- ✓ アカデミアの医薬品開発とICH E8(R1)ガイドラインへの期待

ICH E8(R1)ガイドラインの特徴

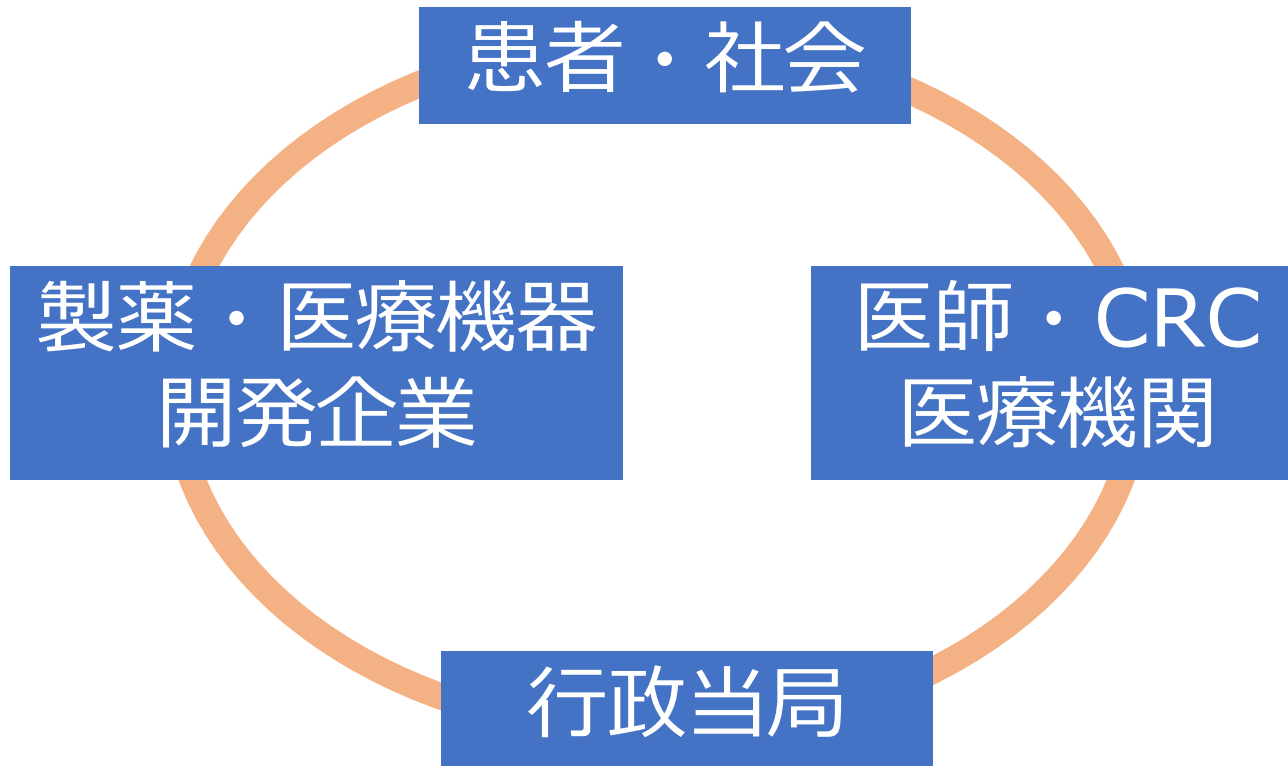

- ✓ Quality by Design of Clinical Studies
- ✓ Critical to Quality Factors
- ✓ Feasibility

Quality by Design of Clinical Studies

Quality by design in clinical research sets out to ensure that the quality of a study is driven proactively by designing quality into the study protocol and processes. This involves the use of a prospective, multidisciplinary approach to promote the quality of protocol and process design, and clear communication of how this will be achieved.

