

Joint MHLW/PMDA-USP Workshop “Role of Quality in Pharmaceuticals”

June 16 - 17, 2021 Virtual/Hibiya Conference Square

Session 3: Standards for Biologics

General Monographs, New testing for endotoxin

Current trends and future perspectives of JP standards for biologics

Akiko Ishii-Watabe, Hiroko Shibata

PMDA JP Expert committee on Biologicals

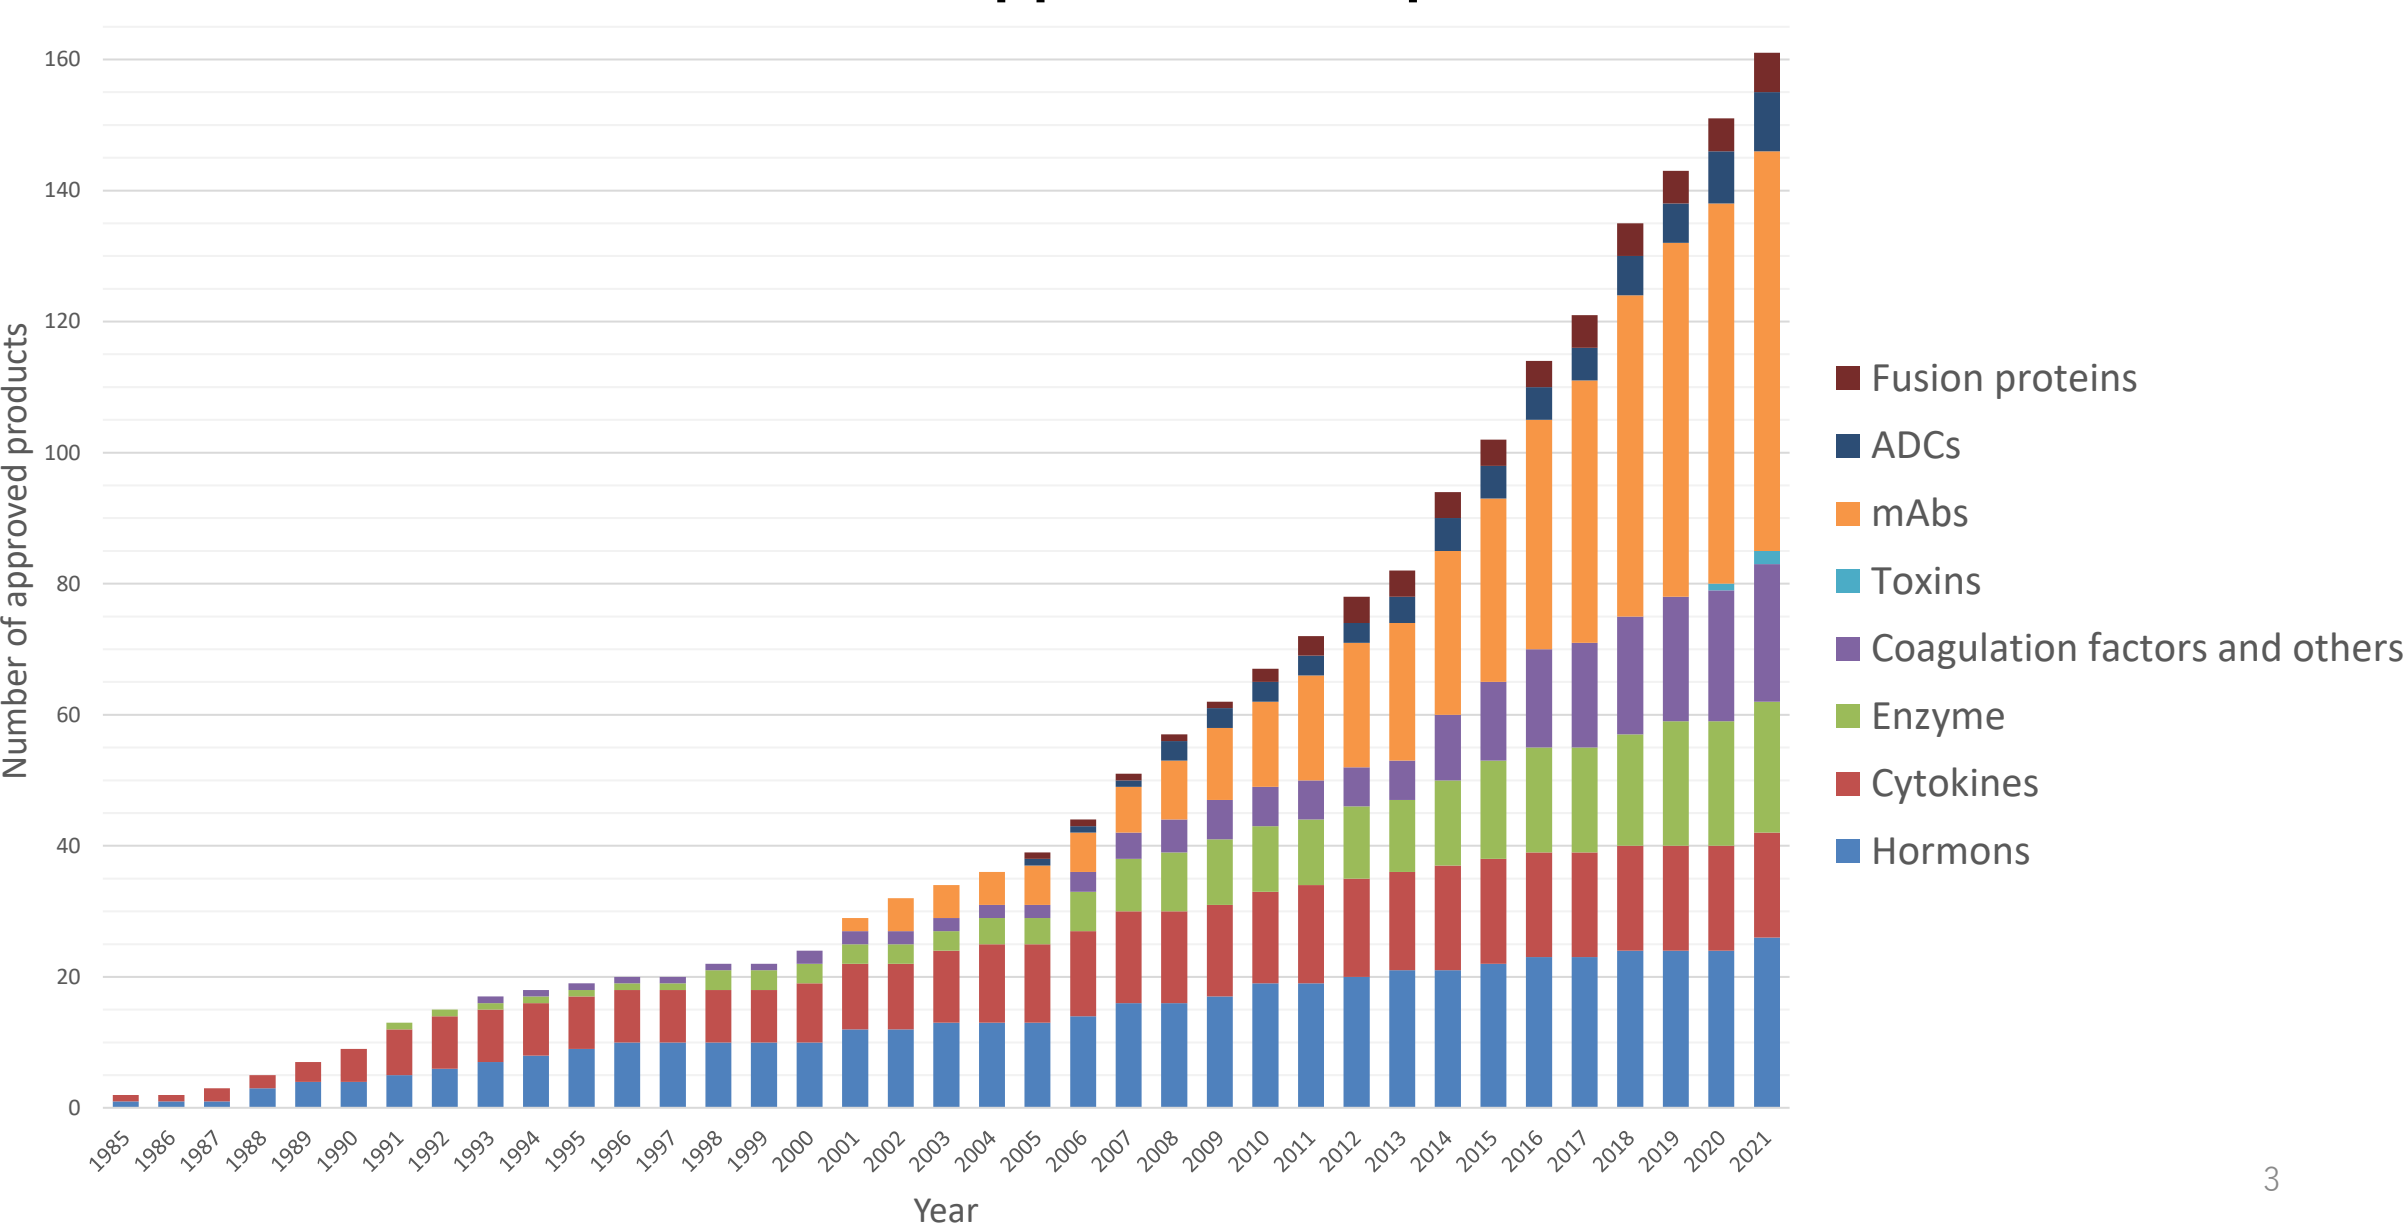

& National Institute of Health Sciences

Outline

1. Biological Products approved in Japan
 - Drugs including Biological products and Regenerative medicinal products
2. Overview of JP chapters related to Biological products
 - Monographs, General tests, General Informations
3. Recent revision related to Biological products
 - <6.17> Insoluble particulate matter test for therapeutic protein injections
 - New General Information for “Basic concept of the quality control on biotechnological products”
4. Ongoing projects and future plan
 - Activities of AMED research group ~Flow Imaging~ ~Bioassay~
 - Multi-Attribute Method
 - General monograph of mAbs

Biological products (mainly recombinant therapeutic protein products) approved in Japan

Biosimilar products approved in Japan, EU and US

EU

somatropin
insulin glargine
insulin lispro
insulin aspart
teriparatide
epoetin alfa, zeta
filgrastim
pegfilgrastim
★ follitropin alfa
infliximab
adalimumab
rituximab
trastuzumab
bevacizumab
etanercept

15 original products

