The Maureen and Mike Mansfield Foundation
Promoting Understanding and Cooperation in U.S.-Asia Relations since 1983

Program Overview

The Mansfield Fellowship Program—named after Mike Mansfield, former U.S. Ambassador to Japan, Senate Majority Leader, U.S. Senator and U.S. Congressman from Montana—is a first-of-its-kind program for both the United States and Japan. The two-year Fellowships enable U.S. federal government employees to develop an in-depth understanding of Japan, learn how its government works, and establish relationships with their counterparts in the government of Japan as well as in the business, professional and academic communities.

[FDA](#) > [CDRH](#) > [International Issues](#) > Japan - U.S. "Harmonization By Doing" HBD Pilot Program Initiative

Japan - U.S. "Harmonization By Doing" HBD Pilot Program Initiative

"Harmonization by Doing," commonly known as HBD, is an international effort to develop global clinical trials and address regulatory barriers that may be impediments to timely device approvals. This process is a cooperative effort to move both Japan and the U.S. toward international regulatory harmonization. Participants in this process include:

- U.S. Food and Drug Administration (FDA) Center for Devices and Radiological Health (CDRH)
- Japan's Pharmaceutical and Food Safety Bureau (PFSB) of the Ministry of Health, Labour and Welfare (MHLW) and its review agency, the Pharmaceutical and Medical Device Agency (PMDA)
- Duke Clinical Research Institute (DCRI),
- Japanese academic community, and
- Japanese and U.S. medical device industry.

What is the HBD initiative?

The HBD initiative is a pilot project launched in December 2003 that seeks to harmonize the FDA and MHLW-PMDA premarket review of device cardiovascular technology. In addition to harmonization, HBD will utilize parallel development, application submission, and joint review of device projects by FDA and MHLW-PMDA in conjunction with the above-named organizations to eliminate redundancies, added costs, and time delays inherent in sequential review processes. The goal is to create guidance and discuss policy but to develop common protocols for

June 2009: The “Collaborative Scheme” for parallel medical device development

Japan - U.S. "Harmonization By Doing" HBD Pilot Program Initiative

ANNOUNCEMENT (June 23, 2009): U.S. – Japan Pilot Program Regarding Medical Device Collaborative Consultation and Review of Premarketing Applications

Japan MHLW/PMDA and U.S. FDA announced this week the launch of a bilateral pilot program on collaborative consultation and review of new cardiovascular devices. The goal of the pilot program is to advance both the speed and quality of clinical/statistical consultations and the regulatory review process for potential earlier market access and improved public health benefit. This collaboration would permit the scientific review staff of both MHLW/PMDA and FDA to discuss the contents of an individual submission in order to gain valuable regulatory information pertaining to device development and clinical trial design.

The Collaborative Scheme is one of several focused topics that will be discussed at the upcoming [Japan-US Harmonization By Doing \(HBD\) West 2009 Meeting, July 16-17](#) at the FDA White Oak Campus.

on behalf of the Harmonization by Doing Program Working Group

Background: Global medical devices have become more popular, but investment money for medical device development is not easily available in the market. Worldwide health-care budget constraints mean that efficient medical device development has become essential. To achieve efficient development, globalization is a key to success. Spending large amounts of money in different regions for medical device development is no longer feasible.

Methods and Results: In order to streamline processes of global medical device development, an academic, governmental, and industrial consortium, called the Harmonization by Doing program, has been set up. The program has been operating between Japan and the USA since 2003. The program has 4 working groups: (1) Global Cardiovascular Device Trials; (2) Study on Post-Market Registry; (3) Clinical Trials; and (4) Infrastructure and Methodology/Regulatory Convergence and Communication. Each working group has as its goals the achievement of speedy and efficient medical device development in Japan and the USA. The program has held multiple international meetings to deal with obstacles against efficient medical device development.

International Medical Device Regulators Forum

About IMDRF

The International Medical Device Regulators Forum (IMDRF) was conceived in February 2011, as a forum to discuss future directions in medical device regulatory harmonization. It is a voluntary group of medical device regulators from around the world who have come together to build on the strong foundational work of the Global Harmonization Task Force on Medical Devices (GHTF). The Forum will accelerate international medical device regulatory harmonization and convergence.

In October 2011, representatives from the medical device regulatory authorities of Australia, Brazil, Canada, China, European Union, Japan and the United States, as well as the World Health Organization (WHO) met in Ottawa to address the establishment and operation of this new Forum.