- 臨床試験の開始前、試験実施計画書や実施手順を検討する段階から、試験の質を設計することによって臨床試験の質の向上を目指す
- 明確な目的意識をもってコミュニケーションを図り前向きに、さまざまなアプローチを用いて試験プロトコルやプロセスデザインの質を向上させる

臨床試験のプレイヤー

この臨床試験のデザインは

Our study design, organisation, clinical measurements, endpoint definitions, power calculations, and recruitment rates have been published previously.²³ Briefly, between January, 2002, and December, 2004, we recruited patients to an investigator-initiated, independent, investigator-led, multicentre, controlled trial.²³ Participating centres included the four hospitals of the Jikei University in Tokyo, which has some of the largest inpatient and outpatient facilities in Japan, and 17 associated hospitals led by physicians from Jikei University.²³ We used a prospective randomised open blinded endpoint (PROBE) design.²⁴

We recruited patients with hypertension, coronary heart disease, heart failure, or a combination of these cardiovascular disorders. The study population was selected and

Prospective Randomized **Open** Blinded Endpoint
PROBE Design

Prospective Randomized **Open** Blinded Endpoint PROBE Design

二重盲検化されないオープン試験であるにも関わらず
ソフトエンドポイントが評価項目に組み込まれていた

- 脳卒中や一過性虚血発作による入院
- 心不全による入院
- 狭心症による入院
- 透析への移行

- オープン試験であるならばハードエンドポイントのみを評価項目とする
- ソフトエンドポイント組み入れるならば二重盲検試験とする

EMR "Stamp" for Cardiovascular Events

The screenshot displays the MegaOak HR EMR system interface. At the top, the user is identified as 浜松 太郎 (医師) with a login time of 2013/05/23 12:12. The patient record for 90000035 (男性, 1950(S25)年01月01日生(63歳4ヶ月)) is shown, with a main diagnosis of 心療内科 2階東病棟 62 01. A dialog box titled "Event" is open, allowing the user to record cardiovascular events. The dialog includes a "Date of Evaluation" field set to 2017/9/1 and a "Start Date" field also set to 2017/9/1. A list of events with radio buttons for "N" (No) and "Y" (Yes) is provided:

- Hypoglycemic Event
- Death
- Transient Ischemic Attack and Stroke
- Myocardial Infarction
- Unstable Angina
- Percutaneous Coronary Intervention
- Peripheral Vascular Intervention
- Heart Failure Hospitalization
- Dialysis
- Discontinuation of follow-up

At the bottom of the dialog, there is a checkbox for "Is the above information correct?" and "Cancel" and "Confirm" buttons. The system's taskbar at the bottom shows the Windows logo, open applications like "Windows M...", "D:\MegaOak", and "コンピュータ...", and the system clock at 15:46.

Scheme of EMR “Stamp”

