freely soluble in methanol, in ethanol (95) and in acetic acid (100), and slightly soluble in acetic anhydride.

The pH of a solution of Distigmine Bromide (1 in 100) is between 5.0 and 5.5.

It is slightly hygroscopic.

It is gradually colored by light.

Melting point: about 150°C (with decomposition).

**Identification** (1) Determine the absorption spectrum of a solution of Distigmine Bromide (1 in 25,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Distigmine Bromide as directed in the potassium bromide disk method under Infrared Spectrophotometry \(<2.25\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) To 5 mL of a solution of Distigmine Bromide (1 in

10) add 2 mL of dilute nitric acid: the solution responds to the Qualitative Tests \(<1.09\) (1) for bromide.

**Purity** (1) Clarity and color of solution—Dissolve 0.25 g of Distigmine Bromide in 5 mL of water: the solution is clear and colorless.

(2) Sulfate \(<1.14\)—Perform the test with 0.40 g of Distigmine Bromide. Prepare the control solution with 0.40 mL of 0.005 mol/L sulfuric acid VS (not more than 0.048%).

(3) Heavy metals \(<1.07\)—Proceed with 2.0 g of Distigmine Bromide according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Dissolve 40 mg of Distigmine Bromide in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.93\). Spot 10 μL each of the sample solution and standard solution on a plate of cellulose with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water, ethanol (99.5) and acetic acid (100) (8:3:2:1) to a distance of about 13 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution. Spray evenly Dragendorff’s TS for spraying on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Water** \(<2.48\) Not more than 1.0% (1 g, volumetric titration, direct titration).

**Residue on ignition** \(<2.44\) Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Distigmine Bromide, dissolve in 60 mL of a mixture of acetic anhydride and acetic acid (100) (8:1), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration with platinum electrode) Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 28.82 mg of C₂₂H₃₂Br₂N₄O

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

### Distigmine Bromide Tablets

ジスチグミン臭化物錠

Distigmine Bromide Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of distigmine bromide (C₂₂H₃₂Br₂N₄O₄: 576.32).

**Method of preparation** Prepare as directed under Tablets, with Distigmine Bromide.

**Identification** Determine the absorption spectrum of the sample solution obtained in the Assay, as directed under Ultraviolet-visible Spectrophotometry \(<2.24\): it exhibits a
maximum between 268 nm and 272 nm, and a minimum between 239 nm and 243 nm.

**Uniformity of dosage units** 
6.02 Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Distigmine Bromide Tablets add 30 mL of 0.1 mol/L hydrochloric acid TS, shake for 1 hour, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and filter. Discard the first 20 mL of the filtrate, pipet V mL of the subsequent filtrate, and add 0.1 mol/L hydrochloric acid TS to make exactly V’ mL so that each mL contains about 30 µg of distigmine bromide (C₂₂H₃₂Br₂N₄O₄), and use this solution as the sample solution. Proceed as directed in the Assay.

Amount (mg) of distigmine bromide (C₂₂H₃₂Br₂N₄O₄) = M₅ × (A₁₂₂ − A₁₁)/((Aₛ₂ − Aₛ₁) × V’/V × 1/20

M₅: Amount (mg) of distigmine bromide for assay, calculated on the anhydrous basis

**Dissolution** 6.10 When the test is performed at 75 revolutions per minute to the Paddle method, using 500 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Distigmine Bromide Tablets is not less than 80%.

Start the test with 1 tablet of Distigmine Bromide Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 µm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V’ mL so that each mL contains about 10 µg of distigmine bromide (C₂₂H₃₂Br₂N₄O₄) according to the labeled amount, and use this solution as the sample solution. Separa
tely, weigh accurately about 50 mg of distigmine bromide for assay (separately, determine the water <2.48% in the same manner as Distigmine Bromide), and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add water to make exactly 500 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry 2.24, and determine the absorbances, A₁₁ and A₃₁, at 270 nm, and A₁₂ and A₃₂, at 350 nm.

Dissolution rate (%) with respect to the labeled amount of distigmine bromide (C₂₂H₃₂Br₂N₄O₄) = M₅ × (A₁₂₂ − A₁₁)/(Aₛ₂ − Aₛ₁) × V’/V × 1/C × 10

M₅: Amount (mg) of distigmine bromide for assay, calculated on the anhydrous basis

C: Labeled amount (mg) of distigmine bromide (C₂₂H₃₂Br₂N₄O₄) in 1 tablet

**Assay** Weigh accurately and powder not less than 20 tablets of Distigmine Bromide Tablets. Weigh accurately a portion of the powder, equivalent to about 15 mg of Distigmine Bromide (C₂₂H₃₂Br₂N₄O₄), add 30 mL of 0.1 mol/L hydrochloric acid TS, shake for 1 hour, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and filter. Discard the first 20 mL of the filtrate, pipet 10 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of distigmine bromide for assay (previously determine the water <2.48% in the same manner as Distigmine Bromide), and dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 10 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances of the sample solution and standard solution, A₁₂ and A₃₂, at 270 nm and, A₁₁ and A₃₁, at 241 nm as directed under Ultraviolet-visible Spectrophotometry 2.24, respectively.

Amount (mg) of distigmine bromide (C₂₂H₃₂Br₂N₄O₄) = M₅ × (A₁₂₂ − A₁₁)/(Aₛ₂ − Aₛ₁) × 1/2

M₅: Amount (mg) of distigmine bromide for assay, calculated on the anhydrous basis

**Containers and storage** Containers—Tight containers.

**Disulfiram**

ジスルフィラム

\[
\text{C}_{10}\text{H}_{20}\text{N}_{2}\text{S}_{4}: 296.54
\]

Tetraethylthiuram disulfide [97-77-8]

Disulfiram, when dried, contains not less than 99.0% of C₁₀H₂₀N₂S₄.

**Description** Disulfiram occurs as white to yellowish white crystals or crystalline powder. It is freely soluble in acetone and in toluene, sparingly soluble in methanol and in ethanol (95), and practically insoluble in water.

**Identification** (1) Determine the absorption spectrum of a solution of Disulfiram in ethanol (95) (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Disulfiram, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry 2.24, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60° 70 – 73°C

**Purity** (1) Heavy metals <1.07—Proceed with 2.0 g of Disulfiram according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Arsenic <1.17—Prepare the test solution with 1.0 g of Disulfiram according to Method 4, and perform the test (not more than 2 ppm).

(3) Diethylthiocarbamic acid—Dissolve 0.10 g of Disulfiram in 10 mL of toluene, and shake with 10 mL of diluted sodium carbonate TS (1 in 20). Discard the toluene layer, wash the water layer with 10 mL of toluene, shake with 5 drops of a solution of cupric sulfate (1 in 250) and 2
mL of toluene, and allow to stand: no light yellow color develops in the toluene layer.

(4) Related substances—Dissolve 50 mg of Disulfiram in 40 mL of methanol, add water to make 50 mL, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and the standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the total area of the peaks other than the peak of disulfiram from the sample solution is not larger than the peak area of disulfiram from the standard solution.

**Operating conditions**—
Detector: An ultraviolet absorption photometer (wavelength: 210 nm).
Column: A stainless steel column about 5 mm in inside diameter and about 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of methanol and water (7:3).
Flow rate: Adjust the flow rate so that the retention time of disulfiram is about 8 minutes.
Selection of column: Dissolve 50 mg of Disulfiram and 50 mg of benzenophenone in 40 mL of methanol, and add water to make 50 mL. To 1 mL of this solution add the mobile phase to make 200 mL. Proceed with 10 μL of this solution under the above operating conditions, and calculate the resolution. Use a column giving elution of benzenophenone and disulfiram in this order with the resolution between these peaks being not less than 4.
Detection sensitivity: Adjust the detection sensitivity so that the peak height of disulfiram obtained from 10 μL of the standard solution is 15–30 mm.

Time span of measurement: About 3.5 times of the retention time of disulfiram.

**Loss on drying** <2.41> Not more than 0.20% (2 g, silica gel, 24 hours).

**Residue on ignition** <2.44> Not more than 0.1% (2 g).

**Assay** Weigh accurately about 0.2 g of Disulfiram, previously dried, in an iodine bottle, dissolve in 20 mL of acetone, add 1.5 mL of water and 1.0 g of potassium iodide, and dissolve by shaking thoroughly. To this solution add 3.0 mL of hydrochloric acid, stopper the bottle tightly, shake, and allow to stand in a dark place for 3 minutes. Add 70 mL of water, and titrate <2.50> with 0.1 mol/L sodium thiosulfate VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L sodium thiosulfate VS = 14.83 mg of C₁₀H₂₀N₂S₄

**Containers and storage** Containers—Tight containers.

---

**Dobutamine Hydrochloride**

**ドブタミン塩酸塩**

C₁₈H₂₃NO₃.HCl: 337.84
4-[2-[(1RS)-3-(4-Hydroxyphenyl)-1-methylpropylamino]ethyl]benzene-1,2-diol monohydrochloride [49745-95-1]

Dobutamine Hydrochloride, when dried, contains not less than 98.0% of C₁₈H₂₃NO₃.HCl.

**Description** Dobutamine Hydrochloride occurs as white to very pale orange crystalline powder or grains. It is freely soluble in methanol, sparingly soluble in water and in ethanol (95), and practically insoluble in diethyl ether.

A solution of Dobutamine Hydrochloride (1 in 100) shows no optical rotation.

**Identification** (1) Determine the infrared absorption spectra of Dobutamine Hydrochloride, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Dobutamine Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) A solution of Dobutamine Hydrochloride (1 in 50) responds to the Qualitative Tests <1.09> (2) for chloride.

**pH** <2.54> Dissolve 1.0 g of Dobutamine Hydrochloride in 100 mL of water: the pH of this solution is between 4.0 and 5.5.

**Melting point** <2.60> 188–191°C

**Purity** (1) Clarity and color of solution—Dissolve 0.5 g of Dobutamine Hydrochloride in 30 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.67>—Dissolve 1.0 g of Dobutamine Hydrochloride in 40 mL of water by warming, cool, and add 2 mL of dilute acetic acid and water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 2.0 mL of Standard Lead Solution add water to make 50 mL (not more than 20 ppm).

(3) Related substances—Dissolve 0.10 g of Dobutamine Hydrochloride in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>.

**Related substances**—Dissolve 10 mL of each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol and formic acid (78:22:5) to a distance of about 12 cm, and air-dry the plate. Allow the plate to stand for 5 minutes in iodine vapor: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.
Loss on drying \(<2.4\)% Not more than 0.30% (1 g, 105°C, 3 hours).

Residue on ignition \(<2.4\)% Not more than 0.1% (1 g).

Assay Weigh accurately about 0.1 g each of Dobutamine Hydrochloride and Dobutamine Hydrochloride RS, each previously dried, dissolve separately in exactly 10 mL of the internal standard solution, add diluted methanol (1 in 2) to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 5 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\)> according to the following conditions, and calculate the ratios, \(Q_T\) and \(Q_S\), of the peak area of dobutamine to that of the internal standard, respectively.

\[
\text{Amount (mg) of } C_{18}H_{23}NO_3\cdot HCl = M_S \times \frac{Q_T}{Q_S}
\]

\(M_S\): Amount (mg) of Dobutamine Hydrochloride RS

Internal standard solution—A solution of salicylamide in diluted methanol (1 in 2) (1 in 125).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.0 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (7 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of tartrate buffer solution, pH 3.0 and methanol (7:3).

Flow rate: Adjust the flow rate so that the retention time of dobutamine is about 7 minutes.

**System suitability—**

System performance: When the procedure is run with 5 \(\mu\)L of the standard solution under the above operating conditions, dobutamine and internal standard are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 5 \(\mu\)L of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of dobutamine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

---

**Domperidone**

\(\text{C}_{22}\text{H}_{24}\text{ClN}_5\text{O}_2\): 425.91

5-Chloro-1-[1-[3-(2-oxo-2,3-dihydro-1H-benzoimidazol-1-yl)propyl]piperidin-4-yl]-1,3-dihydro-2H-benzoimidazol-2-one

[57808-66-9]

Domperidone, when dried, contains not less than 99.0% and not more than 101.0% of \(\text{C}_{22}\text{H}_{24}\text{ClN}_5\text{O}_2\).

**Description** Domperidone occurs as a white to pale yellow, crystalline powder or powder.

It is freely soluble in acetic acid (100), slightly soluble in methanol and in ethanol (99.5), very slightly soluble in 2-propanol, and practically insoluble in water.

Melting point: about 243°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Domperidone in a mixture of 2-propanol and 0.1 mol/L hydrochloric acid TS (9:1) (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Related substances**—Dissolve 30 mg of Domperidone in 100 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 \(\mu\)L of each of the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\>\) according to the following conditions, and determine each peak area of each solution by the automatic integration method: the area of each peak other than domperidone obtained from the sample solution is not larger than 1/2 times the peak area of domperidone from the standard solution. Furthermore, the total area of the peaks other than domperidone is not larger than the peak area of domperidone from the standard solution.

**Purity (1)** Heavy metals \(<1.07\>—Proceed with 2.0 g of Domperidone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wave-
Donepezil Hydrochloride

\[ \text{C}_{24}\text{H}_{29}\text{NO}_3\cdot\text{HCl}; 415.95] \\
(2RS)-2-\{(1-Benzylpiperidin-4-yl)methyl\}-5,6-dimethoxy-2,3-dihydro-1H-inden-1-one monohydrochloride

\[120011-70-3]\

Donepezil Hydrochloride contains not less than 98.0% and not more than 102.0% of \( \text{C}_{24}\text{H}_{29}\text{NO}_3\cdot\text{HCl} \), calculated on the anhydrous basis.

**Description**

Donepezil Hydrochloride occurs as a white crystalline powder.

It is soluble in water, and slightly soluble in ethanol (99.5).

A solution of Donepezil Hydrochloride (1 in 100) shows no optical rotation.

**Identification (1)**

Determine the absorption spectrum of a solution of Donepezil Hydrochloride (1 in 50,000) as directed in Ultraviolet-visible Spectrophotometry \(2.24\), and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Donepezil Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

Determine the infrared absorption spectrum of Donepezil Hydrochloride as directed in the potassium bromide disk method under Infrared Spectrophotometry \(2.25\), and compare the spectrum with the Reference Spectrum or the spectrum of Donepezil Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, recrystallize the sample and the RS according to the method otherwise specified, filter and dry the crystals, and perform the test with the crystals.

A solution of Donepezil Hydrochloride (1 in 50) responds to the Qualitative Tests \(1.09\) (2) for chloride.

**Purity (1)**

Heavy metals \(1.07\)—To 1.0 g of Donepezil Hydrochloride in a porcelain or platinum crucible add 5 mL of sulfuric acid, incinerate by heating gradually, then incinerate by ignition between 500 and 600°C. If a carbonized residue still retains, moisten the residue with a little amount of sulfuric acid, and incinerate again by ignition between 500 and 600°C. After cooling, dissolve the residue with 3 mL of hydrochloric acid, then evaporate to dryness on a water bath or hot plate, and dissolve the residue with 10 mL of water by warming. Then, proceed as directed in Method 4, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

Related substances—Dissolve 50 mg of Donepezil Hydrochloride in 25 mL of the mobile phase. To 10 mL of this solution add the mobile phase to make 50 mL, and use this solution as the sample solution. Pipet 2 mL of the sample solution, and add the mobile phase to make exactly 100 mL. Pipet 5 mL of this solution, add the mobile phase to
make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than donepezil obtained from the sample solution is not larger than the peak area of donepezil from the standard solution.

Operating conditions —
Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of donepezil, beginning after the solvent peak.

System suitability —
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

Containers and storage — Containers—Well-closed containers.

**Donepezil Hydrochloride Fine Granules**

Donepezil Hydrochloride Fine Granules contain not less than 95.0% and not more than 105.0% of the labeled amount of donepezil hydrochloride (C_{24}H_{29}NO_{3}.HCl: 415.95).

Method of preparation — Prepare as directed under Granules, with Donepezil Hydrochloride.

Identification — To 2.5 mL of the sample solution obtained in the Assay add water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits maxima between 228 nm and 232 nm, between 269 nm and 273 nm, and between 313 nm and 317 nm.

Uniformity of dosage units — Perform the test according to the following method: the Donepezil Hydrochloride Fine Granules in single-unit containers meet the requirement of the Content uniformity test.

To the total amount of the content of 1 container of Donepezil Hydrochloride Fine Granule add exactly V mL of 0.1 mol/L hydrochloric acid TS so that each mL contains about 0.2 mg of donepezil hydrochloride (C_{24}H_{29}NO_{3}.HCl), disperse the particles with the aid of ultrasonic waves with occasional shaking, and treat with ultrasonic waves for a further 10 minutes. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg each of Donepezil Hydrochloride and Donepezil Hydrochloride RS (separately determine the water <2.48> in the same manner as Donepezil Hydrochloride); dissolve them in the mobile phase to make exactly 25 mL. Pipet 10 mL each of these solutions, add the mobile phase to make exactly 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the donepezil peak areas, A_F and A_S, of both solutions.

Amount (mg) of donepezil hydrochloride (C_{24}H_{29}NO_{3}.HCl) = M_S × A_F/A_S

M_S: Amount (mg) of Donepezil Hydrochloride RS, calculated on the anhydrous basis

Operating conditions —
Detector: An ultraviolet absorption photometer (wavelength: 271 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeccysilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 35°C.
Mobile phase: Dissolve 2.5 g of sodium 1-decansulfonate in 650 mL of water, and add 350 mL of acetonitrile and 1 mL of perchloric acid.
Flow rate: Adjust the flow rate so that the retention time of donepezil is about 11 minutes.

System suitability —
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.
System suitability—

System performance: When the procedure is run with 20 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 4000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

**Dissolution**

When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of 2nd fluid for dissolution test as the dissolution medium, the dissolution rate in 15 minutes of Donepezil Hydrochloride Fine Granules is not less than 80%.

Start the test with an accurately weighed amount of Donepezil Hydrochloride Fine Granules, equivalent to about 3 mg of donepezil hydrochloride \( (C_{24}H_{29}NO_3.HCl) \) according to the labeled amount, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 \( \mu m \). Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 55 mg of Donepezil Hydrochloride RS (separately determine the water \(< 2.48% \) in the same manner as Donepezil Hydrochloride), and dissolve in a mixture of methanol and 0.1 mol/L hydrochloric acid (3:1) to make exactly 50 mL. Pipet 3 mL of this solution, add the dissolution medium to make exactly 50 mL. Pipet 5 mL of this solution, add the dissolution medium at the specified minute after starting the test, and treat with ultrasonic waves with occasional shaking, and treat with ultrasonic waves for a further 15 minutes. Add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of Donepezil Hydrochloride RS (separately determine the water \(< 2.48% \) in the same manner as Donepezil Hydrochloride), and dissolve in a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) to make exactly 25 mL. Pipet 10 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography \(< 2.07% \) according to the following conditions, and determine the peak areas, \( A_1 \) and \( A_3 \), of donepezil from each solution.

Amount (mg) of donepezil hydrochloride \( (C_{24}H_{29}NO_3.HCl) \) = \( \frac{M_S \times A_1}{A_3} \times \frac{1/C}{27/5} \)

**Operating conditions**

Detector, column, and column temperature: Proceed as directed in the operating conditions in the Assay under Donepezil Hydrochloride.

Mobile phase: A mixture of water, acetonitrile and perchloric acid (650:350:1).

Flow rate: Adjust the flow rate so that the retention time of donepezil is about 4 minutes.

System suitability—

System performance: When the procedure is run with 50 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 50 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

**Particle size**

It meets the requirements of Fine granules.

**Assay**

Powder Donepezil Hydrochloride Fine Granules, if necessary. Weigh accurately a portion of the powder, equivalent to about 20 mg of donepezil hydrochloride \( (C_{24}H_{29}NO_3.HCl) \), add 30 mL of 0.1 mol/L hydrochloric acid TS, disperse into the fine particles with the aid of ultrasonic waves with occasional shaking, and treat with ultrasonic waves for a further 15 minutes. Add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of Donepezil Hydrochloride RS (separately determine the water \(< 2.48% \) in the same manner as Donepezil Hydrochloride), and dissolve in a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) to make exactly 25 mL. Pipet 10 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography \(< 2.07% \) according to the following conditions, and determine the peak areas, \( A_1 \) and \( A_3 \), of donepezil from each solution.

Amount (mg) of donepezil hydrochloride \( (C_{24}H_{29}NO_3.HCl) \) = \( \frac{M_S \times A_1}{A_3} \times \frac{1/C}{27/5} \)

**Operating conditions**

Proceed as directed in the operating conditions in the Assay under Donepezil Hydrochloride.

**System suitability**

System performance: When the procedure is run with 20 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

**Containers and storage**

Containers—Well-closed containers.

Storage—Light-resistant.

**Donepezil Hydrochloride Tablets**

Donepezil Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of donepezil hydrochloride \( (C_{24}H_{29}NO_3.HCl) = 415.95 \) g.

**Method of preparation**

Prepare as directed under Tablets, with Donepezil Hydrochloride.

**Identification**

To 2.5 mL of the sample solution obtained in the Assay add water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultravi-
Uniformity of dosage units (6.02) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Donepezil Hydrochloride Tablets add exactly \( V \) mL of a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) so that each mL contains about 0.2 mg of donepezil hydrochloride (C\(_{24}\)H\(_{29}\)NO\(_3\)HCl), disperse with the aid of ultrasonic waves. Shake until the tablet is disintegrated, and treat with ultrasonic waves for a further 10 minutes. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of Donepezil Hydrochloride RS (separately, determine the water (2.48) in the same manner as Donepezil Hydrochloride), dissolve in a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) to make exactly 50 mL. Pipet 5 mL of this solution, add a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) to make exactly 25 mL, and use this solution as the standard solution. Perform the test with exactly 20 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and determine the donepezil peak areas, \( A_T \) and \( A_S \), of both solutions.

Amount (mg) of donepezil hydrochloride (C\(_{24}\)H\(_{29}\)NO\(_3\)HCl) = \( M_S \times A_T/A_S \times V/250 \)

\( M_S \) : Amount (mg) of Donepezil Hydrochloride RS, calculated on the anhydrous basis

Operating conditions —
Proceed as directed in the operating conditions in the Assay under Donepezil Hydrochloride.

System suitability —
System performance: When the procedure is run with 20 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 4000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

Assay Accurately weigh the mass of not less than 20 Donepezil Hydrochloride Tablets and powder. Weigh accurately a portion of the powder, equivalent to about 20 mg of donepezil hydrochloride (C\(_{24}\)H\(_{29}\)NO\(_3\)HCl), add 30 mL of a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1), disperse with the aid of ultrasonic waves, and add a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) to make exactly 50 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 50 mg of Donepezil Hydrochloride RS (separately, determine the water (2.48) in the same manner as Donepezil Hydrochloride), dissolve in a mixture of methanol and 0.1 mol/L hydrochloric acid TS (3:1) to make exactly 50 mL. Pipet 5 mL of this solution, and add the dissolution medium to make exactly 50 mL. Further, pipet 3 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 \( \mu \)L each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of donepezil from each solution.

Dissolution rate (%) with respect to the labeled amount of donepezil hydrochloride (C\(_{24}\)H\(_{29}\)NO\(_3\)HCl) = \( M_S \times A_T/A_S \times V/V \times 1/C \times 27/5 \)

\( M_S \) : Amount (mg) of Donepezil Hydrochloride RS, calculated on the anhydrous basis

C: Labeled amount (mg) of donepezil hydrochloride (C\(_{24}\)H\(_{29}\)NO\(_3\)HCl) in 1 tablet

Operating conditions —
Detector, column, and column temperature: Proceed as directed in the operating conditions in the Assay under Donepezil Hydrochloride.

Mobil phase: A mixture of water, acetonitrile and perchloric acid (650:350:1). Flow rate: Adjust the flow rate so that the retention time of donepezil is about 4 minutes.

System suitability —
System performance: When the procedure is run with 50 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 50 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

System performance: When the procedure is run with 50 \( \mu \)L of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 50 \( \mu \)L of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.
Operating conditions—

Proceed as directed in the operating conditions in the Assay under Donepezil Hydrochloride.

System suitability—

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of donepezil are not less than 5000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of donepezil is not more than 1.0%.

Containers and storage  Containers—Well-closed containers.

Dopamine Hydrochloride

Dopamine Hydrochloride Injection

Dopamine Hydrochloride injection is an aqueous solution for injection. It contains not less than 97.0% and not more than 103.0% of the labeled amount of dopamine hydrochloride (C₈H₁₁NO₂.HCl: 189.64).

Method of preparation  Prepare as directed under Injections, with Dopamine Hydrochloride.

Description  Dopamine Hydrochloride Injection occurs as a clear, colorless liquid.

Identification  To a volume of Dopamine Hydrochloride Injection, equivalent to 0.04 g of Dopamine Hydrochloride according to the labeled amount, add 0.1 mol/L hydrochloric acid TS to make 100 mL. To 5 mL of this solution add 0.1 mol/L hydrochloric acid TS to make 50 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits a maximum between 278 nm and 282 nm.

pH  <2.54>  3.0 – 5.0

The total content of Donepezil Hydrochloride in the sample is not less than 97.0% of the labeled amount. The total content of dopamine hydrochloride is not more than 1.0% of the labeled amount.

Containers and storage  Containers—Well-closed containers.

Loss on drying  <7.2.4>  Not more than 0.5% (1 g, 105°C, 3 hours).

Residue on ignition  <7.4.4>  Not more than 0.1% (1 g).

The solution is clear and colorless.
Bacterial endotoxins <4.0I> Less than 4.2 EU/mg.

Extractable volume <6.0I> It meets the requirement.

Foreign insoluble matter <6.0I> Perform the test according to Method 1; it meets the requirement.

Insoluble particulate matter <6.0I> It meets the requirement.

Sterility <4.0I> Perform the test according to the Membrane filtration method; it meets the requirement.

Assay To an exact volume of Dopamine Hydrochloride Injection, equivalent to about 30 mg of dopamine hydrochloride (C8H11NO2.HCl), add the mobile phase to make exactly 50 mL. Pipet 2.5 mL of this solution, add exactly 2.5 mL of the internal standard solution and the mobile phase to make 20 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of dopamine hydrochloride for assay, previously dried at 105°C for 3 hours, dissolve in the mobile phase to make exactly 50 mL. Pipet 2.5 mL of this solution, add exactly 2.5 mL of the internal standard solution and the mobile phase to make 20 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.0I> according to the following conditions, and calculate the ratios, Qs and Qs5, of the peak area of dopamine to that of the internal standard.

\[ Q_s = \frac{A_s}{A_{s5}} \]

Amount (mg) of dopamine hydrochloride (C8H11NO2.HCl) = \( M_s \times Q_s/Q_{s5} \)

\( M_s \): Amount (mg) of dopamine hydrochloride for assay

Internal standard solution—A solution of uracil in the mobile phase (3 in 10,000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Disodium hydrogen phosphate-citric acid buffer solution, pH 3.0.

Flow rate: Adjust the flow rate so that the retention time of dopamine is about 10 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and dopamine are eluted in this order with the resolution between these peaks being not less than 10.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of peak area of dopamine to that of the internal standard is not more than 1.0%.

Containers and storage—Containers—Hermetic containers.

Plastic containers for aqueous injections may be used.

Doxapram Hydrochloride Hydrate

Doxapram Hydrochloride Hydrate contains not less than 98.0% of doxapram hydrochloride (C24H30N2O2.HCl: 414.97), calculated on the anhydrous basis.

Description Doxapram Hydrochloride Hydrate occurs as white crystals or crystalline powder.

It is freely soluble in methanol and in acetic acid (100), sparingly soluble in water, in ethanol (95) and in acetic anhydride, and practically insoluble in diethyl ether.

Identification (1) Determine the absorption spectrum of a solution of Doxapram Hydrochloride Hydrate (1 in 2500) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Doxapram Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Doxapram Hydrochloride Hydrate (1 in 50) responds to the Qualitative Tests <1.0I> for chloride.

pH <2.5I> Dissolve 1.0 g of Doxapram Hydrochloride Hydrate in 50 mL of water: the pH of this solution is between 3.5 and 5.0.

Melting point <2.6I> 218 – 222°C

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Doxapram Hydrochloride Hydrate in 50 mL of water: the solution is clear and colorless.

(2) Sulfate <1.14I>—Perform the test with 1.0 g of Doxapram Hydrochloride Hydrate. Prepare the control solution with 0.50 mL of 0.005 mol/L sulfuric acid VS (not more than 0.024%).