(LMWH products are not listed here)

Japan

somatropin
insulin glargine BS1,2
insulin lispro BS1
insulin aspart BS1
filgrastim BS1,2,3
teriparatide BS1
epoetin alfa BS1
★ ★ darbepoetin alfa BS1,2,3
★ agalsidase beta BS1
infliximab BS1,2,3
adalimumab BS1,2,3
rituximab BS1,2
trastuzumab BS1,2,3
bevacizumab BS1,2
etanercept BS1,2

15 original products

US

somatropin*
insulin glargine*
Insulin lispro*
teriparatide*
filgrastim
pegfilgrastim
epoetin alfa
infliximab
adalimumab
rituximab
trastuzumab
bevacizumab
etanercept

13 original products

*FDC Act 505(b)(2) Follow-on product

mAb
TNFR-Fc

Each biosimilar product has its own Japanese Accepted Name (JAN) in Japan.

Regulation of biological products and regenerative medicinal products in Japan

Japan MHLW

Drugs (including Biological products)

- chemical entities
- peptide, protein, sugar
- recombinant therapeutic proteins
- vaccines, blood products
- allergens

Regenerative medicinal products

- cell therapy products
- gene therapy products

➡ Both are regulated under PMD Act
(Pharmaceutical and Medical Device Act)

US FDA

Drugs

- chemical entities
- ➡ Regulated under FD&C Act
(Food, Drug, and Cosmetic Act)

Biological Products

- vaccines, blood and blood components
- allergenics
- sugars, proteins, nucleic acids
- recombinant therapeutic proteins
- somatic cells, gene therapy, tissues,

➡ Regulated under PHS Act
(Public Health Service Act)

What is a biological product?