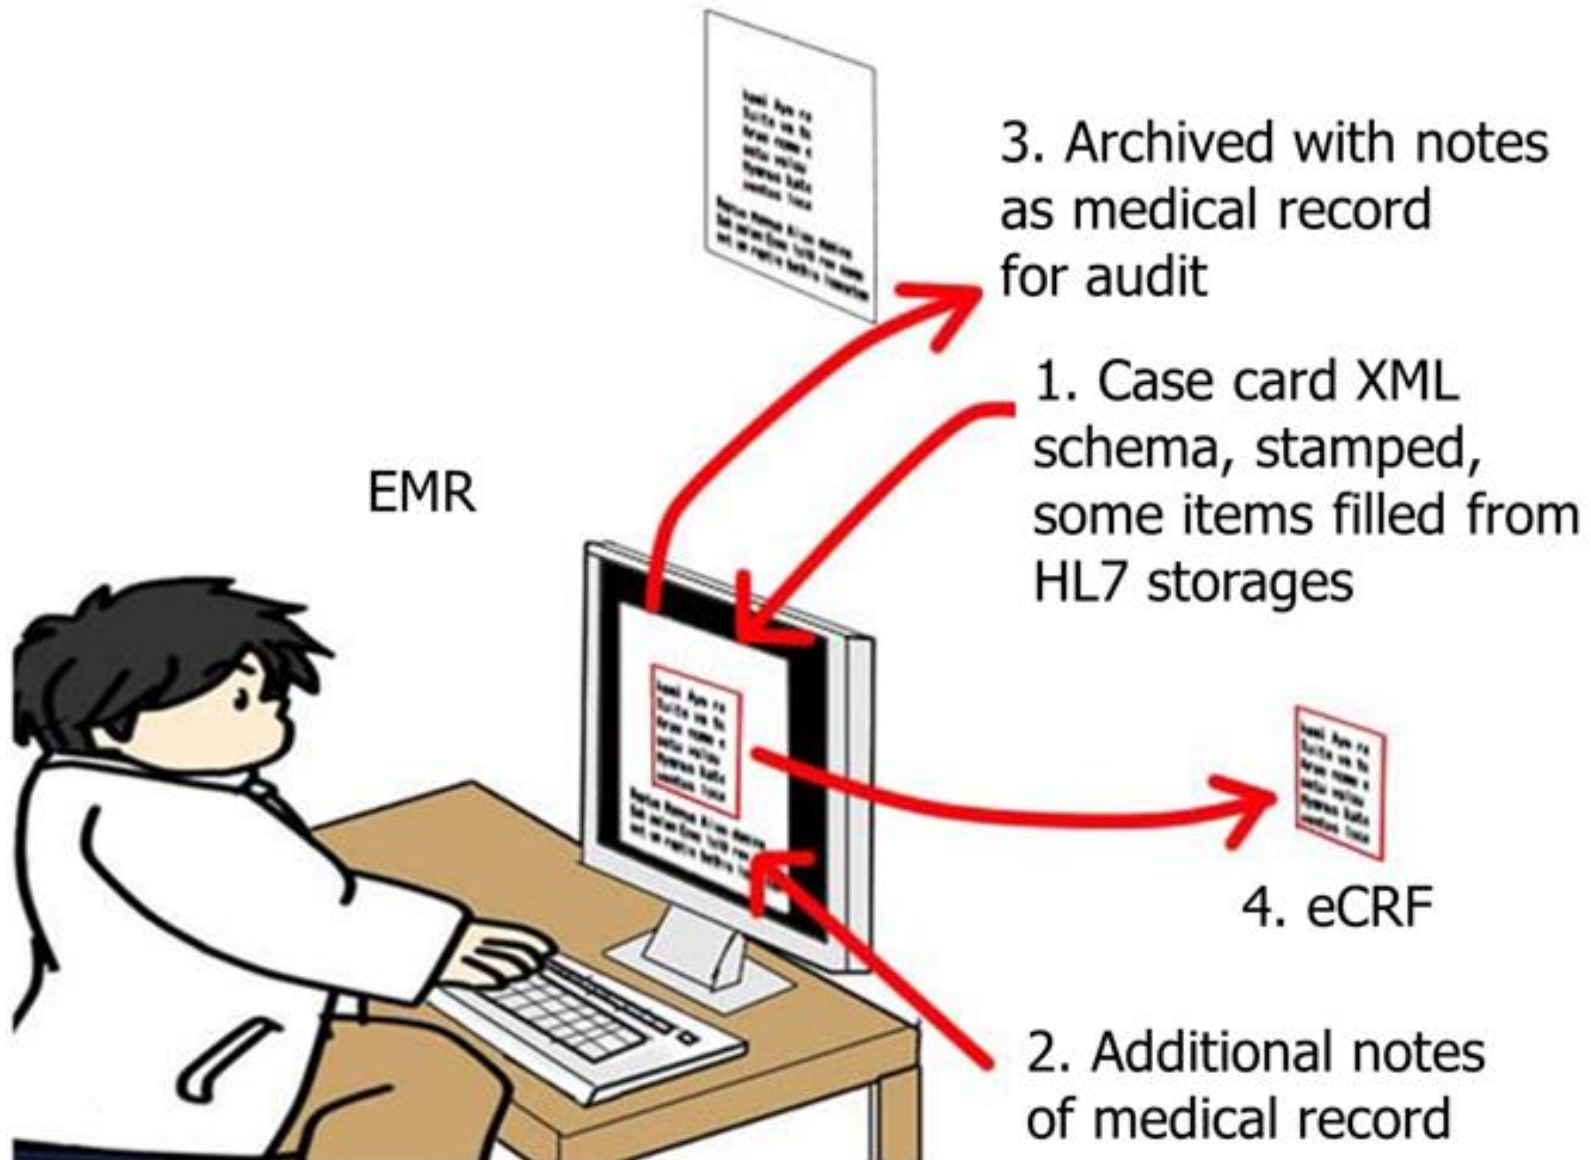

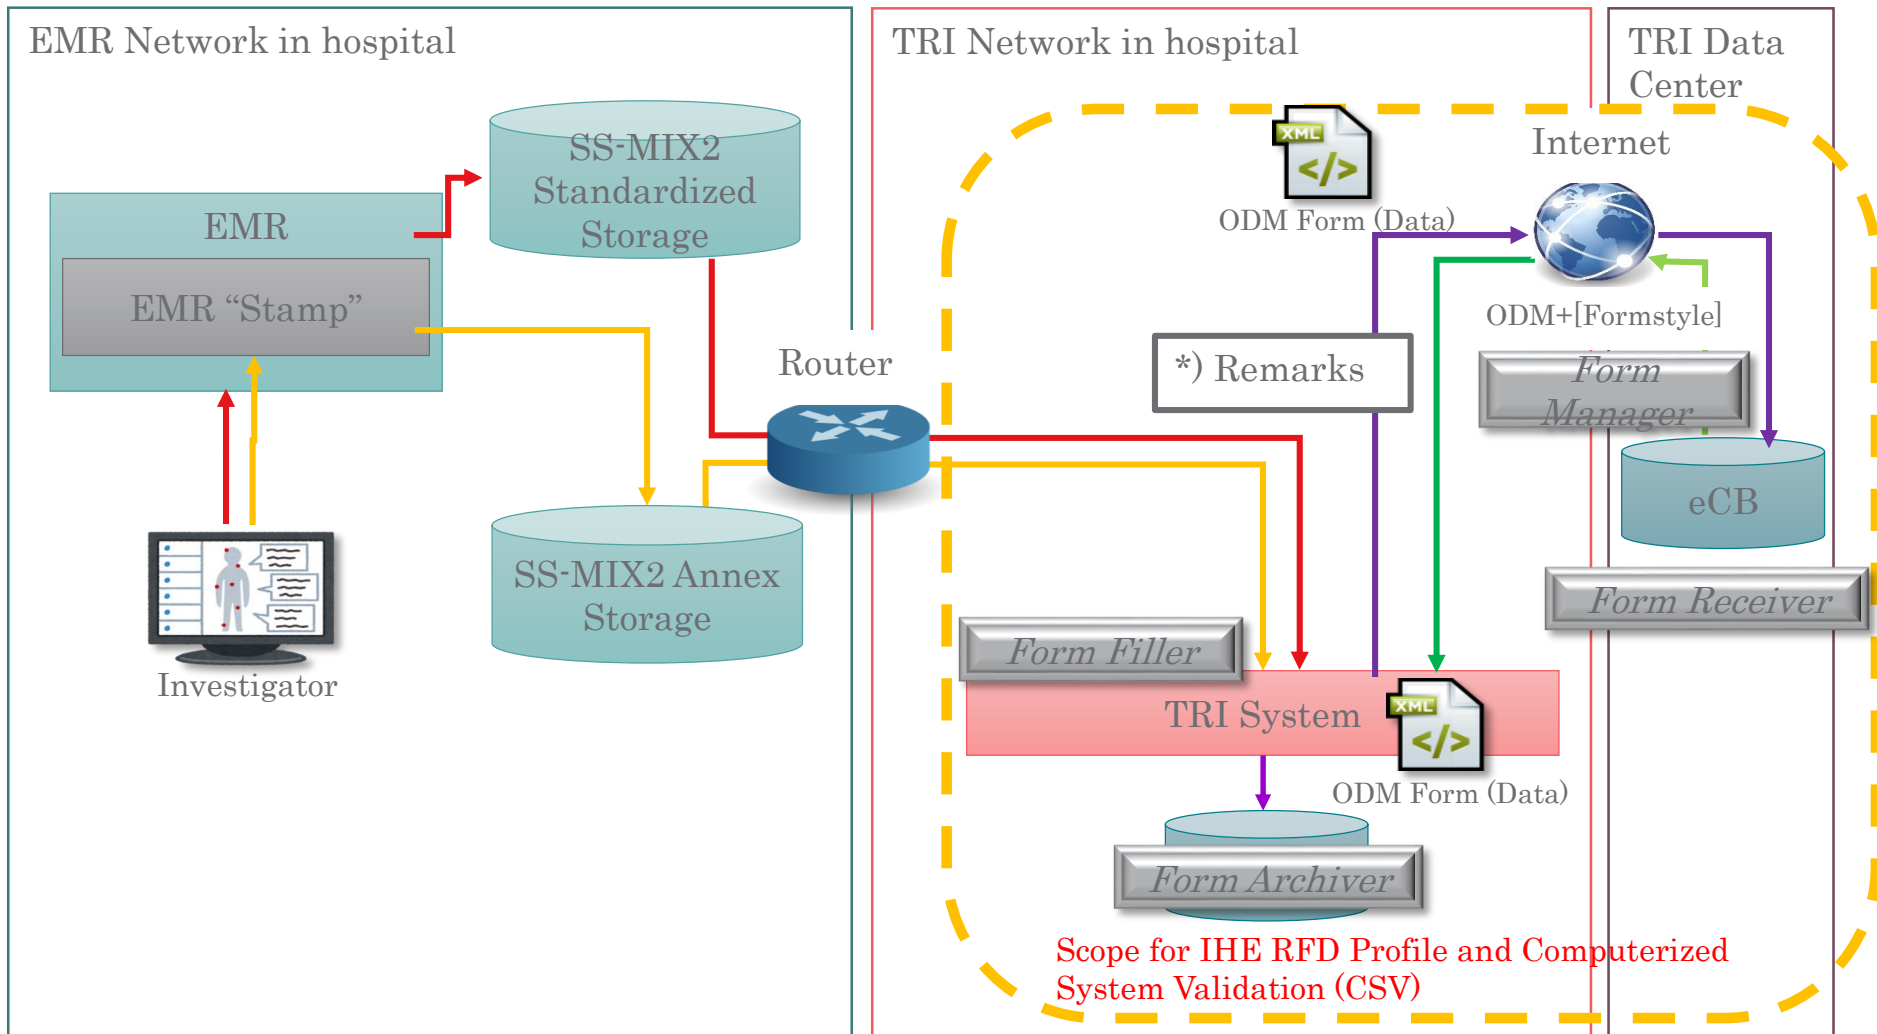

Diagram of the Total System

- FDA uses RWD and RWE to monitor postmarket safety and adverse events and to make regulatory decisions.
- The health care community is using these data to support coverage decisions and to develop guidelines and decision support tools for use in clinical practice.
- **Medical product developers are using RWD and RWE to support clinical trial designs (e.g., large simple trials, pragmatic clinical trials) and observational studies to generate innovative, new treatment approaches.**

The 21st Century Cures Act, passed in 2016, places additional focus on the use of these types of data to support regulatory decision making, including approval of new indications for approved drugs. Congress