(3) Heavy metals <1.0I>—Proceed with 2.0 g of Doxapram Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Arsenic <1.1I>—Prepare the test solution with 1.0 g of Doxapram Hydrochloride Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.5 g of Doxapram Hydrochloride Hydrate in 10 mL of methanol, and use this so-
lution as the sample solution. Pipet 3 mL of the sample solution, and add methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography (2.03). Spot 6 µL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, formic acid, ethyl formate and methanol (8:3:3:2) to a distance of about 10 cm, and air-dry the plate. Allow the plate to stand in iodine vapor: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Water <2.48> 3.5 - 4.5% (0.5 g, volumetric titration, direct titration).

Residue on ignition <2.44> Not more than 0.3% (1 g).

**Assay** Weigh accurately about 0.8 g of Doxapram Hydrochloride Hydrate, dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3), and titrate with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 41.50 mg of C₂₄H₃₀N₂O₂.HCl

**Containers and storage** Containers—Tight containers.

**Doxazosin Mesilate**

Doxazosin Mesilate, when dried, contains not less than 98.0% and not more than 102.0% of C₂₃H₂₅N₅O₅.CH₄O₃S.

**Description** Doxazosin Mesilate occurs as a white to yellowish white crystalline powder. It is freely soluble in dimethylsulfoxide, slightly soluble in water and in methanol, and very slightly soluble in ethanol (99.5%).

A solution of Doxazosin Mesilate in dimethylsulfoxide solution (1 in 20) shows no optical rotation.

Melting point: about 272°C (with decomposition).

**Identification (1)** Determine the absorption spectrum of a solution of Doxazosin Mesilate in 0.01 mol/L hydrochloric acid-methanol TS (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.26>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Doxazosin Mesilate RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Doxazosin Mesilate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.27>, and compare the spectrum with the Reference Spectrum or the spectrum of Doxazosin Mesilate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) 30 mg of Doxazosin Mesilate responds to the Qualitative Tests <1.09> (2) for mesilate.

**Purity (1)** Heavy metals <1.07>—Proceed with 1.0 g of Doxazosin Mesilate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 20 mg of Doxazosin Mesilate in 5 mL of a mixture of methanol and acetic acid (100) (1:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of methanol and acetic acid (100) (1:1) to make exactly 100 mL. Pipet 5 mL of this solution, add a mixture of methanol and acetic acid (100) (1:1) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with an upper layer of a mixture, prepared by adding 1 volume of water and 1 volume of acetic acid (100) to 2 volumes of 4-methyl-2-pentanone and shaking, to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spot at the Rf value about 0.15 obtained from the sample solution is not more intense than the spot from the standard solution, and no spots other than the principal spot and other than the spots mentioned above appear from the sample solution.

(3) Residual solvent—Being specified separately.

**Loss on drying <2.41>** Not more than 1.0% (1 g, 105°C, 4 hours).

**Residue on ignition <2.44>** Not more than 0.2% (1 g).

**Assay** Weigh accurately about 25 mg each of Doxazosin Mesilate and Doxazosin Mesilate RS, previously dried, dissolve separately in methanol to make exactly 50 mL. Pipet 3 mL each of these solutions, add the mobile phase to make exactly 100 mL. Pipet 5 µL of this solution, add a mixture of methanol and acetic acid (100) (1:1) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas, A₁ and A₃, of doxazosin in each solution.

Amount (mg) of doxazosin mesilate (C₂₃H₂₅N₅O₅.CH₄O₃S) = M₅ × A₁/A₃

M₅: Amount (mg) of Doxazosin Mesilate RS

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 246 nm).

Column: A stainless steel column 3.9 mm in inside diameter and 15 cm in length, packed with octadecysiliclanized silica
gel for liquid chromatography (4 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of 0.05 mol/L potassium dihydrogen phosphate TS, pH 3.0, methanol and acetonitrile (12:8:3).

Flow rate: Adjust the flow rate so that the retention time of doxazosin is about 5 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of doxazosin are not less than 2000 and not more than 2.0, respectively.

System repeatability: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doxazosin is not more than 1.0%.

Containers and storage  Containers—Tight containers.

Doxazosin Mesilate Tablets

Dokisyosun Mesumeshi Akusatai

Doxazosin Mesilate Tablets contain not less than 95.0% and not more than 105.0% of doxazosin (C23H25N5O5): 451.48.

Method of preparation  Prepare as directed under Tablets, with Doxazosin Mesilate.

Identification  To a quantity of powdered Doxazosin Mesilate Tablets, equivalent to 5 mg of doxazosin (C23H25N5O5) according to the labeled amount, add 100 mL of 0.01 mol/L hydrochloric acid-methanol TS, shake vigorously, and centrifuge. To 4 mL of the supernatant liquid add 0.01 mol/L hydrochloric acid-methanol TS to make 50 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 244 nm and 248 nm.

Uniformity of dosage units <6.02>  Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Doxazosin Mesilate Tablets add 1 mL of water, disintegrate the tablet by shaking, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL, and shake for 30 minutes. Centrifuge, pipet 5 mL of the supernatant liquid, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 10 mL so that each mL contains about 5 μg of doxazosin (C23H25N5O5), and use this solution as the sample solution. Separately, weigh accurately about 30 mg of Doxazosin Mesilate RS, previously dried at 105°C for 4 hours, and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution, add methanol to make exactly 50 mL. Then, pipet 2 mL of this solution, add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of methanol, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography: it exhibits a maximum between 244 nm and 248 nm.

Dissolution <6.10>  When the test is performed at 75 revolutions per minute according to the Paddle method, using 900 mL of 0.05 mol/L acetic acid-sodium acetate buffer solution, pH 4.0 as the dissolution medium, the dissolution rate in 15 minutes of Doxazosin Mesilate Tablets is not less than 75%.

Start the test with 1 tablet of Doxazosin Mesilate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, and add the dissolution medium to make exactly 5 mL so that each mL contains about 0.56 μg of doxazosin (C23H25N5O5) according to the labeled amount. Pipet 5 mL of this solution, add exactly 5 mL of methanol, and use this solution as the sample solution. Separately, weigh accurately about 21 mg of Doxazosin Mesilate RS, previously dried at 105°C for 4 hours, and dissolve in methanol to make exactly 50 mL. Pipet 2 mL of this solution, add methanol to make exactly 50 mL. Then, pipet 2 mL of this solution, add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the dissolution medium, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography: it exhibits a maximum between 244 nm and 248 nm.

Operating conditions—

Detector: An ultraviolet absorption spectrophotometer (wavelength: 246 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 3.4 g of potassium dihydrogen phosphate in 500 mL of water, and adjust to pH 3.0 with diluted phosphoric acid (1 in 10). To 450 mL of this solution add 550 mL of methanol.

Flow rate: Adjust the flow rate so that the retention time of doxazosin is about 5 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of doxazosin are not less than 2000 and not more than 2.0, respectively.

System repeatability: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doxazosin is not more than 2.0%.

Assay  Weigh accurately the mass of not less than 20 Doxazosin Mesilate Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 5 mg of doxazosin (C23H25N5O5), add 0.01 mol/L hydrochloric acid-
methanol TS to make exactly 100 mL, and stir for 30 minutes. Centrifuge, pipet 4 mL of the supernatant liquid, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 24 mg of Doxazosin Mesilate RS, previously dried at 105°C for 4 hours, dissolve in 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL. Pipet 2 mL of this solution, add 0.01 mol/L hydrochloric acid-methanol TS to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \( A_T \) and \( A_S \), of the sample solution and standard solution at 246 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
\text{Amount (mg) of doxazosin (C}_{23}\text{H}_{32}\text{N}_{2}\text{O}_{3}) = \frac{M_S \times A_T/A_S}{1/4 \times 0.825}
\]

**Doxifluridine**

Doキシフルリジン

\[
\text{C}_{9}\text{H}_{11}\text{FN}_{2}\text{O}_{5}: 246.19
\]

5'-Deoxy-5-fluorouridine

\[\text{C}_9\text{H}_{10}\text{FN}_{2}\text{O}_5 \cdot \text{H}_{2}\text{O} \quad \text{M}: \text{293.25} \]

Doxifluridine, when dried, contains not less than 98.5% and not more than 101.0% of \( \text{C}_9\text{H}_{11}\text{FN}_{2}\text{O}_5 \).

**Description**

Doxifluridine occurs as a white crystalline powder.
It is freely soluble in \( \text{N},\text{N}-\text{dimethylformamide} \), soluble in water and in methanol, and slightly soluble in ethanol (99.5).
It dissolves in 0.1 mol/L hydrochloric acid TS and in 0.01 mol/L sodium hydroxide TS.
Melting point: about 191°C (with decomposition).

**Identification**

(1) Determine the absorption spectrum of a solution of Doxifluridine in 0.1 mol/L hydrochloric acid TS (1 in 50,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Doxifluridine, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** <2.4> \([\alpha]_{\text{D}}^20 +160 – +174^\circ\) (after drying, 0.1 g, water, 10 mL, 100 mm).

\( \text{PH} <2.54> \) The pH of a solution obtained by dissolving 0.10 g of Doxifluridine in 10 mL of water is between 4.2 and 5.2.

**Purity** (1) Fluoride—Dissolve 0.10 g of Doxifluridine in 10.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20). Transfer 5.0 mL of this solution into a 20-mL volumetric flask, add 5 mL of a mixture of acetone and lanthanum-alizarin complexone TS (2:1) and water to make 20 mL, allow to stand for 1 hour, and use this solution as the sample solution. Separately, put 1.0 mL of Standard Fluorine Solution in a 20-mL volumetric flask, add 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) and 5 mL of the mixture of acetone and alizarin complexone TS (2:1), then proceed in the same manner as for preparation of the sample solution, and use the solution so obtained as the standard solution. Determine the absorbances, \( A_T \) and \( A_S \), of the sample solution and standard solution at 620 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using a solution obtained in the same way with 5.0 mL of diluted 0.01 mol/L sodium hydroxide TS (1 in 20) as a blank: \( A_T \) is not larger than \( A_S \).

(2) Chloride <1.03>—Perform the test with 0.30 g of Doxifluridine. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.035%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Doxifluridine according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Related substances—Dissolve 20 mg of Doxifluridine in 2 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 25 mL. Pipet 5 mL of this solution, add methanol to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 \( \mu L \) each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid (100) and water (17:2:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the number of the spot other than the principal spot with the sample solution is not more than three, and they are not more intense than the spot with the standard solution.

**Loss on drying** <2.4> Not more than 0.5% (1 g, 105°C, 4 hours).

**Residue on ignition** <2.4> Not more than 0.1% (1 g, platinum crucible).

**Assay**
Weigh accurately about 0.25 g of Doxifluridine, previously dried, dissolve in 50 mL of \( \text{N},\text{N}-\text{dimethylformamide} \) and titrate <2.30> with 0.1 mol/L tetramethylammonium hydroxide VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.
Each mL of 0.1 mol/L tetramethylammonium hydroxide VS = 24.62 mg of \( \text{C}_9\text{H}_{11}\text{FN}_{2}\text{O}_5 \).

**Containers and storage**
Containers—Tight containers.
Doxifluridine Capsules

Doxifluridine Capsules contain not less than 95.0% and not more than 105.0% of doxifluridine (C9H11FN2O5: 246.19).

Method of preparation  Prepare as directed under Capsules, with Doxifluridine.

Identification  (1)  Dissolve an amount of the contents of Doxifluridine Capsules, equivalent to 20 mg of Doxifluridine according to the labeled amount, in 0.1 mol/L hydrochloric acid TS to make 100 mL, and filter. To 1 mL of the filtrate add 0.1 mol/L hydrochloric acid TS to make 20 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using 0.1 mol/L hydrochloric acid TS as the blank: it exhibits a maximum between 267 nm and 271 nm.

(2)  To an amount of powdered contents of Doxifluridine Capsules, equivalent to 20 mg of Doxifluridine according to the labeled amount, add 2 mL of methanol, shake, centrifuge, and use the supernatant liquid as the sample solution. Separately, dissolve 20 mg of doxifluridine in 2 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid (100) and water (17:2:1) to a distance of about 12 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the principal spot with the sample solution and standard solution show a dark purple color and the f values are the same.

Uniformity of dosage units  <6.02>  It meets the requirements of the Mass variation test.

Dissolution  <6.10>  When the test is performed at 50 revolutions per minute according to the Paddle method using the sinker, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Doxifluridine Capsules is not less than 85%.

Start the test with 1 capsule of Doxifluridine Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet the subsequent V mL, add water to make exactly V mL so that each mL contains about 13 μg of doxifluridine (C9H11FN2O5) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 26 mg of doxifluridine for assay, previously dried at 105°C for 4 hours, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A1 and A3, of the sample solution and standard solution at 269 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>.

Dissolution rate (%) with respect to the labeled amount of doxifluridine (C9H11FN2O5)

\[ M_S \times \frac{A_1}{A_S} \times \frac{V}{V'} \times \frac{1}{C} \times 45 \]

M_S: Amount (mg) of doxifluridine for assay
C: Labeled amount (mg) of doxifluridine (C9H11FN2O5) in 1 capsule

Assay  Weigh accurately the mass and powder the contents of not less than 20 Doxifluridine Capsules. Weigh accurately a portion of the powder, equivalent to about 50 mg of doxifluridine (C9H11FN2O5), add 40 mL of water, shake for about 10 minutes, add water to make exactly 50 mL, and filter. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add exactly 10 mL of the internal standard solution, then add a mixture of water and methanol (5:3) to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of doxifluridine for assay, previously dried at 105°C for 4 hours, and dissolve in water to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 10 mL of the internal standard solution, then add the mixture of water and methanol (5:3) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and calculate the ratios, Q1 and Q5, of the peak height of doxifluridine to that of the internal standard.

Amount (mg) of doxifluridine (C9H11FN2O5)

\[ M_S \times \frac{Q_1}{Q_5} \]

M_S: Amount (mg) of doxifluridine for assay

Internal standard solution—A solution of anhydrous caffeine (1 in 1000).

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 6 mm in inside diameter and 15 cm in length, packed with octadeclsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: A mixture of water and methanol (13:7).
Flow rate: Adjust the flow rate so that the retention time of doxifluridine is about 2.5 minutes.

System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, doxifluridine and the internal standard are eluted in this order with the resolution between these peaks being not less than 5.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak height of doxifluridine to that of the internal standard is not more than 1.0%.

Containers and storage  Containers—Tight containers.
Doxorubicin Hydrochloride

Doxorubicin Hydrochloride is the hydrochloride of a derivative of daunorubicin.

It contains not less than 980 μg (potency) and not more than 1080 μg (potency) per mg, calculated on the anhydrous basis. The potency of Doxorubicin Hydrochloride is expressed as mass (potency) of doxorubicin hydrochloride (C27H29NO11.HCl).

**Description**

Doxorubicin Hydrochloride occurs as a red-orange crystalline powder.

It is sparingly soluble in water, slightly soluble in methanol, very slightly soluble in ethanol (99.5), and practically insoluble in acetone.

**Identification** (1) Determine the absorption spectrum of a solution of Doxorubicin Hydrochloride in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.4>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Doxorubicin Hydrochloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Doxorubicin Hydrochloride as directed in the potassium dichromate disk method under Infrared Spectrophotometry <2.5>, and compare the spectrum with the Reference Spectrum or the spectrum of Doxorubicin Hydrochloride RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Doxorubicin Hydrochloride (1 in 200) responds to the Qualitative Tests <1.09> (1) for chloride.

**Optical rotation** <2.4> [α]D: +240 – +290° (20 mg calculated on the anhydrous basis, methanol, 20 mL, 100 mm).

**pH** <2.54> The pH of a solution obtained by dissolving 50 mg of Doxorubicin Hydrochloride in 10 mL of water is between 4.0 and 5.5.

**Purity** (1) Clarity and color of solution—Dissolve 50 mg of Doxorubicin Hydrochloride in 10 mL of water: the solution is clear and red.

(2) Related substances—Dissolve 25 mg of Doxorubicin Hydrochloride in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than doxorubicin obtained from the sample solution is not larger than 1/4 times the peak area of doxorubicin from the standard solution, and the total area of the peaks other than doxorubicin is not larger than the peak area of doxorubicin from the standard solution.

**Operating conditions—**

- Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
- Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
- Column temperature: A constant temperature of about 25°C.
- Mobile phase: Dissolve 3 g of sodium lauryl sulfate in 1000 mL of diluted phosphoric acid (7 in 5000), and add 1000 mL of acetonitrile.
- Flow rate: Adjust the flow rate so that the retention time of doxorubicin is about 8 minutes.
- Time span of measurement: About 3 times as long as the retention time of doxorubicin.

**System suitability—**

Test for required detectability: Measure 1 mL of the standard solution, and add the mobile phase to make exactly 20 mL. Confirm that the peak area of doxorubicin obtained from 20 μL of this solution is equivalent to 3.5 to 6.5% of that from 20 μL of the standard solution.

System performance: Dissolve 5 mg of Doxorubicin Hydrochloride in 20 mL of water, add 1.5 mL of phosphoric acid, and allow to stand at room temperature for 30 minutes. Adjust the pH of this solution to 2.5 with 2 mol/L sodium hydroxide TS. When the procedure is run with 20 μL of this solution under the above operating conditions, doxorubicinone, having the relative retention time of about 0.6 with respect to doxorubicin, and doxorubicin are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doxorubicin is not more than 2.0%.

**Water** <2.48> Not more than 3.0% (0.3 g, volumetric titration, direct titration).

**Assay**

Weigh accurately an amount of Doxorubicin Hydrochloride and Doxorubicin Hydrochloride RS, equivalent to about 10 mg (potency), dissolve each in water to make exactly 25 mL. Pipet 5 mL each of these solutions, add water to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Determine the absorbances at 495 nm, A1 and A2, of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>.

\[
\text{Amount [μg (potency)] of } \text{C}_{27}\text{H}_{29}\text{NO}_{11}\cdot\text{HCl} = \frac{M_s \times A_1}{A_2} \times 1000
\]

\[M_s: \text{Amount [μg (potency)] of Doxorubicin Hydrochlo-}\]
Doxorubicin Hydrochloride for Injection

注射用ドキソルビシン塩酸塩

Doxorubicin Hydrochloride for Injection is a preparation for injection, which is dissolved before use.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of doxorubicin hydrochloride (C27H29NO11.HCl: 579.98).

Method of preparation Prepare as directed under Injections, with Doxorubicin Hydrochloride.

Description Doxorubicin Hydrochloride for Injection occurs as red-orange, powder or masses.

Identification Dissolve an amount of Doxorubicin Hydrochloride for Injection, equivalent to 10 mg (potency) of Doxorubicin Hydrochloride according to the labeled amount, in methanol to make 100 mL. To 5 mL of this solution add methanol to make 50 mL, and determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry (2.24): it exhibits maxima between 231 nm and 235 nm, between 250 nm and 254 nm, between 477 nm and 481 nm, and between 493 nm and 497 nm, and exhibits a shoulder between 528 nm and 538 nm.

pH (2.54) The pH of a solution, prepared by dissolving an amount of Doxorubicin Hydrochloride for Injection equivalent to 10 mg (potency) of Doxorubicin Hydrochloride according to the labeled amount in 2 mL of water, is 5.0 to 6.0.

Purity Clarity and color of solution—Dissolve an amount of Doxorubicin Hydrochloride for Injection, equivalent to 50 mg (potency) of Doxorubicin Hydrochloride according to the labeled amount, in 10 mL of water: the solution is clear and red.

Water (2.48) Not more than 4.0% (0.25 g, volumetric titration, direct titration).

Bacterial endotoxins (4.01) Less than 2.50 EU/mg (potency).

Uniformity of dosage units (6.02) It meets the requirement of the Mass variation test.

Foreign insoluble matter (6.06) Perform the test according to Method 2: it meets the requirement.

Insoluble particulate matter (6.07) It meets the requirement.

Sterility (4.06) Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Weigh accurately the mass of the contents of not less than 10 containers of Doxorubicin Hydrochloride for Injection. Weigh accurately an amount of the contents, equivalent to about 10 mg (potency) of Doxorubicin Hydrochloride, add exactly 5 mL of the internal standard solution and the mobile phase to make 100 mL, and use the solution as the sample solution. Separately, weigh accurately an amount of Doxorubicin Hydrochloride RS, equivalent to 10 mg (potency), add exactly 5 mL of the internal standard solution and the mobile phase to make 100 mL, and use this solution as the standard solution. Perform the test with 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01), and calculate the ratios, Q1 and Q2, of the peak area of doxorubicin to that of the internal standard.

\[
M_S = \frac{Q_1}{Q_2} \times M_S
\]

Internal standard solution—A solution of butyl parahydroxybenzoate in the mobile phase (1 in 1000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 3 g of sodium lauryl sulfate in 1000 mL of diluted phosphoric acid (7 in 5000). To this solution add 1000 mL of acetonitrile.

Flow rate: Adjust the flow rate so that the retention time of doxorubicin is about 8 minutes.

System suitability—

System performance: When the procedure is run with 10 µL of the standard solution under the above operating conditions, doxorubicin and the internal standard are eluted in this order with the resolution between these peaks being not less than 5, and the symmetry factor of the peak of doxorubicin is between 0.8 and 1.2.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of doxorubicin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Hermetic containers.
**Doxycycline Hydrochloride Hydrate**

ドキシサイクリン塩酸塩水和物

\[
\text{C}_{22}\text{H}_{24}\text{N}_{2}\text{O}_{8}\cdot\text{HCl} \cdot \frac{1}{2}\text{C}_{2}\text{H}_{2}\text{O} \cdot \frac{1}{2}\text{H}_{2}\text{O} : 512.94
\]

(4S,4aR,5S,5aR,6R,12aS)-4-Dimethylamino-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydratetraene-2-carboxamide monohydrochloride hemihydrate

[564-25-0, Doxycycline]

Doxycycline Hydrochloride Hydrate is the hydrochloride of a derivative of oxytetracycline.

It contains not less than 880 μg (potency) and not more than 943 μg (potency) per mg, calculated on the anhydrous basis and corrected by the amount of ethanol. The potency of Doxycycline Hydrochloride Hydrate is expressed as mass (potency) of doxycycline (C\textsubscript{22}H\textsubscript{24}N\textsubscript{2}O\textsubscript{8}: 444.43).

**Description**

Doxycycline Hydrochloride Hydrate occurs as yellow to dark yellow, crystals or crystalline powder.

It is freely soluble in water and in methanol, and slightly soluble in ethanol (99.5).

**Identification**

(1) Determine the infrared absorption spectrum of Doxycycline Hydrochloride Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.255>, and compare the spectrum with the Reference Spectrum or the spectrum of Doxycycline Hydrochloride Hydrate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Dissolve 10 mg of Doxycycline Hydrochloride Hydrate in 10 mL of water, and add silver nitrate TS: a white turbidity is produced.

**Absorbance**

\(<2.24\) \(E_{1%}^{10}\) (349 nm): 285 – 315 (10 mg, 0.01 mol/L hydrochloric acid-methanol TS, 500 mL).

**Optical rotation**

\(<2.49\) \(\left[\alpha\right]_{D}\): –105 – –120° (0.25 g calculated on the anhydrous basis and corrected by the amount of ethanol, 0.01 mol/L hydrochloric acid-methanol TS, 25 mL, 100 mm). Determine within 5 minutes after the sample solution is prepared.

**Purity**

(1) Heavy metals \(<1.07\)—Proceed with 1.0 g of Doxycycline Hydrochloride Hydrate according to Method 2, and perform the test. Prepare the control solution with 5.0 mL of Standard Lead Solution (not more than 50 ppm).

(2) Related substance—Dissolve 20 mg of Doxycycline Hydrochloride Hydrate in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the sample solution. Separately, dissolve 20 mg of 6-epidoxycycline hydrochloride in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as 6-epidoxycycline hydrochloride stock solution. Separately, dissolve 20 mg of metacycline hydrochloride in 0.01 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as metacycline hydrochloride stock solution. Pipet 2 mL each of 6-epidoxycycline hydrochloride stock solution and metacycline hydrochloride stock solution, add 0.01 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.015> according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of metacycline and 6-epidoxycycline obtained from the sample solution are not larger than the peak areas of them obtained from the standard solution, respectively, and the areas of the two peaks, appeared between the solvent peak and metacycline and behind of doxycycline, obtained from the sample solution are not larger than 1/4 times the peak area of 6-epidoxycycline from the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with styrene-divinylbenzene copolymer for liquid chromatography (8 μm in particle diameter).

Column temperature: A constant temperature of about 60°C.

Mobile phase: Mix 125 mL of 0.2 mol/L potassium dihydrogen phosphate TS, 117 mL of 0.2 mol/L sodium hydroxide TS, and add water to make 500 mL. To 400 mL of this solution add 50 mL of a solution of tetrabutylammonium hydrogen sulfate (1 in 100), 10 mL of a solution of disodium dihydrogen ethylenediamine tetracetate dihydrate (1 in 25), 60 g of t-butanol and 200 mL of water, adjust the pH to 8.0 with 2 mol/L sodium hydroxide TS, and add water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of doxycycline is about 19 minutes.

Time span of measurement: About 2.4 times as long as the retention time of doxycycline beginning after the solvent peak.

**System suitability**

Test for required detectability: Measure exactly 1 mL of the standard solution, and add 0.01 mol/L hydrochloric acid TS to make exactly 20 mL. Confirm that the peak areas of 6-epidoxycycline and metacycline obtained from 20 μL of this solution are equivalent to 3.5 to 6.5% of them obtained from 20 μL of the standard solution, respectively.

System performance: To 8 mL of the sample solution, 3 mL of 6-epidoxycycline hydrochloride stock solution and 2 mL of metacycline hydrochloride stock solution add 0.01 mol/L hydrochloric acid TS to make 50 mL. When the procedure is run with 20 μL of this solution under the above operating conditions, metacycline, 6-epidoxycycline and doxycycline are eluted in this order with the resolutions between the peaks, metacycline and 6-epidoxycycline, and 6-epidoxycycline and doxycycline, being not less than 1.3 and not less than 2.0, respectively, and the symmetry factor of the peak of doxycycline is not more than 1.3.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviations of the peak area of metacycline and 6-epidoxycycline are not more than
amount of ethanol is not less than 4.3% and not more than 6.0%.

\[ \text{Amount (％) of ethanol} = \frac{M_S}{M_T} \times \frac{Q_I}{Q_S} \]

- \( M_S \): Amount (mg) of ethanol (99.5)
- \( M_T \): Amount (mg) of the sample

**Internal standard solution—A solution of 1-propanol (1 in 2000).**

**Operating conditions—**
- Detector: An hydrogen flame-ionization detector.
- Column: A glass column 3.2 mm in inside diameter and 1.5 m in length, packed with porous ethylvinylbenzene-divinylbenzene copolymer for gas chromatography (0.0075 \( \mu \text{m} \) in average pore size, 500 – 600 \( \mu \text{m}^2/g \) in specific surface area) (150 – 180 \( \mu \text{m} \) in particle diameter).
- Column temperature: A constant temperature of about 135°C.
- Carrier gas: Nitrogen.
- Flow rate: Adjust the flow rate so that the retention time of ethanol is about 5 minutes.

**System suitability—**
- System performance: When the procedure is run with 1 \( \mu \text{L} \) of the standard solution under the above operating conditions, ethanol and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.0.
- System repeatability: When the test is repeated 5 times with 1 \( \mu \text{L} \) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ethanol to that of the internal standard is not more than 2.0%.

**Water** \( <2.48 \) Not less than 1.4% and not more than 2.8% (0.6 g, volumetric titration, direct titration).

**Residue on ignition** \( <2.44 \) Not more than 0.3% (1 g).

**Assay**
- Weigh accurately an amount of Doxycycline Hydrochloride Hydrate and Doxycycline Hydrochloride RS, equivalent to about 50 mg (potency), dissolve each in water to make exactly 10 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 10 \( \mu \text{L} \) each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.01 \) according to the following conditions, and determine the peak areas, \( A_T \) and \( A_S \), of doxycycline.

\[
\text{Amount [\mu g (potency)] of doxycycline (C}_{22}\text{H}_{22}\text{FN}_{3}\text{O}_{2}} = \frac{M_S}{M_T} \times A_T/A_S \times 1000
\]

- \( M_S \): Amount [\mu g (potency)] of Doxycycline Hydrochlo-

**Operating conditions—**
- Detector: An ultraviolet absorption photometer (wavelength: 280 nm).
- Column: A stainless steel column 3.9 mm in inside diameter and 30 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (10 \( \mu \text{m} \) in particle diameter).
- Column temperature: A constant temperature of about 30°C.
- Mobile phase: Dissolve 7.0 g of sodium dihydrogen phosphate dihydrate in 450 mL of water, add 553 mL of a mixture of methanol and N,N-dimethyl-n-octylamine (550:3), and adjust the pH to 8.0 with a solution of sodium hydroxide (43 in 200).
- Flow rate: Adjust the flow rate so that the retention time of doxycycline is about 6 minutes.