A copy of the [outcome statement from this meeting](#) is available on the Therapeutic Goods Administration website.

ABSTRACT

The lack of consistent definitions and nomenclature across clinical trials of novel devices, drugs, or biologics poses a significant barrier to accrual of knowledge in and across peripheral artery disease therapies and technologies. Recognizing this problem, the Peripheral Academic Research Consortium, together with the U.S. Food and Drug Administration

Tracking Real-World Outcomes

The TVT Registry™ is a new benchmarking tool developed to track patient safety at introduced transcatheter aortic valve replacement (TAVR) procedure. Created by The American College of Cardiology (ACC), the TVT Registry is designed to monitor the treatment of aortic stenosis.

Employing a first-of-its-kind transcatheter heart valve technology, TAVR provides a considered to be inoperable for conventional aortic valve replacement surgery.

Through the capture and reporting of patient demographics, procedure details, and Registry provides a data repository capable of delivering insight into clinical practice

For Participating Hospitals, the TVT Registry Offers:

- Quarterly reports containing practice patterns, demographics and outcomes of performance with that of the national experience
- Standardized, evidence-based data elements and definitions
- A web-based data collection tool
- A wide range of other quality improvement tools to advance quality improvement

The TVT Registry Measures:

- Patient demographics, provider and facility characteristics
- History/risk factors, cardiac status and detailed health status
- Well-defined indications for the procedure
- Pre, intra and post procedure data points and adverse event rates
- Outcomes at 30 days and one year

Providing an Invaluable Data Source

In June 2014, the Medical Device Epidemiology Network (MDEPinet) Public-Private Partnership, on behalf of the US Food and Drug Administration Center for Devices and Radiologic Health (CDRH), convened the Medical Device Registries Task Force (MDRTF) (see eAppendix in the Supplement). The task force was launched to address the CDRH's commitments^{1,2} to strengthen the medical device postmarket surveillance system using existing resources and under current authorities and to develop an integrated system that efficiently and effectively achieves its basic functions, from timely identification of postmarket signals to facilitating premarket device clearance and approval.

The MDRTF included broad stakeholder representation and was mandated to examine the objectives and logistics of leveraging existing electronic registries and information repositories in support of a national system. This work was done in parallel with efforts at the Engelberg Center at the Brookings Institution, which in 2015 reported recommendations from their planning board for a "national medical device surveillance system." These recommendations depicted a system that "supports optimal patient care by leveraging the experiences of patients, clinicians, device manufacturers, and medical device regulators."

The MDRTF recognized that most existing registries, electronic health records (EHRs), and data sources do not contain all the elements necessary for device evaluations, including device and procedural details, patient description, or long-term outcomes. However, the MDRTF recognized that such limitations could be mitigated through interoperability solutions that strategically link complementary registries and data sources to produce networks for which the data composite could support robust device evaluation. The MDRTF termed this structure the strategically coordinated registries network, or CRN—with the recognition that many key elements in such networks (such as EHRs, administrative claims data, or mobile device outputs) are not registries per se. The MDRTF recommends strategic CRNs as the foundational architectural construct for the national system that will augment national registry development and unique device identifier implementation rather than replace them.

The proposed CRN structure could provide novel, important attributes to the national system. Creation of CRNs could encourage efficient "dual purpose" leveraging of existing registries, EHRs, administrative data resources, and lessons learned from existing linked registry models such as the Transcatheter Valve Therapy Registry, administrative

HBD for children

Industry

- *Cost of approval process*
- *Market scale*
- *Contribution to society*

Public grant

Academia

- *Investigator-oriented clinical trial*
- *Collaborative clinical trial*
- *Enlighten and education*
- *Promote Certification system*

*Research &
development of
new device*

HBD-Children Work Report & schedule

Introduction and achievement of HBD-for-Children

Yasuko Nakamura

Reviewer, Office of Medical Devices III

***Pharmaceuticals and Medical Devices Agency
(PMDA)***

An established scheme ← HBD

- Development of pediatric medical device tends to delay in the U.S. and Japan but there are **high needs** in clinical institutions.
- Regulatory authorities have to resolve problems in the U.S. and Japan.

**HBD has made a great contribution
to promote innovative medical device development
for ADULT !**

**We will find problems of development of
pediatric medical devices in the U.S. and Japan
and propose solutions *by Doing*.**

POC candidate

	Covered CP Stent	Medtronic Melody Transcatheter Pulmonary Valve	AMPLATZER muscular VSD occluder
industry	NuMED	Medtronic	ST.JUDE MEDICAL