<https://www.fda.gov/about-fda/center-biologics-evaluation-and-research-cber/what-are-biologics-questions-and-answers>

JP focuses on Drugs (including biological products)

Regenerative medicinal products approved in Japan

Category	Trade name	Nonproprietary name	Approved year
Cell Therapy	Jacc	Human (auto) cartilage cell	2012
	Temcell	Human (allo) bonemarrow-derived MSC	2015
	HeartSheet	Human (auto) skeletal muscle-derived cell sheet	2015
	Jace	Human (auto)epidermal cell sheet	2016
	Stemirac	Human (allo) bonemarrow-derived MSC	2018
	Kymriah	Tisagenlecleucel	2019
	Nepic	Human (auto) corneal epithelial cell sheet	2020
Gene Therapy	Colategen	Beperminogene perplasmid	2019
	Zolgensma	Onasemnogene abeparvovec	2020

Total 9 products

Usefulness of JP General chapters for Regenerative medicinal products

- Regenerative medicinal products and Drugs are defined as different categories in Japan.
- JP is used for Drugs (including Biological products)
- However, some of JP General Tests and General Informations are useful for testing of regenerative medicinal products.

Examples of analytical methods used in specifications of regenerative medicinal products

HPLC	Flowcytometry	Endotoxin
ICP-MS	Cell morphology	Microbiological contamination
UV	Cell number	Sterility
Fluorescence	Colony formation	Mycoplasma testing
Protein assay		Electron microscopy
Electrophoresis	pH	Hemagglutination assay
ELISA	Osmotic pressure	Hemadsorption assay
PCR	Extractable volume	In vivo virus test
DNA analysis	Foreign insoluble matter	
Analytical ultracentrifugation	Insoluble particulate matter	

JP monographs of biological products (therapeutic proteins)

Category	Monograph	First adopted issue
Insulins	Insulin Human (Genetical Recombination) Insulin Human (Genetical Recombination) Injection Insulin Glargin (Genetical Recombination) Insulin Glargin (Genetical Recombination) Injection Insulin Aspart (Genetical Recombination) Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension Biphasic Isophane Insulin Human (Genetical Recombination) Injectable Aqueous Suspension	JP14 JP16-2 JP16-2 JP16-2 JP17-1 JP17-1 JP17-1
Interleukin-2	Celmoleukin (Genetical Recombination) Teceleukin (Genetical Recombination) Teceleukin for Injection (Genetical Recombination)	JP15 JP15 JP15
Granulocyte-Colony Stimulating Factors	Filgrastim (Genetical Recombination) Filgrastim (Genetical Recombination) Injection Lenograstim (Genetical Recombination) Nartograstim (Genetical Recombination) Nartograstim for Injection (Genetical Recombination)	JP16-1 JP16-1 JP16-1 JP16-1 JP16-1
Erythropoietins	Epoetin Alfa (Genetical Recombination) Epoetin Beta (Genetical Recombination)	JP16-1 JP16-1
Interferons	Interferon Alfa (NAMALWA) Interferon Alfa (NAMALWA) Injection	JP17 JP17
Glucagon	Glucagon (Genetical Recombination)	JP18

JP General tests related to biological products

Chapter	Harmonisation in PDG
2.01 Liquid Chromatography	
2.04 Amino Acid Analysis of Proteins	
2.05 Size Exclusion Chromatography	
2.64 Glycosylation Analysis of Glycoprotein	
4.01 Bacterial Endotoxins Test	✓
4.06 Sterility Test	✓
6.05 Test for Extractable Volume of Parenteral Preparations	✓
6.06 Foreign Insoluble Matter Test for Injections	
6.07 Insoluble Particulate Matter Test for Injections	✓
6.17 Insoluble Particulate Matter Test for Protein Injections	

JP General Informations related to biological products

	Chapter	Harmonisation in PDG
〈G3-1-180〉	A basic Concept of the Quality Assurance on Biotechnological Products (Biopharmaceuticals)	
〈G3-2-171〉	Amino Acid Analysis	✓
〈G3-3-142〉	Peptide Mapping	✓
〈G3-4-161〉	Mass Spectrometry of Peptides and Proteins	
〈G3-5-170〉	Monosaccharide Analysis and Oligosaccharide Analysis/Oligosaccharide Profiling	
〈G3-6-142〉	Isoelectric Focusing	✓
〈G3-7-180〉	Capillary Electrophoresis	✓
〈G3-8-170〉	SDS-Polyacrylamide Gel Electrophoresis	✓
〈G3-9-172〉	Host Cell Protein Assay	
〈G3-10-170〉	Surface Plasmon Resonance	
〈G3-11-171〉	Enzyme-linked Immunosorbent Assay (ELISA)	
〈G3-12-172〉	Total Protein Assay	
〈G3-13-141〉	Basic Requirements for Viral Safety of Biotechnological/Biological Products listed in Japanese Pharmacopoeia	
〈G3-14-170〉	Mycoplasma Testing for Cell Substrates used for the Production of Biotechnological/Biological Products	
〈G3-3 15-141〉	Qualification of Animals as Origin of Animal-derived Medicinal Products provided in the General Notices of Japanese Pharmacopoeia and Other Standards	

General test <6.17> Insoluble Particulate Matter Test for Protein Injections

Listed in JP17-2

Collaborative study by 6 laboratories.