**System suitability—**
- System performance: When the procedure is run with 10 \( \mu \text{L} \) of the standard solution under the above operating conditions, the theoretical plates and the symmetry factor of the peak of doxycycline are not less than 1000 and not more than 2.0, respectively.
- System repeatability: When the test is repeated 6 times with 10 \( \mu \text{L} \) of the standard solution under the above operating conditions, the relative standard deviation of the peak area of doxycycline is not more than 1.0%.

**Containers and storage** Containers—Tight containers. Storage—Light-resistant.

**Droperidol**

The description of Droperidol is provided with a chemical structure and additional information including its molecular weight, CAS number, and various properties such as solubility, description, and identification. The text also includes the identification of droperidol, its solubility in various solvents, and its preparation for analysis. The instruction for preparation includes dissolving droperidol in a brown volumetric flask and transferring it to a volumetric flask to reach a specific concentration. This preparation is followed by the addition of hydrochloric acid to adjust the pH to a specific value, which is crucial for the subsequent analysis.
make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry \( <2.24> \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Droperidol, previously dried, in the potassium bromide disk method under Infrared Spectrophotometry \( <2.25> \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers. If any difference appears between the spectra, dissolve Droperidol in acetone, evaporate the acetone, dry the residue in a desiccator (in vacuum, silica gel, 70°C) for 4 hours, and perform the test with the residue.

**Purity**

(1) Heavy metals \( <1.07> \)—Produce with 1.0 g of Droperidol in a platinum crucible according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. Dissolve 50 mg of Droperidol in 5 mL of dichloromethane, and use this solution as the standard solution. Pipet 1 mL of the sample solution, add dichloromethane to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \( <2.03> \). Spot 10 mL of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, chloroform, methanol and acetic acid-sodium acetate buffer solution, pH 4.7, (54:23:18:5) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \( <2.41> \) Not more than 3.0% (0.5 g, in vacuum, silica gel, 70°C, 4 hours).

**Residue on ignition** \( <2.44> \) Not more than 0.2% (1 g, platinum crucible).

**Assay**

Weigh accurately about 0.5 g of Droperidol, previously dried, dissolve in 50 mL of acetic acid (100), and titrate \( <2.50> \) with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 37.94 mg of \( \text{C}_2\text{H}_2\text{F}_7\text{N}_2\text{O}_2 \)

**Containers and storage**

Containers—Tight containers. Storage—Light-resistant.

---

**Droxidopa**

Droxidopa occurs as white to light brown crystals or crystalline powder. It is slightly soluble in water and practically insoluble in ethanol (99.5). It dissolves in 0.1 mol/L hydrochloric acid TS.

**Identification**

(1) Determine the absorption spectrum of a solution of Droxidopa in 0.1 mol/L hydrochloric acid TS (1 in 25,000) as directed under Ultraviolet-visible Spectrophotometry \( <2.24> \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Droxidopa as directed in the potassium bromide disk method under Infrared Spectrophotometry \( <2.25> \), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation** \( <2.49> \) \( [\alpha]_D^{20} = -38 - -43^\circ \) (after drying, 0.1 g, 0.1 mol/L hydrochloric acid TS, 20 mL, 100 mm).

**Purity**

(1) Chloride \( <1.03> \) Dissolve 0.40 g of Droxidopa in 6 mL of dilute nitric acid, and add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution with 0.40 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.036%).

(2) Heavy metals \( <1.07> \) Proceed with 2.0 g of Droxidopa according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic \( <1.11> \) Prepare the test solution with 1.0 g of Droxidopa according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—To 0.10 g of Droxidopa add 50 mL of 0.1 mol/L hydrochloric acid TS, dissolve by shaking while cooling in an ice bath, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 5 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.01> \) according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of each peak other than d Roxidopa obtained from the sample solution is not larger than the peak area of d Roxidopa from the standard solution.
Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (3 μm in particle diameter).
Column temperature: A constant temperature of about 25°C.
Mobile phase: Dissolve 1.0 g of sodium 1-heptanesulfonate and 1.36 g of potassium dihydrogen phosphate in 1000 mL of water, and adjust the pH to 2.0 with phosphoric acid. To 930 mL of this solution add 70 mL of acetonitrile.
Flow rate: Adjust the flow rate so that the retention time of droxidopa is about 5 minutes.
Time span of measurement: About 12 times as long as the retention time of droxidopa, beginning after the solvent peak.
System suitability—
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of droxidopa are not less than 10,000 and not more than 1.5, respectively.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of droxidopa is not more than 2.0%.
(5) Residual solvent—Being specified separately.
Loss on drying <2.4> Not more than 0.1% (1 g, in vacuum, 60°C, 3 hours).
Residue on ignition <2.4> Not more than 0.2% (1 g).
Assay Weigh accurately about 0.3 g of Droxidopa, previously dried, dissolve in exactly 20 mL of 0.1 mol/L perchloric acid VS, add 50 mL of acetic acid (100), and titrate <2.5> the excess perchloric acid with 0.1 mol/L sodium acetate VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.
Each mL of 0.1 mol/L perchloric acid VS = 21.32 mg of C₉H₁₁NO₅
Containers and storage Containers—Well-closed containers.

Droxidopa Capsules
ドロキシドパカプセル

Droxidopa Capsules contain not less than 93.0% and not more than 107.0% of the labeled amount of droxidopa (C₉H₁₁NO₅: 213.19).
Method of preparation Prepare as directed under Capsules, with Droxidopa.
Identification (1) To an amount of the contents of Droxidopa Capsules, equivalent to 50 mg of Droxidopa according to the labeled amount, add 20 mL of diluted acetic acid (100) (1 in 500), shake for 10 minutes, and filter. To 1 mL of the filtrate add 4 mL of water and 1 drop of iron (III) chloride TS: a deep green color is produced, and it gradually changes to light brown.
(2) To an amount of the contents of Droxidopa Capsules, equivalent to 50 mg of Droxidopa according to the labeled amount, add 50 mL of 0.1 mol/L hydrochloric acid TS, shake well, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and filter. Discard the first 10 mL of the filtrate, and to 2 mL of the subsequent filtrate add 0.1 mol/L hydrochloric acid TS to make 25 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits a maximum between 278 nm and 282 nm.
Uniformity of dosage units <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.
To the contents of 1 capsule of Droxidopa Capsules, add 100 mL of 0.1 mol/L hydrochloric acid TS, shake well, and add 0.1 mol/L hydrochloric acid TS to make exactly V mL so that each mL contains about 0.5 mg of droxidopa (C₉H₁₁NO₅). Filter this solution, discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of droxidopa for assay, previously dried in vacuum at 60°C for 3 hours, dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 2 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A_T and A_S, at 280 nm.

\[
\text{Amount (mg) of droxidopa (C₉H₁₁NO₅)} = \frac{M_S \times A_T}{A_S} \times \frac{1}{100}
\]
\[
M_S: \text{Amount (mg) of droxidopa for assay}
\]

Dissolution <6.10> When the test is performed at 75 revolutions per minute according to the Paddle method using the sinker, using 900 mL of water as the dissolution medium, the dissolution rate in 90 minutes of Droxidopa Capsules is not less than 70%.
Start the test with 1 capsule of Droxidopa Capsules, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 56 μg of droxidopa (C₉H₁₁NO₅) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of droxidopa for assay, previously dried in vacuum at 60°C for 3 hours, dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A_T and A_S, at 280 nm, and A_T and A_S, at 350 nm.

sules, equivalent to 20 mg of Droxidopa according to the labeled amount, add 20 mL of diluted acetic acid (100) (1 in 500), shake for 10 minutes, and filter. To 1 mL of the filtrate add 4 mL of water and 1 drop of iron (III) chloride TS: a deep green color is produced, and it gradually changes to light brown.
Dissolution rate (%) with respect to the labeled amount of droxidopa (C₉H₁₁NO₅)

\[ M_s = M_s \times \frac{A_{T1}}{A_S} \]

Mₕ: Amount (mg) of droxidopa for assay
C: Labeled amount (mg) of droxidopa (C₉H₁₁NO₅) in 1 capsule

**Assay**

Take out the contents of not less than 20 Droxidopa Capsules, weigh accurately the mass of the contents, and mix uniformly. Weigh accurately an amount equivalent to about 50 mg of droxidopa (C₉H₁₁NO₅), add 50 mL of 0.1 mol/L hydrochloric acid TS, shake well, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and filter. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of droxidopa for assay, previously dried in vacuum at 60°C for 3 hours, dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 2 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A₁ and Aₕ, at 280 nm.

\[ \text{Amount (mg) of droxidopa (C₉H₁₁NO₅)} = M_s \times \frac{A_{T1}}{A_S} \]

Mₕ: Amount (mg) of droxidopa for assay

**Containers and storage**

Containers—Tight containers.

**Droxidopa Fine Granules**

Droxidopa Fine Granules contain not less than 93.0% and not more than 107.0% of droxidopa (C₉H₁₁NO₅: 213.19).

**Method of preparation**

Prepare as directed under Granules, with Droxidopa.

**Identification**

(1) To a quantity of powdered Droxidopa Fine Granules, equivalent to 50 mg of Droxidopa according to the labeled amount, add 50 mL of water, shake for 10 minutes, and filter. To 5 mL of the filtrate add 1 mL of ninhydrin TS, heat in a water bath for 3 minutes: a blue-purple color develops.

(2) To a quantity of powdered Droxidopa Fine Granules, equivalent to 20 mg of Droxidopa according to the labeled amount, add 20 mL of dilute acetic acid (100) (1 in 500), shake for 10 minutes, and filter. To 1 mL of the filtrate add 4 mL of water and 1 drop of iron (III) chloride TS: a deep green color is produced, and it gradually changes to light brown.

(3) To a quantity of powdered Droxidopa Fine Granules, equivalent to 50 mg of Droxidopa according to the labeled amount, add 50 mL of 0.1 mol/L hydrochloric acid TS, shake well, add 0.1 mol/L hydrochloric acid TS to make 100 mL, and filter. Discard the first 10 mL of the filtrate, to 2 mL of the subsequent filtrate add 0.1 mol/L hydrochloric acid TS to make 25 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 278 nm and 282 nm.

**Dissolution<6.10>**

When the test is performed at 75 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Droxidopa Fine Granules is not less than 70%.

Start the test with an accurately weighed amount of Droxidopa Fine Granules, equivalent to about 0.1 g of droxidopa (C₉H₁₁NO₅), according to the labeled amount, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add exactly 5 mL of water, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of droxidopa for assay, previously dried in vacuum at 60°C for 3 hours, dissolve in water to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 20 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A₁ and Aₕ, at 280 nm, and A₁ and Aₕ, at 350 nm.

\[ \text{Amount (mg) of droxidopa (C₉H₁₁NO₅)} = M_s \times \frac{A_{T1}}{A_S} \]

Mₕ: Amount (mg) of droxidopa for assay
Mₚ: Amount (g) of Droxidopa Fine Granules
C: Labeled amount (mg) of droxidopa (C₉H₁₁NO₅) in 1 g

**Particle size <6.03>**

It meets the requirements of Fine granules.

**Assay**

Powder not less than 20 g of Droxidopa Fine Granules. Weigh accurately a portion of the powder, equivalent to about 50 mg of droxidopa (C₉H₁₁NO₅), add 50 mL of 0.1 mol/L hydrochloric acid TS, shake well, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and filter. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of droxidopa for assay, previously dried in vacuum at 60°C for 3 hours, dissolve in 0.1 mol/L hydrochloric acid TS to make exactly 100 mL. Pipet 2 mL of this solution, add 0.1 mol/L hydrochloric acid TS to make exactly 25 mL, and use this solution as the standard solution. Perform the test with the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and determine the absorbances, A₁ and Aₕ, at 280 nm.

\[ \text{Amount (mg) of droxidopa (C₉H₁₁NO₅)} = M_s \times \frac{A_{T1}}{A_S} \]

Mₕ: Amount (mg) of droxidopa for assay

**Containers and storage**

Containers—Tight containers.
Dydrogesterone

Dydrogesterone occurs as white to light yellowish white crystals or crystalline powder. It is odorless.

**Description**  
Dydrogesterone is freely soluble in chloroform, soluble in acetonitrile, sparingly soluble in methanol and in ethanol (95), slightly soluble in diethyl ether, and practically insoluble in water.

**Identification (1)**  
To 5 mg of Dydrogesterone add 5 mL of 4-methoxybenzaldehyde-acetic acid TS and 2 to 3 drops of sulfuric acid, and heat in a water bath for 2 minutes: an orange-red color develops.

(2) Determine the absorption spectrum of a solution of Dydrogesterone in methanol (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry (2.24), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave lengths.

(3) Determine the infrared absorption spectrum of Dydrogesterone, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry (2.25), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation (2.49)**  
[a]_D^20: -470° to -500° (after drying, 0.1 g, chloroform, 10 mL, 100 mm).

**Melting point (2.60)**  
167° to 171°C

**Purity (1)**  
Heavy metals (1.07)—Proceed with 1.0 g of Dydrogesterone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 10 mg of Dydrogesterone in 200 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions. Determine each peak area of these solutions by the automatic integration method: the total area of peaks other than the peak of dydrogesterone from the sample solution is not larger than the peak area of dydrogesterone from the standard solution.

**Operating conditions—**  
Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Dydrogesterone Tablets

Dydrogesterone Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of dydrogesterone (C_{21}H_{28}O_{2}: 312.45).

**Method of preparation**  
Prepare as directed under Tablets, with Dydrogesterone.

**Identification (1)**  
To a quantity of powdered Dydrogesterone Tablets, equivalent to 0.05 g of Dydrogesterone according to the labeled amount, add 50 mL of methanol, shake well, and filter. Evaporate 5 mL of the filtrate on a water bath to dryness. Proceed with the residue as directed in the Identification (1) under Dydrogesterone.

(2) To 1 mL of the filtrate obtained in (1) add methanol to make 200 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry (2.24): it exhibits a maximum between 284 nm and 288 nm.

**Uniformity of dosage units (6.02)**  
Perform the test accord-
ing to the following method: it meets the requirement of the Content uniformity test.

Crush 1 tablet of Dydrogesterone Tablets, and add methanol to make exactly 100 mL. Shake until the tablet is completely disintegrated, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 20 mL of the filtrate, pipet the subsequent V mL of the filtrate, add methanol to make exactly V mL so that each mL contains about 5 μg of dydrogesterone (C21H28O2), and use this solution as the sample solution. Then, proceed as directed in the Assay.

\[
\text{Amount (mg) of dydrogesterone (C}_2\text{H}_{28}\text{O}_2) = M_S \times A_T / A_S \times V'/V \times 1/20
\]

\[
M_S: \text{Amount (mg) of dydrogesterone for assay}
\]

**Dissolution** When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Dydrogesterone Tablets is not less than 80%.

Start the test with 1 tablet of Dydrogesterone Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 56 μg of dydrogesterone (C21H28O2) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of dydrogesterone for assay, previously dried in a desiccator (in vacuum, phosphorus (V) oxide) for 24 hours, and dissolve in methanol to make exactly 100 mL. Pipet 1 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \(A_T\) and \(A_S\), of the sample solution and standard solution at 296 nm as directed under Ultraviolet-visible Spectrophotometry.<2.24>, using water as the control.

\[
\text{Dissolution rate} = M_S \times A_T / A_S \times V'/V \times 1/C \times 9
\]

\[
M_S: \text{Amount (mg) of dydrogesterone for assay}
\]

\[
C: \text{Labeled amount (mg) of dydrogesterone (C}_2\text{H}_{28}\text{O}_2) \text{ in 1 tablet}
\]

**Assay** Weigh accurately and powder not less than 20 Dydrogesterone Tablets. Weigh accurately a portion of the powder, equivalent to about 10 mg of dydrogesterone (C21H28O2), shake with 50 mL of methanol, and add methanol to make exactly 100 mL, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 20 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of dydrogesterone for assay, previously dried in vacuum for 24 hours using phosphorus (V) oxide as a desiccant, and dissolve in methanol to make exactly 100 mL. Pipet 5 mL of this solution, add methanol to make exactly 100 mL, and use the solution as the standard solution. Determine the absorbances, \(A_T\) and \(A_S\), of the sample solution and standard solution at 286 nm as directed under Ultraviolet-visible Spectrophotometry.<2.24>

\[
\text{Amount (mg) of dydrogesterone (C}_2\text{H}_{28}\text{O}_2) = M_S \times A_T / A_S
\]

\[
M_S: \text{Amount (mg) of dydrogesterone for assay}
\]

**Containers and storage** Containers—Tight containers.

**Ebastine**

エバスチン

\[
\begin{align*}
\text{C}_2\text{H}_{28}\text{NO}_2: & \quad 469.66 \\
1-\{1,1-\text{Dimethylethyl}\}\{\text{phenyl}\} & \quad 4-\{\text{diphenylmethoxy}\}\{\text{piperidin-1-yl}\}\{\text{butan-1-one}\} \\
& \quad [90729-43-4]
\end{align*}
\]

Ebastine, when dried, contains not less than 99.0% and not more than 101.0% of C21H28NO2.

**Description** Ebastine occurs as white crystals or crystalline powder.

It is freely soluble in acetic acid (100), soluble in methanol, sparingly soluble in ethanol (95), and practically insoluble in water.

It gradually becomes yellowish white on exposure to light.

**Identification** (1) Dissolve 20 mg of Ebastine in 5 mL of ethanol (95), add 2 mL of 1,3-dinitrobenzene TS and 2 mL of sodium hydroxide TS, and allow to stand: the color of the solution is purple to red-purple, which gradually changes to blained.

(2) Determine the absorption spectrum of a solution of Ebastine in methanol (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry.<2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Ebastine as directed in the potassium bromide disk method under Infrared Spectrophotometry.<2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** 84 – 87°C

**Purity** (1) Heavy metals <1.07>—Proceed with 1.0 g of Ebastine according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm). A platinum crucible may be used.

(2) Related substances—Dissolve 0.10 g of Ebastine in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 5 mL of the sample solution, and add the mobile phase to make exactly 100 mL. Pipet 2 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10μL each of the sample solution and standard solution as directed under Liquid Chromatography.<2.01>
according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than ebastine obtained from the sample solution is not larger than the peak area of ebastine from the standard solution, and the total area of the peaks other than ebastine from the sample solution is not larger than 4 times the peak area of ebastine from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: Dissolve 7.8 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust to pH 3.0 with diluted phosphoric acid (1 in 5), and add water to make 1000 mL. To 375 mL of this solution add 625 mL of acetonitrile for liquid chromatography, and dissolve 0.72 g of sodium lauryl sulfate in this solution.
Flow rate: Adjust the flow rate so that the retention time of ebastine is about 9 minutes.
Time span of measurement: About twice as long as the retention time of ebastine, beginning after the solvent peak.
System suitability—
Test for required detectability: Pipet 5 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of ebastine obtained with 10 μL of this solution is equivalent to 35 to 65% of that with 10 μL of the standard solution.
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ebastine are not less than 6000 and not more than 1.5, respectively.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ebastine is not more than 2.0%.

Residual on drying <2.42> Not more than 0.5% (1 g, in vacuum, phosphorus (V) oxide, 60°C, 2 hours).
Residue on ignition <2.44> Not more than 0.1% (1 g).
Assay Weigh accurately about 0.5 g of Ebastine, previously dried, dissolve in 60 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.
Each mL of 0.1 mol/L perchloric acid VS = 46.97 mg of C32H39NO2

Containers and storage Containers—Well-closed containers.
Storage—Light-resistant.

Ebastine Orally Disintegrating Tablets

Ebastine Orally Disintegrating Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of ebastine (C32H39NO2: 469.66).

Method of preparation Prepare as directed under Tablets, with Ebastine.

Identification Pulverize Ebastine Orally Disintegrating Tablets. To a portion of the powder, equivalent to 30 mg of Ebastine according to the labeled amount, add 100 mL of methanol, shake for 10 minutes, then add methanol to make 100 mL, and centrifuge. To 5 mL of the supernatant liquid add methanol to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 251 nm and 255 nm.

Purity Related substances—Pulverize Ebastine Orally Disintegrating Tablets. To a portion of the powder, equivalent to 50 mg of Ebastine according to the labeled amount, add 30 mL of methanol for liquid chromatography, shake for 10 minutes, and add the mobile phase to make 50 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than ebastine obtained from the sample solution is not larger than 75% of that with 10 μL of the standard solution.

Operating conditions—
Column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.
Detector: An ultraviolet absorption photometer (wavelength: 220 nm).
Time span of measurement: About 3 times as long as the retention time of ebastine, beginning after the solvent peak.
System suitability—
Test for required detectability: Pipet 10 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of ebastine obtained with 10 μL of this solution is equivalent to 15 to 25% of that with 10 μL of the standard solution.
System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ebastine are not less than 6000 and not more than 1.5, respectively.
System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ebastine is not more than 2.0%.
area of ebastine is not more than 2.0%.

**Uniformity of dosage units**<sup>6.02</sup> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Ebastine Orally Disintegrating Tablets add 10 mL of 0.1 mol/L hydrochloric acid TS, and disperse the particles with the aid of ultrasonic waves with occasional shaking. Add 3 mL of methanol, shake for 10 minutes, then add methanol to make exactly 50 mL so that each mL contains about 0.1 mg of ebastine (C\textsubscript{32}H\textsubscript{39}NO\textsubscript{2}), and centrifuge. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of ebastine (C\textsubscript{32}H\textsubscript{39}NO\textsubscript{2})

\[ M_s = M_x \times \frac{Q_s}{Q_x} \times \frac{V}{500} \]

\( M_s \): Amount (mg) of ebastine for assay

**Internal standard solution**—A solution of diphenyl in the mobile phase (1 in 40,000).

**Disintegration** Being specified separately.

**Dissolution**<sup>6.10</sup> When the test is performed at 50 revolutions per minute according to the paddle method, using 900 mL of the 1st fluid for dissolution test as the dissolution medium, the dissolution rate in 15 minutes of Ebastine Orally Disintegrating Tablets is not less than 80%.

Start the test with 1 tablet of Ebastine Orally Disintegrating Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add the dissolution medium to make exactly 50 mL so that each mL contains about 5.6 μg of ebastine (C\textsubscript{32}H\textsubscript{39}NO\textsubscript{2}) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of ebastine for assay, previously dried at 60°C under reduced pressure with phosphorous (V) oxide for 2 hours, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, add methanol to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \( A_1 \) and \( A_2 \), of the sample solution and standard solution at 258 nm as directed under Liquid Chromatography<sup>2.24</sup>, using the dissolution medium as the blank.

Dissolution rate (% with respect to the labeled amount of ebastine (C\textsubscript{32}H\textsubscript{39}NO\textsubscript{2})

\[ D = M_x \times \frac{A_1}{A_2} \times \frac{V}{V} \times \frac{1}{C} \times 18 \]

\( D \): Dissolution rate (%)

\( M_x \): Amount (mg) of ebastine for assay

\( C \): Labeled amount (mg) of ebastine (C\textsubscript{32}H\textsubscript{39}NO\textsubscript{2}) in 1 tablet

**Assay** Weigh accurately the mass of not less than 20 Ebastine Orally Disintegrating Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 20 mg of ebastine (C\textsubscript{32}H\textsubscript{39}NO\textsubscript{2}), add 20 mL of 0.1 mol/L hydrochloric acid TS, and disperse the particles with the aid of ultrasonic waves. Add 120 mL of methanol, shake for 10 minutes, then add methanol to make exactly 200 mL, and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of ebastine for assay, previously dried at 60°C under reduced pressure with phosphorous (V) oxide for 2 hours, and dissolve in methanol to make exactly 50 mL. Pipet 5 mL of this solution, add 5 mL of 0.1 mol/L hydrochloric acid TS, and add methanol to make exactly 50 mL. Pipet 5 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography<sup>2.01</sup> according to the following conditions, and calculate the ratios, \( Q_1 \) and \( Q_2 \), of the peak area of ebastine to that of the internal standard.

Amount (mg) of ebastine (C\textsubscript{32}H\textsubscript{39}NO\textsubscript{2})

\[ M_s = M_x \times \frac{Q_1}{Q_2} \times \frac{2}{5} \]

\( M_s \): Amount (mg) of ebastine for assay

**Internal standard solution**—A solution of diphenyl in the mobile phase (1 in 40,000).

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: Dissolve 7.8 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust to pH 3.0 with diluted phosphoric acid (1 in 5), and add water to make 1000 mL. To 375 mL of this solution add 625 mL of acetonitrile for liquid chromatography, and dissolve 0.72 g of sodium lauryl sulfate in this solution.

Flow rate: Adjust the flow rate so that the retention time of ebastine is about 9 minutes.

**System suitability**—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and ebastine are eluted in this order with the resolution between these peaks being not less than 5.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of ebastine to that of the internal standard is not more than 1.0%.

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant.

**Ebastine Tablets**

**エバスチン錠**

Ebastine Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of ebastine (C\textsubscript{32}H\textsubscript{39}NO\textsubscript{2}: 469.66).

**Method of preparation** Prepare as directed under Tablets, with Ebastine.

**Identification** Powder Ebastine Tablets. To a portion of the powder, equivalent to 30 mg of Ebastine according to the
labeled amount, add 70 mL of methanol, shake for 10 minutes, then add methanol to make 100 mL, and centrifuge. To 5 mL of the supernatant liquid add methanol to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, it exhibits a maximum between 251 nm and 255 nm.

**Purity** Related substances—Powder Ebastine Tablets. To a portion of the powder, equivalent to 50 mg of Ebastine according to the labeled amount, add 30 mL of methanol for liquid chromatography, shake for 10 minutes, and add the mobile phase to make 50 mL. Centrifuge this solution, and use the supernatant liquid as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: the area of the peak other than ebastine obtained from the sample solution is not larger than the peak area of ebastine from the standard solution, and the total area of the peaks other than ebastine from the sample solution is not larger than 2 times the peak area of ebastine from the standard solution.

**Operating conditions**—
Column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Detector: An ultraviolet absorption photometer (wavelength: 220 nm).

Time span of measurement: About 3 times as long as the retention time of ebastine, beginning after the solvent peak.

**System suitability**—
Test for required detectability: Pipet 10 mL of the standard solution, and add the mobile phase to make exactly 50 mL. Confirm that the peak area of ebastine obtained with 10 μL of this solution is equivalent to 15 to 25% of that with 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ebastine are not less than 6000 and not more than 1.5, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ebastine is not more than 2.0%.

**Uniformity of dosage units** <6.02> Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Ebastine Tablets add V/10 mL of 0.1 mol/L hydrochloric acid TS, and disperse the particles with the aid of ultrasonic waves with occasional shaking. Add 3V/5 mL of methanol, shake for 10 minutes, then add methanol to make exactly V mL so that each mL contains about 0.1 mg of ebastine (C32H39NO2), and centrifuge. Pipet 5 mL of the supernatant liquid, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Then, proceed as directed in the Assay.

\[
M_S = \frac{M \times Q_T}{Q_S} \times \frac{V}{500}
\]

\[
M_S: \text{Amount (mg) of ebastine for assay}
\]

**Internal standard solution**—A solution of diphenyl in the mobile phase (1 in 40,000).

**Dissolution** <6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of the 1st fluid for dissolution test as the dissolution medium, the dissolution rate in 30 minutes of Ebastine Tablets is not less than 75%.

Start the test with 1 tablet of Ebastine Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add the dissolution medium to make exactly V mL so that each mL contains about 5.6 μg of ebastine (C32H39NO2) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of ebastine for assay, previously dried at 60°C under reduced pressure with phosphorous (V) oxide for 2 hours, and dissolve in methanol to make exactly 50 mL. Pipet 1 mL of this solution, add the dissolution medium to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A and A9, of the sample solution and standard solution at 258 nm as directed under Ultraviolet-visible Spectrophotometry <2.24>, using the dissolution medium as the blank.

\[
\text{Dissolution rate (\%): } \frac{A - A9}{A} \times 100
\]

\[
M_S: \text{Amount (mg) of ebastine for assay}
\]

**Assay** Weigh accurately the mass of not less than 20 Ebastine Tablets, and powder. Weigh accurately a portion of the powder, equivalent to about 20 mg of ebastine (C32H39NO2), add 20 mL of 0.1 mol/L hydrochloric acid TS, and disperse the particles with the aid of ultrasonic waves. Ecabet Sodium Hydrate

エカベトナトリウム水和物

C₂₁H₂₇NaO₅S·5H₂O: 492.56
(1R,4aS,10aS)-1,4a-Dimethyl-7-(1-methylethyl)-6-sodiosulfonato-1,2,3,4,4a,9,10,10a-octahydrophenanthrene-1-carboxylic acid pentahydrate [219773-47-4]

Ecabet Sodium Hydrate contains not less than 98.5% and not more than 101.5% of ecabet sodium (C₂₁H₂₇NaO₅S: 402.48), calculated on the anhydrous basis.