defined RWE as data regarding the usage, or the potential benefits or risks, of a drug derived from sources other than traditional clinical trials.

Minimize Efforts and Maximize Quality

- Eliminating the need to transcribe data
- Streamlining the clinical research process while reducing clinician burden by the system

Quality by Design of Clinical Studies

Quality should rely on good design and its execution rather than overreliance on retrospective document checking, monitoring, auditing or inspection. These activities are an important part of a quality assurance process but are not sufficient to ensure quality of a clinical study.

- 臨床試験における質は、適切なデザインとデザインに従った研究遂行に依存すべきであり、後から実施する文書チェック、モニタリング及び監査や査察に過度に依存するべきではない。これらの活動は臨床研究の質保証に重要であるが、臨床研究の質を確保するためには十分ではない。

モニタリングや監査にリソースが多く配分されている現状

Quality by Design of Clinical Studies

Good planning and implementation of a clinical study derive from attention to well-established principles of clinical research, which include the protection of the rights, safety and wellbeing of study subjects and scientific criteria, such as:

- the need for clear pre-defined study objectives that address the primary scientific question(s);
- selection of appropriate subjects that have the disease, condition, or molecular/genetic profile that is being studied;
- use of approaches to minimize bias, such as randomisation, blinding or masking, and/or control of confounding;
- endpoints that are well-defined and measurable, and methods of assessment of those endpoints that are accurate and able to be implemented with minimal reporting or measurement bias.