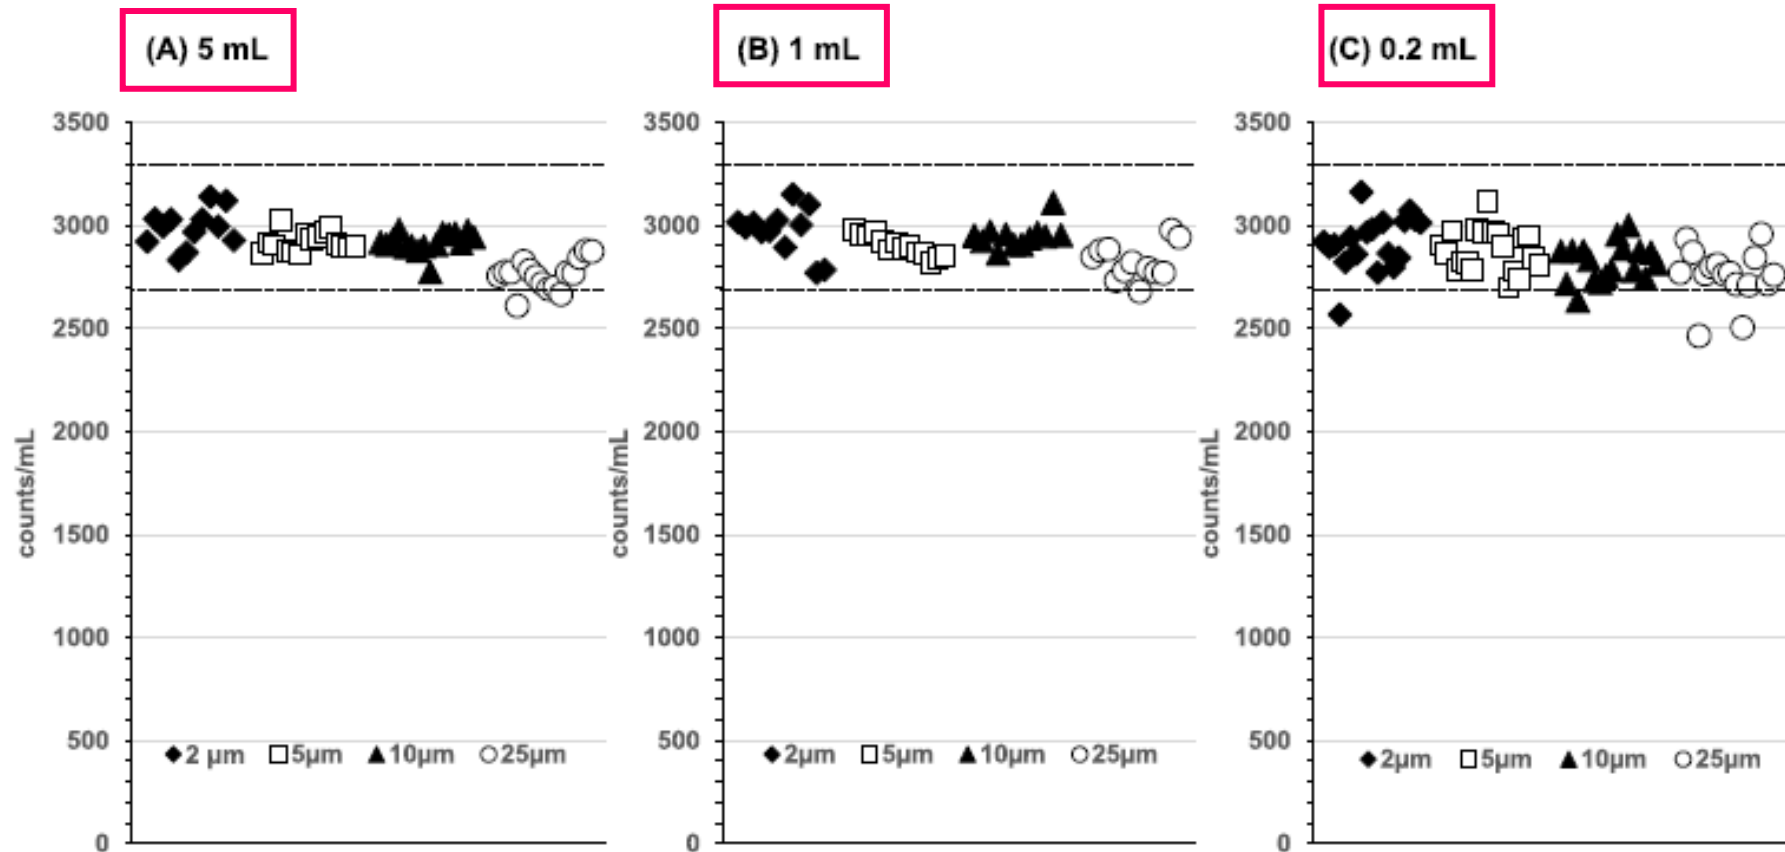

Fig. 1. Influence of measurement volume on particle count of light obscuration method.

The plots show the counts of all tests for 2, 5, 10 and 25 μm polystyrene count standards at a measurement volume of 5 mL (A), 1 mL (B), and 0.2 mL (C).

	6.07 Insoluble Particulate Matter Test for Injections	6.17 Insoluble Particulate Matter Test for Therapeutic Protein Injections
Definition of insoluble particulate matter	Extraneous, mobile undissolved particles, other than gas bubbles, that are unintentionally present in the solutions.	Mobile undissolved particles other than gas bubbles in preparations. Extraneous substances, substances derived from manufacturing processes, protein aggregates and so on maybe included.
methods	Method1. Light Obscuration Particle Count Test Method 2. Microscopic Particle Count Test	Light Obscuration
Elimination of gas bubbles	Eliminate gas bubbles by appropriate measures such as allowing to stand for 2 minutes or sonicating.	For elimination of air bubbles, it is recommended to allow a container to stand under ambient pressure or reduced pressure. Other procedures are applicable if confirmed to be appropriate. Sonicating is not appropriate be-cause it may aggregate or denature proteins.
Measurement volume	Remove 4 portions, each of not less than 5 mL, and count the number of particles equal to or greater than 10mm and 25mm. the contents of 10 or more units are combined in a cleaned container to obtain a volume of not less than 25 mL	The measurement volume is 1 to 5 mL. The measurement volume can be reduced to 0.2 mL when the validity of the reduction is confirmed in considering the property of the sample and the tare volume of the apparatus.
Acceptance criteria	Same (B—Solutions for injection supplied in containers with a nominal content of less than 100 mL. The average number of particles of equal to or greater than 10 μ m does not exceed 6000 per container and that of particles of equal to or greater than 25 μ m does not exceed 600 per container	

Recent revision of JP ~Incorporation of ICH Quality guidelines~

- ✓Quality assurance via process control
- ✓Harmonization with international standard

JP18 (2021)

General Information (Basic concept of the quality assurance on biotechnological products (biopharmaceuticals)) Q8~11 + Q5 series, Q6B

General Information: Basic concept of the quality control on biotechnological products (biopharmaceuticals)

To be listed in JP18

1. Quality evaluation and control of biopharmaceuticals

1.1 Quality evaluation

1.1.1 Characterization

Q6B

- a. Structure and Physicochemical Properties
- b. Biological activities
- c. Molecular Variants of desired product
- d. Process-related impurities