Description Ecabet Sodium Hydrate is white crystals.
It is freely soluble in methanol, and slightly soluble in water and in ethanol (99.5).
It dissolves in sodium hydroxide TS.
Dissolve 1.0 g of Ecabet Sodium Hydrate in 200 mL of water: the pH of the solution is about 3.5.

Identification (1) Determine the absorption spectrum of a solution of Ecabet Sodium Hydrate in dilute sodium hydroxide TS (3 in 10,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ecabet Sodium Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) Place 1 g of Ecabet Sodium Hydrate in a porcelain crucible, and carbonize. After cooling, add 0.5 mL of nitric acid, heat gradually to incinerate, and dissolve the residue in 10 mL of water: the solution responds to the Qualitative Tests <1.09> for sodium salt.

Optical rotation (2) <2.49> [α]D: +69°–+76° (0.25 g calculated on the anhydrous basis, methanol, 25 mL, 100 mm).

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Ecabet Sodium Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 10 mg of Ecabet Sodium Hydrate in 10 mL of the mobile phase, and use this solution as the sample solution. Pipet 2 mL of the sample solution, add the mobile phase to make exactly 20 mL. Pipet 1 mL of this solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions. Determine each peak area of both solutions by the automatic integration method: the area of each peak other than ecabet obtained from the sample solution is not larger than the peak area of ecabet from the standard solution.

Operating conditions—
Detector: An ultraviolet absorption photometer (wavelength: 225 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
Column temperature: A constant temperature of about 40°C.
Mobile phase: To 0.1 mol/L potassium dihydrogen phosphate TS add phosphoric acid to adjust the pH to 3.0. To 730 mL of this solution add 270 mL of acetonitrile.
Flow rate: Adjust the flow rate so that the retention time of ecabet is about 8 minutes.
Time span of measurement: About 2 times as long as the retention time of ecabet, beginning after the solvent peak.

System suitability—
System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ecabet are not less than 5000 and not more than 1.5, respectively.
System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ecabet is not more than 2.0%.

(3) Residual solvent—Being specified separately.

Water <2.48> 17.3 – 19.2% (0.2 g, volumetric titration, direct titration).
Assay Weigh accurately about 1.2 g of Ecabet Sodium Hydrate, dissolve in 30 mL of methanol, add 30 mL of water, and titrate with 0.1 mol/L sodium hydroxide VS (indicator: 4 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 40.25 mg of C$_{20}$H$_{27}$NaO$_5$S

Containers and storage Containers—Well-closed containers.

**Ecabet Sodium Granules**

Ecabet Sodium Granules contain not less than 95.0% and not more than 105.0% of the labeled amount of ecabet sodium hydrate (C$_{20}$H$_{27}$NaO$_5$S.5H$_2$O: 492.56).

**Method of preparation** Prepare as directed under Granules, with Ecabet Sodium Hydrate.

**Identification** To a quantity of Ecabet Sodium Granules, equivalent to 50 mg of Ecabet Sodium Hydrate according to the labeled amount, add 25 mL of dilute sodium hydroxide TS, shake, and filter. Discard the first 10 mL of the filtrate, and to 3 mL of the subsequent filtrate add dilute sodium hydroxide TS to make 20 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.24>; it exhibits maxima between 269 nm and 273 nm, and between 278 nm and 282 nm.

**Uniformity of dosage units**<6.02> Perform the test according to the following method: Ecabet Sodium Granules in single-unit containers meet the requirement of the Content uniformity test.

Take out the total amount of the content of 1 container of Ecabet Sodium Granules, add 70 mL of dilute sodium hydroxide TS, treat with ultrasonic waves for 5 minutes with occasional shaking, add dilute sodium hydroxide TS to make exactly V mL so that each mL contains about 10 mg of ecabet sodium hydrate (C$_{20}$H$_{27}$NaO$_5$S.5H$_2$O), and filter. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add water to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of ecabet sodium hydrate for assay (separately, determine the water <2.50> with 0.1 mol/L sodium hydroxide VS (indicator: 4 drops of phenolphthalein TS). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L sodium hydroxide VS = 40.25 mg of C$_{20}$H$_{27}$NaO$_5$S

**Dissolution**<6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Ecabet Sodium Granules is not less than 80%.

Start the test with an accurately weighed amount of Ecabet Sodium Granules, equivalent to about 1 g (potency) of Ecabet Sodium Hydrate according to the labeled amount, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet 2 mL of the subsequent filtrate, add water to make exactly 10 mL, and use this solution as the sample solution. Separately, weigh accurately about 22 mg of ecabet sodium hydrate for assay (separately, determine the water <2.48> in the same manner as Ecabet Sodium Hydrate), dissolve in 1 mL of methanol, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A$_T$ and A$_S$, at 271 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the blank.

Dissolution rate (%) with respect to the labeled amount of ecabet sodium hydrate (C$_{20}$H$_{27}$NaO$_5$S.5H$_2$O) = M$_S$/M$_T$ × (A$_T$ - A$_S$) × 1/C × 4500 × 1.224

M$_S$: Amount (mg) of ecabet sodium hydrate for assay, calculated on the anhydrous basis

M$_T$: Amount (g) of Ecabet Sodium Granules

C: Labeled amount (mg) of ecabet sodium hydrate (C$_{20}$H$_{27}$NaO$_5$S.5H$_2$O) in 1 g

**Assay** Weigh accurately an amount of Ecabet Sodium Granules, equivalent to about 30 mg of ecabet sodium hydrate (C$_{20}$H$_{27}$NaO$_5$S.5H$_2$O), add exactly 5 mL of the internal standard solution, add 25 mL of diluted methanol (1 in 2), shake vigorously for 20 minutes, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 3 mL of the filtrate, to 3 mL of the subsequent filtrate add the mobile phase to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 30 mg of ecabet sodium hydrate for assay (separately, determine the water <2.48> in the same manner as Ecabet Sodium Hydrate), dissolve in 5 mL of the internal standard solution, add 5 mL of the internal standard solution, and dissolve in dilute methanol (1 in 2) to make 30 mL. To 3 mL of this solution add the mobile phase to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q$_T$ and Q$_S$, of the peak area of ecabet to that of the internal standard.

Amount (mg) of ecabet sodium hydrate (C$_{20}$H$_{27}$NaO$_5$S.5H$_2$O) = M$_S$ × Q$_T$/Q$_S$ × 1.224

M$_S$: Amount (mg) of ecabet sodium hydrate for assay, calculated on the anhydrous basis

Internal standard solution—A solution of ethyl parahydroxybenzoate in diluted methanol (1 in 2) (3 in 400).

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column 4.6 mm in inside diame-
Ecothiopate Iodide

エコチオパートヨウ化物

\[
\text{C}_9\text{H}_{23}\text{INO}_3\text{PS} : 383.23
\]

2-(Diethoxyphosphorylsulfanyl)-N,N,N-trimethylethylaminium iodide

[513-10-0]

Ecothiopate Iodide contains not less than 95.0% of C₉H₂₃INO₃PS, calculated on the dried basis.

**Description** Ecothiopate Iodide occurs as white crystals or crystalline powder.

It is very soluble in water, freely soluble in methanol, slightly soluble in ethanol (95), and practically insoluble in diethyl ether.

**Identification (1)** Dissolve 0.1 g of Ecothiopate Iodide in 2 mL of water, and add 1 mL of nitric acid: a brown precipitate is formed. To 1 drop of the turbid solution containing this precipitate add 1 mL of hexane, and shake: a light red color develops in the hexane layer.

(2) Heat the suspension of the precipitate obtained in (1) until it becomes colorless, cool, add 10 mL of water, and use this solution as the sample solution. Two mL of the sample solution responds to the Qualitative Tests \(<1.09>\) (2) for phosphate.

(3) Two mL of the sample solution obtained in (2) responds to the Qualitative Tests \(<1.09>\) for sulfate.

**pH** \(<2.54>\) Dissolve 0.1 g of Ecothiopate Iodide in 40 mL of water: the pH of this solution is between 3.0 and 5.0.

**Melting point** \(<2.60>\) 116 - 122°C

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Ecothiopate Iodide in 5 mL of water: the solution is clear and colorless.

(2) Heavy metals \(<1.07>\)—To 1.0 g of Ecothiopate Iodide in a Kjeldahl flask add 5 mL of nitric acid and 2 mL of sulfuric acid, put a small funnel on the mouth of the flask, and heat carefully until white fumes are evolved. After cooling, add 2 mL of nitric acid, and heat. Repeat this procedure twice, add several 2-mL portions of hydrogen peroxide (30), and heat until the solution becomes colorless, and white fumes are evolved. After cooling, transfer the solution together with a small quantity of water to a Nessler tube, and add water to make about 20 mL. Adjust the solution with ammonia solution (28) and ammonia TS to a pH between 3.0 and 3.5, add water to make 50 mL, and use this solution as the test solution. Prepare the control solution as follows: proceed in the same manner as the preparation of the test solution, and add 2.0 mL of Standard Lead Solution and water to make 50 mL (not more than 20 ppm).

(3) Related substances—Dissolve 0.20 g of Ecothiopate Iodide in 10 mL of methanol, and use this solution as the sample solution. Pipet 3 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.03>\). Spot 10 μL each of the sample solution and standard solution on a plate of cellulose for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (4:2:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly Dragendorff’s TS for spraying on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \(<2.41>\) Not more than 1.0% (1 g, in vacuum, phosphorus (V) oxide, 50°C, 3 hours).

**Assay** Weigh accurately about 0.125 g of Ecothiopate Iodide, and dissolve in water to make exactly 100 mL. Pipet 10 mL of this solution, add 30 mL of water, then add exactly 10 mL of phosphate buffer solution, pH 12, stopper the container, and allow to stand at 25 ± 3°C for 20 minutes. To this solution add quickly 2 mL of acetic acid (100), and titrate \(<2.50>\) with 0.002 mol/L iodine VS (potentiometric titration). Perform the test in the same manner without phosphate buffer solution, pH 12, and make any necessary correction.

Each mL of 0.002 mol/L iodine VS = 1.533 mg of C₉H₂₃INO₃PS

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and not exceeding 0°C.

"JP XVI"
Edrophonium Chloride

エドロホニウム塩化物

\[
\text{C}_{10}\text{H}_{16}\text{ClNO} : 201.69
\]
\[\text{N-Ethyl-3-hydroxy-N,N-dimethylanilinium chloride}\]

[116-38-1]

**Edrophonium Chloride**

Edrophonium Chloride, when dried, contains not less than 98.0% of \(\text{C}_{10}\text{H}_{16}\text{ClNO}\).

**Description** Edrophonium Chloride occurs as white crystals or crystalline powder. It is odorless. It is very soluble in water, freely soluble in ethanol (95) and in acetic acid (100), and practically insoluble in acetic anhydride and in diethyl ether.

It is hygroscopic.

It is gradually colored by light.

**Identification**

1. To 5 mL of a solution of Edrophonium Chloride (1 in 100) add 1 drop of iron (III) chloride TS: a light red-purple color develops.

2. Determine the absorption spectrum of a solution of Edrophonium Chloride in 0.1 mol/L hydrochloric acid TS (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Edrophonium Chloride RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

3. A solution of Edrophonium Chloride (1 in 50) responds to the Qualitative Tests <1.00> for chloride.

**pH** <2.54> Dissolve 1.0 g of Edrophonium Chloride in 10 mL of water: the pH of this solution is between 3.5 and 5.0.

**Melting point** >2.60° 166 – 171°C (with decomposition).

**Purity**

1. Clarity and color of solution—Dissolve 1.0 g of Edrophonium Chloride in 10 mL of water: the solution is clear and colorless.

2. Heavy metals <1.07>—Proceed with 1.0 g of Edrophonium Chloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

3. Arsenic <1.11>—Prepare the test solution with 1.0 g of Edrophonium Chloride according to Method 1, and perform the test (not more than 2 ppm).

4. Related substances—Dissolve 0.50 g of Edrophonium Chloride in 10 mL of ethanol (95), and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add ethanol (95) to make exactly 100 mL. Pipet 3 mL of this solution, add ethanol (95) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of methanol, chloroform and ammonia solution (28) (16:4:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** <2.41> Not more than 0.20% (1 g, in vacuum, phosphorus (V) oxide, 3 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.2 g of Edrophonium Chloride, previously dried, and dissolve in 100 mL of a mixture of acetic anhydride and acetic acid (100) (7:3). Titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 20.17 mg of \(\text{C}_{10}\text{H}_{16}\text{ClNO}\)

**Containers and storage**

Containers—Tight containers.

Storage—Light-resistant.

**Edrophonium Chloride Injection**

エドロホニウム塩化物注射液

Edrophonium Chloride Injection is an aqueous solution for injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of edrophonium chloride (\(\text{C}_{10}\text{H}_{16}\text{ClNO}\): 201.69).

**Method of preparation** Prepare as directed under Injections, with Edrophonium Chloride.

**Description** Edrophonium Chloride Injection is a clear and colorless liquid.

**Identification**

1. To a volume of Edrophonium Chloride Injection, equivalent to 0.04 g of Edrophonium Chloride, add 1 drop of iron (III) chloride TS: a light red-purple color develops.

2. Determine the absorption spectrum of the sample solution obtained in the Assay as directed under Ultraviolet–visible Spectrophotometry <2.24>: it exhibits a maximum between 272 nm and 276 nm.

**pH** <2.54> 6.5 – 8.0

**Bacterial endotoxins** <4.01> Less than 15 EU/mg.

**Extractable volume** <6.05> It meets the requirement.

**Foreign insoluble matter** <6.06> Perform the test according to Method 1: it meets the requirement.

**Insoluble particulate matter** <6.07> It meets the requirement.

**Sterility** <4.06> Perform the test according to the Membrane filtration method: it meets the requirement.

**Assay** Conduct this procedure without exposure to daylight, using light-resistant containers. Measure exactly a volume of Edrophonium Chloride Injection, equivalent to about 50 mg of edrophonium chloride (\(\text{C}_{10}\text{H}_{16}\text{ClNO}\), place
in a chromatographic column prepared by pouring 10 mL of weakly basic DEAE-bridged dextran anion exchanger (Cl type) (50 to 150 \( \mu \)m in particle diameter) into a chromatographic tube about 2 cm in inside diameter and about 10 cm in length, add 25 mL of water, and elute at the flow rate of 1 to 2 mL per minute. Wash the column with two 25-mL portions of water at the flow rate of 1 to 2 mL per minute. Combine the washings with above effluent solutions, and add water to make exactly 100 mL. Measure exactly 10 mL of this solution, and add 10 mL of phosphate buffer solution, pH 8.0, and 5 g of sodium chloride. Wash this solution with four 20-mL portions of a mixture of diethyl ether and hexane (1:1), collect the water layer, add 0.1 mol/L hydrochloric acid TS to make exactly 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 50 mg of Edrophonium Chloride RS, previously dried to constant weight under Ultraviolet-visible Spectrophotometry \(<2.24\). Amount (mg) of edrophonium chloride (C\(_{10}\)H\(_{16}\)ClNO) = \( M_S \times \frac{A_T}{A_S} \),
\( M_S \): Amount (mg) of Edrophonium Chloride RS

Containers and storage Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant.

**Elcatonin**

エルカトニン

![Elcatonin](Image 58x316 to 283x367)

Elcatonin contains not less than 5000 Elcatonin Units and not more than 7000 Elcatonin Units per 1 mg of peptide, calculated on the dehydrated and deacetic acid basis.

**Description** Elcatonin is a white powder.

It is very soluble in water, freely soluble in ethanol (95), and practically insoluble in acetonitrile.

It is hygroscopic.

The pH of its solution (1 in 500) is between 4.5 and 7.0.

**Identification** Dissolve 5 mg of Elcatonin in 5 mL of water. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry \(<2.24\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

**Constituent amino acids** Put about 1 mg of Elcatonin in a test tube for hydrolysis, add phenol-hydrochloric acid TS to dissolve, replace the air inside with Nitrogen, seal the tube under reduced pressure, and heat at 110 ± 2°C for 24 hours. After cooling, open the tube, evaporate the hydrolyzate to dryness under reduced pressure, dissolve the residue in 1 mL of 0.02 mol/L hydrochloric acid TS, and use this solution as the sample solution. Separately, weigh exactly 1.33 mg of L-aspartic acid, 1.19 mg of L-threonine, 1.05 mg of L-serine, 1.47 mg of L-glutamic acid, 1.15 mg of L-proline, 0.75 mg of glycine, 0.89 mg of L-alamine, 1.17 mg of L-valine, 1.89 mg of L-2-aminosubaric acid, 1.31 mg of L-leucine, 1.81 mg of L-tyrosine, 1.83 mg of L-lysine hydrochloride, 2.10 mg of L-histidine hydrochloride monohydrate and 2.11 mg of L-arginine hydrochloride, dissolve them in 0.02 mol/L hydrochloric acid TS to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 \( \mu \)L of each the sample solution and standard solution as directed under Liquid Chromatography \(<2.01\) according to the following conditions: 14 peaks of amino acids appear on the chromatogram obtained from the sample solution, and their respective molar ratios against alanine are 1.7 – 2.2 for aspartic acid, 3.5 – 4.2 for threonine, 2.4 – 3.0 for serine, 2.7 – 3.2 for glutamic acid, 1.7 – 2.2 for for proline, 2.7 – 3.2 for glycine, 1.6 – 2.2 for valine, 0.8 – 1.2 for 2-aminosubaric acid, 4.5 – 5.2 for leucine, 0.7 – 1.2 for tyrosine, 1.7 – 2.2 for lysine, 0.8 – 1.2 for histidine and 0.7 – 1.2 for arginine.

**Operating conditions**

Detector: A visible spectrophotometer (wavelength: 440 nm and 570 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 8 cm in length, packed with strongly acidic ion-exchange resin for liquid chromatography composed with a sulfonated styrene-divinylbenzene copolymer (3 \( \mu \)m in particle diameter).

Column temperature: Varied between 50°C and 65°C.

Chemical reaction vessel temperature: A constant temperature of about 130°C.

Color developing time: About 1 minute.

Mobile phase: Buffer solutions A, B, C and D, with sodium ion concentrations of 0.10 mol/L, 0.135 mol/L, 1.26 mol/L and 0.20 mol/L, respectively. The ion concentration of the mobile phase is changed stepwise from 0.10 mol/L to 1.26 mol/L by using these buffer solutions.

Reaction reagent: Mix 407 g of lithium acetate dihydrate, 245 mL of acetic acid (100) and 801 mL of 1-methoxy-2-
propanol, add water to make 2000 mL, stir for about 20 minutes while passing Nitrogen, and use this solution as solution A. Separately, to 1957 mL of 1-methoxy-2-propanol add 77 g of ninhydrin and 0.134 g of sodium borohydride, stir for about 20 minutes while passing Nitrogen, and use this solution as solution B. Mix solution A and solution B before use.

Flow rate of mobile phase: Adjust the flow rate so that the retention time of arginine is about 75 minutes.

Flow rate of reaction reagent: About 0.2 mL per minute.

Selection of column: Proceed with 10 µL of the standard solution under the above operating conditions. Use a column from which aspartic acid, threonine, serine, glutamic acid, proline, glycine, alanine, valine, 2-aminosuberic acid, leucine, tyrosine, lysine, histidine and arginine are eluted in this order, with complete separation of each peak.

**Purity (1)** Acetic acid—Weigh accurately 3 – 6 mg of Elcatonin quickly under conditions of 25 ± 2°C and 50 ± 5% relative humidity, add exactly 1 mL of the internal standard solution to dissolve it, and use this solution as the sample solution. Separately, weigh accurately about 0.5 g of acetic acid (100), and add the internal standard solution to make exactly 100 mL. Pipet 5 mL of this solution, add the internal standard solution to make exactly 100 mL, and use this solution as the standard solution. Perform the test with 20 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q_t and Q_s, of the peak area of acetic acid to that of the internal standard: the amount of acetic acid is not more than 7.0%.

\[
\text{Amount} \,(\%) \, \text{of acetic acid} \,(\text{CH}_2\text{COOH}) = \frac{M_{st}}{M_{sa}} \times \frac{Q_t}{Q_s} \times 50
\]

*M_st:* Amount (g) of acetic acid (100)

*M_sa:* Amount (mg) of sample

**Internal standard solution—** A solution of citric acid monohydrate (1 in 4000).

**Operating conditions—**

Detecting instrument: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecyl-silanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: Dissolve 13.2 g of diammonium hydrogen phosphate in 900 mL of water, add phosphoric acid to adjust the pH to 2.5, and add water to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of acetic acid is about 4 minutes.

Selection of column: Proceed with 20 µL of the standard solution under the above operating conditions. Use a column from which acetic acid and citric acid are eluted in this order with the resolution between their peaks being not less than 2.0.

(2) Related substances—Dissolve 1.0 mg of Elcatonin in 1 mL of a mixture of trifluoroacetic acid TS and acetonitrile (2:1), and use this solution as the sample solution. Take exactly 0.3 mL of the sample solution, add a mixture of trifluoroacetic acid TS and acetonitrile (2:1) to make exactly 10 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than the peak of elcatonin from the sample solution is not larger than 1/3 times the peak area of elcatonin from the standard solution, and the total of the peak areas other than the peak of elcatonin is not larger than the peak area of elcatonin from the standard solution.

**Operating conditions—**

Detector: An ultraviolet absorption photometer (wavelength: 225 nm).

Column: A stainless steel column about 4 mm in inside diameter and about 15 cm in length, packed with octadecyl-silanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 40°C.

Mobile phase: A mixture of trifluoroacetic acid TS and acetonitrile (change the ratio linearly from 85:15 to 55:45 in 30 minutes).

Flow rate: Adjust the flow rate so that the retention time of elcatonin is about 25 minutes.

Selection of column: Dissolve 2 mg of Elcatonin in 200 µL of trypsin TS for test of elcatonin, warm at 37°C for 1 hour, then add 1 drop of acetic acid (100), and heat at 95°C for 1 minute. To 10 µL of this solution add 50 µL of the sample solution, and mix. Proceed with 10 µL of this solution under the above operating conditions, and calculate the resolution. Use a column such that the resolution between the peak of elcatonin and the peak which appears immediately before the peak of elcatonin is not less than 2.0, and the retention time of elcatonin is about 25 minutes.

Detection sensitivity: Adjust the detection sensitivity so that the peak height of elcatonin from 10 µL of the standard solution is between 50 mm and 200 mm.

Time span of measurement: Continue measurement until the regularly changing base-line of the chromatogram disappears, beginning after the solvent peak.

**Water** <2.48> Weigh accurately 1 – 3 mg of Elcatonin quickly under conditions of 25 ± 2°C and 50 ± 5% relative humidity, and perform the test as directed in 2. Coulometric titration: not more than 8.0%.

**Nitrogen content** Weigh accurately 0.015 – 0.02 g of Elcatonin quickly under conditions of 25 ± 2°C and 50 ± 5% relative humidity, and perform the test as directed under Nitrogen Determination <1.08>: it contains not less than 16.1% and not more than 18.7% of nitrogen (N: 14.01) in the peptide, calculated on the dehydrated and de-acetic acid basis.

**Assay (i)** Animals: Select healthy male Sprague-Dawley rats each weighing between 90 g and 110 g. Keep the rats for not less than 3 days before use, providing an appropriate uniform diet and water.

(ii) Diluent for elcatonin: Dissolve 2.72 g of sodium acetate in water to make 200 mL, add 0.2 g of bovine serum albumin, and adjust the pH to 6.0 with acetic acid (100). Prepare before use.

(iii) Standard solution: Dissolve Elcatonin RS in the diluent for elcatonin to make two standard solutions, one to contain exactly 0.075 Unit in each mL which is designated as
the high-dose standard solution, $S_H$, and the other to contain exactly 0.0375 Unit in each mL which is designated as the low-dose standard solution, $S_L$.

(iv) Sample solution: Weigh accurately 0.5 - 2.0 mg of Elcatonin quickly under conditions of $25 \pm 2^\circ C$ and 50 - 5% relative humidity, and dissolve in the diluent for elcatonin to make two sample solutions, $T_H$, which contains the Units per mL equivalent to $S_H$ and the low-dose sample solution, $T_L$, which contains the Units per mL equivalent to $S_L$.

(v) Deproteinizing solution for elcatonin: Dissolve 160 g of trichloroacetic acid and 30.6 g of strontium chloride in water to make 3600 mL.

(vi) Procedure: Divide the animals into 4 equal groups of not less than 10 animals each. Withhold all food, but not water, for 18 to 24 hours before the injections, and withhold water during the assay until the final blood sample is taken. Handle the animals with care in order to avoid undue excitement.

Inject exactly 0.2 mL of each of the standard solutions and the sample solutions into the tail vein of each animal as indicated in the following design:

- First group $S_H$  
- Second group $S_L$  
- Third group $T_H$  
- Fourth group $T_L$

At 1 hour after the injection, take a sufficient blood sample to perform the test from the carotid artery and vein of each animal under ether anesthesia, centrifuge the blood samples to separate serum, and determine the serum calcium according to the following (vii).

(vii) Serum calcium determination: Take exactly 0.3 mL of the serum, add the deproteinizing solution for elcatonin to make exactly 3 mL, mix well, centrifuge, and use the supernatant liquid as the sample solution for calcium determination. Separately, pipet 1 mL of Standard Calcium Solution for Atomic Absorption Spectrophotometry $<2.23>$, and add a solution of sodium chloride (17 in 2000) to make exactly 10 mL. Pipet 5 mL of this solution, add the deproteinizing solution for elcatonin to make exactly 50 mL, and use this solution as the standard solution for calcium determination. Determine the absorbances, $A_1$ and $A_2$, of the sample solution and the standard solution as directed under Atomic Absorption Spectrophotometry $<2.23>$ according to the following conditions. Determine the absorbance, $A_0$, of a solution obtained in the same manner used for preparation of the standard solution, but with 1 mL of water instead of the standard solution.

Amount (mg) of calcium (Ca) in 100 mL of the serum

\[ M = 0.01 \times (A_1 - A_0)/(A_S - A_0) \times 10 \times 100 \]

Gas: Combustible gas—Acetylene.

Supporting gas—Air.

Lamp: Calcium hollow-cathode lamp.

Wavelength: 422.7 nm.

(viii) Calculation: Amounts of calcium in 100 mL of the serum obtained with $S_H$, $S_L$, $T_H$ and $T_L$ in (vii) are symbolized as $y_1$, $y_2$, $y_3$, and $y_4$, respectively. Sum up individual $y_1$, $y_2$, $y_3$, and $y_4$ to obtain $Y_1$, $Y_2$, $Y_3$, and $Y_4$, respectively.

Units per mg of peptide, calculated on the dehydrated and de-acetic acid basis

\[ M = 0.3010 \times Y_5/Y_6 \]

\[ Y_5 = -Y_1 - Y_2 + Y_3 + Y_4 \]

\[ Y_6 = Y_1 - Y_2 + Y_3 - Y_4 \]

\[ a: \text{Amount (mg) of the sample} \]

\[ \times [100 - \text{water content (\%)} + \text{acetic acid content (\%)}]/100 \]

\[ b: \text{Total volume (mL) of the high-dose sample solution prepared by dissolving the sample with diluent for elcatonin} \]

$F'$ computed by the following equation should be smaller than $F$ shown in the table against $n$ with which $s^2$ is calculated. Calculate $L (P = 0.95)$ by use of the following equation: $L$ should be not more than 0.20. If $F'$ exceeds $F$, or if $L$ exceeds 0.20, repeat the test, increasing the number of animals or arranging the assay conditions so that $F'$ is not more than $F$ and $L$ is not more than 0.20.

\[ F' = (- Y_1 + Y_2 + Y_3 - Y_4)/4fs^2 \]

\[ n = 4 (f - 1) \]

\[ L = 2f(C - 1)(CM^2 + 0.09062) \]

\[ C = Y^2/(Y^2 - 4fs^2t^2) \]

$t^2$: Value shown in the following table against $n$ used to calculate $s^2$.