バイアスを最小化するアプローチは質を確保するために重要

ICH E8(R1)ガイドラインの特徴

- ✓ Quality by Design of Clinical Studies
- ✓ Critical to Quality Factors
- ✓ Feasibility

Critical to Quality Factors

Perfection in every aspect of an activity is rarely achievable or can only be achieved by use of resources that are out of proportion to the benefit obtained. The quality factors should be prioritized to identify those that are critical to the study, at the time of the study design, and study procedures should be proportionate to the risks inherent in the study and the importance of the information collected. The critical to quality factors should be clear and should not be cluttered with minor issues (e.g., due to extensive secondary objectives or processes/data collection not linked to the proper protection of the study subjects and/or primary study objectives).

- 研究の全ての事項に完全性を求めない
- 質を構成する要素の中から、その研究に欠かすことの出来ない要素を同定し、優先順位を付けること
- 研究のリスクや収集された情報の重要性に応じた資源配分
- 質に重要な要素は明確であるべきで、マイナーな事柄と混同すべきでない

ICH E8(R1)ガイドラインの特徴

- ✓ Quality by Design of Clinical Studies
- ✓ Critical to Quality Factors
- ✓ Feasibility

Feasibility

Consideration of critical to quality factors relating to study feasibility can inform study design and enhance quality implementation. Feasibility considerations include but are not limited to the availability of qualified investigators/site personnel with experience in conducting a clinical study; availability of equipment and facilities required to successfully conduct the clinical study; availability of the desired patient population; ability to enrol sufficient numbers of participants as determined by the study's power analysis; the ethical and regulatory considerations, which include informed consent, parental/caregiver consent and patient assent for paediatric studies; and regional standards of care.

- 経験を有し良質なInvestigatorの確保
- 試験を成功裡に実施しうる設備や施設
- 目標とする患者数の確保
- 統計学的評価に必要な被験者数の組み入れ能力
- 倫理および規制への考慮

Feasibility

An important aspect of study feasibility is understanding the view of potential study subjects about protocol elements that could impact their willingness to enrol or continue participation in the study (e.g., impact of study procedures, meaningfulness of the study objectives/outcomes). The retention of study subjects and the follow-up of subjects who have withdrawn from treatment are key critical to quality factors. It is important to not underestimate the value that appropriate and early consultation with patients will have on the feasibility of the study, adherence to the protocol, and, more essentially, relevance (or suitability) for patients of the drug approval based on the accumulated knowledge and experience from the clinical studies.

- 研究への参加あるいは継続の意志に影響を及ぼしうるプロトコルの要素について患者の見解を理解することは、研究の実施可能性を検討する上で重要

Research, and Drug Research in particular, will, of course, continue. But in the twenty-first century it will no longer be a monopoly of a single industry, certainly not the monopoly of the classical pharmaceutical industry. Many partners will play a variety of roles in this new game: the biotechnology industry as the actual discoverer, the universities as important providers of ideas and preincubated projects, the classical pharmaceutical firms as developers, manufacturers, and distributors, and, increasingly, contract research organizations (CROs) as supporters of development. (In Quest of Tomorrow's Medicines, Springer New York, 2000) Juergen Drews

Biomedical Research: Increasing Value, Reducing Waste

Regulators of research are motivated to protect research participants, mindful of the atrocities of the past that associate biomedical researchers with war criminals (eg, in the Nuremberg trials). However, the result has been that **regulatory burdens are often disproportionate to the plausible risks of the research, which jeopardizes the capacity and motivation of researchers to answer some important questions.**

Across the product lifecycle, different types of studies will be conducted with different objectives and designs. Depending on the study objectives and the position of the study in the overall development plan, the data sources may vary. For purposes of this guideline, the development plan is considered to **cover the entire product lifecycle and include non-clinical, clinical, and post-approval studies.**

Different types of question require different types of evidence