1.1.2. Identification of CQA

Q8-11

1.2 Construction of quality control strategy

1.2.1. Raw materials control

Q5B

- a. Evaluation and Control of Cell Bank
- b. Control of other raw materials

Q5D

1.2.2. Manufacturing process control

- a. Process Parameter Control
- b. In Process Tests

Q5A

1.2.3. Evaluation and control of contaminant

1.2.4. Specifications

Q6B

- a. Setting Basis of Specification
- b. Description
- c. Identification test
- d. Specific physical and/or chemical values
- e. Purity test
- f. Biological activities
- g. Assay
- h. Tests for preparations

1.2.5. Stability testing

Q5C

- a. Conditions of stability testing
- b. Attributes to be evaluated

Q5E

2. Comparability of biopharmaceuticals subject to changes in their manufacturing process

2.1 Considerations for the comparability exercise

2.2 Quality considerations

2.3 Manufacturing process considerations

J Pharm Sci. 2019

Purpose:

to assess the adequacy/feasibility for the standardization of flow Imaging (FI) technique

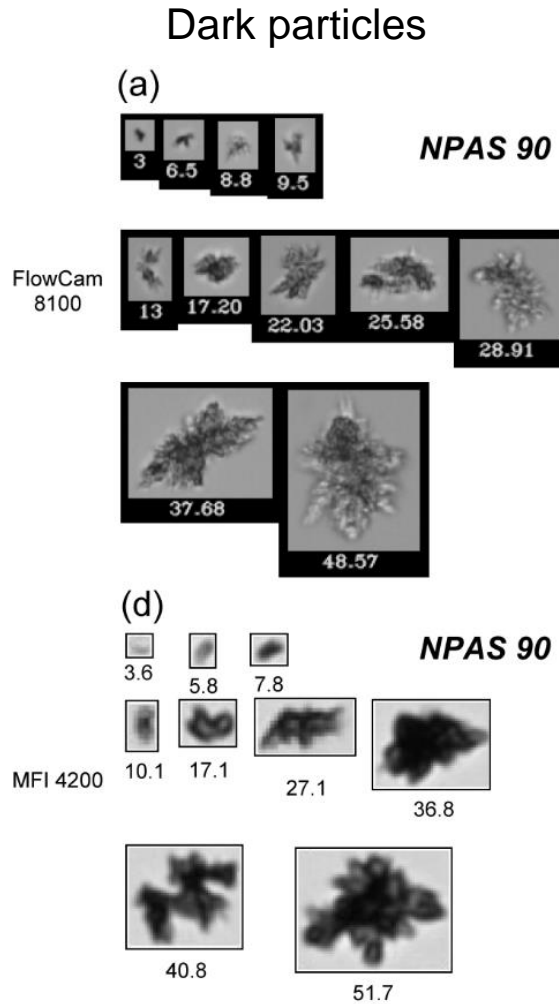

Elucidated the analytical performance of FI, mainly focusing on

- ✓ Comparison between methods (LO vs FI)
- ✓ Comparison between manufactures (MFI vs FlowCam)
- ✓ Comparison among laboratories (inter-laboratory variability)