Containers and storage

Containers—Tight containers.

Storage—Not exceeding 8°C.
Emorfazone

エモルファゾン

C_{11}H_{17}N_{3}O_{3}: 239.27
4-Ethoxy-2-methyl-5-(morpholin-4-yl)pyridazin-3(2H)-one

Emorfazone, when dried, contains not less than 98.5% and not more than 101.0% of C_{11}H_{17}N_{3}O_{3}.

**Description**
Emorfazone occurs as colorless crystals or a white to light yellow crystalline powder.

It is very soluble in ethanol (99.5), and freely soluble in water and in acetic anhydride.

It dissolves in 1 mol/L hydrochloric acid TS.

It gradually turns yellow and decomposes on exposure to light.

**Identification**

(1) Dissolve 20 mg of Emorfazone in 2 mL of 1 mol/L hydrochloric acid TS, and add 5 drops of Reinecke’s TS: light red floating matters are formed.

(2) Determine the absorption spectrum of a solution of Emorfazone (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Emorfazone as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point** <2.60> 89 – 92°C (after drying).

**Purity**

(1) Chloride <1.03> — Perform the test with 1.0 g of Emorfazone. Prepare the control solution with 0.50 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.018%).

(2) Heavy metals <1.07> — Proceed with 2.0 g of Emorfazone according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

**Arsenic** <1.11> — Prepare the test solution with 2.0 g of Emorfazone according to Method 3, and perform the test (not more than 1 ppm).

(4) Related substances — Conduct this procedure using light-resistant vessels. Dissolve 0.5 g of Emorfazone in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area by the automatic integration method: each peak area other than emorfazone obtained from the sample solution is not larger than 1/10 times the peak area of emorfazone from the standard solution, and the total area of the peaks other than the peak of emorfazone is not larger than 1/2 times the peak area of emorfazone from the standard solution.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and methanol (11:10).

Flow rate: Adjust the flow rate so that the retention time of emorfazone is about 5 minutes.

Time span of measurement: About 2.5 times as long as the retention time of emorfazone, beginning after the solvent peak.

**System suitability**

Test for required detectability: Pipet 1 mL of the standard solution, add the mobile phase to make exactly 20 mL. Confirm that the peak area of emorfazone obtained with 20 μL of this solution is equivalent to 3.5 to 6.5% of that with 20 μL of the standard solution.

System performance: Dissolve 16 mg of Emorfazone and 30 mg of 2,4-dinitrophenylhydrazine in 100 mL of methanol. When the procedure is run with 20 μL of this solution under the above operating conditions, emorfazone and 2,4-dinitrophenylhydrazine are eluted in this order with the resolution between these peaks being not less than 2.5.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of emorfazone is not more than 1.0%.

**Loss on drying** <2.4I> Not more than 0.5% (1 g, in vacuum, 60°C, 4 hours).

**Residue on ignition** <2.44> Not more than 0.1% (1 g).

**Assay**
Weigh accurately about 0.2 g of Emorfazone, previously dried, dissolve in 60 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 23.93 mg of C_{11}H_{17}N_{3}O_{3}

**Containers and storage** Containers—Tight containers.
Storage—Light-resistant.

**Emorfazone Tablets**

Emorfazone Tablets contain not less than 95.0% and not more than 105.0% of the labeled amount of emorfazone (C_{11}H_{17}N_{3}O_{3}: 239.27).

**Method of preparation** Prepare as directed under Tablets, with Emorfazone.

**Identification** To a quantity of powdered Emorfazone Tablets, equivalent to 0.1 g of Emorfazone according to the labeled amount, add 100 mL of water, shake well, and cen-
trifuge. Filter the supernatant liquid, and to 1 mL of the filtrate add water to make 100 mL. Determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry. It exhibits maxima between 237 nm and 241 nm, and between 310 nm and 314 nm, and a shoulder between 288 nm and 298 nm.

**Uniformity of dosage units**

Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Emorfazone Tablets add methanol to make exactly 50 mL so that each mL contains about 4 mg of emorfazone (C11H17N3O3), and shake well to disintegrate. Centrifuge this solution, pipet 2 mL of the supernatant liquid, add exactly 10 mL of the internal standard solution, add methanol to make 50 mL, and use this solution as the sample solution. Proceed as directed in the Assay.

\[
\text{Amount (mg) of emorfazone (C}_{11}\text{H}_{17}\text{N}_{3}\text{O}_{3}) = M_S \times \frac{Q_t}{Q_s} \times V/5
\]

\[
M_S: \text{Amount (mg) of emorfazone for assay}
\]

**Internal standard solution** — A solution of 2,4-dinitrophenyl-hydrazine in methanol (3 in 2000). Prepare before use.

**Dissolution**

When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Emorfazone Tablets is not less than 80%.

Start the test with 1 tablet of Emorfazone Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly 50 mL so that each mL contains about 11 μg of emorfazone (C11H17N3O3) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 28 mg of emorfazone for assay, previously dried in vacuum conditions, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, \(A_t\) and \(A_o\), of the sample solution and standard solution at 239 nm as directed under Ultraviolet-visible Spectrophotometry.

\[
\text{Dissolution rate (cm)}^{2}\text{cm}^{-1}\text{min}^{-1}\]

\[
= M_S \times \frac{A_t}{A_o} \times \frac{V'}{V} \times \frac{1}{C} \times 36
\]

\[
M_S: \text{Amount (mg) of emorfazone for assay}
\]

**Assay**

To 10 tablets of Emorfazone Tablets add 200 mL of methanol, shake well to disintegrate, add methanol to make exactly 250 mL, and centrifuge. Pipet a volume of the supernatant liquid, equivalent to about 8 mg of emorfazone (C11H17N3O3), add exactly 10 mL of the internal standard solution, add methanol to make 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 20 mg of emorfazone for assay, previously dried in vacuum conditions, and dissolve in methanol to make exactly 25 mL. Pipet 10 mL of this solution, add exactly 10 mL of the internal standard solution, add methanol to make 50 mL, and use this solution as the standard solution. Perform the test with 20 μL each of the sample solution and standard solution as directed under Liquid Chromatography according to the following conditions, and calculate the ratios, \(Q_t\) and \(Q_s\), of the peak area of emorfazone to that of the internal standard.

\[
\text{Amount (mg) of emorfazone (C}_{11}\text{H}_{17}\text{N}_{3}\text{O}_{3}) = M_S \times \frac{Q_t}{Q_s} \times 2/5
\]

\[
M_S: \text{Amount (mg) of emorfazone for assay}
\]

**Internal standard solution** — A solution of 2,4-dinitrophenyl-hydrazine in methanol (3 in 2000). Prepare before use.

**Operating conditions**

Detector: An ultraviolet absorption photometer (wavelength: 313 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and methanol (11:10).

Flow rate: Adjust the flow rate so that the retention time of emorfazone is about 5 minutes.

**System suitability**

System performance: When the procedure is run with 20 μL of the standard solution under the above operating conditions, emorfazone and the internal standard are eluted in this order with the resolution between these peaks being not less than 2.5.

System repeatability: When the test is repeated 6 times with 20 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratio of the peak area of emorfazone to that of the internal standard is not more than 1.0%.

**Containers and storage**

Containers—Tight containers.

Storage—Light-resistant.

**Enalapril Maleate**

エナラプリルマレイン酸塩

\[
\text{C}_{20}\text{H}_{28}\text{N}_{2}\text{O}_{5}\cdot\text{C}_{4}\text{H}_{4}\text{O}_{4}: \quad 492.52
\]

\[
(2S)-1-\{(255)-2-\{(1S)-1\text{-Ethoxycarbonyl-3-phenylpropylamino\}propanoyl\}pyrrolidine-2-carboxylic acid monomaleate
\]

[76959-16-4]

Enalapril Maleate, when dried, contains not less than 98.0% and not more than 102.0% of C20H28N2O5·C4H4O4.

**Description**

Enalapril Maleate occurs as white crystals or a white crystalline powder.

It is freely soluble in methanol, sparingly soluble in water and in ethanol (99.5), and slightly soluble in acetonitrile.

Melting point: about 145°C (with decomposition).
Identification (1) Determine the infrared absorption spectra of Enalapril Maleate as directed in the potassium bromide disc method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Enalapril Maleate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) To 20 mg of Enalapril Maleate add 5 mL of 1 mol/L hydrochloric acid TS, shake, add 5 mL of diethyl ether, and shake for 5 minutes. Take 3 mL of the upper layer, distil off the diethyl ether on a water bath, add 5 mL of water to the residue with shaking, and add 1 drop of potassium permanaganate TS: the red color of the test solution immediately disappears.

Optical rotation <2.49> \(\left[\alpha\right]_D^20 = -41.0 - 43.5^\circ\) (after drying, 0.25 g, methanol, 25 mL, 100 mm).

Purity (1) Heavy metals <1.07>—Proceed with 2.0 g of Enalapril Maleate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(2) Related substances—Dissolve 30 mg of Enalapril Maleate in 100 mL of a mixture of sodium dihydrogen phosphate TS, pH 2.5 and acetonitrile (19:1), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mixture of sodium dihydrogen phosphate TS, pH 2.5 and acetonitrile (19:1) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 \(\mu\)L of each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine each peak area of these solutions by the automatic integration method: the area of the peak other than maleic acid and enalapril obtained from the sample solution is not larger than twice the peak area of enalapril from the standard solution. Furthermore, the total area of the peaks other than maleic acid and enalapril is not larger than twice the peak area of enalapril from the standard solution.

Operating conditions—

Detector, column, column temperature, mobile phases, mobile phase flow, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 2 times as long as the retention time of enalapril, beginning after the peak of maleic acid.

System suitability—

Test for required detectability: Pipet 1 mL of the standard solution, and add a mixture of sodium dihydrogen phosphate TS, pH 2.5 and acetonitrile (19:1) to make exactly 10 mL. Confirm that the peak area of enalapril obtained from 50 \(\mu\)L of this solution is equivalent to 7 to 13% of that from 50 \(\mu\)L of the standard solution.

System performance: When the procedure is run with 50 \(\mu\)L of the standard solution under the above conditions, the number of theoretical plates and the symmetry factor of the peak of enalapril are not less than 3000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 50 \(\mu\)L of the standard solution under the above conditions, the relative standard deviation of the peak area of enalapril is not more than 2.0%.

Loss on drying <2.41> Not more than 1.0% (1 g, in vacuum, 60°C, 2 hours).

Residue on ignition <2.44> Not more than 0.2% (1 g).

Assay Weigh accurately about 30 mg each of Enalapril Maleate and Enalapril Maleate RS, both previously dried, and dissolve in a mixture of sodium dihydrogen phosphate TS, pH 2.5 and acetonitrile (19:1) to make exactly 100 mL, and use these solutions as the sample solution and standard solution. Perform the test with exactly 50 \(\mu\)L each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the peak areas of enalapril, \(A_T\) and \(A_S\), of both solutions.

\[
\text{Amount (mg) of } C_9H_{13}N_2O_5 \cdot C_4H_4O_4 = M_S \times A_T / A_S
\]

Operating conditions—

Column: A stainless steel column 4.1 mm in inside diameter and 15 cm in length, packed with porous styrene-divinylbenzene copolymer for liquid chromatography (5 \(\mu\)m in particle diameter).

Column temperature: A constant temperature of about 70°C.

Mobile phase A: Dissolve 3.1 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust the pH to 6.8 with a solution of sodium hydroxide (1 in 4), and add water to make 1000 mL. To 950 mL of this solution, add 50 mL of acetonitrile for liquid chromatography.

Mobile phase B: Dissolve 3.1 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust the pH to 6.8 with a solution of sodium hydroxide (1 in 4), and add water to make 1000 mL. To 340 mL of this solution, add 660 mL of acetonitrile for liquid chromatography.

Mobile phase flow: Control the concentration gradient by changing the ratio of the mobile phases A and B as follows.

<table>
<thead>
<tr>
<th>Time after injection (min)</th>
<th>Mobile phase A (%vol)</th>
<th>Mobile phase B (%vol)</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

Flow rate: 1.4 mL per minute.

System suitability—

System performance: When the procedure is run with 50 \(\mu\)L of the standard solution under the above conditions, the number of theoretical plates and the symmetry factor of the peak of enalapril are not less than 3000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 50 \(\mu\)L of the standard solution under the above conditions, the relative standard deviation of the peak area of enalapril is not more than 1.0%.

Containers and storage Containers—Well-closed containers.
Enalapril Maleate Tablets

エナラプリルメレート酸塩錠

Enalapril Maleate Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of enalapril maleate (C$_{20}$H$_{28}$N$_{2}$O$_{5}$·C$_{4}$H$_{4}$O$_{4}$: 492.52).

Method of preparation Prepare as directed under Tablets, with Enalapril Maleate.

Identification To a quantity of powdered Enalapril Maleate Tablets equivalent to 50 mg of Enalapril Maleate according to the labeled amount, add 20 mL of methanol, shake, centrifuge, and then use the supernatant liquid as the sample solution. Separately, dissolve 25 mg of enalapril maleate in 10 mL of methanol, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-Layer Chromatography.<2.01> , Spot 20 µL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of water, acetone, 1-butanol, acetic acid (100) and toluene (1:1:1:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the Rf values of the 2 spots obtained from the sample solution and the 2 spots obtained from the standard solution are equivalent.

Purity Enalaprilat and enalapril diketopiperazine—Use the sample solution obtained in the Assay as the standard solution. Pipet 1 mL of the sample solution, add sodium dihydrogen phosphate TS, pH 2.2 to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 50 µL each of the sample solution and standard solution as directed under Liquid Chromatography.<2.07> according to the following conditions, and determine each peak area of both solutions by the automatic integration method: the peak area of enalaprilat, having the relative retention time of about 0.5 with respect to enalapril obtained from the sample solution, is not larger than 2 times the peak area of enalapril from the standard solution. Also, the peak area of enalapril diketopiperazine, having the relative retention time of about 1.5 is not larger than the peak area of enalapril from the standard solution.

Operating conditions—
Proceed as directed in the operating conditions in the Assay.

System suitability—
Test for required detectability: Pipet 1 mL of the standard solution, and add sodium dihydrogen phosphate TS, pH 2.2 to make exactly 10 mL. Confirm that the peak area of enalapril obtained from 50 µL of this solution is equivalent to 7 to 13% of that from 50 µL of the standard solution.

System performance: Proceed as directed in the system suitability in the Assay.

System repeatability: When the test is repeated 6 times with 50 µL of the standard solution under the above conditions, the relative standard deviation of the peak area of enalapril is not more than 2.0%.

Uniformity of dosage units.<6.02> Perform the test according to the following method: it meets the requirement of the

Content uniformity test.
Take 1 tablet of Enalapril Maleate Tablets, add V/2 mL of sodium dihydrogen phosphate TS, pH 2.2, treat with ultrasonic waves for 15 minutes, shake for 30 minutes, and add sodium dihydrogen phosphate TS, pH 2.2 to make exactly V mL so that 1 mL of the solution contains about 0.1 mg of enalapril maleate (C$_{20}$H$_{28}$N$_{2}$O$_{5}$·C$_{4}$H$_{4}$O$_{4}$). Treat this solution with ultrasonic waves for 15 minutes, filter through a membrane filter with a pore size not exceeding 0.45 µm, and use the filtrate as the sample solution. Then, proceed as directed in the Assay.

Amount (mg) of enalapril maleate (C$_{20}$H$_{28}$N$_{2}$O$_{5}$·C$_{4}$H$_{4}$O$_{4}$) = M$_{5}$ × A$_{1}$/A$_{5}$ × V/200

M$_{5}$: Amount (mg) of Enalapril Maleate RS

Dissolution.<6.10> When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rates are 15 minutes of a 2.5- and 5-mg tablet and in 30 minutes of a 10-mg tablet are not less than 85%, respectively.

Start the test with 1 tablet of Enalapril Maleate Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 µm. Discard the first 10 mL of the filtrate, pipet V mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 2.8 µg of enalapril maleate (C$_{20}$H$_{28}$N$_{2}$O$_{5}$·C$_{4}$H$_{4}$O$_{4}$) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 14 mg of Enalapril Maleate RS, previously dried in vacuum at 60°C for 2 hours, and dissolve in water to make exactly 500 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 50 µL each of the sample solution and standard solution as directed under Liquid Chromatography.<2.07> according to the following conditions, and determine the enalapril peak areas, A$_{1}$ and A$_{2}$, of both solutions.

Dissolution rate (%) with respect to the labeled amount of enalapril maleate (C$_{20}$H$_{28}$N$_{2}$O$_{5}$·C$_{4}$H$_{4}$O$_{4}$) $= M_{5} × A_{1}/A_{5} × V/V × 1/C × 18$

M$_{5}$: Amount (mg) of Enalapril Maleate RS

C: Labeled amount (mg) of enalapril maleate (C$_{20}$H$_{28}$N$_{2}$O$_{5}$·C$_{4}$H$_{4}$O$_{4}$) in 1 tablet

Operating conditions—
Detector, column, column temperature, and flow rate: Proceed as directed in the operating conditions in the Assay.

Mobile phase: Dissolve 1.88 g of sodium dihydrogen phosphate dihydrate in 900 mL of water, adjust the pH to 2.2 with phosphoric acid, and add water to make 1000 mL. To 750 mL of this solution add 250 mL of acetonitrile.

System suitability—
System performance: When the procedure is run with 50 µL of the standard solution under the above conditions, the number of theoretical plates and the symmetry factor of the peak of enalapril are not less than 300 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 50 µL of the standard solution under the above conditions, the relative standard deviation of the peak area of enalapril is not more than 2.0%.
**Enalapril Maleate**

**Assay**  Weigh accurately not less than 20 Enalapril Maleate Tablets, and powder. Weigh accurately a portion of the powder equivalent to about 10 mg of enalapril maleate ((C₂₀H₂₈N₂O₅.C₄H₄O₄), add 50 mL of sodium dihydrogen phosphate TS, pH 2.2, treat with ultrasonic waves for 15 minutes, shake for 30 minutes, and then add sodium dihydrogen phosphate TS, pH 2.2 to make exactly 100 mL. Treat this solution with ultrasonic waves for 15 minutes, filter through a membrane filter with a pore size not exceeding 0.45 μm, and use the filtrate as the sample solution. Separately, weigh accurately about 20 mg of Enalapril Maleate RS, previously dried in vacuum at 60°C for 2 hours, dissolve in sodium dihydrogen phosphate TS, pH 2.2 to make exactly 200 mL, and use this solution as the standard solution. Perform the test with exactly 50 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and determine the enalapril peak areas, A₁ and A₅, of both solutions.

\[
M₅ = M₅ \times A₁/A₅ \times 1/2
\]

- **Operating conditions—**
  - Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with octylsilanized silica gel for liquid chromatography (5 μm in particle diameter).
  - Column temperature: A constant temperature of about 50°C.
  - Mobile phase: A mixture of sodium dihydrogen phosphate TS, pH 2.2 and acetonitrile (3:1).
  - Flow rate: Adjust the flow rate so that the retention time of enalapril is about 5 minutes.
  - **System suitability—**
    - System performance: Heat to fusion about 20 mg of enalapril maleate. After cooling, add 50 mL of acetonitrile, and treat with ultrasonic waves to dissolve. To 1 mL of this solution, add the standard solution to make 50 mL, and use this solution as the solution for system suitability test. When the procedure is run with 50 μL of the solution for system suitability test under the above conditions, enalapril and enalapril diketopiperazine, which has a relative retention time of 1.5 to enalapril, are eluted in this order with the resolution between these peaks being not less than 2.0.
    - System repeatability: When the test is repeated 6 times with 50 μL of the solution for system suitability test under the above conditions, the relative standard deviation of the peak area of enalapril is not more than 1.0%.

**Containers and storage**  Containers—Well-closed containers.

---

**Enflurane**

エンフルラン

C₇H₅ClF₂O: 184.49
(2RS)-2-Chloro-1-(difluoromethoxy)-1,1,2-trifluoroethane [13838-16-9]

**Description**  Enflurane is a clear, colorless liquid. It is slightly soluble in water. It is miscible with ethanol (95) and with diethyl ether. It is a volatile, and not an inflammable. It shows no optical rotation.

**Boiling point**  54 – 57°C

**Identification (1)**  Take 50 μL of Enflurane, and prepare the test solution as directed to the Oxygen Flask Combustion Method <1.06> using 40 mL of water as the absorbing liquid. The test solution responds to the Qualitative Tests <1.09> for chloride and fluoride.

(2)  Determine the infrared absorption spectrum of Enflurane as directed in the liquid film method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Refractive index**  <2.45>  \(n^20\): 1.302 – 1.304

**Specific gravity**  <2.56>  d₂₀: 1.520 – 1.540

**Purity (1)**  Acidity or alkalinity—To 60 mL of Enflurane add 60 mL of freshly boiled and cooled water, shake for 3 minutes, separate the water later, and use the layer as the sample solution. To 20 mL of the sample solution add one drop of bromocresol purple TS and 0.10 mL of 0.01 mol/L sodium hydroxide VS: the color of the solution is purple. To 20 mL of the sample solution add one drop of bromocresol purple TS and 0.06 mL of 0.01 mol/L hydrochloric acid VS: the color of the solution is yellow.

(2)  Chloride <1.09>—To 20 g of Enflurane add 20 mL of water, shake well, and separate the water layer. Take 10 mL of the water layer add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.30 mL of 0.01 mol/L hydrochloric acid VS (not more than 0.001%).

(3)  Related substances—Proceed the test with 5 μL of Enflurane as directed under Gas chromatography <2.02> according to the following conditions. Determine each peak area other than the peak of air which appears soon after injection of the sample by the automatic integration method, and calculate the amount of each peak by the area percentage method: the amount of the substances other than enflurane is not more than 0.10%.

**Operating conditions—**

- Detector: A thermal conductivity detector.
- Column: A column 3 mm in inside diameter and 3 m in length, packed with siliceous earth for gas chromatography, 180 to 250 μm in particle diameter, coated with diethylene glycol succinate ester for gas chromatography in the ratio of 20%.
- Column temperature: A constant temperature of about 180 to 250°C.
Enoxacin Hydrate

**JP XVI**

80°C.

Carrier gas: Helium.

Flow rate: Adjust the flow rate so that the retention time of enfurane is about 3 minutes.

Time span of measurement: About 3 times as long as the retention time of enfurane.

**System suitability**—

Test for required detection: To exactly 1 mL of enfurane add 2-propanol to make exactly 100 mL. To exactly 2 mL of this solution add 2-propanol to make exactly 10 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add 2-propanol to make exactly 10 mL. Confirm that the peak area of enfurane obtained from 5 μL of this solution is equivalent to 7 to 13% of that from 5 μL of the solution for system suitability test.

System performance: Mix 5 mL of Enflurane and 5 mL of 2-propanol. When the procedure is run with 5 μL of this mixture under the above operating conditions, enfurane and 2-propanol are eluted in this order with the resolution between these peaks being not less than 2.0.

System repeatability: When the test is repeated 6 times with 5 μL of the solution for system suitability test under the above operating conditions, the relative standard deviation of the peak area of enfurane is about 3 minutes.

**2.24** Not more than 0.10% (10 g, volumetric titration, direct titration).

**Containers and storage**—Tight containers.

**Storage**—Not exceeding 30°C.

**Enoxacin Hydrate**

エノキサシン水和物

![Chemical Structure](image)

C₁₅H₁₇FN₄O₃ · 1½H₂O: 347.34

1-Ethyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydro-1,8-naphthyridine-3-carboxylic acid sesquihydrate [84294-96-2]

Enoxacin Hydrate, when dried, contains not less than 98.5% of enoxacin (C₁₅H₁₇FN₄O₃: 320.32)

**Description**—Enoxacin Hydrate occurs as white to pale yellow-brown crystals or crystalline powder.

It is freely soluble in acetic acid (100), slightly soluble in methanol, very slightly soluble in chloroform, and practically insoluble in water, in ethanol (95) and in diethyl ether.

It dissolves in dilute sodium hydroxide TS.

It is gradually colored by light.

**Identification**—(1) Place 0.02 g of Enoxacin Hydrate and 0.05 g of sodium in a test tube, and heat gradually to ignition with precaution. After cooling, add 0.5 mL of methanol and then 5 mL of water, and heat to boiling. To this solution add 2 mL of dilute acetic acid, and filter: the filtrate responds to the Qualitative Tests <1.099 (2) for fluoride.

(2) Dissolve 0.05 g of Enoxacin Hydrate in dilute sodium hydroxide TS to make 100 mL. To 1 mL of the solution add water to make 100 mL. Determine the absorption spectrum of the solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Enoxacin Hydrate as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Melting point**—225 – 229°C (after drying).

**Purity**—(1) Sulfate <1.14>—Dissolve 1.0 g of Enoxacin Hydrate in 50 mL of dilute sodium hydroxide TS, shake with 10 mL of dilute hydrochloric acid, and centrifuge. Filter the supernatant liquid, and to 30 mL of the filtrate add water to make 50 mL. Perform the test using this solution as the test solution. Prepare the control solution as follows: to 0.50 mL of 0.005 mol/L sulfuric acid VS add 25 mL of dilute sodium hydroxide TS, 5 mL of dilute hydrochloric acid TS and water to make 50 mL (not more than 0.048%).

(2) Heavy metals <1.07>—Proceed with 1.0 g of Enoxacin Hydrate according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic <1.11>—Prepare the test solution with 1.0 g of Enoxacin Hydrate according to Method 3, and perform the test (not more than 2 ppm).

(4) Related substances—Dissolve 50 mg of Enoxacin Hydrate in 25 mL of a mixture of chloroform and methanol (7:3), and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a mixture of chloroform and methanol (7:3) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 5 μL of each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of 1-butanol, water and acetic acid (100) (3:1:1) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying**—<2.41> 7.0 – 9.0% (1 g, 105°C, 3 hours).

**Residue on ignition**—<2.44> Not more than 0.1% (1 g, platinum crucible).

**Assay**—Weigh accurately about 0.3 g of Enoxacin Hydrate, previously dried, dissolve in 30 mL of acetic acid (100), and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 32.03 mg of C₁₅H₁₇FN₄O₃

**Containers and storage**—Tight containers.

[33103-22-9, Tuberactinomycin N]

Tuberactinomycin O Sulfate

(3S)-N-[(3S,9S,12S,15S)-9,12-Bis(hydroxymethyl)-3-[(4R)-2-iminohexahydropyrimidin-4-yl]-2,5,8,11,14-pentaaoxo-6(Z)-ureidomethylene-1,4,7,10,13-pentaazacyclohexadec-15-yl]-3,6-diaminohexanamide sesquisulfate

[33137-73-4, Tuberactinomycin O]

Enviomycin Sulfate is the sulfate of a mixture of peptide substances having antibacterial activity produced by the growth of Streptomyces griseoverticilla var. tuberacticus.

It contains not less than 770 μg (potency) per mg, calculated on the dried basis. The potency of Enviomycin Sulfate is expressed as mass (potency) of tuberactinomycin N (C$_{25}$H$_{43}$N$_{13}$O$_{10}$) 685.69.

Description

Enviomycin Sulfate occurs as a white powder. It is very soluble in water, and practically insoluble in ethanol (99.5).

Identification

(1) To 5 mL of a solution of Enviomycin Sulfate (1 in 200) add 1.5 mL of sodium hydroxide TS, and add 1 drop of a mixture of 0.01 mol/L citric acid TS and copper (II) sulfate TS (97:3) : a blue-purple color develops.

(2) Determine the absorption spectrum of a solution of Enviomycin Sulfate (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) To 2 mL of a solution of Enviomycin Sulfate (1 in 20) add 1 drop of barium chloride TS: a white precipitate is produced.

Optical rotation

$\langle 2.4 \rangle$ $[\alpha]_D^{20} -16 \sim -22^\circ$ (0.5 g calculated on the dried basis, water, 50 mL, 100 mm).

pH

$\langle 2.5 \rangle$ The pH of a solution obtained by dissolving 2.0 g of Enviomycin Sulfate in 20 mL of water is between 5.5 and 7.5.

Content ratio of the active principle

Dissolve 0.1 g of Enviomycin Sulfate in water to make 100 mL, and use this solution as the sample solution. Perform the test with 3 μL of the sample solution as directed under Liquid Chromatography, according to the following conditions, and determine the peak areas, $A_{T1}$ and $A_{T2}$, of tuberactinomycin N and tuberactinomycin O, having the relative retention time, 1.4 ± 0.4, with respect to tuberactinomycin N, by the automatic integration method: $A_{T2}/(A_{T1} + A_{T2})$ is between 0.090 and 0.150.

