Key points for safe use

(Case) A bronchoscopy was performed because a chest X-ray showed an abnormal shadow in the lung fields. It was found that a tip of a closed suction catheter was in the bronchus.

1. Precaution when cutting a tracheal tube to adjust its length

- Be careful of the location of the tip of the closed suction catheter when cutting a tracheal tube to adjust its length.

Risk of bronchial obstruction

The tip of a catheter that was accidentally cut off has become lodged in the bronchus.
Make sure that the tip of the closed suction catheter is pulled back from the tracheal tube before cutting the tracheal tube to adjust its length.
2 Other precautions for use

- Make sure to pull back the suction catheter from the tracheal tube after suction has been completed.

Examples of closed suction catheters

- Kimberly-Clark Health Care Inc. KimVent®, Turbo-Cleaning Closed Suction System for Adults
- Covidien Japan Co., Ltd. Eco-cath
- Smiths Medical Japan Ltd. SuctionPro

A suction catheter left inside the tracheal tube may increase airway resistance. Check the location of the marker at the tip of the suction catheter after tracheal suction has been completed.

About this information

* PMDA Medical Safety Information is issued by the Pharmaceuticals and Medical Devices Agency for the purpose of providing healthcare providers with clearer information from the perspective of promoting the safe use of pharmaceuticals and medical devices. The information presented here has been compiled, with the assistance of expert advice, from cases collected as Medical Accident Information Reports by the Japan Council for Quality Health Care, and collected as Adverse Drug Reaction and Malfunction Reports in accordance with the Pharmaceutical Affairs Law.