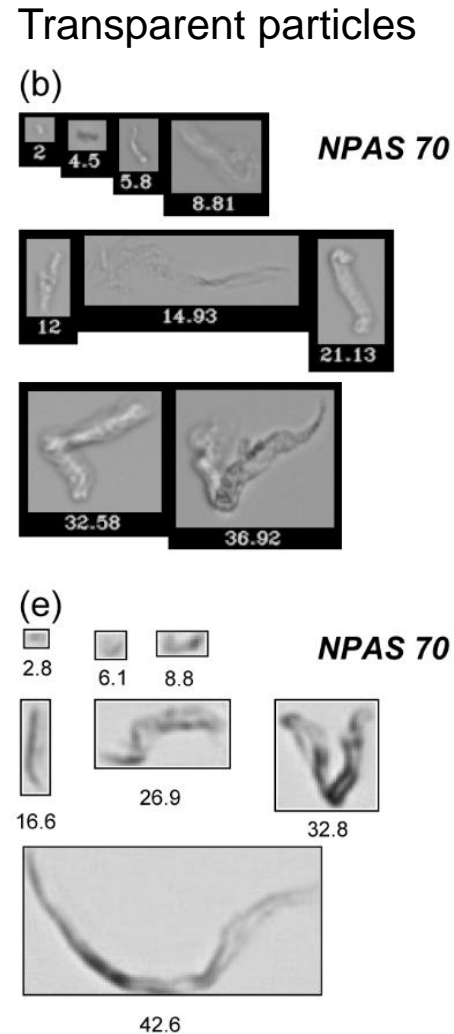

Representative digital images of particles used in the study

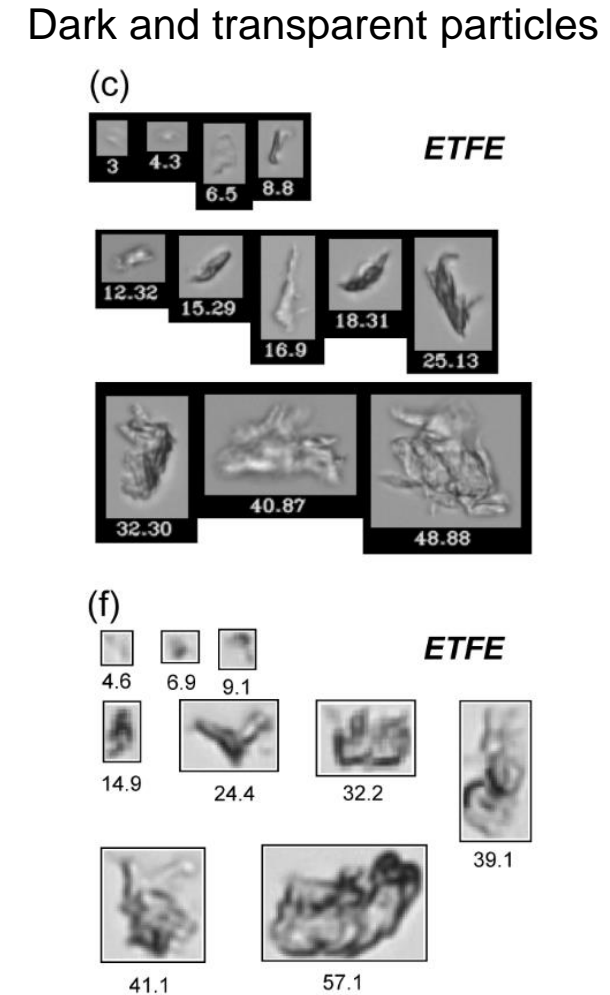

NPAS90: IVIG heated at 90 °C

NPAS70: IVIG heated at 70 °C

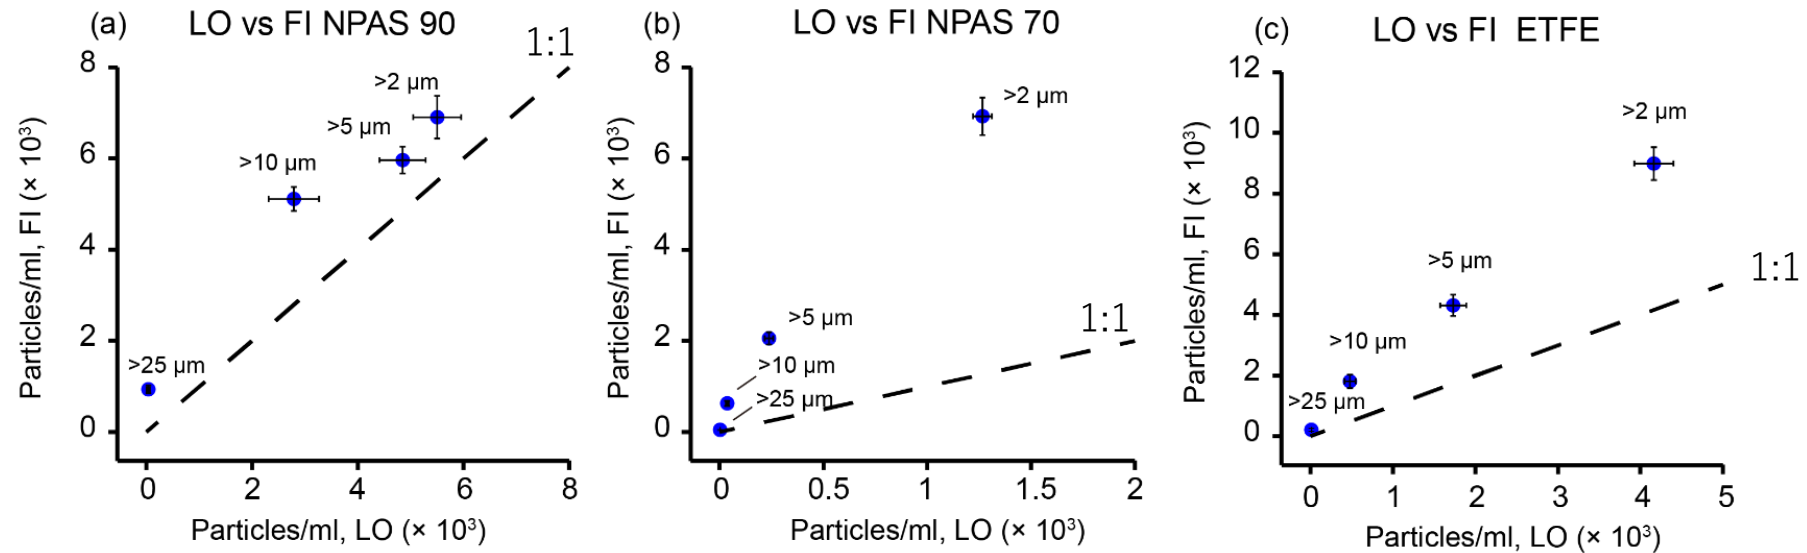

ETFE: Not proteinaceous

Aspect ratio : NPAS 90 < ETFE < NPAS 70

Transparency : NPAS 90 < ETFE < NPAS 70

Comparison of particulate counts (LO vs FI)