Operating conditions

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of ammonium acetate TS, 1,4-dioxane, tetrahydrofuran, water and ammonia solution (28:100:75:50:23:2).

Flow rate: Adjust the flow rate so that the retention time of tuberactinomycin N is about 9 minutes.

System suitability

System performance: When the procedure is run with 3 μL of the sample solution under the above operating conditions, tuberactinomycin N and tuberactinomycin O are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 3 μL of the sample solution under the above operating conditions, the relative standard deviation of the peak area of tuberactinomycin N is not more than 2.0%.

Purity

(1) Clarity and color of solution—Dissolve 1.0 g of Enviomycin Sulfate in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals $\langle 1.0 \rangle$—Proceed with 2.0 g of Enviomycin Sulfate according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic $\langle 1.1 \rangle$—Prepare the test solution with 2.0 g of Enviomycin Sulfate according to Method 1, and perform the test (not more than 1 ppm).

Loss on drying $\langle 2.4 \rangle$ Not more than 4.0% (0.2 g, in vacuum, phosphorus (V) oxide, 60°C, 3 hours).

Assay

Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics, according to the following conditions.

(i) Test organism—Bacillus subtilis ATCC 6633

Purity (1) Heavy metals $<1.07$—Proceed with 1.0 g of Eperisone Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Piperidine hydrochloride—Dissolve 1.0 g of Eperisone Hydrochloride in 20 mL of water, add 2.0 mL of diluted hydrochloric acid (1 in 2), 2.0 mL of a solution of copper (II) sulfate pentahydrate (1 in 1000) add 18 mL of water, 2.0 mL of a solution of copper (II) sulfate pentahydrate (1 in 20) and 1.5 mL of ammonia solution (28), and use this solution as the sample solution. Separately, to 2.0 mL of a solution of piperidine hydrochloride (1 in 1000) add 18 mL of water, 2.0 mL of a solution of copper (II) sulfate pentahydrate (1 in 20) and 1.5 mL of ammonia solution (28), and use this solution as the standard solution. To each of the sample solution and standard solution add 10 mL of a mixture of isopropylether and carbon disulfide (3:1), shake for 30 seconds, allow them to stand for 2 minutes, and compare the color of the upper layer: the color obtained from the sample solution is not more darker than that from the standard solution.

(3) Related substances—Dissolve 0.1 g of Eperisone Hydrochloride in 100 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL of each of the sample solution and standard solution as directed under Liquid Chromatography (2.24), according to the following conditions, and determine each peak area by the automatic integration method: the total area of the peaks other than the peak of eperisone from the sample solution is not larger than 1/5 times the peak area of eperisone from the standard solution.

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadeccylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 30°C.

Mobile phase: A mixture of methanol, 0.0375 mol/L sodium 1-decanesulfonate TS and perchloric acid (600:400:1).

Flow rate: Adjust the flow rate so that the retention time of eperisone is about 17 minutes.

Time span of measurement: About 2 times as long as the retention time of eperisone.

System suitability—

Test for required detectability: Pipet 1 mL of the standard solution, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of eperisone obtained from 10 μL of this solution is equivalent to 7 to 13% of that from 10 μL of the standard solution.

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of eperisone are not less than 4000 steps and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of eperisone is not more than 3.0%.

Water (2.48) Not more than 0.2% (0.1 g, coulometric
Ephedrine Hydrochloride / Official Monographs

**Residue on ignition**<sup>2.44</sup> Not more than 0.2% (1 g).

**Assay** Weigh accurately about 0.6 g of Ephedrine Hydrochloride, dissolve in 20 mL of acetic acid (100), add 80 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination in the same manner, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 25.95 mg of C₁₀H₁₅NO.HCl

**Containers and storage** Containers—Well-closed containers.

**Ephedrine Hydrochloride**

エフェドリン塩酸塩

C₁₀H₁₅NO.HCl: 201.69

(1R,2S)-2-Methylamino-1-phenylpropan-1-ol monohydrochloride [50-98-6]

Ephedrine Hydrochloride, when dried, contains not less than 99.0% of C₁₀H₁₅NO.HCl.

**Description** Ephedrine Hydrochloride occurs as white crystals or crystalline powder.

It is freely soluble in water, soluble in ethanol (95), slightly soluble in acetic acid (100), and practically insoluble in acetonitrile and in acetic anhydride.

**Identification (1)** Determine the absorption spectrum of a solution of Ephedrine Hydrochloride (1 in 2000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2) Determine the infrared absorption spectrum of Ephedrine Hydrochloride, previously dried, as directed in the potassium chloride disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

(3) A solution of Ephedrine Hydrochloride (1 in 15) responds to the Qualitative Tests <1.09> for chloride.

**Optical rotation**<sup>2.49</sup> [α]₂₀° = 33.0 – 36.0° (after drying, 1 g, water, 20 mL, 100 mm).

**pH**<sup>2.54</sup> Dissolve 1.0 g of Ephedrine Hydrochloride in 20 mL of water: the pH of this solution is between 4.5 and 6.5.

**Melting point**<sup>2.60</sup> 218 – 222°C

**Purity (1)** Clarity and color of solution—Dissolve 0.5 g of Ephedrine Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Sulfate—Dissolve 0.05 g of Ephedrine Hydrochloride in 40 mL of water, add 1 mL of dilute hydrochloric acid and 1 mL of barium chloride TS, and allow to stand for 10 minutes: no turbidity is produced.

(3) Heavy metals<sup>1.07</sup>—Proceed with 1.0 g of Ephedrine Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 1.0 mL of Standard Lead Solution (not more than 10 ppm).

(4) Related substances—Dissolve 0.05 g of Ephedrine Hydrochloride in 50 mL of the mobile phase, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add the mobile phase to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 10 µL of each of the sample solution and standard solution as directed under Liquid Chromatography <2.07> according to the following conditions, and determine the areas of each peak by the automatic integration method: the total area of the peaks other than ephedrine from the sample solution is not larger than the peak area of ephedrine from the standard solution.

**Operating conditions**—

Detector: An ultraviolet absorption photometer (wavelength: 210 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 µm in particle diameter).

Column temperature: A constant temperature of about 45°C.

Mobile phase: A mixture of a solution of sodium lauryl sulfate (1 in 128), acetonitrile and phosphoric acid (640:360:1).

Flow rate: Adjust the flow rate so that the retention time of ephedrine is about 14 minutes.

Time span of measurement: About 3 times as long as the retention time of ephedrine beginning after the solvent peak.

System suitability—

Test for required detectability: To exactly 1 mL of the standard solution add the mobile phase to make exactly 20 mL. Confirm that the peak area of ephedrine obtained from 10 µL of this solution is equivalent to 4 to 6% of that from 10 µL of the standard solution.

System performance: Dissolve 1 mg of ephedrine hydrochloride for assay and 4 mg of atropine sulfate in 100 mL of diluted methanol (1 in 2). When the procedure is run with 10 µL of this solution under the above operating conditions, ephedrine and atropine are eluted in this order with the resolution between these peaks being not less than 1.5.

System repeatability: When the test is repeated 6 times with 10 µL of the standard solution under the above operating conditions, the relative standard deviation of the peak areas of ephedrine is not more than 2.0%.

**Loss on drying**<sup>2.41</sup> Not more than 0.5% (1 g, 105°C, 3 hours).

**Residue on ignition**<sup>2.44</sup> Not more than 0.1% (1 g).

**Assay** Weigh accurately about 0.4 g of Ephedrine Hydrochloride, previously dried, and dissolve in 50 mL of a mixture of acetic anhydride and acetic acid (100) (7:3) by warming. Cool, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration). Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 20.17 mg of C₁₀H₁₅NO.HCl
Containers and storage  Containers—Well-closed containers.

Ephedrine Hydrochloride Injection

Ephedrine Hydrochloride Injection is aqueous solution for injection.

It contains not less than 95.0% and not more than 105.0% of the labeled amount of ephedrine hydrochloride (C₁₀H₁₅NO.HCl: 201.69).

Method of preparation  Prepare as directed under Injections, with Ephedrine Hydrochloride.

Description  Ephedrine Hydrochloride Injection is a clear, colorless liquid. pH: 4.5 – 6.5

Identification  To a volume of Ephedrine Hydrochloride Injection, equivalent to 0.05 g of Ephedrine Hydrochloride according to the labeled amount, add water to make 100 mL, and determine the absorption spectrum of this solution as directed under Ultraviolet-visible Spectrophotometry <2.242>: it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

Bacterial endotoxins <4.01>  Less than 7.5 EU/mg.

Extractable volume <6.05>  It meets the requirement.

Foreign insoluble matter <6.06>  Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter <6.07>  It meets the requirement.

Sterility <4.06>  Perform the test according to the Membrane filtration method: it meets the requirement.

Assay  To an exact volume of Ephedrine Hydrochloride Injection, equivalent to 40 mg of ephedrine hydrochloride (C₁₀H₁₅NO.HCl), add exactly 10 mL of the internal standard solution and water to make 200 mL, and use this solution as the sample solution. Separately, weigh accurately about 40 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, add exactly 10 mL of the internal standard solution to dissolve, add water to make 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₅, of the peak area of ephedrine to that of the internal standard of each solution.

Amount (mg) of ephedrine hydrochloride (C₁₀H₁₅NO.HCl) = M₅ × Q₁/Q₅

M₅: Amount (mg) of ephedrine hydrochloride for assay

Internal standard solution—A solution of etilefrine hydrochloride (1 in 500).

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Purity (4) under Ephedrine Hydrochloride.

10% Ephedrine Hydrochloride Powder

Ephedrine Hydrochloride Powder

Ephedrine Hydrochloride Powder contains not less than 9.3% and not more than 10.7% of ephedrine hydrochloride (C₁₀H₁₅NO.HCl: 201.69).

Method of preparation  Prepare as directed under Granules or Powders, with the above ingredients.

Identification  To 0.5 g of 10% Ephedrine Hydrochloride Powder add 100 mL of water, shake for 20 minutes, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry <2.242>: it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

Assay  Weigh accurately about 0.4 g of 10% Ephedrine Hydrochloride Powder, add 150 mL of water, and extract with the aid of ultrasonicator for 10 minutes with occasional shaking. Shake more for 10 minutes, then add exactly 10 mL of the internal standard solution and water to make 200 mL, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 40 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, add exactly 10 mL of the internal standard solution to dissolve, add water to make 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₅, of the peak area of ephedrine to that of the internal standard of each solution.

Amount (mg) of ephedrine hydrochloride (C₁₀H₁₅NO.HCl) = M₅ × Q₁/Q₅

M₅: Amount (mg) of ephedrine hydrochloride for assay

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and ephedrine are eluted in this order with the resolution between these peaks being not less than 15.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ephedrine to that of the internal standard is not more than 1.0%.

Containers and storage  Containers—Hermetic containers. Storage—Light-resistant.
Internal standard solution—A solution of etilefrine hydrochloride (1 in 500).

Operating conditions—

Detector, column, column temperature, mobile phase and flow rate: Perform as directed in the operating conditions in the Purity (4) under Ephedrine Hydrochloride.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and ephedrine are eluted in this order with the resolution between these peaks being not less than 15.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ephedrine to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Well-closed containers.

Ephedrine Hydrochloride Tablets

エフェドリン塩酸塩錠

Ephedrine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labeled amount of ephedrine hydrochloride (C₁₀H₁₅NO.HCl: 201.69).

Method of preparation Prepare as directed under Tablets, with Ephedrine Hydrochloride.

Identification To an amount of powdered Ephedrine Hydrochloride Tablets, equivalent to 0.05 g of Ephedrine Hydrochloride, add 100 mL of water, shake for 20 minutes, and filter. Determine the absorption spectrum of the filtrate as directed under Ultraviolet-visible Spectrophotometry (2.24): it exhibits maxima between 249 nm and 253 nm, between 255 nm and 259 nm, and between 261 nm and 265 nm.

Uniformity of dosage units (6.02) Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Ephedrine Hydrochloride Tablets add V mL of water so that each mL contains 0.25 mg of ephedrine hydrochloride (C₁₀H₁₅NO.HCl), then add exactly V/4 mL of the internal standard solution, disperse the tablet into small particles using ultrasonic waves, then stir for a further 10 minutes in the same way. Shake this solution for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 25 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, dissolve in water to make exactly 100 mL. Pipet 20 mL of this solution, add exactly 5 mL of the internal standard solution, disperse the tablet into small pieces using ultrasonic waves, then stir for a further 10 minutes in the same way. Shake this solution for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 25 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, dissolve in water to make exactly 100 mL. Pipet 20 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the standard solution. Then, proceed as directed in the Assay.

Amount (mg) of ephedrine hydrochloride (C₁₀H₁₅NO.HCl) = Mₕ × Qₗ/Qₘ × V/100

Mₕ: Amount (mg) of ephedrine hydrochloride for assay

Internal standard solution—A solution of etilefrine hydrochloride (1 in 2000).

Dissolution (6.10) When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Ephedrine Hydrochloride Tablets is not less than 80%.

Start the test with 1 tablet of Ephedrine Hydrochloride Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.45 μm. Discard the first 10 mL of the filtrate, and use the subsequent filtrate as the sample solution. Separately, weigh accurately about 28 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, and dissolve in water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 50 mL, and use this solution as the standard solution. Perform the test with exactly 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and determine the peak areas, Aₗ and Aₘ, of ephedrine in each solution.

Dissolution rate (%) with respect to the labeled amount of ephedrine hydrochloride (C₁₀H₁₅NO.HCl)

\[ Mₕ \times Aₗ/ₘ \times 1/C \times 90 \]

Mₕ: Amount (mg) of ephedrine hydrochloride for assay

C: Labeled amount (mg) of ephedrine hydrochloride (C₁₀H₁₅NO.HCl) in 1 tablet

Operating conditions—

Detector, column, column temperature, mobile phase and flow rate: Proceed as directed in the operating conditions in the Purity (4) under Ephedrine Hydrochloride.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the number of theoretical plates and the symmetry factor of the peak of ephedrine are not less than 10,000 and not more than 2.0, respectively.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the peak area of ephedrine is not more than 2.0%.

Assay Weigh accurately not less than 20 tablets of Ephedrine Hydrochloride Tablets, and powder. Weigh accurately an amount of the powder, equivalent to about 40 mg of ephedrine hydrochloride (C₁₀H₁₅NO.HCl), add 150 mL of water, and extract with the aid of ultrasonicator for 10 minutes with occasional shaking. Shake more for 10 minutes, then add exactly 10 mL of the internal standard solution and water to make 200 mL, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 40 mg of ephedrine hydrochloride for assay, previously dried at 105°C for 3 hours, add exactly 10 mL of the internal standard solution to dissolve, add water to make 200 mL, and use this solution as the standard solution. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography (2.01) according to the following conditions, and calculate the ratios, Qₗ and Qₘ, of the peak area of ephedrine to that of the internal standard of each solution.

Amount (mg) of ephedrine hydrochloride (C₁₀H₁₅NO.HCl) = Mₕ × Qₗ/Qₘ
Epirizole
Mepirizole

Epirizole occurs as white crystals or crystalline powder. It is odorless, and has a bitter taste.

It is very soluble in methanol and in acetic acid (100), freely soluble in ethanol (95), and sparingly soluble in water and in diethyl ether.

It dissolves in dilute hydrochloric acid and in sulfuric acid.

The pH of a solution of Epirizole (1 in 100) is between 6.0 and 7.0.

Identification

1 To 0.1 g of Epirizole add 0.1 g of vanillin, 5 mL of water and 2 mL of sulfuric acid, and mix with shaking for a while: a yellow precipitate is formed.

2 Dissolve 0.1 g of Epirizole in 10 mL of water, and add 10 mL of 2,4,6-trinitrophenol TS: a yellow precipitate is produced. Collect the precipitate by filtration, wash with 50 mL of water, and dry at 105°C for 1 hour: it melts between 163°C and 169°C.

3 Determine the absorption spectrum of a solution of Epirizole in 0.1 mol/L hydrochloric acid TS (1 in 200,000) as directed under Ultraviolet-visible Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

Melting point

Purity

Clarity and color of solution—Dissolve 0.20 g of Epirizole in 20 mL of water: the solution is clear and colorless.

Chloride

Add 0.5 g of Epirizole to a ground mixture of 0.7 g of potassium nitrate and 1.2 g of anhydrous sodium carbonate, mix well, transfer little by little to a platinum crucible, previously heated, and heat until the reaction is completed. After cooling, add 15 mL of dilute sulfuric acid and 5 mL of water to the residue, boil for 5 minutes, filter, wash the insoluble matter with 10 mL of water, and add 6 mL of dilute nitric acid and water to the combined filtrate and washings to make 50 mL. Perform the test with this solution as the test solution. Prepare the control solution as follows: proceed with the same quantities of the same reagents as directed for the preparation of the test solution, and add 0.25 mL of 0.01 mol/L hydrochloric acid VS and water to make 50 mL (not more than 0.018%).

Heavy metals

Proceed with 2.0 g of Epirizole according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

Arsenic

Prepare the test solution with 1.0 g of Epirizole according to Method 3, and perform the test (not more than 2 ppm).

Related substances

Dissolve 1.0 g of Epirizole in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, and add methanol to make exactly 50 mL. Pipet 1 mL of this solution, add methanol to make exactly 10 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography. Develop the plate with a mixture of isopropyl diethyl ether, ethanol (95) and water (23:10:2) to a distance of about 10 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution. Place this plate in a chamber filled with iodine vapor: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Readily carbonizable substances

Perform the test with 0.10 g of Epirizole: the solution has no more color than Matching Fluid A.

Loss on drying

Not more than 0.5% (1 g, silica gel, 4 hours).

Residue on ignition

Not more than 0.1% (1 g).

Assay

Weigh accurately about 0.5 g of Epirizole, previously dried, dissolve in 40 mL of acetic acid (100) and titrate with 0.1 mol/L perchloric acid VS (indicator: 2 drops of crystal violet TS) until the color of the solution changes from purple through blue-green to green.

Perform a blank determination, and make any necessary correction.
Each mL of 0.1 mol/L perchloric acid VS = 23.43 mg of C₁₁H₁₄N₄O₂

Containers and storage  Containers—Well-closed containers.

Epirubicin Hydrochloride  エピルビシン塩酸塩

C₂₇H₃₂N₄O₁₁·HCl: 579.98
(2S,4S)-4-(3-Amino-2,3,6-trideoxy-α-L-arabino-hexopyranosyloxy)-2,5,12-trihydroxy-2-hydroxyacetyl-7-methoxy-1,2,3,4-tetrahydrotetracene-6,11-dione mono hydrochloride
[56590-09-1]

Epirubicin Hydrochloride is the hydrochloride of a derivative of daunorubicin.

It contains not less than 970 μg (potency) and not more than 1020 μg (potency) per mg, calculated on the anhydrous basis and corrected by the amount of the residual solvent. The potency of Epirubicin Hydrochloride is expressed as mass (potency) of epirubicin anhydrous basis and corrected by the amount of epirubicin hydrochloride (C₂₇H₃₂N₄O₁₁·HCl).

Description  Epirubicin Hydrochloride occurs as a pale yellowish red to brownish red powder.

It is soluble in water and in methanol, slightly soluble in ethanol (95), and practically insoluble in acetonitrile.

It is hygroscopic.

Identification (1)  Determine the absorption spectrum of a solution of Epirubicin Hydrochloride in methanol (3 in 200,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(2)  Determine the infrared absorption spectrum of Epirubicin Hydrochloride and Epirubicin Hydrochloride RS as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare these spectra: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation  <2.49>  [α]D²⁰  = +310° – +340° (10 mg calculated on the anhydrous basis and collected by the amount of the residual solvent, methanol, 20 mL, 100 mm).

pH  <2.54>  Dissolve 10 mg of Epirubicin Hydrochloride in 2 mL of water: the pH of the solution is between 4.0 and 5.5.

Purity (1)  Clarity and color of solution—Dissolve 50 mg of Epirubicin Hydrochloride in 5 mL of water: the solution is clear and dark red.

(2)  Heavy metals <1.07>—Proceed with 1.0 g of Epirubicin Hydrochloride according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3)  Related substances—Perform the test with 10 μL of the sample solution obtained in the Assay as directed under Liquid Chromatography <2.07> according to the following conditions, determine each peak area by the automatic integration method, and calculate the sum amount of the peaks other than epirubicin and 2-naphthalenesulfonic acid by the area percentage method: not more than 5.0%.

Operating conditions—

Detector, column, column temperature, mobile phase, and flow rate: Proceed as directed in the operating conditions in the Assay.

Time span of measurement: About 3 times as long as the retention time of epirubicin beginning after the solvent peak.

System suitability—

Test for required detectability: To 1 mL of the sample solution add the mobile phase to make 100 mL, and use this solution as the solution for system suitability test. Pipet 1 mL of the solution for system suitability test, and add the mobile phase to make exactly 10 mL. Confirm that the peak area of epirubicin obtained from 10 μL of this solution is equivalent to 7 to 13% of that from 10 μL of the solution for system suitability test.

System performance, and system repeatability: Proceed as directed in the system suitability in the Assay.

(4)  Residual solvents <2.46>—Weigh accurately about 0.3 g of Epirubicin Hydrochloride, add exactly 0.6 mL of the internal standard solution, add N,N-dimethylformamide to make 6 mL, and use this solution as the sample solution. Separately, pipet 1 mL of methanol, add N,N-dimethylformamide to make exactly 25 mL, and use this solution as methanol standard stock solution. Take exactly 125 μL of acetone, 30 μL of ethanol (99.5), 32 μL of 1-propanol and 17 μL of the methanol standard stock solution, add exactly 10 mL of the internal standard solution and N,N-dimethylformamide to make 100 mL, and use this solution as the sample solution. Perform the test with 1 μL of each of the sample solution and standard solution as directed under Gas Chromatography <2.07> according to the following conditions, and calculate the ratios of the peak areas of acetone, ethanol, 1-propanol and methanol to that of the internal standard, Q₁₀, Q₈₅, Q₁₇₈ and Q₂₈, Q₁₀ and Q₂₈, respectively. Calculate the amounts of acetone, ethanol, 1-propanol and methanol by the following equations: the amounts of acetone, ethanol, 1-propanol and methanol are not more than 1.5%, not more than 0.5%, not more than 0.5% and not more than 0.1%, respectively.

Amount (%) of acetone = 1/M₁ × Q₁₀/Q₈₅ × 593
Amount (%) of ethanol = 1/M₁ × Q₁₀/Q₂₈ × 142
Amount (%) of 1-propanol = 1/M₁ × Q₁₀/Q₈₅ × 154
Amount (%) of methanol = 1/M₁ × Q₁₀/Q₂₈ × 2.23
M₁: Amount (mg) of Epirubicin Hydrochloride

Internal standard solution—A solution of 1,4-dioxane in N,N-dimethylformamide (1 in 100).

Operating conditions—

Detector: Hydrogen flame-ionization detector.
Column: A fused silica column 0.53 mm in inside diameter
and 30 m in length, coated with polyethylene glycol for gas-chromatography 1 μm in thickness.

Column temperature: 40°C for 11 minutes after injection of the sample, then rise to 90°C at a rate of 10°C per minute. If necessary, rise to 130°C at a rate of 50°C per minute and maintain the temperature for 30 minutes.

Injection port temperature: A constant temperature of about 120°C.

Detector temperature: A constant temperature of about 150°C.

Carrier gas: Helium.

Flow rate: Adjust the flow rate so that the retention time of the internal standard is about 8 minutes.

Split ratio: 1:15

System suitability—

System performance: When the procedure is run with 1 μL of the standard solution under the above operating conditions, the relative standard deviations of the ratios of the peak areas of acetone and the internal standard being not less than 30.

System repeatability: When the test is repeated 6 times with 1 μL of the standard solution under the above operating conditions, the relative standard deviations of the peak areas of acetone, methanol, ethanol and 1-propanol are not more than 4.0%, respectively.

Water <2.48> Not more than 8.0% (0.1 g, volumetric titration, direct titration).

Residue on ignition <2.44> Not more than 0.5% (0.1 g).

Assay Weigh accurately an amount of Epirubicin Hydrochloride and Epirubicin Hydrochloride RS, equivalent to about 50 mg (potency), dissolve each in the internal standard chloride and Epirubicin Hydrochloride RS, equivalent to about 50 mg (potency), dissolve each in the internal standard.

\[ \text{Amount} = M_s \times \frac{Q_1}{Q_2} \times 1000 \]

where:
- \( M_s \): Amount [mg (potency)] of Epirubicin Hydrochloride RS
- \( Q_1 \): Amount [μg (potency)] of \( \text{C}_27\text{H}_29\text{NO}_{11}\text{HCl} \)
- \( Q_2 \): Amount [μg (potency)] of \( \text{C}_44\text{H}_{36}\text{O} \)

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 254 nm).

Column: A stainless steel column 4 mm in inside diameter and 25 cm in length, packed with trimethylsilanized silica gel for liquid chromatography (6 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: Dissolve 2 g of sodium lauryl sulfate in a mixture of water, acetonitrile, methanol and phosphoric acid (540:290:170:1) to make 1000 mL.

Flow rate: Adjust the flow rate so that the retention time of epirubicin is about 9.5 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, the internal standard and epirubicin are eluted in this order with the resolution between these peaks being not less than 20.

System repeatability: When the test is repeated 5 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of epirubicin to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Tight containers.

Storage—At a temperature between 0°C and 5°C.

**Ergocalciferol**

**Calciferol**

**Vitamin D₂**

エルゴカルシフェロール

C₃₈H₄₆O: 396.65
(3S,5Z,7E,22E)-9,10-Secoergosta-5,7,10(19),22-tetraen-3-ol

[50-14-6]

Ergocalciferol contains not less than 97.0% and not more than 103.0% of C₃₈H₄₆O.

Description Ergocalciferol occurs as white crystals. It is odorless, or has a faint, characteristic odor.

It is freely soluble in ethanol (95), in diethyl ether and in chloroform, sparingly soluble in isooctane, and practically insoluble in water.

It is affected by air and by light.

Melting point: 115 – 118°C Transfer Ergocalciferol to a capillary tube, and dry for 3 hours in a desiccator (in vacuum at a pressure not exceeding 2.67 kPa). Immediately fire-seal the capillary tube, put it in a bath fluid, previously heated to a temperature about 10°C below the expected melting point, and heat at a rate of rise of about 3°C per minute, and read the melting point.

Identification (1) Dissolve 0.5 mg of Ergocalciferol in 5 mL of chloroform, add 0.3 mL of acetic anhydride and 0.1 mL of sulfuric acid, and shake: a red color is produced, and rapidly changes through purple and blue to green.

(2) Determine the infrared absorption spectrum of Ergocalciferol as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of Ergocalciferol RS: both spectra exhibit similar intensities of absorption at the same wave numbers.
Ergometrine Maleate / Official Monographs

Absorbance
\[< 2.24 \times 10^{17} (265 \text{ nm}) \quad 445 - 485 \quad (10 \text{ mg}, \text{ ethanol (95), 100 mL}).\]

Optical rotation
\[< 2.49^\circ \quad [\alpha]_{D}^{20} + 102 - + 107^\circ (0.3 \text{ g}, \text{ ethanol (95), 20 mL, 100 nm}).\] Prepare the solution of Ergocalciferol within 30 minutes after the container has been opened, and determine the rotation within 30 minutes after the solution has been prepared.

Purity
Ergosterol—Dissolve 10 mg of Ergocalciferol in 2.0 mL of diluted ethanol (9 in 10), add a solution of 20 mg of digitonin in 2.0 mL of diluted ethanol (9 in 10), and allow the mixture to stand for 18 hours: no precipitate is formed.

Assay
Weigh accurately about 30 mg each of Ergocalciferol and Ergocalciferol RS, and dissolve each in isooctane to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 3 mL each of the internal standard solution, then add the mobile phase to make 50 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 to 20 mg of digitonin in 2.0 mL of diluted ethanol (9 in 10), and allow the mixture to stand for 18 hours: no precipitate is formed.

Chromatography
Stationary phase—A silica gel for liquid chromatography (250 mm particle diameter).
Flow rate: Adjust the flow rate so that the retention time of Ergocalciferol is about 25 minutes.
Detector: An ultraviolet absorption photometer (wavelength: 254 nm).
Column: A stainless steel column 4.6 mm in inside diameter and 25 cm in length, packed with a silica gel for liquid chromatography (10 μm particle diameter).
Mobile phase: A mixture of hexane and tert-amylalcohol (97:3).
Column temperature: A constant temperature of about 20°C.
Flow rate: Adjust the flow rate so that the retention time of ergocalciferol is about 25 minutes.
System suitability—
System performance: Dissolve 15 mg of Ergocalciferol RS in 25 mL of isooctane. Transfer this solution to a flask, heat in an oil bath under a reflux condenser for 2 hours, and cool immediately to room temperature. Transfer the solution to a quartz test tube, and irradiate with a short-wave lamp (main wavelength: 254 nm) and a long-wave lamp (main wavelength: 365 nm) for 3 hours. To 10 mL of this solution add the mobile phase to make 50 mL. When the procedure is run with 10 μL of this solution under the above operating conditions, the ratios of the retention time of previtamin D₂, trans-vitamin D₂ and tachysterol₂ to that of ergocalciferol are about 0.5, about 0.6 and about 1.1, respectively, and the resolution between previtamin D₂ and trans-vitamin D₂ is not less than 0.7, and that between ergocalciferol and tachysterol₂ is not less than 1.0.
System retestability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of ergocalciferol to that of the internal standard is not more than 1.0%.

Containers and storage
Containers—Hermetic containers.
Storage—Light-resistant, under Nitrogen atmosphere, and in a cold place.

Ergometrine Maleate
エルゴメトリンマレイン酸塩

C₁₉H₂₃N₃O₂.C₄H₄O₄: 441.48
(85)-N-[[(1S)-2-Hydroxy-1-methylethyl]-6-methyl-9,10-dihydroergoline-8-carboxamide monomaleate

Ergometrine Maleate, when dried, contains not less than 98.0% of C₁₉H₂₃N₃O₂.C₄H₄O₄.

Description
Ergometrine Maleate occurs as a white to pale yellow, crystalline powder. It is odorless.
It is sparingly soluble in water, slightly soluble in methanol and in ethanol (95), and practically insoluble in diethyl ether.
Melting point: About 185°C (with decomposition).
It gradually changes to yellow in color on exposure to light.

Identification
(1) Prepare a solution of Ergometrine Maleate (1 in 50); the solution shows a blue fluorescence.
(2) Dissolve 1 mg of Ergometrine Maleate in 5 mL of water. To 1 mL of this solution add 2 mL of 4-dimethylaminobenzaldehyde-ferric chloride TS, shake, and allow to stand for 5 to 10 minutes: a deep blue color develops.
(3) To 5 mL of a solution of Ergometrine Maleate (1 in 500) add 1 drop of potassium permanganate TS: the red color of the solution disappears immediately.

Optical rotation
\[< 2.49^\circ \quad [\alpha]_{D}^{20} + 102 - + 107^\circ (0.3 \text{ g}, \text{ ethanol (95), 20 mL, 100 mm}).\]

pH
\[< 2.54^\circ \quad \text{Dissolve 0.10 g of Ergometrine Maleate in 10 mL of water. The pH of the solution is between 3.0 and 5.0.}\]

Purity
(1) Clarity and color of solution—Dissolve 0.10 g of Ergometrine Maleate in 10 mL of water: the solution is clear and colorless to light yellow.
(2) Ergotamine and ergotoxine—To 0.02 g of Ergometrine Maleate add 2 mL of a solution of sodium hydroxide (1 in 10), and heat to boiling: the gas evolved does not change moistened red litmus paper to blue.
(3) Related substances—Dissolve 5.0 mg each of Ergometrine Maleate and Ergometrine Maleate RS in 1.0 mL of methanol, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with these solutions as directed under Thin-layer Chromatography \[< 2.07^\circ \]. Spot 10 μL each of the sample solution and standard solution on a plate, prepared with silica gel for
thin-layer chromatography and dilute sodium hydroxide TS. Develop the plate with a mixture of chloroform and methanol (4:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde-iron (III) chloride TS on the plate: the spots obtained from the sample solution and the standard solution show a red-purple color and the same RF value, and any spot from the sample solution other than that corresponding to the spot from the standard solution does not appear.

Loss on drying $<2.4\%$ Not more than 2.0% (0.2 g, silica gel, 4 hours).

Assay Weigh accurately about 10 mg each of Ergometrine Maleate and Ergometrine Maleate RS, previously dried in a desiccator (silica gel) for 4 hours, to separate glass-stoppered test tubes, and proceed as directed in the Assay under Ultraviolet-visible Spectrophotometry $<2.27>$, using a solution, prepared with 2 mL of water in the same manner, as the blank. Determine the absorbances, $A_T$ and $A_S$, of the subsequent solutions of the sample solution and the standard solution at 550 nm, respectively.

\[
M_S = A_T / A_S
\]

$M_S$: Amount (mg) of Ergometrine Maleate RS

Containers and storage Containers—Tight containers.

Storage—Light-resistant.

Ergometrine Maleate Injection

エルゴメトリンメレイン酸塩注射液

Ergometrine Maleate Injection is an aqueous solution for injection.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of ergometrine maleate ($\text{C}_{19}\text{H}_{23}\text{N}_3\text{O}_2\cdot\text{C}_4\text{H}_4\text{O}_4$; 441.48).

Method of preparation Prepare as directed under Injections, with Ergometrine Maleate.

Description Ergometrine Maleate Injection is a clear, colorless to pale yellow liquid.

pH: 2.7 – 3.5

Identification (1) Measure a volume of Ergometrine Maleate Injection, equivalent to 3 mg of Ergometrine Maleate according to the labeled amount, if necessary, dilute with water or evaporate on a water bath to make 15 mL, and use this solution as the sample solution. The sample solution shows a blue fluorescence.

(2) To 1 mL of the sample solution obtained in (1) add 1 mL of ammonia TS, and extract with 20 mL of diethyl ether. To the diethyl ether extract add 1 mL of dilute sulfuric acid, shake, and warm to remove diethyl ether in a water bath.

Cool, to the residue obtained add 2 mL of 4-dimethylaminobenzaldehyde-iron (III) chloride TS, and allow to stand for 5 to 10 minutes: a deep blue color develops.

(3) To 5 mL of the sample solution obtained in (1) add 1 drop of potassium permanganate TS: a red color disappears immediately.

Bacterial endotoxins $<4.01>$ Less than 1500 EU/mg.

Extractable volume $<6.05>$ It meets the requirement.

Foreign insoluble matter $<6.06>$ Perform the test according to Method 1: it meets the requirement.

Insoluble particulate matter $<6.07>$ It meets the requirement.

Sterility $<4.06>$ Perform the test according to the Membrane filtration method: it meets the requirement.

Assay Transfer an exactly measured volume of Ergometrine Maleate Injection, equivalent to about 2 mg of ergometrine maleate ($\text{C}_{19}\text{H}_{23}\text{N}_3\text{O}_2\cdot\text{C}_4\text{H}_4\text{O}_4$), and add sodium chloride in a ratio of 0.3 g to 1 mL of the solution. To this mixture add 20 mL of diethyl ether and 2 mL of ammonia TS, shake, and extract. Further, extract with three 15-mL portions of diethyl ether, combine all the extracts, add 5 g of anhydrous sodium sulfate, filter through a pledget of absorbent cotton, and wash with three 5-mL portions of diethyl ether. Add the washings to the filtrate, shake with 5 mL of dilute sulfuric acid, evaporate the diethyl ether by warming in a current of nitrogen, to the remaining solution add water to make exactly 50 mL, and use this solution as the sample solution.

Separately, weigh accurately about 2 mg of Ergometrine Maleate RS, previously dried in a desiccator (silica gel) for 4 hours, add water to make exactly 50 mL, and use this solution as the standard solution. Transfer 2 mL each of the sample solution and standard solution, accurately measured, to separate glass-stoppered test tubes, and proceed as directed in the Assay under Ergometrine Maleate.

Amount (mg) of ergometrine maleate ($\text{C}_{19}\text{H}_{23}\text{N}_3\text{O}_2\cdot\text{C}_4\text{H}_4\text{O}_4$) $M_S = A_T / A_S$

$M_S$: Amount (mg) of Ergometrine Maleate RS

Containers and storage Containers—Hermetic containers, and colored containers may be used.

Storage—Light-resistant, and in a cold place.

Ergometrine Maleate Tablets

エルゴメトリンメレイン酸塩錠

Ergometrine Maleate Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of ergometrine maleate ($\text{C}_{19}\text{H}_{23}\text{N}_3\text{O}_2\cdot\text{C}_4\text{H}_4\text{O}_4$; 441.48).

Method of preparation Prepare as directed under Tablets, with Ergometrine Maleate.

Identification To a quantity of powdered Ergometrine Maleate Tablets, equivalent to 3 mg of Ergometrine Maleate according to the labeled amount, add 15 mL of warm water, shake, and filter: the filtrate shows a blue fluorescence. Proceed with this solution as directed in the Identification (2)
and (3) under Ergometrine Maleate.

**Uniformity of dosage units** Perform the test according to the following method: it meets the requirement of the Content uniformity test.

Transfer 1 tablet of Ergometrine Maleate Tablets to a brown glass-stoppered centrifuge tube, and add a solution of L-tartaric acid (1 in 100) to make exactly $V \text{ mL}$ so that each mL contains about 40 μg of ergometrine maleate ($C_{19}H_{23}N_{3}O_{2} \cdot C_{4}H_{4}O_{4}$). Stopper the tube, shake for 30 minutes vigorously, centrifuge, and use the supernatant liquid as the sample solution. Separately, weigh accurately about 4 mg of Ergometrine Maleate RS, previously dried in a desiccator (silica gel) for 4 hours, dissolve in water to make exactly 100 mL, and use this solution as the standard solution. Pipet 4 mL each of the sample solution and standard solution into separate brown glass-stoppered test tubes, add exactly 8 mL of a solution of 4-dimethylaminobenzaldehyde-iron (III) chloride TS while cooling in an ice bath, after shaking, and allow to stand for 1 hour at ordinary temperature. Perform the test with these solutions as directed under Ultraviolet-Visible Spectrophotometry <2.24>, using a solution, prepared with 4 mL of water in the same manner, as the blank. Determine the absorbances, $A_1$ and $A_5$, of the subsequent solutions of the sample solution and the standard solution at 550 nm, respectively.

Amount (mg) of ergometrine maleate ($C_{19}H_{23}N_{3}O_{2} \cdot C_{4}H_{4}O_{4}$)  

$$M_S \times A_1 / A_5 \times V / 100$$

$M_S$: Amount (mg) of Ergometrine Maleate RS

**Assay** Weigh accurately, and powder not less the 20 Ergometrine Maleate Tablets. Weigh accurately a portion of the powder, equivalent to about 2 mg of ergometrine maleate ($C_{19}H_{23}N_{3}O_{2} \cdot C_{4}H_{4}O_{4}$), transfer to a glass filter (G4), add 10 mL of a solution of L-tartaric acid (1 in 100), and filter with thorough shaking. Repeat the procedures 3 times, combine the filtrates, add a solution of L-tartaric acid (1 in 100) to make exactly 50 mL, and use this solution as the sample solution. Separately, weigh accurately about 2 mg of Ergometrine Maleate RS, previously dried in a desiccator (silica gel) for 4 hours, dissolve in a solution of L-tartaric acid (1 in 100) to make exactly 50 mL, and use this solution as the standard solution. Pipet 2 mL each of the sample solution and standard solution, and proceed as directed in the Assay under Ergometrine Maleate.

Amount (mg) of ergometrine maleate ($C_{19}H_{23}N_{3}O_{2} \cdot C_{4}H_{4}O_{4}$)  

$$M_S \times A_1 / A_5$$

$M_S$: Amount (mg) of Ergometrine Maleate RS

**Containers and storage** Containers—Well-closed containers.

Storage—Light-resistant.

---

**Ergotamine Tartrate**

エルゴタミン酒石酸塩

$$(C_{19}H_{23}N_{3}O_{2} \cdot C_{4}H_{4}O_{4}); C_{19}H_{23}N_{3}O_{3} \cdot C_{4}H_{4}O_{4}; \text{ 1313.41}

(5'S)-5'-Benzyl-12'-hydroxy-2'-methylergotaman-3',6',18-trione hemitartrate

[C17H35N6O16] 

Ergotamine Tartrate contains not less than 98.0% of ($C_{33}H_{35}N_{5}O_{5}$)2:C4H6O6, calculated on the dried basis.

**Description** Ergotamine Tartrate occurs as colorless crystals, or a white to pale yellowish white or grayish white, crystalline powder.

It is slightly soluble in water and in ethanol (95). Melting point: about 180°C (with decomposition).

**Identification** (1) Dissolve 1 mg of Ergotamine Tartrate in 10 mL of a mixture of acetic acid (100) and ethyl acetate (1:1). To 0.5 mL of this solution add slowly 0.5 mL of sulfuric acid, with shaking in cold water, and allow to stand: a purple color develops. To this solution add 0.1 mL of diluted iron (III) chloride TS (1 in 12): the color of the solution changes to blue to blue-purple.

(2) Dissolve 1 mg of Ergotamine Tartrate in 5 mL of a solution of L-tartaric acid (1 in 100). To 1 mL of this solution add 2 mL of 4-dimethylaminobenzaldehyde-iron (III) chloride TS, and shake: a blue color develops.

**Optical rotation** <2.49> Ergotamine base [α]$\text{D}^\circ$ = −155 to −165°. Dissolve 0.35 g of Ergotamine Tartrate in 25 mL of a solution of L-tartaric acid (1 in 100), add 0.5 g of sodium hydrogen carbonate, shake gently and sufficiently, and extract with four 10-mL portions of ethanol-free chloroform. Filter the extracts successively through a small filter paper, moistened with ethanol-free chloroform, into a 50-mL volumetric flask. Allow the flask to stand in a water bath at 20°C for 10 minutes, and determine the optical rotation in a 100-mm cell. Separately, pipet 25 mL of this solution, evaporate to dryness under reduced pressure at a temperature not higher than 45°C, dissolve the residue in 25 mL of acetic acid (100), and titrate <2.50> with 0.05 mol/L perchloric acid VS (indicator: 1 drop of crystal violet TS). Perform a blank determination, and make any necessary correction. Calculate the specific rotation of the ergotamine base from the consumed volume of 0.05 mol/L perchloric acid VS and the optical rotation.

Each mL of 0.05 mol/L perchloric acid VS  

$$= 29.08 \text{ mg of } C_{33}H_{35}N_{5}O_{5}$$

**Purity** Related substances—Conduct this procedure without exposure to daylight, using light-resistant vessels. To 40 mg of Ergotamine Tartrate add 10 mL of a solution of L-
tartaric acid in diluted methanol (1 in 2) (1 in 1000), dissolve with thorough shaking, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add a solution of L-tartaric acid in diluted methanol (1 in 2) (1 in 1000) to make exactly 50 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \( <2.03 > \). Spot 10 \( \mu L \) each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (9:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-dimethylaminobenzaldehyde TS on the plate: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \( <2.4 > \) Not more than 5.0% (0.1 g, in vacuum, 60°C, 4 hours).

**Assay** Weigh accurately about 0.2 g of Ergotamine Tartrate, dissolve in 15 mL of a mixture of acetic acid (100) and acetic anhydride (50:3), and titrate \( <2.50 > \) with 0.05 mol/L perchloric acid VS (indicator: 1 drop of crystal violet TS). Perform a blank determination, and make any necessary correction.

Each mL of 0.05 mol/L perchloric acid VS = 32.84 mg of \((C_{17}H_{22}N_{2}O_{5})\cdot C_{4}H_{6}O_{6}\)

**Containers and storage** Containers—Tight containers.

Storage—Light-resistant, and almost well-filled, or under nitrogen atmosphere, and not exceeding 5°C.

**Erythromycin**

エリスロマイシン

\[
\text{C}_{37}\text{H}_{67}\text{NO}_{13}; 733.93
\]

\((2R,3S,4S,5R,6R,8R,10R,11R,12S,13R)-5-(3,4,6-Trideoxy-3-dimethylamino-\beta-D-xylo-hexopyranosoyloxy)-3-(2,6-dideoxy-3-C-methyl-3-O-methyl-\alpha-L-ribo-hexopyranosoyloxy)-6,11,12-trihydroxy-2,4,6,8,10,12-hexamethyl-9-oxopentadecan-13-olide}

[114-07-8]

Erythromycin is a macrolide substance having antibacterial activity produced by the growth of *Saccharopolyspora erythraea*.

It contains not less than 930 \( \mu g \) (potency) and not more than 1020 \( \mu g \) (potency) per mg, calculated on the anhydrous basis. The potency of Erythromycin is expressed as mass (potency) of erythromycin \((C_{37}H_{67}NO_{13})\).

**Description** Erythromycin occurs as a white to light yellowish white powder.

It is very soluble in \(N,N\)-dimethylformamide, freely soluble in methanol and in ethanol (95), and very slightly soluble in water.

**Identification** (1) Determine the infrared absorption spectrum of Erythromycin as directed in the potassium bromide disk method under Infrared Spectrophotometry \( <2.2S > \), and compare the spectrum with the Reference Spectrum or the spectrum of Erythromycin RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

(2) Dissolve 10 mg each of Erythromycin and Erythromycin RS in 1 mL of methanol, and use these solutions as the sample solution and standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \( <2.03 > \). Spot 5 \( \mu L \) each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of methanol and ammonia solution (28) (50:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly 4-methoxybenzaldehyde-sulfuric acid TS on the plate, and heat at 100°C for 15 minutes: the principal spot from the sample solution and the spot from the standard solution are dark purple in color, and their \( R_f \) values are the same.

**Optical rotation** \( <2.49 > \) [\( \alpha \)]\(_D\)\(^{20} = -71 \sim -78^\circ\) (1 g calculated on the anhydrous basis, ethanol (95), 50 mL, 100 mm).

**Purity** (1) Heavy metals \( <1.07 > \)—Proceed with 1.0 g of Erythromycin according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Arsenic \( <1.11 > \)—Prepare the test solution with 1.0 g of Erythromycin according to Method 5 using hydrochloric acid instead of diluted hydrochloric acid (1 in 2), and perform the test (not more than 2 ppm).

(3) Related substances—Dissolve 40 mg of Erythromycin in 2 mL of methanol, add a mixture of phosphate buffer solution, \( \text{pH} 7.0 \) and methanol (15:1) to make exactly 10 mL, and use this solution as the sample solution. Separately, dissolve 16 mg of Erythromycin RS in 2 mL of methanol, add a mixture of phosphate buffer solution, \( \text{pH} 7.0 \) and methanol (15:1) to make exactly 10 mL, and use this solution as the standard stock solution. Dissolve 5 mg each of erythromycin B and erythromycin C in 2 mL of methanol, add exactly 2 mL of the standard stock solution, add a mixture of phosphate buffer solution, \( \text{pH} 7.0 \) and methanol (15:1) to make exactly 25 mL, and use this solution as the standard solution. Perform the test with exactly 100 \( \mu L \) each of the sample solution and standard solution as directed under Liquid Chromatography \( <2.01 > \) according to the following conditions, and determine each peak area by the automatic integration method: the peak areas of erythromycin B and erythromycin C from the sample solution are not larger than those of erythromycin B and erythromycin C from the standard solution, respectively, and each area of the peaks other than erythromycin, erythromycin B and erythromycin C is not larger than the area of the peak of erythromycin from the standard solution.

**Operating conditions**—

Column: A stainless steel column 4.6 mm in inside diame-
Erythromycin Enteric-Coated Tablets

Erythromycin Enteric-Coated Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of erythromycin (C_{37}H_{67}NO_{13}: 733.93).

**Method of preparation** Prepare as directed under Tablets, with Erythromycin.

**Identification** To a quantity of powdered Erythromycin Enteric-Coated Tablets, equivalent to 10 mg (potency) of Erythromycin according to the labeled amount, add 1 mL of methanol, shake well, filter, and use the filtrate as the sample solution. Separately, dissolve 10 mg of Erythromycin RS in 1 mL of methanol, and use this solution as the standard solution. Then, proceed as directed in the Identification (2) under Erythromycin.

**Loss on drying** Not more than 10.0% (0.2 g, in vacuum not exceeding 0.67 kPa, 60°C, 3 hours).

**Uniformity of dosage units** It meets the requirement of the Mass variation test.

**Disintegration** It meets the requirement. For the test with 2nd fluid for disintegration test, use the disk.

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics according to the following conditions.

(i) Test organism—*Staphylococcus aureus* ATCC 6538 P

(ii) Culture medium—Use the medium i in 3) Medium for other organisms under (i) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to 8.0 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Erythromycin RS, equivalent to about 25 mg (potency), dissolve in 25 mL of methanol, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 4°C or below, and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration sample solution, respectively.

containers and storage Containers—Well-closed containers.
C_{37}H_{67}NO_{13}: 733.93.

Erythromycin Ethylsuccinate is a derivative of erythromycin.

It contains not less than 780 μg (potency) and not more than 900 μg (potency) per mg, calculated on the anhydrous basis. The potency of Erythromycin Ethylsuccinate is expressed as mass (potency) of erythromycin on the anhydrous basis.

**Description**

Erythromycin Ethylsuccinate occurs as a white powder.

It is freely soluble in methanol and in acetone, soluble in ethanol (95), and practically insoluble in water.

**Identification (1)**

Dissolve 3 mg of Erythromycin Ethylsuccinate in 2 mL of acetone, and add 2 mL of hydrochloric acid: an orange color develops and is immediately changed to deep purple.

(2) Determine the infrared absorption spectrum of Erythromycin Ethylsuccinate, previously dried in a desiccator at reduced pressure, silica gel for 24 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Water**

Not more than 5.0% (0.5 g, volumetric titration, direct titration).

**Assay**

Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics according to the following conditions.

(i) Test organism—Staphylococcus aureus ATCC 6538

(ii) Culture medium—Use the medium in (i) for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to 8.0 after sterilization.

(iii) Standard solutions—Weigh accurately an amount of Erythromycin RS equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Erythromycin Ethylsuccinate equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, and add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL. Take exactly a suitable amount of the solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Containers and Storage**

Containers—Tight containers.

---

**Erythromycin Lactobionate**

C_{37}H_{67}NO_{13}.C_{12}H_{22}O_{12}: 1092.22

Erythromycin Lactobionate is the lactobionate of erythromycin.

It contains not less than 560 μg (potency) and not more than 700 μg (potency) per mg, calculated on the anhydrous basis. The potency of Erythromycin Lactobionate is expressed as mass (potency) of erythromycin on the anhydrous basis.

**Description**

Erythromycin Lactobionate occurs as a white powder.

It is freely soluble in water, in methanol and in ethanol (99.5), and very slightly soluble in acetone.

**Identification (1)**

To 3 mg of Erythromycin Lactobionate add 2 mL of acetone, and add 2 mL of hydrochloric acid: an orange color is produced, and it changes immediately to red to deep purple.

(2) Transfer about 0.3 g of Erythromycin Lactobionate to a separator, add 15 mL of ammonia TS and 15 mL of chloroform, shake, and take the separated aqueous layer.

---
Wash the aqueous layer with three 15-mL portions of chloroform, and evaporate the aqueous liquid on a water bath to dryness. Dissolve the residue in 10 mL of a mixture of methanol and water (3:2), and use this solution as the sample solution. Separately, dissolve 0.10 g of lactobionic acid in 10 mL of a mixture of methanol and water (3:2), and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography _<2.03>_. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with the upper layer obtained from a mixture of water, 1-butanol and acetic acid (100) (3:3:1) to a distance of about 10 cm, and air-dry the plate. Spray evenly dilute sulfuric acid, and heat at 105°C for 20 minutes: the principal spot obtained from the sample solution shows a deep brown and the RF value which are the same as those of the principal spot from the standard solution.

\[
\text{pH < 2.5} \quad \text{The pH of a solution obtained by dissolving 0.5 g of Erythromycin Lactobionate in 10 mL of water is between 5.0 and 7.5.}
\]

**Water < 2.48** Not more than 5.0% (0.5 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics _<4.02>_ according to the following conditions.

(i) **Test organism**— _Staphylococcus aureus_ ATCC 6538 P

(ii) **Culture medium**—Use the medium i in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to 8.0 after sterilization.

(iii) **Standard solutions**—Weigh an amount of Erythromycin RS, equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 5°C between 5.0 and 7.5.

Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 5°C between 5.0 and 7.5.

Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at not exceeding 5°C between 5.0 and 7.5.

(iv) **Sample solutions**—Weigh an amount of Erythromycin Lactobionate, equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, and add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL. Take exactly a suitable amount of this solution, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

**Erythromycin Stearate**

エリスロマイシンステアリン酸塩

C₁₇H₂₂NO₁₅.C₁₈H₃₆O₂·10H₂O: 1018.40
(C₂₉₅₃₅₄S₅₆₇₈O₉₁₀₁₁₁₂₁₃₁₄₁₅₁₆₁₇₁₈₁₉₂₀): 733.93

- Not less than 600 μg (potency) and not more than 720 μg (potency) per mg, calculated on the anhydrous basis. The potency of Erythromycin Stearate is expressed as mass (potency) of erythromycin (C₃₇H₆₇NO₁₃: 733.93).

**Description** Erythromycin Stearate occurs as a white powder.

It is freely soluble in ethanol (95) and in acetone, soluble in methanol, and practically insoluble in water.

**Identification** (1) Dissolve 3 mg of Erythromycin Stearate in 2 mL of acetone, and add 2 mL of hydrochloric acid: an orange color develops and is immediately changed to red to deep purple.

(2) Determine the infrared absorption spectrum of Erythromycin Stearate, previously dried in a desiccator (reduced pressure, silica gel) for 24 hours, as directed in the potassium bromide disk method under Infrared Spectrophotometry _<2.25>_, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Water < 2.48** Not more than 5.0% (0.5 g, volumetric titration, direct titration).

**Assay** Perform the test according to the Cylinder-plate method as directed under Microbial Assay for Antibiotics _<4.02>_ according to the following conditions.

(i) **Test organism**— _Staphylococcus aureus_ ATCC 6538 P

(ii) **Culture medium**—Use the medium i in 3) Medium for other organisms under (1) Agar media for seed and base layer. Adjust the pH of the medium so that it will be 7.8 to 8.0 after sterilization.

(iii) **Standard solutions**—Weigh accurately an amount of Erythromycin RS equivalent to about 50 mg (potency), dis-
solve in 50 mL of methanol, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL, and use this solution as the standard stock solution. Keep the standard stock solution at 5°C or below and use within 7 days. Take exactly a suitable amount of the standard stock solution before use, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration standard solution and the low concentration standard solution, respectively.

(iv) Sample solutions—Weigh accurately an amount of Erythromycin Stearate equivalent to about 50 mg (potency), dissolve in 50 mL of methanol, and add 0.1 mol/L phosphate buffer solution, pH 8.0 to make exactly 100 mL. Take exactly a suitable amount of the sample, add 0.1 mol/L phosphate buffer solution, pH 8.0 to make solutions so that each mL contains 20 μg (potency) and 5 μg (potency), and use these solutions as the high concentration sample solution and the low concentration sample solution, respectively.

Containers and storage Containers—Tight containers.

Estazolam

エスタゾラム

C₁₆H₁₁ClN₄: 294.74
8-Chloro-6-phenyl-[1,2,4]triazolo[4,3-a][1,4]benzodiazepine [29975-16-4]

Estazolam, when dried, contains not less than 98.5% of C₁₆H₁₁ClN₄.

Description Estazolam occurs as white to pale yellowish white crystals or crystalline powder. It is odorless, and has a bitter taste.

It is soluble in methanol and in acetic anhydride, sparingly soluble in ethanol (95), and practically insoluble in water and in diethyl ether.

Identification (1) Dissolve 0.01 g of Estazolam in 3 mL of sulfuric acid: the solution shows a yellow-green fluorescence under ultraviolet light (main wavelength: 365 nm).

(2) Determine the absorption spectrum of a solution of Estazolam in 1 mol/L hydrochloric acid TS (1 in 100,000) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Perform the test with Estazolam as directed under Flame Coloration Test (2) <1.04>: a green color appears.

Melting point <2.60> 229 – 233°C

Purity (1) Clarity and color of solution—Dissolve 0.10 g of Estazolam in 10 mL of ethanol (95): the solution is clear and colorless.

(2) Chloride <1.03>—Dissolve 1.0 g of Estazolam in 10 mL of ethanol (95) by heating, add 40 mL of water, cool with shaking in ice water, allow to stand to attain ordinary temperature, and filter. To 30 mL of the filtrate add 6 mL of dilute nitric acid and water to make 50 mL, and perform the test using this solution as the test solution. Prepare the control solution with 0.25 mL of 0.01 mol/L hydrochloric acid VS and 6 mL of ethanol (95) (not more than 0.015%).