Difference in particle counts in the measurement by LO and FI

NPAS 90 < ETFE < NPAS 70

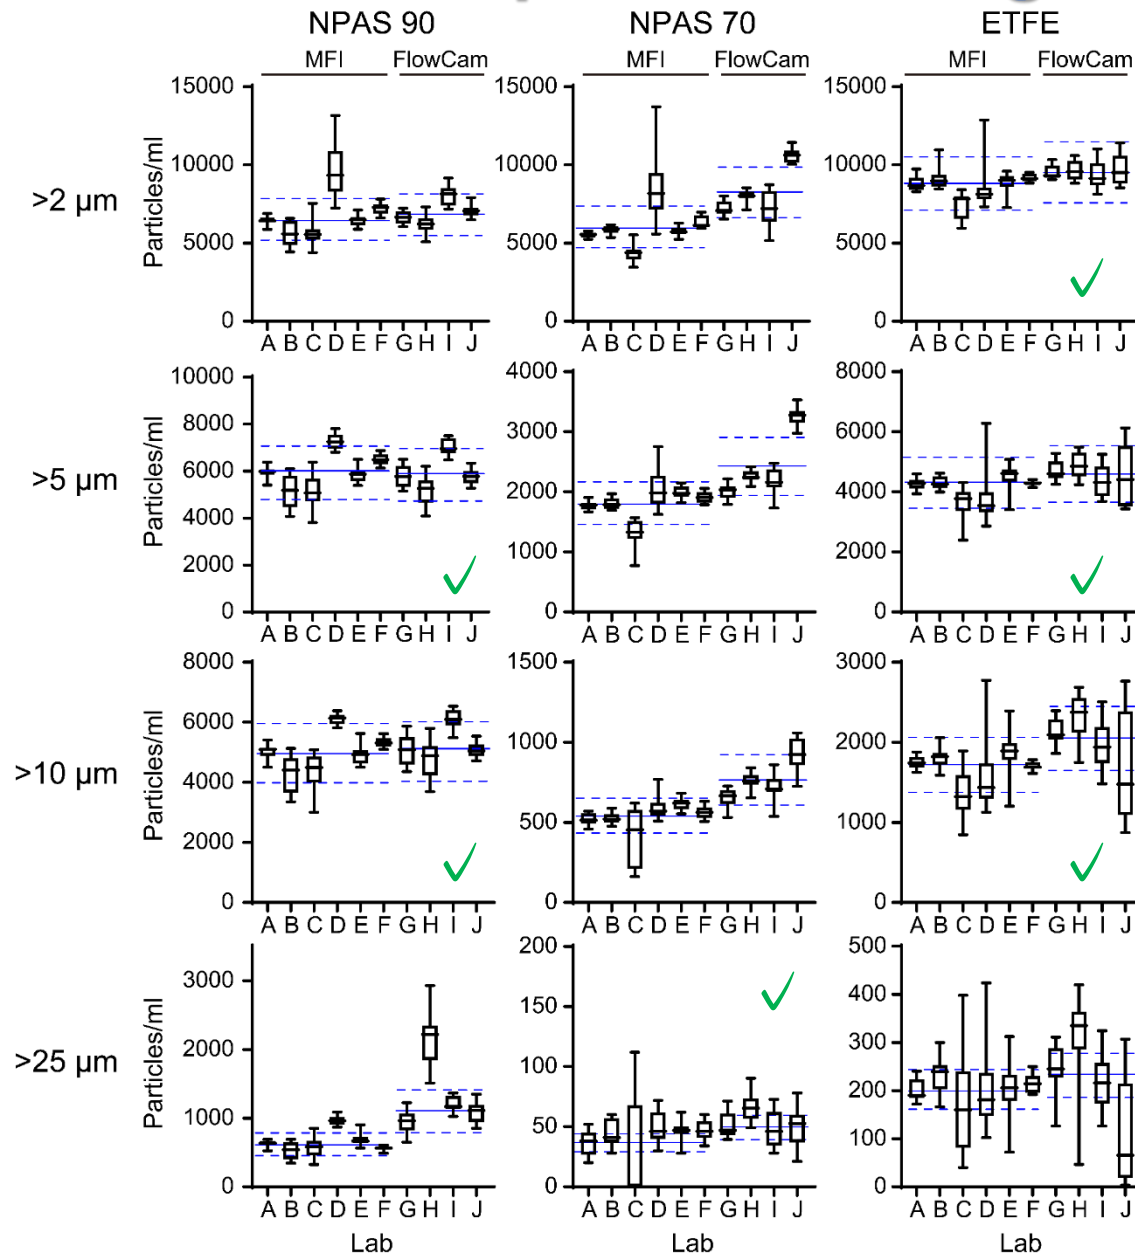

Transparency or Aspect ratio

NPAS 90 < ETFE < NPAS 70

LO underestimated the counts and size, especially for highly transparent and irregularly shaped particles.

FI can detect highly transparent and irregularly shaped particles more precisely.