(3) Heavy metals <1.07>—Proceed with 1.0 g of Estazolam according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(4) Arsenic <1.11>—Prepare the test solution with 1.0 g of Estazolam according to Method 3, and perform the test (not more than 2 ppm).

(5) Related substances—Dissolve 0.20 g of Estazolam in 10 mL of methanol, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add methanol to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of hexane, chloroform and methanol (5:3:1) to a distance of about 10 cm, and air-dry the plate. Examine the plate under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the principal spot from the standard solution.

Loss on drying <2.41> Not more than 1.0% (1 g, 105°C, 4 hours).

Residue on ignition <2.44> Not more than 0.1% (2 g).

Assay Weigh accurately about 0.25 g of Estazolam, previously dried, dissolve in 100 mL of acetic anhydride, and titrate <2.50> with 0.1 mol/L perchloric acid VS (potentiometric titration), until the solution changes to the second equivalence point. Perform a blank determination, and make any necessary correction.

Each mL of 0.1 mol/L perchloric acid VS = 14.74 mg of C₁₆H₁₁ClN₄

Containers and storage Containers—Well-closed containers.
**Estradiol Benzoate**

エストラジオール安息香酸エステル

![Chemical Structure](image)

C₂₅H₂₈O₃: 376.49  
Estra-1,3,5(10)-triene-3,17β-diol 3-benzoate  
[50-50-0]

Estradiol Benzoate, when dried, contains not less than 97.0% of C₂₅H₂₈O₃.

**Description**  
Estradiol Benzoate occurs as a white, crystalline powder. It is odorless. It is sparingly soluble in acetone, slightly soluble in methanol, in ethanol (95) and in diethyl ether, and practically insoluble in water.

**Identification (1)**  
To 2 mg of Estradiol Benzoate add 2 mL of sulfuric acid: a yellowish green color with a blue fluorescence is produced, and the color of the solution changes to light orange on the careful addition of 2 mL of water.

(2) Determine the infrared absorption spectrum of Estradiol Benzoate, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry< 2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of dried Estradiol Benzoate RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

**Optical rotation**< 2.49> [α]D<sub>20</sub>: +54 - +58° (after drying, 0.1 g, acetone, 10 mL, 100 mm).

**Melting point**< 2.60> 191 – 198°C

**Purity (1)**  
17β-Estradiol—Dissolve 5.0 mg each of Estradiol Benzoate and Estradiol Benzoate RS in acetone to make exactly 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Place exactly 2 mL each of the sample solution and standard solution in separate glass-stoppered test tube, add boiling stones, exactly 2 mL each of the sample solution and standard solution on a water bath, shake in a water bath for several seconds, and heat for 2 minutes. Cool the solutions in ice for 2 minutes, then add methanol to make 20 mL, and use these solutions as the sample solution and standard solution as directed under Liquid Chromatography< 2.01> according to the following conditions, and calculate the ratios, Q<sub>T</sub> and Q<sub>S</sub>, of the peak area of estradiol benzoate to that of the internal standard.

Amount (mg) of C₂₅H₂₈O₃: = M<sub>T</sub> × Q<sub>T</sub>/Q<sub>S</sub>

M<sub>S</sub>: Amount (mg) of Estradiol Benzoate RS

**Internal standard solution**—A solution of progesterone in methanol (13 in 80,000).

**Operating conditions**—  
Detector: An ultraviolet absorption photometer (wavelength: 230 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilanized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 35°C.

Mobile phase: A mixture of acetonitrile and water (7:3).

Flow rate: Adjust the flow rate so that the retention time of estradiol benzoate is about 10 minutes.

**System suitability**—  
System performance: When the procedure is run with 5 μL of the standard solution under the above operating conditions, the internal standard and estradiol benzoate are eluted in this order with the resolution between these peaks being not less than 9.

System repeatability: When the test is repeated 6 times with 5 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of estradiol benzoate to that of the internal standard is not more than 1.0%.

**Containers and storage**  
Containers—Tight containers.

Storage—Light-resistant.

---

**Estradiol Benzoate Injection**

エストラジオール安息香酸エステル注射液

Estradiol Benzoate Injection is an oily solution for injection. It contains not less than 90.0% and not more than 110.0% of the labeled amount of estradiol benzoate.
Estradiol Benzoate Injection (Aqueous Suspension)

エストラジオール安息香酸エステル水性懸濁注射液

Estradiol Benzoate Injection (Aqueous Suspension) is an aqueous suspension for injection.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of estradiol benzoate (C_{25}H_{28}O_{3}: 376.49).

Method of preparation Prepare as directed under Injection, with Estradiol Benzoate.

Description Estradiol Benzoate Injection (Aqueous Suspension) produces a white turbidity on shaking.

Identification Extract a volume of Estradiol Benzoate Injection (Aqueous Suspension), equivalent to 1 mg of Estradiol Benzoate according to the labeled amount, with 5 mL of chloroform, and use this solution as the standard solution. Separately, dissolve 1 mg of Estradiol Benzoate RS in 5 mL of chloroform, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.03>. Spot 50 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform and methanol (99:1) to a distance of about 15 cm, and air-dry the plate.

Extractable volume <6.05> It meets the requirement.

Foreign insoluble matter <6.06> Perform the test according to Method 1: easily detectable foreign matters are not observed.

Sterility <4.06> Perform the test according to the Direct inoculation method: it meets the requirement.

Assay Measure exactly a volume of well-mixed Estradiol Benzoate Injection (Aqueous Suspension), equivalent to about 2 mg of estradiol benzoate (C_{25}H_{28}O_{3}), dissolve the crystals with an appropriate quantity of methanol, and add methanol to make exactly 20 mL. Pipet 10 mL of this solution, add methanol to make exactly 30 mL, and use this solution as the standard solution. Transfer 2 mL each of the sample solution and standard solution, exactly measured, to light-resistant 20-mL volumetric flasks, and evaporate to dryness on a water bath with the aid of a current of air. Dissolve the residue in 1 mL of methanol, add 10 mL of boric acid-methanol buffer solution, shake, and boil under a reflux condenser for 30 minutes. Cool, add 5 mL of boric acid-methanol buffer solution, shake, and cool with ice. To each solution add 2 mL of ice-cold diazo TS quickly, shake vigorously, add 2 mL of sodium hydroxide TS, then add water to make 20 mL, and filter after shaking. Discard the first 3 mL of the filtrate, and perform the test with the subsequent filtrate as directed under Ultraviolet-visible Spectrophotometry <2.24> using a solution, prepared with 2 mL of methanol in the same manner, as the blank. Determine the absorbances, \( A_7 \) and \( A_{38} \), of the subsequent solutions obtained from the sample solution and standard solution in a 4-cm cell at 490 nm, respectively.

\[
\text{Amount (mg) of estradiol benzoate (C}_{25}\text{H}_{28}\text{O}_{3}) = M_3 \times \frac{A_7}{A_{38}} \times \frac{2}{5} \\
M_3: \text{Amount (mg) of Estradiol Benzoate RS}
\]

Containers and storage Containers—Hermetic containers.
methanol (13 in 100,000).

Containers and storage Containers—Hermetic containers.

**Estriol**

![Image](image.png)

C₁₈H₂₄O₃: 288.38  
Estra-1,3,5(10)-triene-3,16α,17β-triol  
[50-27-7]

Estriol, when dried, contains not less than 97.0% and not more than 102.0% of C₁₈H₂₄O₃.

Description Estriol occurs as a white, crystalline powder. It is odorless.

It is sparingly soluble in methanol, slightly soluble in ethanol (95) and in 1,4-dioxane, and practically insoluble in water and in diethyl ether.

Identification (1) Dissolve 0.01 g of Estriol in 100 mL of ethanol (95) by warming, and use this solution as the sample solution. Evaporate 1 mL of the sample solution on a water bath to dryness, add 5 mL of a solution of sodium p-phenolsulfonate in diluted phosphoric acid (1 in 50), heat at 150°C for 10 minutes, and cool: a red-purple color develops.

(2) Determine the absorption spectrum of the sample obtained in (1) as directed under Ultraviolet-visible Spectrophotometry <2.24>, and compare the spectrum with the Reference Spectrum or the spectrum of a solution of Estriol RS prepared in the same manner as the sample solution: both spectra exhibit similar intensities of absorption at the same wavelengths.

(3) Determine the infrared absorption spectrum of Estriol, previously dried, as directed in the potassium bromide disk method under Infrared Spectrophotometry <2.25>, and compare the spectrum with the Reference Spectrum or the spectrum of previously dried Estriol RS: both spectra exhibit similar intensities of absorption at the same wave numbers.

Optical rotation <2.49> [α]D: +54° to +62° (after drying, 40 mg, 1,4-dioxane, 10 mL, 100 mm).

Melting point <2.60> 281 – 286°C

Purity (1) Heavy metals <1.07>—Proceed with 1.0 g of Estriol according to Method 2, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(2) Related substances—Dissolve 40 mg of Estriol in 10 mL of ethanol (95) by warming, and use this solution as the sample solution. Pipet 1 mL of the sample solution, add ethanol (95) to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography <2.07>. Spot 5 μL each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of chloroform, methanol, acetone and acetic acid (100:18:1:1:1) to a distance of about 15 cm, and air-dry the plate. Spray evenly diluted sulfuric acid (1 in 2) on the plate, and heat at 105°C for 15 minutes: the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

Loss on drying <2.41> Not more than 0.5% (0.5 g, 105°C, 3 hours).

Residue on ignition <2.44> Not more than 0.1% (0.5 g).

Assay Weigh accurately about 25 mg each of Estriol and Estriol RS, previously dried, and dissolve each in methanol to make exactly 50 mL. Pipet 10 mL each of these solutions, add exactly 5 mL of the internal standard solution, add methanol to make 100 mL, and use these solutions as the sample solution and the standard solution, respectively. Perform the test with 10 μL each of the sample solution and standard solution as directed under Liquid Chromatography <2.01> according to the following conditions, and calculate the ratios, Q₁ and Q₂, of the peak area of estriol to that of the internal standard, respectively.

\[
\text{Amount (mg) of } C_{18}H_{24}O_3 = M_s \times \frac{Q_1}{Q_2}
\]

Mₛ: Amount (mg) of Estriol RS

Internal standard solution—A solution of methyl benzoate for estriol limit test in methanol (1 in 1000).

Operating conditions—

Detector: An ultraviolet absorption photometer (wavelength: 280 nm).

Column: A stainless steel column 4.6 mm in inside diameter and 15 cm in length, packed with octadecylsilylized silica gel for liquid chromatography (5 μm in particle diameter).

Column temperature: A constant temperature of about 25°C.

Mobile phase: A mixture of water and methanol (51:49).

Flow rate: Adjust the flow rate so that the retention time of estriol is about 10 minutes.

System suitability—

System performance: When the procedure is run with 10 μL of the standard solution under the above operating conditions, estriol and the internal standard are eluted in this order with the resolution between these peaks being not less than 8.

System repeatability: When the test is repeated 6 times with 10 μL of the standard solution under the above operating conditions, the relative standard deviation of the ratios of the peak area of estriol to that of the internal standard is not more than 1.0%.

Containers and storage Containers—Hermetic containers.

**Estriol Injection (Aqueous Suspension)**

エストリオール水性懸濁注射液

Estriol Injection (Aqueous Suspension) is an aqueous suspension for injection.

It contains not less than 90.0% and not more than 110.0% of the labeled amount of estriol (C₁₈H₂₄O₃: 288.38).
Method of preparation  Prepare as directed under Injections, with Estriol.

Description  Shake Estriol Injection (Aqueous Suspension): a white turbidity is produced.

Identification  (1) Shake well, take a volume of Estriol Injection (Aqueous Suspension), equivalent to 2 mg of Estriol according to the labeled amount, add ethanol (95) to make 20 mL, and use this solution as the sample solution. Proceed with the sample solution as directed in the Identification (1) under Estriol.

(2) Determine the absorption spectrum of the sample solution obtained in (1) as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 279 nm and 283 nm.

Extractable volume  It meets the requirement.

Foreign insoluble matter  Perform the test according to Method 1: easily detectable foreign matters are not observed.

Sterility  Perform the test according to the Direct inoculation method: it meets the requirement.

Assay  Shake well, pipet a volume of Estriol Injection (Aqueous Suspension), equivalent to about 5 mg of estriol (C\(_{18}\)H\(_{24}\)O\(_3\)), and dissolve in methanol to make exactly 20 mL. Pipet 4 mL of this solution, add exactly 5 mL of the internal standard solution, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Estriol RS, previously dried at 105 °C for 3 hours, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, add exactly 5 mL of the internal standard solution, then add methanol to make 50 mL, and use this solution as the standard solution. Proceed as directed in the Assay under Estriol.

\[
\text{Amount (mg) of estriol (C}_{18}\text{H}_{24}\text{O}_3) = M_S \times \frac{Q_T}{Q_S} \times \frac{1}{5}
\]

\(M_S\): Amount (mg) of Estriol RS

Internal standard solution—A solution of methyl benzoate for estriol limit test in ethanol (95) (1 in 5000).

Containers and storage  Containers—Hermetic containers.

Estriol Tablets

エストリオール錠

Estriol Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of estriol (C\(_{18}\)H\(_{24}\)O\(_3\)) 288.38).

Method of preparation  Prepare as directed under Tablets, with Estriol.

Identification  (1) Weigh a portion of powdered Estriol Tablets, equivalent to 2 mg of Estriol according to the labeled amount, add ethanol (95) to make 20 mL, shake for 10 minutes, centrifuge, and use the supernatant liquid as the sample solution. Proceed with the sample solution as directed in the Identification (1) under Estriol.

(2) Determine the absorption spectrum of the sample solution obtained in (1) as directed under Ultraviolet-visible Spectrophotometry: it exhibits a maximum between 279 nm and 283 nm.

Uniformity of dosage units  Perform the test according to the following method: it meets the requirement of the Content uniformity test.

To 1 tablet of Estriol Tablets add exactly 5 mL of water, disperse the fine particles with ultrasonic wave, add exactly 15 mL of methanol, and shake for 15 minutes. Centrifuge this solution for 10 minutes, pipet a definite amount of the supernatant liquid, and add methanol to make exactly a definite amount of solution so that each mL of the solution contains about 5 µg of estriol (C\(_{18}\)H\(_{24}\)O\(_3\)). Pipet 5 mL of this solution, add exactly 1 mL of the internal standard solution, and use this solution as the sample solution. Proceed with 20 µL of the sample solution as directed in the Assay under Estriol. Use a solution of methyl benzoate in methanol (1 in 40,000) as the internal standard solution. Calculate the mean value from each ratio of peak areas of 10 samples: the samples conform to the requirements if the deviation (%) of the mean value and each ratio of peak areas is within 15%. If the deviation (%) exceeds 15%, and 1 sample shows deviation within 25%, repeat the test with 20 samples. Calculate the deviation (%) of the mean value from each ratio of peak areas of the 30 samples used in the 2 tests and each ratio of peak areas: the samples conform to the requirements if the deviation exceeds 15%, not more than 1 sample shows deviation within 25%, and no sample shows deviation exceeding 25%.

Dissolution  When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 30 minutes of Estriol Tablets is not less than 80%.

Start the test with 1 tablet of Estriol Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 µm. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly 10 mL so that each mL contains about 0.1 µg of estriol (C\(_{18}\)H\(_{24}\)O\(_3\)) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 10 mg of Estriol RS, previously dried at 105 °C for 3 hours, dissolve in methanol to make exactly 100 mL, then pipet 5 mL of this solution, and add water to make exactly 100 mL. Pipet 2 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Perform the test with exactly 100 µL each of the sample solution and standard solution as directed under Liquid chromatography: it following the according to the following conditions, and determine the peak areas, \(A_T\) and \(A_S\), of estriol.

\[
\text{Dissolution rate} \times \% = \frac{M_S \times A_T}{A_S} \times \frac{V}{V_{\text{in}}} \times \frac{C}{1000} \times \frac{C}{1000}
\]

\(M_S\): Amount (mg) of Estriol RS

\(C\): Labeled amount (mg) of estriol (C\(_{18}\)H\(_{24}\)O\(_3\)) in 1 tablet

Operating conditions— Proceed as directed in the operating conditions in the Assay under Estriol.
**System suitability**

Proceed as directed in the system suitability in the Assay under Estriol.

**Assay**

Weigh accurately and powder not less than 20 Estriol Tablets. Weigh accurately a portion of the powder, equivalent to about 1 mg of estriol \((C_{18}H_{24}O_3)\), add exactly 5 mL of water, disperse the fine particles with ultrasonic wave, shake with 25 mL of methanol for 10 minutes, centrifuge, and take the supernatant liquid. Add 25 mL of methanol, repeat the above procedure twice, combine the supernatant liquids, and make up to 100 mL with methanol. Add exactly 5 mL of the internal standard solution, add exactly 5 mL of the internal standard solution, then add methanol to make 100 mL, and use this solution as the sample solution. Separately, weigh accurately about 25 mg of Estriol RS, previously dried at 105°C for 3 hours, and dissolve in methanol to make exactly 100 mL. Pipet 4 mL of this solution, add exactly 5 mL of the internal standard solution, then add methanol to make 100 mL, and use this solution as the standard solution. Proceed with 20 μL each of the sample solution and standard solution as directed in the Assay under Estriol.

\[
\text{Amount (mg) of estriol (C}_{18}\text{H}_{24}\text{O}_{3}) = M_s \times \frac{Q_T}{Q_b} \times \frac{1}{25}
\]

\(M_s\): Amount (mg) of Estriol RS

**Internal standard solution**—A solution of methyl benzoate for estriol limit test in methanol (1 in 5000).

**Containers and storage** Containers—Tight containers.

---

**Etacrynic Acid**

エタクリン酸

\[\text{C}_{13}\text{H}_{12}\text{Cl}_{2}\text{O}_{4}: 303.14\]

\([2,3\text{-Dichloro-4-(2-ethylacryloyl)phenoxy]acetic acid [58-54-8]}

Etacrynic Acid, when dried, contains not less than 98.0% of \(\text{C}_{13}\text{H}_{12}\text{Cl}_{2}\text{O}_{4}\).

**Description**

Etacrynic Acid occurs as a white, crystalline powder. It is odorless, and has a slightly bitter taste.

It is very soluble in methanol, freely soluble in ethanol (95), in acetic acid (100) and in diethyl ether, and very slightly soluble in water.

**Identification**

(1) Dissolve 0.2 g of Etacrynic Acid in 10 mL of acetic acid (100), and to 5 mL of this solution add 0.1 mL of bromine TS: the color of the test solution disappears. To the remaining 5 mL of the solution add 0.1 mL of potassium permanganate TS: the color of the test solution changes to light orange immediately.

(2) To 0.01 g of Etacrynic Acid add 1 mL of sodium hydroxide TS, and heat in a water bath for 3 minutes. After cooling, add 1 mL of chlorotrope acid TS, and heat in a water bath for 10 minutes: a deep purple color develops.

(3) Determine the absorption spectrum of a solution of Etacrynic Acid in methanol (1 in 20,000) as directed under Ultraviolet-visible Spectrophotometry \(<2.24\>\), and compare the spectrum with the Reference Spectrum: both spectra exhibit similar intensities of absorption at the same wavelengths.

(4) Perform the test with Etacrynic Acid as directed under Flame Coloration Test (2) \(<1.04\>\): a green color appears.

**Melting point** \(<2.60\>\quad 121 - 125°C\)

**Purity**

(1) Clarity and color of solution—Dissolve 1.0 g of Etacrynic Acid in 10 mL of methanol: the solution is clear and colorless.

(2) Heavy metals \(<1.07\>—\)Proceed with 1.0 g of Etacrynic Acid according to Method 4, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 20 ppm).

(3) Arsenic \(<1.11\>—\)Prepare the test solution with 1.0 g of Etacrynic Acid according to Method 3, and perform the test. Add 10 mL of a solution of magnesium nitrate hexahydrate in ethanol (95) (1 in 50), then add 1.5 mL of hydrogen peroxide (30), and fire to burn (not more than 2 ppm).

(4) Related substances—Dissolve 0.20 g of Etacrynic Acid in 10 mL of ethanol (95), and use this solution as the sample solution. Pipet 3 mL of the sample solution, add ethanol (95) to make exactly 200 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \(<2.05\>\). Spot 10 μL each of the sample solution and standard solution on a plate of silica gel with fluorescent indicator for thin-layer chromatography. Develop the plate with a mixture of chloroform, ethyl acetate and acetic acid (100) (6:5:2) to a distance of about 15 cm, and air-dry the plate. Examine under ultraviolet light (main wavelength: 254 nm): the spots other than the principal spot from the sample solution are not more intense than the spot from the standard solution.

**Loss on drying** \(<2.41\>\quad \text{Not more than 0.25% (1 g, in vacuum, 60°C, 2 hours)}.

**Residue on ignition** \(<2.44\>\quad \text{Not more than 0.1% (1 g)}.

**Assay**

Weigh accurately about 0.1 g of Etacrynic Acid, previously dried, place in an iodine bottle, dissolve in 20 mL of acetic acid (100), and add exactly 20 mL of 0.05 mol/L bromine VS. To this solution add 3 mL of hydrochloric acid, stopper tightly at once, shake, and allow to stand in a dark place for 60 minutes. Add carefully 50 mL of water and 15 mL of potassium iodide TS, stopper tightly at once, shake well, and titrate \(<2.50\>\) the liberated iodine with 0.1 mol/L sodium thiosulfate VS (indicator: 1 mL of starch TS). Perform a blank determination.

Each mL of 0.05 mol/L bromine VS

\[
= 15.16 \text{ mg of C}_{13}\text{H}_{12}\text{Cl}_{2}\text{O}_{4}
\]

**Containers and storage** Containers—Well-closed containers.
Etacrynic Acid Tablets

エタクリン酸誘

Etacrynic Acid Tablets contain not less than 90.0% and not more than 110.0% of the labeled amount of etacrynic acid (C_{13}H_{12}Cl_{2}O_{4}: 303.14).

Method of preparation  Prepare as directed under Tablets, with Etacrynic Acid.

Identification (1) Weigh a quantity of powdered Etacrynic Acid Tablets, equivalent to 0.3 g of Etacrynic Acid according to the labeled amount, add 25 mL of 0.1 mol/L hydrochloric acid TS, and extract with 50 mL of Dichloromethane. Filter the dichloromethane extract, and evaporate the filtrate on a water bath to dryness. Proceed with the residue as directed in the Identification (1), (2) and (4) under Etacrynic Acid.

(2) Prepare a solution of the residue obtained in (1), equivalent to a solution of Etacrynic Acid in methanol (1 in 20,000), and determine the absorption spectrum as directed under Ultraviolet-visible Spectrophotometry <2.24>: it exhibits a maximum between 268 nm and 272 nm.

Dissolution 6.10  When the test is performed at 50 revolutions per minute according to the Paddle method, using 900 mL of water as the dissolution medium, the dissolution rate in 45 minutes of Etacrynic Acid Tablets is not less than 70%.

Start the test with 1 tablet of Etacrynic Acid Tablets, withdraw not less than 20 mL of the medium at the specified minute after starting the test, and filter through a membrane filter with a pore size not exceeding 0.8 μm. Discard the first 10 mL of the filtrate, pipet 5 mL of the subsequent filtrate, add water to make exactly V mL so that each mL contains about 28 μg of etacrynic acid (C_{13}H_{12}Cl_{2}O_{4}) according to the labeled amount, and use this solution as the sample solution. Separately, weigh accurately about 55 mg of etacrynic acid for assay, previously dried in vacuum at 60°C for 2 hours, dissolve in 10 mL of methanol, and add water to make exactly 100 mL. Pipet 5 mL of this solution, add water to make exactly 100 mL, and use this solution as the standard solution. Determine the absorbances, A_M and A_s, at 277 nm of the sample solution and standard solution as directed under Ultraviolet-visible Spectrophotometry <2.24>, using water as the blank.

Dissolution rate (%) with respect to the labeled amount of etacrynic acid (C_{13}H_{12}Cl_{2}O_{4})

\[ M_s = M \times (V/V) \times (1/C) \times 45 \]

where

\[ M \] is the weight of the tablet
\[ V \] is the volume of water
\[ C \] is the concentration of the solution

M_s: Amount (mg) of etacrynic acid for assay
C: Labeled amount (mg) of etacrynic acid (C_{13}H_{12}Cl_{2}O_{4}) in 1 tablet

Assay  Weigh accurately and powder not less than 20 Etacrynic Acid Tablets. Weigh accurately a portion of the powder, equivalent to 0.1 g of etacrynic acid (C_{13}H_{12}Cl_{2}O_{4}), add 25 mL of 0.1 mol/L hydrochloric acid TS, and extract with three 30-mL portions of dichloromethane. Filter the dichloromethane extracts through a pledget of absorbent cotton into an iodine bottle. Wash the pledget of absorbent cotton with a small amount of dichloromethane, and combine the washing with the extracts. Evaporate this solution on a water bath to dryness in a current of air, to the residue add 20 mL of acetic acid (100), and proceed as directed in the Assay under Etacrynic Acid.

Each mL of 0.05 mol/L bromine VS
\[ = 15.16 \text{ mg of C}_{13}H_{12}Cl_{2}O_{4} \]

Containers and storage  Containers—Well-closed containers.

Ethambutol Hydrochloride

エタンブトール塩酸塩

Ethambutol Hydrochloride, when dried, contains not less than 98.5% of C_{10}H_{24}N_{2}O_{2}.2HCl.

Description  Ethambutol Hydrochloride occurs as white crystals or crystalline powder. It is odorless, and has a bitter taste.

The pH of a solution of Ethambutol Hydrochloride (1 in 20) is between 3.4 and 4.0.

Identification (1) To 10 mL of a solution of Ethambutol Hydrochloride (1 in 100) add 0.5 mL of copper (II) sulfate TS and 2 mL of sodium hydroxide TS: a deep blue color is produced.

(2) Dissolve 0.1 g of Ethambutol Hydrochloride in 40 mL of water, add 20 mL of 2,4,6-trinitrophenol TS, and allow to stand for 1 hour. Collect the precipitate, wash with 50 mL of water, and dry at 105°C for 2 hours: the precipitate melts <2.60> between 193°C and 197°C.

(3) A solution of Ethambutol Hydrochloride (1 in 30) responds to the Qualitative Tests <1.09> for chloride.

Optical rotation <2.49> [α]_D: +5.5° – +6.1° (after drying, 5 g, water, 50 mL, 200 mm).

Melting point <2.60> 200 – 204°C

Purity (1) Clarity and color of solution—Dissolve 1.0 g of Ethambutol Hydrochloride in 10 mL of water: the solution is clear and colorless.

(2) Heavy metals <1.07>—Proceed with 2.0 g Ethambutol Hydrochloride according to Method 1, and perform the test. Prepare the control solution with 2.0 mL of Standard Lead Solution (not more than 10 ppm).

(3) Arsenic <1.17>—Prepare the test solution with 1.0 g of Ethambutol Hydrochloride according to Method 1, and perform the test (not more than 2 ppm).

(4) 2-Aminobutanol—Dissolve 5.0 g of Ethambutol Hydrochloride in methanol to make exactly 100 mL, and use this solution as the sample solution. Separately, dissolve...
0.05 g of 2-amino-1-butanol in methanol to make exactly 100 mL, and use this solution as the standard solution. Perform the test with these solutions as directed under Thin-layer Chromatography \( \text{<2.02>} \). Spot 2 \( \mu L \) each of the sample solution and standard solution on a plate of silica gel for thin-layer chromatography. Develop the plate with a mixture of ethyl acetate, acetic acid (100), hydrochloric acid and water (11:7:1:1) to a distance of about 10 cm, air-dry the plate, and heat at 105°C for 5 minutes. Cool, spray evenly ninhydrin-L-ascorbic acid TS upon the plate, air-dry the plate, and heat at 105°C for 5 minutes: the resulting liquid is clear. Control solution: water.

**Purity (1)** Clarity and color of solution—Ethanol is clear and colorless. To 1.0 mL of Ethanol add water to make 20 mL, and allow to stand for 5 minutes: the resulting liquid is clear. Control solution: water.

**Acidity or alkalinity**—To 20 mL of Ethanol add 20 mL of freshly boiled and cooled water and 0.1 mL of a solution prepared by addition of 7.0 mL of ethanol (95) and 2.0 mL of water to 1.0 mL of phenolphthalein TS: no color develops. Add 1.0 mL of 0.01 mol/L sodium hydroxide VS to this solution: a light red color develops.