Comparison among laboratories: FI

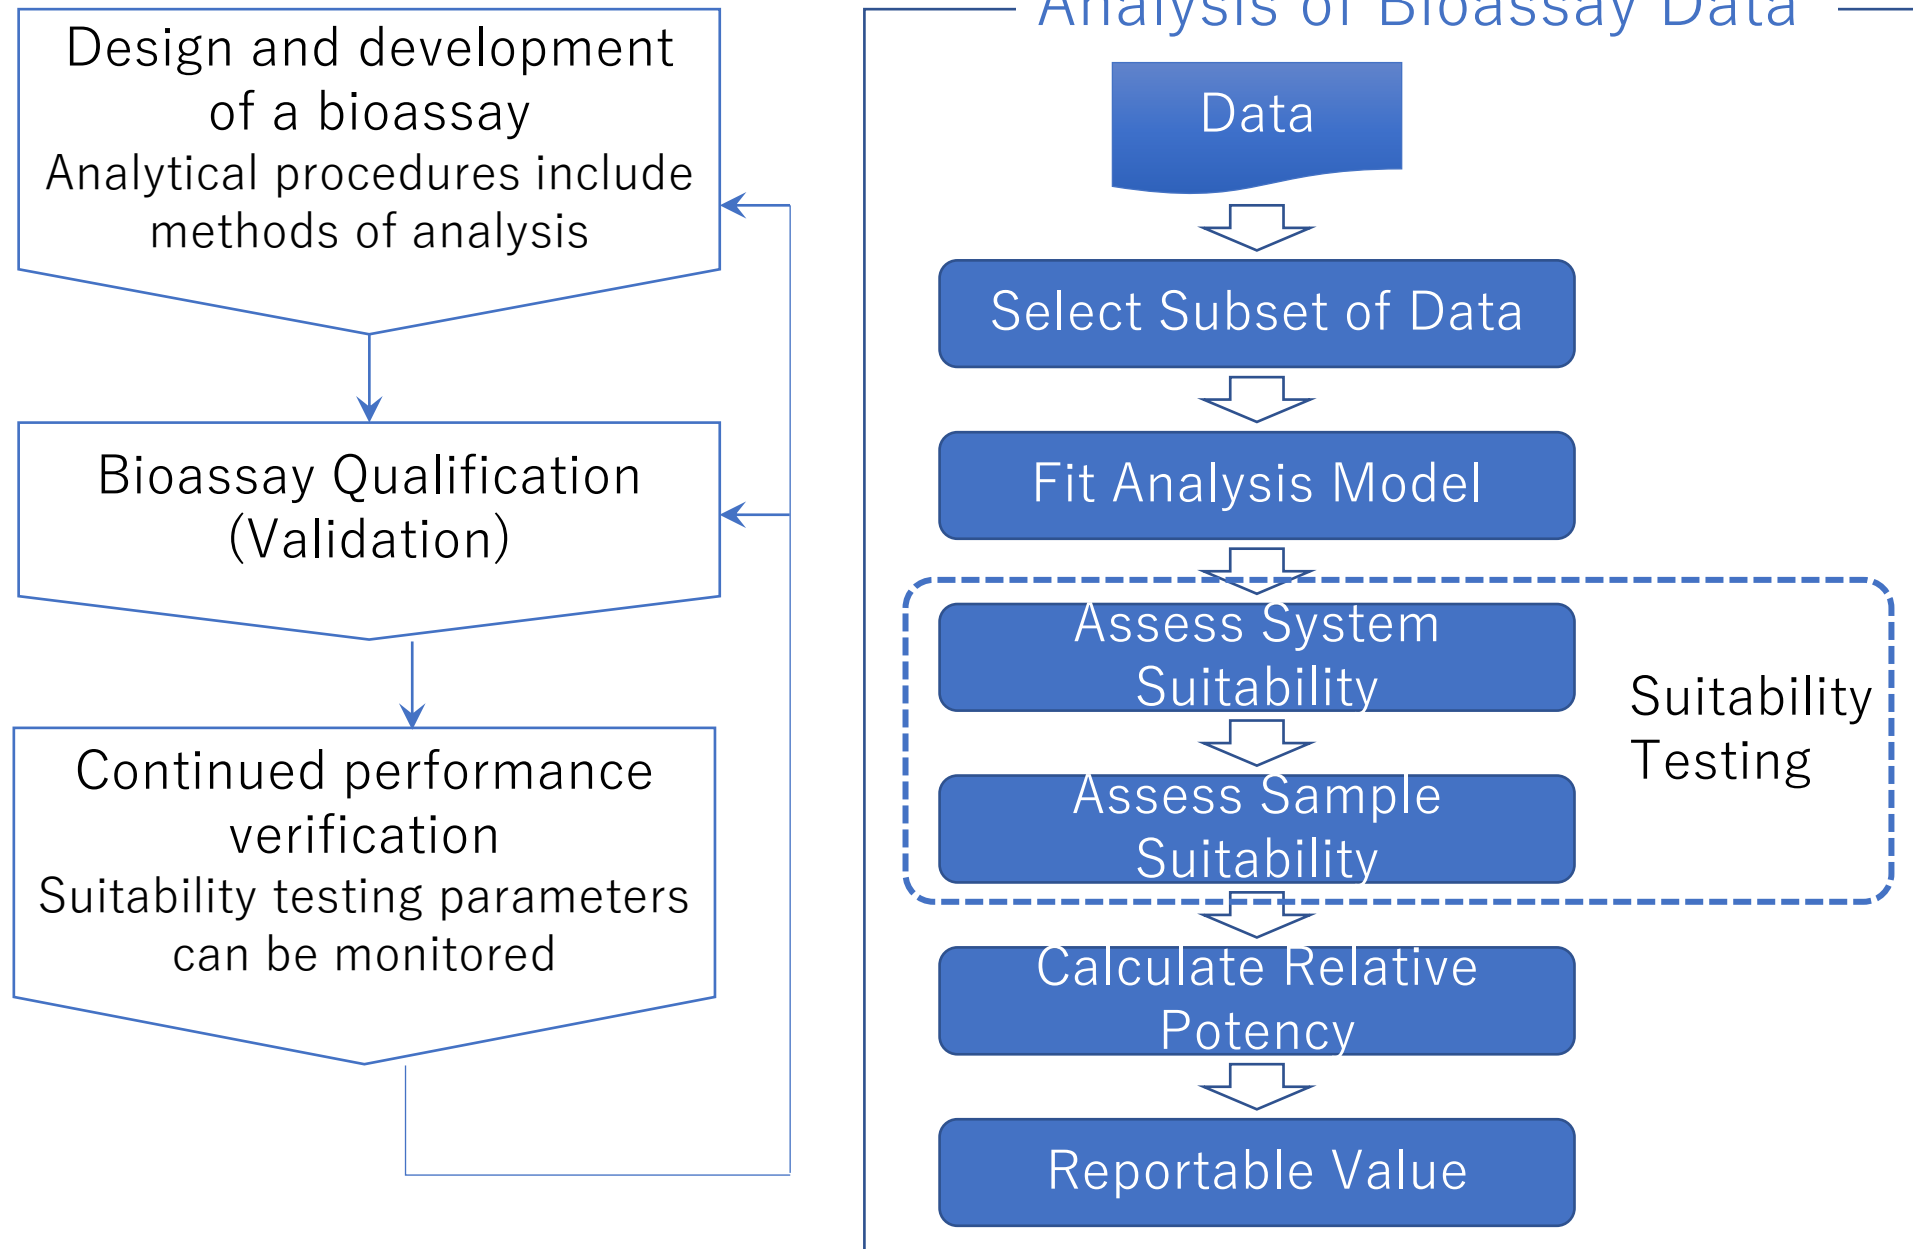

Overall, most of the medians of particle count in each laboratory were within 80-120% of the Lab A-F (MFI users) or Lab G-J (FlowCam users).

✓ Consistent

Considering our data, setting FI as a release test would be feasible to precisely analyze the sizes and counts of particles in therapeutic protein injections.

Research on Multi-attribute method (MAM) for the characterization and quality control of mAbs

Tajiri-Tsukada M., Hashii N.*, Ishii-Watabe A.: Establishment of a Highly Precise Multi-attribute Method for the Characterization and Quality Control of Therapeutic Monoclonal Antibodies. *Bioengineered*, 2020; 11(1) : 984-1000.

➡ Optimization of pre-treatment procedures enabled highly precise analysis.

- ❑ The multi-attribute method (MAM) has garnered attention as a new quality control method of therapeutic monoclonal antibodies (mAbs).
- ❑ MAM analysis allows multiple relative quantifications of several structural attributes of therapeutic mAbs; however, some issues remain to be addressed in its procedures especially for sample preparation.

Parameter	Method 1 (Proposed method)	Method 2	Method 3	Method 4	Method 5	Reference method
Denaturing reagent	GuHCl	GuHCl	SDC and SLS	GuHCl	Not applicable	GuHCl
RCM (temp.)	DTT/MIA (room temp.)	DTT/MIA (65°C)	DTT/MIA (room temp.)	TCEP/IAA (37°C)	(After digestion) DTT/MIA (57°C)	DTT/MIA (room temp.)
Treatment after RCM	Desalting/ buffer exchange by NAP5 column	Desalting by PD10 column and lyophilization	Dilution	Dilution	Not applicable	Desalting/ buffer exchange by NAP5 column Trypsin

(2) Example of specifications

Origin

Manufacture

Description

Identification

Charge variants

Glycosylation profile

Purity (1) aggregates

Purity (2) low molecular weight species

Biological activity (1) antigen binding

Biological activity (2) Fc γ R IIIa activation

Assay

Storage

Reagents and test solutions

Perspective on the role of JP in the field of Biological products

JP is the public standard document showing the standard test methods and concepts

+

Most of the biological products are developed and used globally.

Establishment and harmonization of General tests and General Informations

Contribution to ensuring the quality of innovative biological products used worldwide.
